The variable CTR_CYCNR_R_IT_OBD_LS_DOWN[i] shall be updated with the current value of the input variable CTR_CYCNR_R_IT_LS_DOWN_VLD[i] on each occasion that the integral POW_INT_OBD_LSH_DOWN[i] exceeds the threshold for the first time. For further function calls where the integral condition is met, the one-off update shall not be carried out. This shall continue until the integral condition is no longer met.

Formula section:

Calculation of cooling energy integral:
Determine difference between typical sensor operating temperature and exhaust gas temperature:

TEMP_DIF_OBD_LSH_DOWN[i] = (C_TEMP_SP_OBD_LSH_DOWN - TEG_DYN_LS_DOWN[i])
(NOTE: Resolution of temperature difference is reduced from 0.0625 °C, resolution of the individual temperature variables, to 1 °C; The difference shall be limited to provide only positive values, i.e.   0)

The integral of heat flux (in Watts) provides a measure for the total cooling energy of the exhaust gas (in Joules):

POW_INT_OBD_LSH_DOWN[i]$_{(n)}$ = (POW_INT_OBD_LSH_DOWN[i]$_{(n-1)}$ + TEMP_DIF_OBD_LSH_DOWN[i] * IP_FAC_MAF_OBD_LSH_DOWN)
(NOTE: Integral shall be limited to its maximum hex limit, i.e. FFFFH or 65535 digits, to prevent overflow.)

Detection: (Assumes   Diagnosis detection active)

B.14.1 1.1. Inhibition of diagnosis

FUNCTION DESCRIPTION:

General information:

LV_INH_DIAG_OBD_LSH_DOWN[NC_CBK_EX_NR] represents the influence by errors/conditions de-activating the O2 heater diagnosis. Additionally the interfaces for Rate Based Monitoring RBM are provided.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The calculation shall be done for all exhaust cylinder banks. For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then

i = 1 for exhaust cylinder bank 1
i = 2 for exhaust cylinder bank 2

otherwise (NC_CBK_EX_NR = 1)

i = 1 for single exhaust cylinder bank.

Application conditions

Initialisation: *0 at LV_IGK = 0→1 or at reset*

Recurrence: *1 s*

Activation: *LV_ST_END = 1*

Deactivation: *LV_ST_END = 0*

Formula section:

If LV_ERR_LSH_DOWN[i] = 1
or LV_ERR_SCP_LS_DOWN[i] = 1
or LV_ERR_SCG_LS_DOWN[i] = 1
or LV_ERR_OC_LS_DOWN[i] = 1
or LV_ERR_CHK_LS_DOWN[i] = 1

then LV_INH_DIAG_RBM_OBD_LSH_DOWN[i] = 1
else LV_INH_DIAG_RBM_OBD_LSH_DOWN[i] = 0
endif

If LV_VAR_LSH_DOWN = 0
or LV_CDN_VB_OBD2 = 0
or TCO < C_TCO_MIN_OBD2_LSH_DOWN
or LV_INH_DIAG_RBM_OBD_LSH_DOWN[i] = 1
or LV_LS_DOWN_OBD_2_MAN_DEAC[i] = 1
then LV_INH_DIAG_OBD_LSH_DOWN[i] = 1

endif

LV_DIAG_EOL_REQ_OBD_LSH_DOWN[i] = 0

B.14.2 1.2. Interface for Rate Based Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the OBD_LSH_DOWN[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_OBD_LSH_DOWN[i] data.
Within STATE_RBM_OBD_LSH_DOWN[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0) (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1) (depending on failure status: pending)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions:

Initialisation :
at ECU reset : bit 0, bit 1 and bit 2 of STATE_RBM_OBD_LSH_DOWN[i] = 0
at LV_DC 0 → 1 transition : bit 0 and bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 0
on failure memory reset : bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 0

Recurrence: 1 s
Activation: LV_DC = 1

Formula section:

At LV_DC 0 → 1 transition

bit 2 of STATE_RBM_OBD_LSH_DOWN[i] = 1

The pending status of the following failures has to be checked only once:

LV_ERR_LSH_DOWN[NC_CBK_EX_NR]
LV_ERR_SCP_LS_DOWN[NC_CBK_EX_NR]
LV_ERR_SCG_LS_DOWN[NC_CBK_EX_NR]
LV_ERR_OC_LS_DOWN[NC_CBK_EX_NR]
LV_ERR_CHK_LS_DOWN[NC_CBK_EX_NR]

If(1) { CPU optimization at LV_DC 0 → 1 transition }
CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn't empty }
Then(1)
While bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 0 **do**
with all XX failures of the above list

ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<C

If(2) XX has a pending status
Then(2)
bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 1
Endif(2)
Endwhile
Else(1)
{ the dynamic failure memory is empty }
No action
Endif(1)

Every 1 s :
If (bit 0 of STATE_RBM_OBD_LSH_DOWN[i] = 0 **and**
LV_END_DIAG_OBD_LSH_DOWN[i] = 1)
Then bit 0 of STATE_RBM_OBD_LSH_DOWN[i] = 1
Endif

If (bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 0 **and**
LV_INH_DIAG_RBM_OBD_LSH_DOWN[i] = 1)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Then bit 1 of STATE_RBM_OBD_LSH_DOWN[i] = 1
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.15 O2 sensor (bin, down) oscillation diagnosis

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LAMB_SP_OSC_CHK [NC_CBK_EX_NR]	O/V	0... 7FFFH	0... 31.99902	976.599e-6	-
lambda setpoint requested by oscillation check for downstream lambda sensor					
LV_END_DIAG_OSC_CHK [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
End of oscillation diagnosis for downstream sensor					
LV_ERR_OSC_CHK [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
Debounced failure of oscillation diagnosis for downstream sensor					

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

This is a stub module to provide signals consumed in other EGCP modules.

Application conditions

Initialisation: *The output shall be set to the following values, which are never changed:*
LV_ERR_OSC_CHK[i] = 0
LV_END_DIAG_OSC_CHK[i] = 1
LAMB_SP_OSC_CHK[i] = 0

Recurrence: *not applicable*

Activation: not applicable

Formula section:

- This function does not execute any actions or calculations. -

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.16 O2 sensor fuel trim diagnosis

Data definition:

VLS_DOWN_DIF[i]			

FUNCTION DESCRIPTION:

General information:

This function shall summarize the results of both dynamic fuel trim diagnosis specified in this module. Although this function has variable names which are according to the error management naming convention, it does not include an interface to the error manager.
Error Symptoms are defined as follows:

```
┌─┬─┬─┬─┐
 │  │  │  └─> AF too RICH     ( = SYM_0)
 │  │  └────> AF too LEAN     ( = SYM_1)
 │  └───────> (not used)
 └──────────> (not used)
```

Application conditions

Initialisation: *At transition LV_IGK = 0 to 1, ECU reset or at clearing error memory reset all variables to zero, except for the following:*
T_SUM_RST_DELTA_I_LAM[i] = C_T_SUM_RST_MAX_DELTA_I_LAM[i]
T_SUM_END_DIAG_WIN_DELTA_I_LAM[i] = C_T_SUM_RST_MAX_DELTA_I_LAM[i]
T_SUM_END_READY_DELTA_I_LAM[i] = C_T_SUM_READY_DELTA_I_LAM[i]
LAMB_DELTA_I_SAVE_DIAG[i] shall not be initialized

Recurrence: 100 ms

B.16.1 Monitoring trim controller I-Share

FUNCTION DESCRIPTION:

General information:

To fulfil the legal requirements of the OBDII lambda sensor diagnosis, the trim of the lambda control by the lambda sensor signal downstream of the catalytic converter must be monitored in addition to the diagnosis of the lambda sensor upstream of the catalytic converter. In the case of a trim control error, a plausibility check is performed to assign the faulty behavior to the control sensor or the monitoring sensor.
Faulty behavior of the lambda sensors upstream or downstream from the catalytic converter exists if one of the emission components exceeds the standard emissions in the emission test cycle by a certain factor.

Description:

B.16.2 Reset of time counters and set of end of diagnosis flags

After a calibrateable time during which the diagnosis has been activated and no error has been set, the timers for detection of too rich or lean system are reset or respectively reinitialised for the next diagnosis check. This must be done e.g. to avoid to sum up intermittend failures over a too long period.
Beside the items mentioned above the end of diagnosis flag can be set by two different time counters also. (T_SUM_END_DIAG_WIN_DELTA_I_LAM[i] and T_SUM_END_READY_DELTA_I_LAM[i])
After a calibrateable time during which the diagnosis has been activated the end of diagnosis flag is set. The flag of temporary end of diagnosis is a trigger for the similar conditions check and therefore always set after every completed DELTA_I_LAM cycle check (reset next recurrence).
At engine stop all time counters are reset respectively reinitialised.

Formula section:

If LV_CDN_DIAG_DELTA_I_LAM[i] = 1

B.16.3 Error detection for rich/lean A/F ratio deviation

If the total amount of I-share of the trim controller (LAMB_DELTA_I_LAM_ADJ[i] + LAMB_DELTA_AD_LAM_ADJ[i]) exceeds the diagnostic threshold C_LAMB_DELTA_I_MAX/MIN_DIAG[i], T_SUM_MAX/MIN_DELTA_I_LAM[i] is incremented as long as the diagnostic threshold is exceeded. If (LAMB_DELTA_I_LAM_ADJ[i] + LAMB_DELTA_AD_LAM_ADJ[i]) falls below the diagnostic threshold, then T_SUM_MAX/MIN_DELTA_I_LAM[i] is stopped. A failure is detected as soon as T_SUM_MAX/MIN_DELTA_I_LAM[i] is above the threshold C_T_SUM_MAX/MIN_MAX_DELTA_I_LAM[i]. Incrementation restarts, if the I-share of the trim controller exceeds the limit again.
If the engine is stopped the time counters shall be reset.

```
If        LV_CDN_DIAG_DELTA_I_LAM[i] = 1
then         % Error detection for rich/lean A/F ratio deviation
             If          ( LAMB_DELTA_I_LAM_ADJ[i] + LAMB_DELTA_AD_LAM_ADJ[i] ) >
                                                      C_LAMB_DELTA_I_MAX_DIAG

B.16.4 Monitoring of trim controller deviation

FUNCTION DESCRIPTION:

General information:

In order to get a fast decision of error location in case of oxygen sensor failure, trim controller input signal is monitored. Insufficient trim control over long period can be obtained out of this function. In conjunction with activity check of the up- and downstream sensors it is decided which sensor is damaged (up- or downstream).

Description:

The downstream sensor signal deviation to setpoint (VLS_DIF_LAM_ADJ[i]) is observed during trim controller diagnosis phase. This implements the activation of trim control.
If VLS_DIF_LAM_ADJ[i] exceeds either maximum or minimum voltage thresholds corresponding MAF integrals are started. As long as the diagnostic threshold is exceeded the MAF integral is incremented, else it is stopped. A failure is detected as soon as the MAF integral exceeds the threshold (MAF_INT_VLS_DIF_DLY_MAX/MIN). Then symptom flag LV_ERR_VLS_DOWN_DIF[i] and the corresponding symptom (MIN or MAX) are set.
MAF_INT_RST_VLS_DOWN_DIF_DIAG[i] is incremented if no end flag is set so far, or if a symptom was detected at least once in the current diagnostic cycle, it seves two purposes: It causes a "good" diagnostic result if no symptom is detected after sufficient time has elapsed, and it aborts and restarts the diagnosis if a symptom was present, but occurs only rarely (e.g. due to dynamic driving conditions).

Error Symptoms are defined as follows:

```
 _______________
|   |   |   |   |
 |   |   |   └─> AF too RICH     ( = SYM_0)
 |   |   └─────> AF too LEAN     ( = SYM_1)

B.16.5 Limited dynamic for the function Monitoring the Trim Controller Deviation

FUNCTION DESCRIPTION:

General information:

As it is specified in the function Monitoring Trim Controller Deviation contained in this module, this shall be carried out every time the Trim Controller P-share is beeing calculated. This is active most of the time to maintain the the air fuel ratio inside the catalyst window also if any deviation happens. Under such unstable condition its not proper to carry out the trim controller diagnosis and this shall be inhibit until the system achieves the steady state. This shall be facilitated by the present function which shall summarize informations concerning the dynamic of engine speed, mass air flow and air fuel ratio.

Description:

The floating mean value N_MMV_VLS_DIF_DLY_LDC is computed using the averaging constant C_N_CRLC_LDC_VLS_DIF_DLY. The limited dynamics condition only exist while the engine speed N lies within the dynamics window around N_MMV_VLS_DIF_DLY_LDC.
If the above limited dynamics condition is violated, the floating mean value N_MMV_VLS_DIF_DLY_LDC is set to the current engine speed in order to reach the limited dynamics condition faster:

The floating mean value MAF_MMV_VLS_DIF_DLY_LDC is computed using the averaging constant C_MAF_CRLC_LDC_VLS_DIF_DLY. The limited dynamics condition only exist while the air mass MAF stays within the dynamics window around MAF_MMV_VLS_DIF_DLY_LDC. If the above limited dynamics condition is violated, the floating mean value MAF_MMV_VLS_DIF_DLY_LDC is set to the current air-mass value in order to reach the limited dynamics condition faster:

The floating mean value LAM_MMV_VLS_DIF_DLY_LDC[i] is computed using the averaging constant C_LAM_MV_CRLC_LDC_VLS_DIF_DLY. The limited dynamics condition continues to exist while the mean oxygen value FAC_LAM_MV[i] stays within the dynamics window around LAM_MMV_VLS_DIF_DLY_LDC[i]. If the above limited dynamics condition is violated, the floating mean value LAM_MMV_VLS_DIF_DLY_LDC[i] is set to the current mean oxygen value in order to reach the limited dynamics condition faster.

Application conditions

Initialisation: `- - (see first chapter) -`

Recurrence: `T_SAMPLE = 100ms`

Activation: `If (LV_IGK = 1 and LV_ST_END = 1)`

Deactivation: *the above conditions are not fullfiled*

```
   Initialization at deactivation:
N_MMV_VLS_DIF_DLY_LDC = N
MAF_MMV_VLS_DIF_DLY_LDC = MAF
LAM_MMV_VLS_DIF_DLY_LDC[i]  = FAC_LAM_MV[i]
```

Formula section:

Limited engine speed (N) dynamics:

N_MMV_VLS_DIF_DLY_LDC =
N_MMV_VLS_DIF_DLY_LDC * (1 - C_N_CRLC_LDC_VLS_DIF_DLY) +
C_N_CRLC_LDC_VLS_DIF_DLY * N

IF | N - N_MMV_VLS_DIF_DLY_LDC | < C_N_LDC_VLS_DIF_DLY
THEN LV_VLS_DIF_DLY_LDC_N = 1
ELSE LV_VLS_DIF_DLY_LDC_N = 0
N_MMV_VLS_DIF_DLY_LDC = N
ENDIF

Limited mass air flow (MAF) dynamics:

MAF_MMV_VLS_DIF_DLY_LDC =
MAF_MMV_VLS_DIF_DLY_LDC * (1 - C_MAF_CRLC_LDC_VLS_DIF_DLY) +
C_MAF_CRLC_LDC_VLS_DIF_DLY * MAF

IF | MAF - MAF_MMV_VLS_DIF_DLY_LDC | < C_MAF_LDC_VLS_DIF_DLY
THEN LV_VLS_DIF_DLY_LDC_MAF = 1

ACTION_ERRM_CheckPendingStatus (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR_PND>)

B.17.1 Inhibtion of Dynamic fuel trim diagnosis

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks. For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2), then:

i = 1 for exhaust cylinder bank 1
i = 2 for exhaust cylinder bank 2,

otherwise (NC_CBK_EX_NR = 1)

i = 1 for single exhaust cylinder bank.

Application conditions

Initialisation: at reset all variables shall be set to zero;
at LV_IGK = 0 -> 1 all variables except *STATE_RBM_VLS_DOWN_DIF[i]* shall be set to zero;
at every LV_IGK = 1 -> 0 LV_INH_DIAG_DLY_LAM[i] = 1

Recurrence: *1 s*

Activation: LV_IGK = 1
Dectivation: LV_IGK = 0

Formula section:

If MAF_SCAV_EXT > C_MAF_SCAV_MAX_INH_DLY_LAM
then MAF_INT_SCAV_NOT_ACT = C_MAF_INT_SCAV_NOT_ACT
else MAF_INT_SCAV_NOT_ACTn =

B.17.2 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the VLS_DOWN_DIF[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_VLS_DOWN_DIF[i] data.
Within STATE_RBM_VLS_DOWN_DIF[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for trim diagnosis)

Application conditions

Initialisation:

```
at LV_DC 0 -> 1 transition:
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
        bit 0 , bit 1 of STATE_RBM_VLS_DOWN_DIF[i] = 0
        bit 2 shall be set to 1.
    at ECU reset:
       all bits of STATE_RBM_VLS_DOWN_DIF[i] = 0
```

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0 -> 1 transition

The pending status of the following failures has to be checked only once :

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
  i = 1, for exhaust cylinder bank 1
  i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
    i = 1, for single exhaust cylinder bank.

This function shall facilitate the upstream sensor non-activity detection, which can be caused by a extremely cold sensors or an open circuit some ATIC42 or CJ125 lines.

Description:

In the first part of this test the sensor is assumed to have no activity if VLS_UP_DIAG remains stuck in a tight band around stoichiometric values. If this is true for C_CTR_RAW_ACT_SYM_LSL_UP recurrences, then the raw symptom flag LV_DIAG_RAW_ACT_SYM_LSL_UP is set.
Rate Based Monitoring (RBM) requires similar time spans for the diagnosis to come to an end with or without a failure present. Therefore, if VLS_UP_DIAG is not within the mentioned band (thus a failure is unlikely) the counter CTR_RAW_ACT_END_LSL_UP is incremented until the threshold C_CTR_RAW_ACT_END_LSL_UP is reached. At this point the end flag LV_DIAG_RAW_ACT_END_LSL_UP is set. VLS_UP_DIAG of a faultless sensor might pass through or come to lie within the critical band. In these cases the end counter is frozen and the incrementation is resumed, once the critical band is left again.
In the failure case CTR_RAW_ACT_SYM_LSL_UP is incremented until the threshold C_CTR_RAW_ACT_SYM_LSL_UP is reached, where the end flag and the raw symptom flag are set at the same instance. In case of intermittent faults, excursion from the critical band should not lead to an immediate reset of the raw symptom flag. Therefore, the raw symptom flag is taken back only if the raw symptom counter drops below C_CTR_RAW_ACT_RST_LSL_UP.

Figure B.18.1: : Basic principle of debounce algorithm for first part of activity check (LV_DIAG_RAW_ACT_END/SYM_LSL_UP)

The second part is started once the first part has come to an end and the following conditions are met: The forced stimulation is active and additionally engine speed, engine load, amplitude and period of the forced stimulation are sufficient to provoke the fluctuation of the sensor output. If these conditions are fulfilled then the following procedure is carried out. The difference between LAMB_LS_UP[i] and the moving mean value LAMB_MMV_ACT_LSL_UP[i] is calculated and integrated. After C_CTR_LAMB_DE_INT_ACT_LSL_UP forced stimulation periods the result is saved in the variable LAMB_DE_TOT_ACT_LSL_UP[i].

While integrating the difference between LAMB_LS_UP[i] and the moving mean value two different gain factors are taken into account. First, ID_LAMB_GAIN_LS_UP_DYN considers an aged sensor. Second, with ID_LAMB_GAIN_VLS_DOWN the speed of integration is reduced, if VLS_DOWN[i] shows either very rich or very lean conditions. The background here is that the combination of an upstream signal near stoichiometry and a very rich or very lean downstream signal strongly points to a not active upstream signal.

If the value of the deviation integral after C_CTR_LAMB_DE_INT_ACT_LSL_UP forced stimulation cycles is lower than the threshold C_LAMB_DE_TOT_ACT_LSL_UP, then the symptom counter shall be incremented, otherwise it shall be decremented. If the symptom counter has achieved the maximum C_CTR_SYM_MAX_ACT_LSL_UP cycles, then the symptom flag LV_DIAG_ACT_SYM_LSL_UP[i] is set, indicating that the sensor activity is very poor. This flag shall trigger the Open Circuit Diagnosis to narrow down the source of the failure. To have a valid end flag in case of a faultless sensor the counter C_CTR_END_ACT_LSL_UP is incremented once the end flag of the first part is set and no raw symptom was detected. The end flag of the Activity Check is set when the end counter reaches the sum of both loops needed for the fault detection.

Application conditions

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation: At the transition LV_IGK = 0 to 1, reset or at clearing error memory reset all variables.
At the transition LV_DIAG_ACT_CDN_LSL_UP[i] = 0 -> 1 initialize as follow:

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
  i = 1, for exhaust cylinder bank 1
  i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
    i = 1, for single exhaust cylinder bank.

Application conditions

Initialisation: at every transition LV_IGK = 0 -> 1or reset all variables shall be reset to 0.

at every transition LV_IGK = 1 -> 0 LV_DIAG_ACT_INH_LSL_UP[i] = 1

Recurrence: The functions shall be carried out once every 1s.

Activation:
LV_IGK = 1
Deactivation:
LV_IGK = 0

Formula Section:

This function has to be deactivated, if at least one of the following errors /special modes is active.

	Pump voltage limitation	SYM_1	
	Reference pump current cutoff because of VN overvoltage	SYM_2	

FUNCTION DESCRIPTION:

Application conditions

Initialisation:

At reset and LV_IGK 0 → 1 transition, do the following synchronization with ERRM:
```
ACTION_ERRM_GetLvErr (  in   OFS_LSL_UP_i,
                                out     LV_ERR_OFS_LSL_UP[i])
ACTION_ERRM_GetLvEndDiag ( in OFS_LSL_UP_i,
                                out     LV_END_DIAG_OFS_LSL_
UP[i])
ACTION_ERRM_GetLvErr (  in   CTL_LSL_UP_i,
                                out     LV_ERR_CTL_LSL_UP[i])
ACTION_ERRM_GetLvEndDiag ( in CTL_LSL_UP_i,
                                out     LV_END_DIAG_CTL_LSL_
UP[i])
```
When clearing the error memory, all ERRM related data shall be reset to 0.

Additionally, the following initialization shall be done on all these occasions:
```
CDN_DIAG_CTL_LSL_UP[i] = 0
ERR_DIAG_CTL_LSL_UP[i] = 0
CTR_OFS_ADJ_CMPL[i] = 0
T_DIAG_ACT_OFS[i] = 0
LV_LSL_OFS_ADJ_DIAG_OFS_OLD[i] = 0
```

For activation conditions and recurrences see the individual function blocks.

B.20.1 WRAF Controller Offset Diagnosis

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This part of the function shall check the performance of the offset adjustment carried out by the WRAF controller. The measured offset should fall within a calibrateable band, and the time taken by an offset adjustment should be shorter than a calibrateable upper limit.
Error Symptoms are defined as follows:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Limitation of offset correction in low gain            ( = SYM_0)
 │ │ └───> Limitation of offset correction in high gain           ( = SYM_1)
 │ └─────> Exceeded maximum duration of offset correction         ( = SYM_2)
 └───────> (not used)
```

Recurrence:

The function shall be carried out once every 10ms.

Activation: LV_INH_DIAG_OFS_LSL[i] = 0 **and**
(LV_LSL_OFS_ADJ_DIAG_OFS_OLD[i] = 1 **or**
LV_LSL_OFS_ADJ_ACT[i] = 1)

Formula section:

If(*1*) LV_LSL_OFS_ADJ_ACT[i] = 1
then(*1*) *Increment* T_DIAG_ACT_OFS[i]
else(*1*) *Reset* T_DIAG_ACT_OFS[i]
endif(*1*)
LV_LSL_OFS_ADJ_DIAG_OFS_OLD[i] = LV_LSL_OFS_ADJ_ACT[i]

Setting the symptoms:

if (*1*) LV_VLS_OFS_ADJ_CMPL[i] 0 -> 1
then (*1*) LV_CDN_DIAG_OFS_LSL_UP[i] = 1
Reset T_DIAG_ACT_OFS[i]
Increment CTR_OFS_ADJ_CMPL[i]
if (*2*) LV_VLS_OFS_LIM_LSL_L_GAIN[i] = 1
then (*2*) ERR_SYM_OFS_LSL_UP[i] = SYM_0 % "offset correction limitation low gain"
elseif (*2*) LV_VLS_OFS_LIM_LSL[i] = 1
then (*2*) ERR_SYM_OFS_LSL_UP[i] = SYM_1 % "offset correction limitation high gain"
else (*2*) ERR_SYM_OFS_LSL_UP[i] = NO_SYM % "offset correction works normal"
endif (*2*)
elseif (*1*) T_DIAG_ACT_OFS[i] >= C_T_DIAG_ACT_OFS_MAX
then (1) LV_CDN_DIAG_OFS_LSL_UP[i] = 1
ERR_SYM_OFS_LSL_UP[i] = SYM_2 % "offset correction maximum duration exceeded"
else (*1*) LV_CDN_DIAG_OFS_LSL_UP[i] = 0
endif (*1*)

Symptoms are **unchanged** if condition for doing symptom detection is not fulfilled.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Calling the generic error management for anti-bounce filtering and update of the outputs:

```
ACTION_ERRM_FilterSymptom (      in    OFS_LSL_UP_i,
                                 in    LV_CDN_DIAG_OFS_LSL_UP[i],
                                 in    ERR_SYM_OFS_LSL_UP[i],
                                 in    C_ABC_INC_DIAG_OFS_LSL_UP[i],
                                 in    1,
                                 in    C_ABC_MAX_DIAG_OFS_LSL_UP[i],
                                 out   LV_ERR_OFS_LSL_UP[i])
ACTION_ERRM_GetLvEndDiag (       in    OFS_LSL_UP_i,
                                 out   LV_END_DIAG_OFS_LSL_UP[i])
```

B.20.2 WRAF Controller Limitation Diagnosis

General information:

This part of the function shall check the performance of the pump current controller and (if used) the reference pump current generator in the WRAF sensor controller. For this, the pump current, pump voltage and nernst overvoltage diagnostic flags read out from the controller by the BSW are checked.
Since the flags are also set if there is an open circuit in one or more of the sensor lines, the diagnosis must only operate under conditions that exclude an open circuit. Hence the checks for tip temperature and VLS_UP_DIAG limits.
To disable monitoring for the individual flags based on driving conditions, the corresponding bit in CDN_DIAG_CTL_LSL_INH[i] should be set. To turn off a monitor permanently, the bit in CDN_DIAG_CTL_LSL_DI[i] must be set instead, otherwise the diagnosis end bit will never be set.

Error Symptoms are defined as follows:

```
[ | | | ]
 |  |  |  └─> Limitation of pump current                                  ( = SYM_0)
 |  |  └────> Limitation of pump voltage                                  ( = SYM_1)
 |  └───────> VN voltage too high for reference pump current generation   ( = SYM_2)
 └──────────> (not used)
```

Recurrence:

The function shall be carried out once every 10ms.

Activation: LV_IPLSL_CTL_ENA_LSL_IF[i] = 1 **and**
(CDN_DIAG_CTL_LSL_INH[i].bit_x = 0 and
CDN_DIAG_CTL_LSL_DI[i].bit_x = 0) for any x = 0...2

Formula section:

If LV_IPLSL_CTL_ENA_PLS_ACT[i] = 0
and C_LAMB_SP_MIN_DIAG_CTL_LSL_UP <= LAMB_SP[i]
and LAMB_SP[i] <= C_LAMB_SP_MAX_DIAG_CTL_LSL_UP
and LV_TTIP_MES_VLD_LS_UP[i]
and TTIP_MES_LS_UP[i] > C_TTIP_MIN_DIAG_CTL_LSL_UP
and C_TTIP_MAX_DIAG_CTL_LSL_UP > TTIP_MES_LS_UP[i]
and (VLS_UP_DIAG[i] < C_VLS_UP_MIN_DIAG_CTL_LSL_UP
or C_VLS_UP_MAX_DIAG_CTL_LSL_UP < VLS_UP_DIAG[i])

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

then (1)
% Exclude conditions that may indicate open circuit faults to avoid false CTL_LSL_UP entries.

Diagnostic description	1st symptom description	SYM_0			P21xx			CARB_LS
	2nd symptom description	SYM_1			P21xx			
	3rd symptom description	SYM_2						

Fields information (For more information refer to Error Management file Table of Failure) :

- DTC Symptom : give for each symptom the corresponding DTC. According to the configuration one or two fields are possible (In our table one is for CARB the other for customer)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- DTC Global : recommended DTC value, it may be the code defined by the law. According to the configuration two fields are possible (In our table one is for CARB the other for customer)
- Failure class parameter for calibrating the behaviour of the Error management for this failure. The failure class values are described in Error management aggregate.
- Readiness code : put the corresponding readiness group code.

FUNCTION DESCRIPTION:

General information:

The flag LV_INH_DIAG_OFS_LSL allows to deactivate the corresponding diagnostic.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

Application conditions:

Initialisation:
The following data shall be set to 0 at LV_IGK 0->1 or at ECU reset or at clearing error memory:
LV_INH_DIAG_OFS_LSL[i] = 0
LV_INH_DIAG_CTL_LSL_UP[i] = 0
CDN_DIAG_CTL_LSL_DI[i] = C_CDN_DIAG_CTL_LSL_DI
CDN_DIAG_CTL_LSL_INH[i] = 0

The following data shall be set to 1 at LV_IGK 1->0:
LV_INH_DIAG_OFS_LSL[i] = 1
LV_INH_DIAG_CTL_LSL_UP[i] = 1

Recurrence: 10ms

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0

Formula section:

```
IF      LV_LS_UP_OBD_2_MAN_DEAC[i] = 1     OR
        LV_VB_CDN_OBD_2 = 0                OR
        LV_ERR_LSL_UP_IF[i] = 1            OR
        LV_ERR_EL_LSL_UP[i] = 1
THEN    LV_INH_DIAG_OFS_LSL[i] = 1
ELSE    LV_INH_DIAG_OFS_LSL[i] = 0
ENDIF
```

LC_SWI_SIG_CLC_DIAG	-	0... 1H	0 ...1	1	-
Switch to the controller output signal for calculation of MIN/MAX and amplitude					

General information:

This diagnosis is necessary to recognize delays (especially pure phase shift) of the linear lambda sensor accordingly to OBD requirements.
For the diagnosis the lambda controller output is used. The bigger the oscillations of the signal, bigger will be the diagnosis value.

The diagnosis is covering two concepts:
Evaluation of the integral of the controller output deviation, the integral is representing quasi oxygen loading of the catalyst, which is representing directly the emissions increasing
Evaluation of the absolute amplitude of the controller output

Choice between both these concepts can be done using the LC_SWI_SIG_CLC_DIAG.

Calculation of the O2L integral principle, evaluation of the diagnosed signal when the activation conditions are fulfilled:

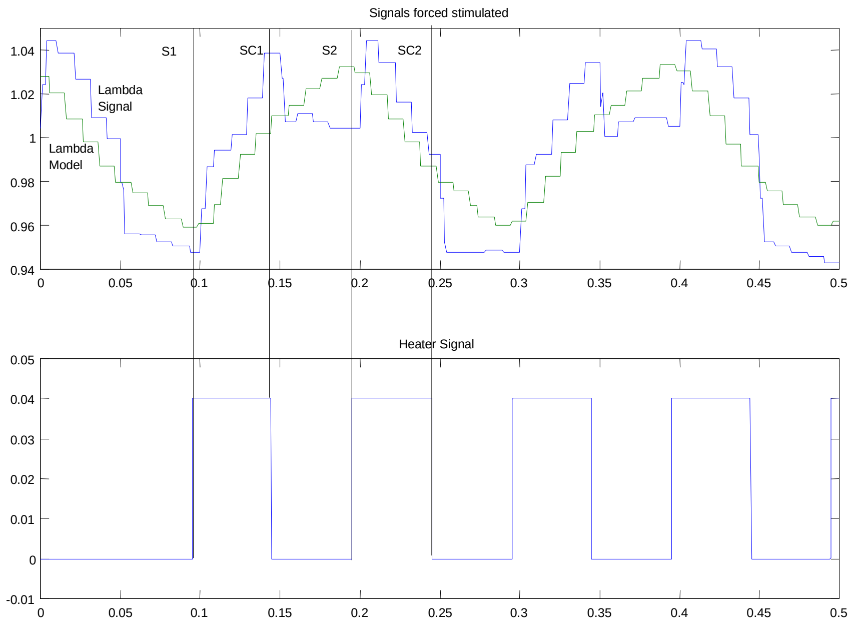
Diagnosis	Symptom	Nr	ABC type
Diagnosis of the heater coupling in the sensor signal *LSH_LSL_UP[NC_CBK_EX_NR]*	Heater Coupling Failure Symptom	*0*	NO

FUNCTION DESCRIPTION:

General information:

The diagnosis of heater coupling on the sensor signal shall detect an increase in the leakage current from heater to sensor circuit, which can be originated by the reduction of insulation resistance, and causes a crosstalk from the heater signal to the sensor circuit. Due to the heater coupling the measured signal of the wide range A/F sensor is perturbed and the lambda regulation influenced. The diagnosis criterion is the difference in the slope between measured sensor signal and model synchronised with the rising and falling edges of the heater PWM-signal. This is showed in the following picture, where a heater frequence of 10 Hz is admitted.

Sx … sampling of the Lambda value
SCx … sampling of the Lambda value and handover from Basic software



The values LAMB_SP_FIL_DELTA_FALL[i], LAMB_SP_FIL_DELTA_RISE[i], VLS_UP_DELTA_RISE[i] and VLS_UP_DELTA_FALL[i] are delivered from the BASIC-Software and represent the lambda model and the oxygen sensor voltage values acquired synchronised with the rising and falling edges of the heater PWM-signal.

Description:

At the beginning of every diagnosis period, the counter CTR_SYM_DIAG_LSH_LSL_UP[i] and the cycle counter CYCNR_DIAG_LSH_LSL_UP[i] shall be initialised by 0 .
After the hand over of VLS_UP_DELTA_RISE[i], VLS_UP_DELTA_FALL[i], LAMB_SP_FIL_DELTA_RISE[i] and LAMB_SP_FIL_DELTA_FALL[i] from the Basic-software (at the time SCx) this function has to start with the calculation of LAMB_DELTA_RISE/FALL[i].
For a better separation of the forced stimulation and the heater coupling (the forced stimulation has the same symptom as the heater coupling), it is necessary to include the sensor signal model in the diagnosis calculation. This will be realised by a subtraction from the relative deviation of the sensor signal model $((?_{SC1} - ?_{S1})_{model})$ and the relative deviation of sensor signal $((?_{SC1} - ?_{S1})_{meas})$. This results gets absolute value. Then it will be filtered by a first order lag element (for mean value). This values will be named to LAMB_DELTA_RISE_LPF[i] (calculated at time point S1 and SC1) and LAMB_DELTA_FALL_LPF[i] $((?_{SC1} - ?_{S2})_{model} - (?_{SC1} - ?_{S2})_{meas})$.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

This values will be compared with the threshold C_LAMB_DELTA_LPF_THD. Is the calculated value higher than the threshold, the error-counter (CTR_SYM_DIAG_LSH_LSL_UP[i]) will be incremented by 1 .
After a resumption of the diagnosis it must be guaranteed that LAMB_DELTA_FALL_LPF[i] contains a current value. If LAMB_DELTA_FALL_LPF[i] and LAMB_DELTA_RISE_LPF[i] are measured, then the cycle counter CYCNR_DIAG_LSH_LSL_UP[i] shall be incremented. If the necessary quantity of diagnosis for one cycle has been carried out, i.e. if CYCNR_DIAG_LSH_LSL_UP[i] > C_CYCNR_MAX_DIAG_LSH_LSL_UP is valid, the diagnosis result must be determined.

By the comparison of the diagnosis results to the limit value, the heater coupling is diagnosed, i.e. if CTR_SYM_DIAG_LSH_LSL_UP[i] > C_CTR_SYM_DIAG_LSH_LSL_UP is true, a heater coupling (ERR_SYM_LSH_LSL_UP[i] = 1) is recognised. If no error is diagnosed, than ERR_SYM_LSH_LSL_UP[i] = 0 is valid. After the reaching of the required number of diagnosis steps C_CYCNR_MAX_DIAG_LSH_LSL_UP, a new diagnosis cycle is started.
If an error could be detected, then the error flag LV_ERR_LSH_LSL_UP[i] = 1 is set, otherwise LV_ERR_LSH_LSL_UP[i] is set to 0.

Remark: The range of lambda sensor heater duty cycle must be limited, through the sampling of the wide range A/F sensor signal with an period of 10 ms. A heater coupling recognitionis possible only in a range of 15% up to 85% of the duty cycle.
At the function reactivation after LV_PUC=1 the MAF-integral shall be calculated. If the MAF-integral exceeds a defined threshold the heater coupling diagnosis starts.

Application conditions:

Initialisation:

At LV_IGK = 0 to 1, reset or at clearing error memory:

LAMB_DELTA_RISE_LPF[i] = 0
LAMB_DELTA_FALL_LPF[i] = 0
ENDIF

Formula section:

1. Calculation of the MAF-integral:

Recurrence: The MAF-Integral calculation shall be incremented every T_SAMPLE =100 ms.

MAF_INT_DIAG_LSH_LSL_UP$_N$ = MAF_INT_DIAG_LSH_LSL_UP$_{N-1}$ + MAF_KGH * T_SAMPLE [ms] * 1/3600 [(g*h) /(kg*ms)]

1. Monitoring the electrical coupling between heater PWM and sensor signal

Recurrence: Every time the BSW hands over new values, i.e. if one of the conditions below is true:

IF(1) LAMB_SP_FIL_DELTA_FALL[i]$_N$? LAMB_SP_FIL_DELTA_FALL[i]$_{N-1}$
OR(1) VLS_UP_DELTA_FALL[i]$_N$? VLS_UP_DELTA_FALL[i]$_{N-1}$
THEN(1)
increment CYCNR_DIAG_LSH_LSL_UP[i]

% Determination of the lambda value synchronized with the heater PWM
LAMB_SYN_LSHPWM_RISE[i] = IP_LAMB_LS_UP(VLS_UP_DELTA_RISE[i])
LAMB_SYN_LSHPWM_FALL[i] = IP_LAMB_LS_UP(VLS_UP_DELTA_FALL[i])
Note:
1) Before the determination of LAMB_SYN_LSHPWM_RISE[i], please adapt the resolution of VLS_UP_DELTA_RISE[i] to the axis of IP_LAMB_LS_UP . The analogous shall be done to LAMB_SYN_LSHPWM_FALL[i].

Diagnostic XX	Symptom description	Symptom	Filter type
AIR_LSL_UP[NC_CBK_EX_NR]	Sensor on air	SYM_0	NO

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

This function shall detect a mechanically not attached sensor to the exhaust gas pipe. To do this the WRAF sensor output signal must be monitored during the engine operation , when power is generated. This shall be done by comparing the sensor signal VLS_UP_DIAG[i] with a threshold.
The function shall be activated during Partial Load or Full Load, if the sensor was recognised as operable, i.e. LV_IPLSL_VLD[i] = 1. A symptom shall be detected if the engine runs, i.e. it generates power, and at the same time the sensor signal is very high, indicating a very lean combustion mixture.

Initialisation:
At LV_IGK = 0 to 1, reset **or**at clearing error memory reset all variables.

Recurrence:
The function shall be carried out every 100 ms.

Activation:
IF
LV_IPLSL_VLD[i] = 1 **AND**
(LV_PL = 1 OR LV_FL = 1) **AND**
LV_INH_DIAG_AIR_LSL_UP[i] = 0
THEN

B.26.1 Interface for Rate - Based - Monitoring AIR_LSL_UP[i]

FUNCTION DESCRIPTION:

General information:

With this module the interface between the AIR_LSL_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_AIR_LSL_UP[i] data.
Within STATE_RBM_AIR_LSL_UP[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for catalyst diagnosis)

Application conditions

Initialisation:

```
at ECU reset:
    bit 0, bit 1 and bit 2 of STATE_RBM_AIR_LSL_UP[i] = 0
         LV_DIAG_EOL_AIR_LSL_UP_DC[i] = 0
LV_DC 0   1 transition:
     bit 0 and bit 1 of STATE_RBM_AIR_LSL_UP[i] = 0
         LV_DIAG_EOL_AIR_LSL_UP_DC[i] = 0
on failure memory reset:
    bit 1 of STATE_RBM_STATE_RBM_AIR_LSL_UP[i] = 0
         LV_DIAG_EOL_AIR_LSL_UP_DC[i] = 0
```

Recurrence: 1 s

Activation: LV_DC = 1

B.27.1.1 Interface for Rate - Based - Monitoring PUC_VLD_LS_UP[I]

FUNCTION DESCRIPTION:

General information:

With this module the interface between the PUC_VLD_LS_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_PUC_VLD_LS_UP[i] data.
Within STATE_RBM_PUC_VLD_LS_UP[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for PUC_VLD_LS_UP[i] diagnosis)

Application conditions

Initialisation:

at ECU reset:
bit 0, bit 1 and bit 2 of STATE_RBM_PUC_VLD_LS_UP[i] = 0
LV_DC 0 → 1 transition:
bit 0 and bit 1 of STATE_RBM_PUC_VLD_LS_UP[i] = 0
on failure memory reset:
bit 1 of STATE_RBM_PUC_VLD_LS_UP[i] = 0

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0 → 1 transition
bit 2 of STATE_RBM_PUC_VLD_LS_UP[i] = 1
The pending status of the following failures has to be checked only once :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. General information:

General information:
The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

This function shall test the plausibility of the upstream sensor signal during the Pull Fuel Cut-off phase (PUC).

Three symptoms are distinguished:

VLS_H_OC indicates too high sensor voltage due to open circuit on sensor pin VRC (compensative resistance)

VLS_AFS_OC indicates very low sensor voltage near offset value of measurement circuit. The reason for a voltage drop down to offset value is either a open circuit on sensor pin VIP or VG.

VLS_L indicates that voltage is too low, but still above offset value. The reason for such a voltage drop may be poisoning or ageing of the lambda sensor.

Figure B.28.1: :

If an open circuit of one of the sensor pins is detected (VLS_H_OC or VLS_AFS_OC), this information is not sent directly to the error management. Instead of this, the information is sent to the function "O2 sensor (lin) open circuit diagnosis" (A0J0). In this function the results of several diagnoses are collected and a clear identification of the open pin is done (pin-pointing). The communication to error management is done by the function "O2 sensor (lin) open circuit diagnosis in this case.

In case of detected failure VLS_L the information is transferred directly to the error management.

The variable VLS_UP_DIAG_SAVE_PUC_LSL_UP[i] contains the sensor voltage at the moment a failure is detected. It retains its value until an updated one is present. It is reset only in case the Error Management memory is deleted.

B.28.1 Subsystem TRIG: Calculation of special initialization condition

In the subsystem TRIG a trigger (LV_trig) for variable initialisation is calculated, which is not supported by standard function calls.

B.28.1.1 Calculation of special initialisation condition:

New Initialization of variables shall take place in case of LV_DIAG_EOL_PUC_LSL_UP 0->1.
The toggling of this variable indicates the beginning of an End-of-line (EOL) test.
The output variable LV_trig is an additional input for the Application conditions (APP_CDN) next to the standard function calls which are provided by the SW-system environment.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

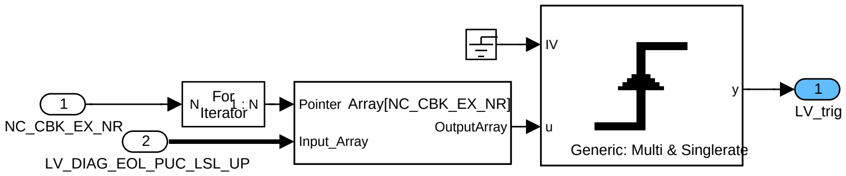

Figure B.28.4: :

B.28.2 INITIALIZATION: Initialization of normal and non-volatile memory variables

Initialization of (normal) variables, non-volatile memory variables and variables that are directly linked to error manager is described.
Initialization of variables takes place at LV_IGK = 0 to 1, reset, LV_DIAG_EOL_PUC_LSL = 0 to 1 (LV_trig) and at clearing error memory.
The variables saved in the non-volatile memory are reset only in case the error memory is cleared.
Variables that are directly linked with the Error manager are initialized according to related error manager routines (ACTION_ERRM).

B.28.2.1 Initialization at RESET

All "normal" variables are initialized with "0"
The ERRM variables are initialized accordingly to filter type

B.28.2.2 Handling NVMY data

B.28.2.2.1 Initialization of NVMY data

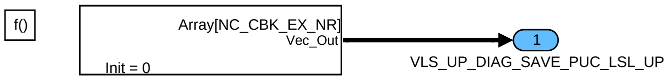

Figure B.28.5: :

B.28.3 Formula section of PUC plausibility diagnosis

B.28.3.1 Introduction multiple bank system

B.28.3.1.1 Check of activation conditions and main calculations

B.28.3.1.1.1 Calculation of activation (condition) flag for the diagnosis

The diagnosis is activated, if fuel cut off is indicated, sensor is active, exhaust gas temperature is below threshold, tip temperature of lambda sensor is controlled and no project specific inhibitions are active.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

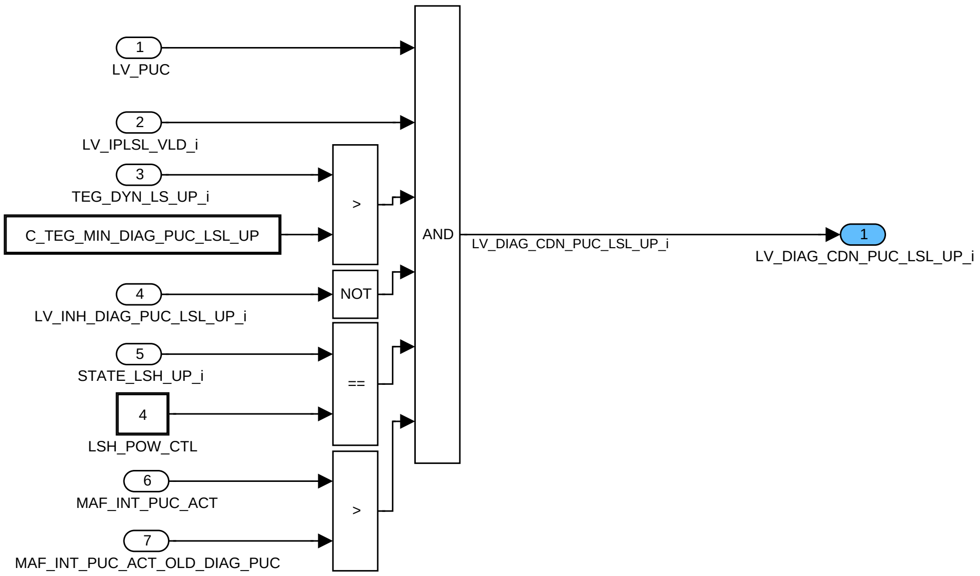

Figure B.28.6: :

B.28.3.1.1.2 Check of the activation conditions for diagnosis

ACT: the LV_DIAG_CDN_PUC_LSL_UP is true
DEAC: the LV_DIAG_CDN_PUC_LSL_UP is false
The calculation at ACT and DEAC are specified in next figures

B.28.3.1.1.2.1 ACT: activation condition for diagnosis true

Content:
Initialization of delay timers

B.28.3.1.1.2.1.1 Calculation of maximal thresholds for delay timers

The bit LV_DIAG_EOL_PUC_LSL_UP indicates, that End-of-line test (EOL) is active. The function gives the possibility to use different calibration data for standard case and EOL. This may become necessary, if only very short PUC-phases are available during EOL.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

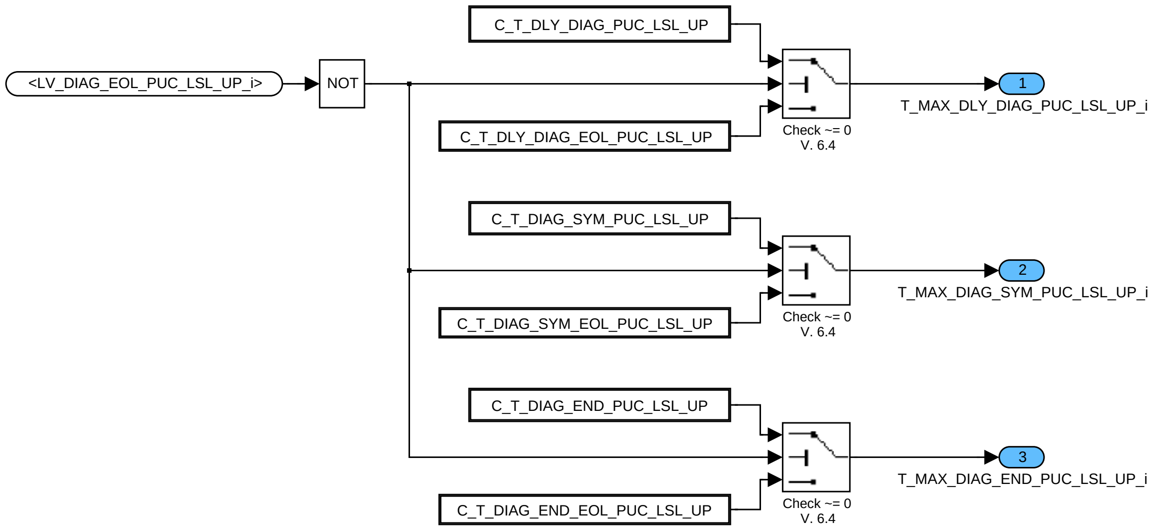

Figure B.28.7: :

B.28.3.1.1.2.1.2 Start and check of delay timer, initialization of diagnosis (DIAG)

As soon as activation conditions for diagnosis are fulfilled, the delay-timer T_DLY_DIAG_PUC_LSL_UP is started.
If the delay timer has exceeded, the calculations for the diagnosis are triggered.

DIAG: calculation of diagnosis result

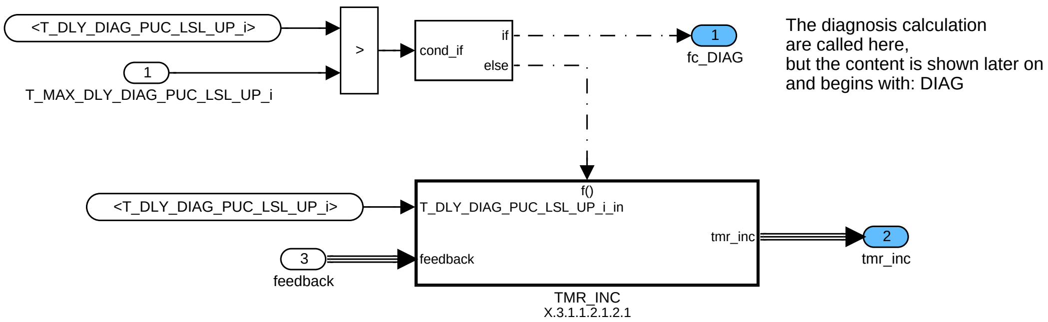

Figure B.28.8: :

B.28.3.1.1.2.1.2.1 Condition false

B.28.3.1.1.2.1.2.1.1 Increment of delay timer

As long as delay timer is below calibrated threshold, increment of timer takes place. The bit LV_CDN_DIAG_PUC_VLD_LSL_UP is set to 0 and inhibits the start of diagnosis.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

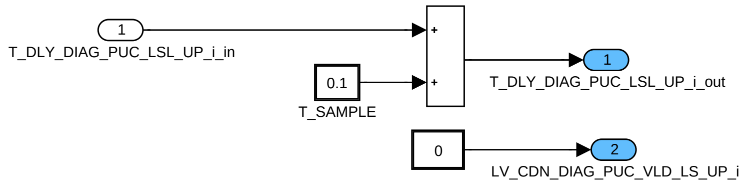

Figure B.28.9: :

B.28.3.1.1.2.2 DEAC: activation condition for diagnosis false

B.28.3.1.1.2.2.1 Deactivate diagnosis

If the activation conditions for the diagnosis are not fulfilled, both condition-bits are reset.

If an symptom has been already detected and de-bounced, STATE_SYM_DIAG_PUC_LSL_UP is frozen to actual value.
Otherwise STATE_SYM_DIAG_PUC_LSL_UP is set to "VLS_OK"
(for the cases : 1) Symptom has never been indicated. 2) symptom is indicated, but de-bounce has not yet been completed, because interrupt by revoke of activation conditions took place)

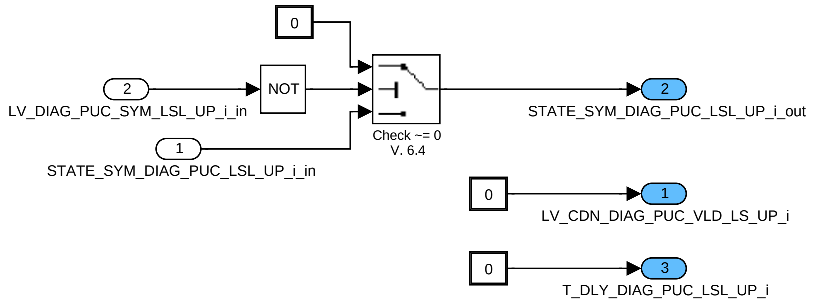

Figure B.28.10: :

B.28.3.1.1.3 DIAG: calculation of diagnosis result

If activation conditions are fulfilled, and the delay timer has passed, the calculations for the PUC plausibility diagnosis take place.
The principal of diagnosis is shown in the signal flow diagram below.
Please note that the diagram gives only an overview about the signal flow. Not all calculations are included in the diagram !

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

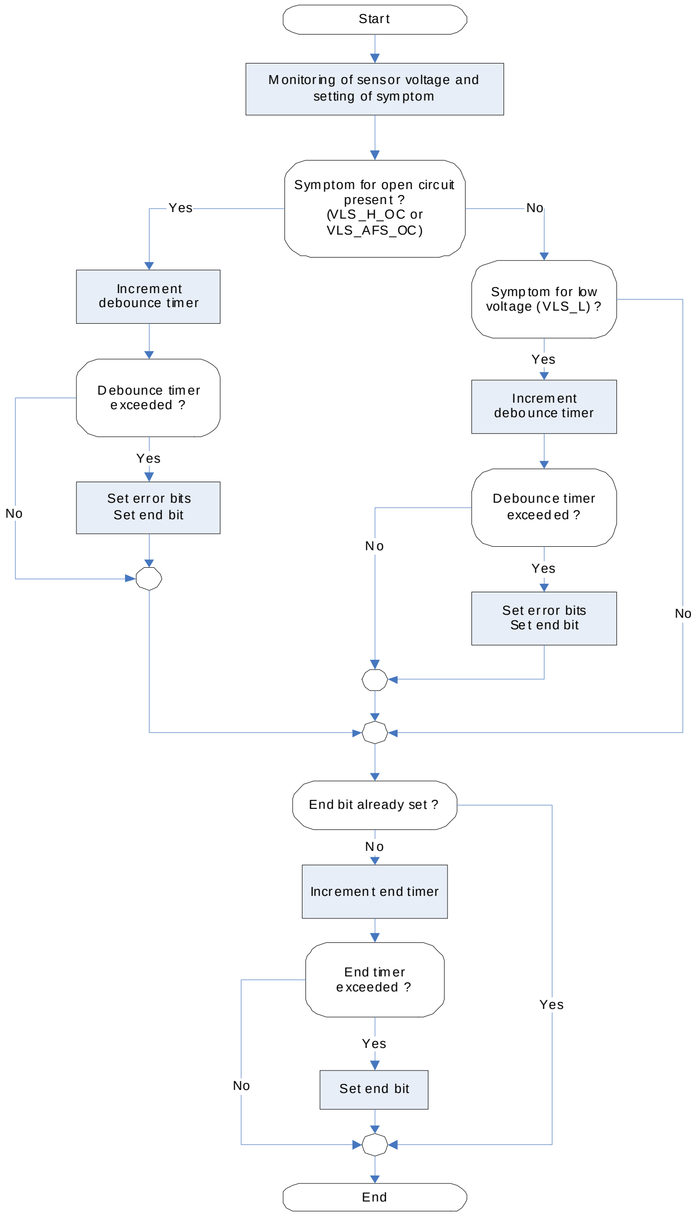

Figure B.28.11: :

B.28.3.1.1.3.1 DIAG: Monitoring of sensor voltage (setting of symptoms)

If activation conditions are fulfilled and the delay timer has passed, the monitoring of the sensor voltage signal starts. STATE_SYM_DIAG_PUC_LSL_UP is set according to measured voltage.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

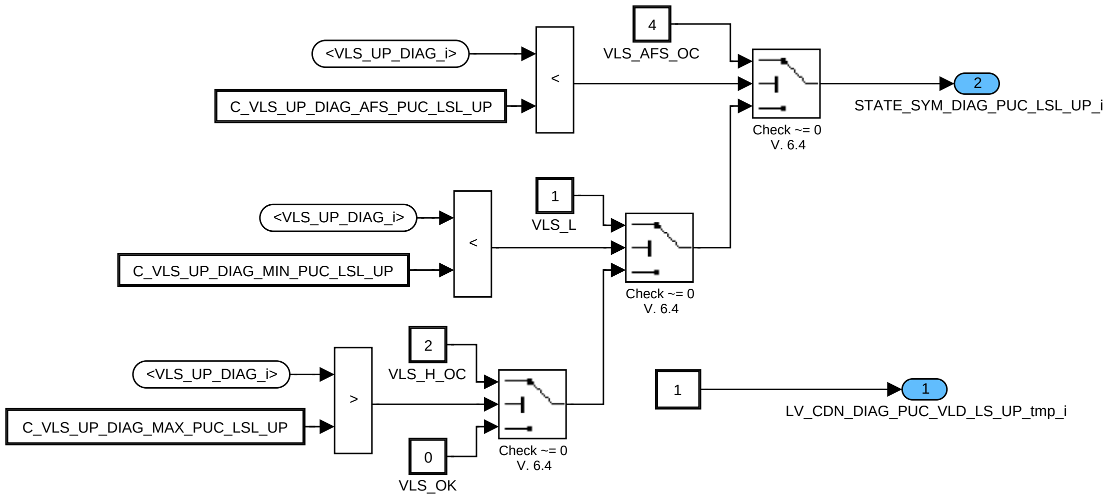

Figure B.28.12: :

B.28.3.1.1.3.2 DIAG: Distinguish symptoms according linkage to Error manager

The symptoms VLS_L and VLS_OK are directly linked to Error Management. The symptoms VLS_AFS_OC and VLS_H_OC are not directly linked to Error Management. Instead of this, they are linked to the function "O2 sensor (lin) open circuit diagnosis" (A0J0).
Because of this difference, different subsystems are called depending on the value of STATE_SYM_DIAG_PUC_LSL_UP.

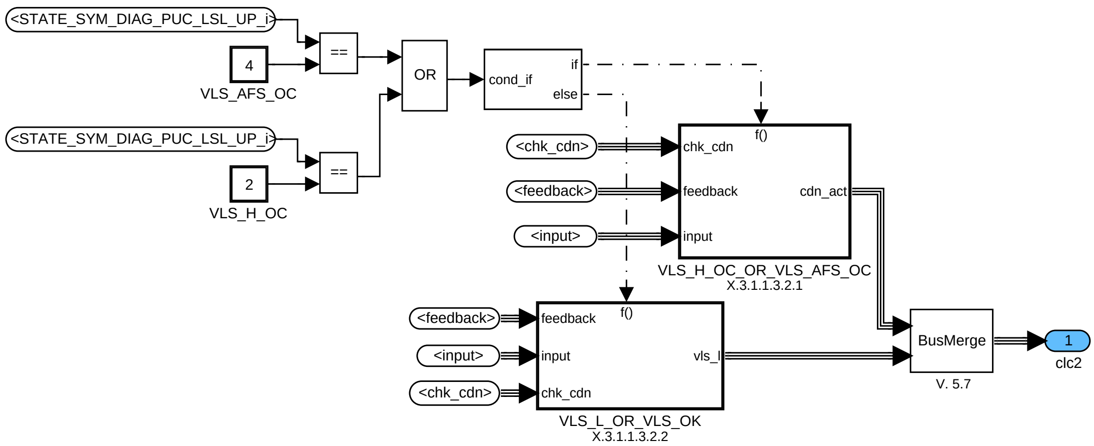

Figure B.28.13: :

B.28.3.1.1.3.2.1 Distinguish symptoms linked to Error manager: condition true

B.28.3.1.1.3.2.1.1 Calculation for Symptoms VLS_AFS_OC and VLS_H_OC

As long as the symptom VLS_AFS_OC or VLS_H_OC is fulfilled, the debounce timer is incremented.
If the de-bounce timer exceeds the calibrated thresholds, the symptom bit and the end bits are set (this information is send to the function "O2 sensor (lin) open circuit diagnosis" (A0J0)).
The actual output voltage of the sensor is stored in the non-volatile memory.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

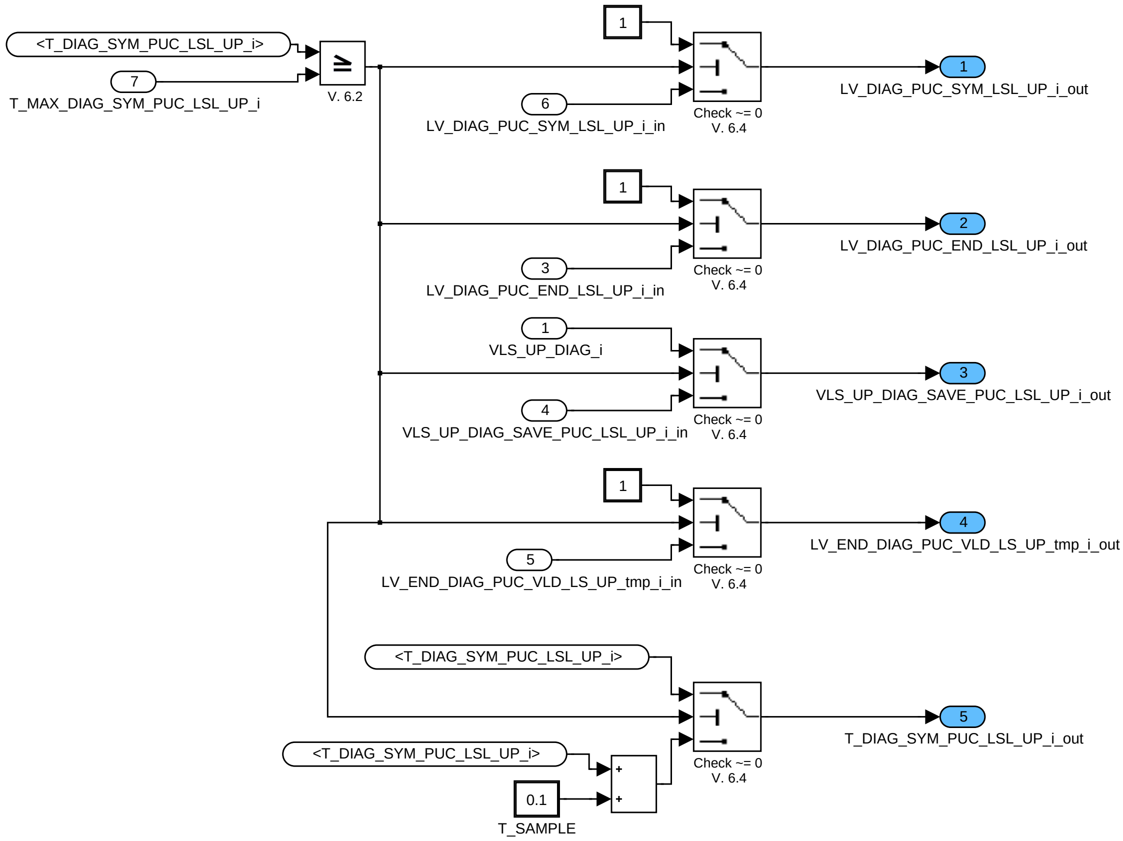

Figure B.28.14: :

B.28.3.1.1.3.2.2 Distinguish symptoms linked to Error manager: condition false

B.28.3.1.1.3.2.2.1 Check of symptoms linked to ERRM

This calculation is only done, if neither symptom VLS_H_OC nor VLS_AFS_OCS is active.
The remaining possible states are VLS_L and VLS_OK. The variable STATE_SYM_DIAG_PUC_LSL_UP is checked and different calculations are triggered.

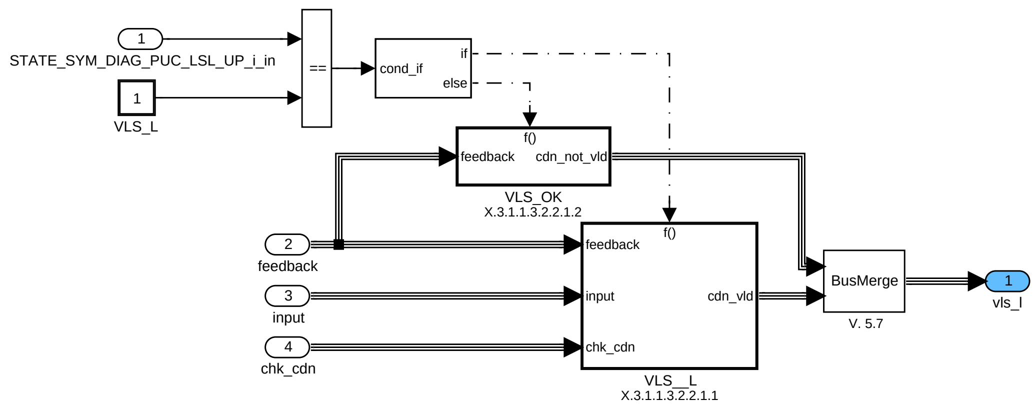

Figure B.28.15: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.28.3.1.1.3.2.2.1.1 Check of symptoms linked to ERRM: condition true

B.28.3.1.1.3.2.2.1.1.1 De-bouncing and setting of failure for symptom VLS_L

The de-bounce counter T_DIAG_SYM_PUC_LSL_UP is increased until the calibrated threshold is reached. The actual sensor voltage is stored in the non-volatile memory and the failure is transferred to Error management by setting of the corresponding variables.

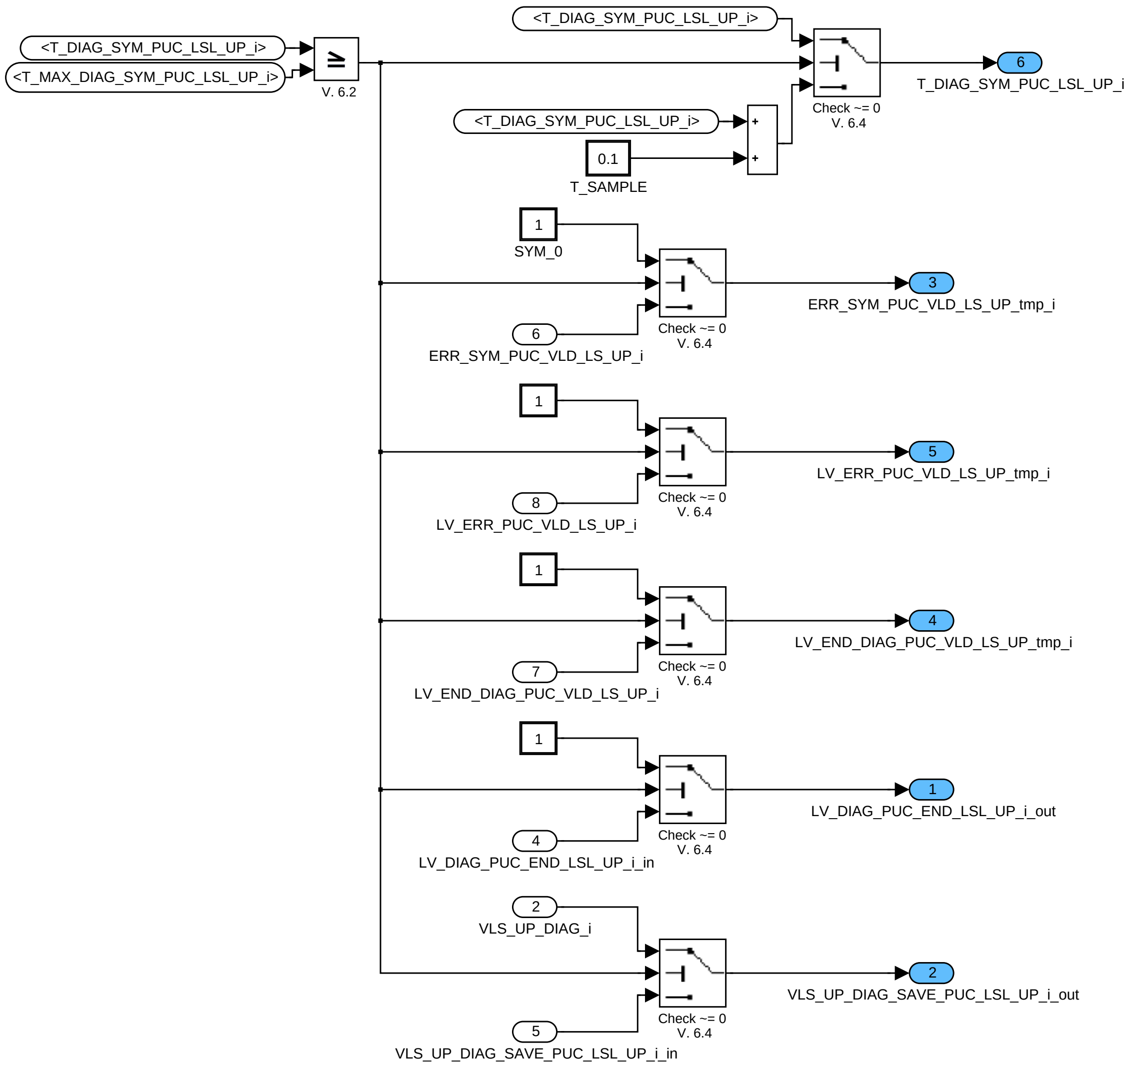

Figure B.28.16: :

B.28.3.1.1.3.2.2.1.2 Check of symptoms linked to ERRM: condition false

B.28.3.1.1.3.2.2.1.2.1 Calculation in case of symptom VLS_OK

As soon as symptom is VLS_OK (sensor voltage within allowed band) the debounce timer is set to zero.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.28.17: :

B.28.3.1.1.3.3 DIAG: Timer for setting the End-bit: Conditions for timer increment

If the End-bit(s) of the diagnosis is set already, no further calculations are done in this subsystem.
If the End-bit(s) are not set, the End-timer of the diagnosis is increased and checked against a calibrated threshold (in subsystem CDN_VLD).

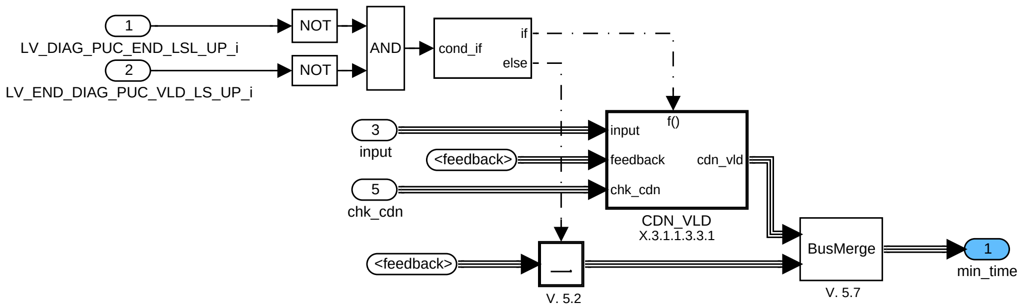

Figure B.28.18: :

B.28.3.1.1.3.3.1 Conditions for timer increment valid

B.28.3.1.1.3.3.1.1 Timer increment and setting of End-bit

The End-timer is increased and compared with a calibrated threshold. If the threshold is reached, the end-bit(s) of the diagnosis are set. (The error-bit remains unchanged, this means = 0)
This is the usual way for setting the end-bit (VLS_OK).
In the failure case (VLS_H_OC, VLS_AFS_OC, VLS_L) end bit is set by on different path together with error-bit.

switch between integral and difference as basis for dynamics diagnosis					

B.29.1 EGCP_PLADGLSL6

This is an alternative diagnosis for the sensor dynamics of WRAF sensors in stratified combustion engines. It expects NOx trap regeneration or other short phases of homogenous combustion in a normally stratified or other lean engine operation. The function interprets the transition from homogenous to stratified mode as a steplike input to the sensor and monitors the sensor's signal response as it rises from around lambda=1 to higher values (typically above lambda=2).
The difference between this response and the modelled behaviour of a good sensor is integrated, start and end of the integral can be calibrated in terms of a MAF integral to focus on the parts of the signal trace that show large and reproducible differences between new and aged sensors. To get more even weighting of differences in the high and low lambda ranges, the modelled and measured lambda values are transformed into O_2 concentrations and the integrals are calculated with these concentrations. A map is used to correct for influences of mass air flow and engine speed on the sensor response.

Figure B.29.11: EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/MON_CHK/MON/Branch1

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/MON_CHK/MON/CTRL_FLAGS

This section shall generate two flags. LV_DIAG_DYN_S_LSL_UP_SAMPLE[i] triggers the calculation of a result at the end of the current diagnostic cycle. It will be set to 1 in the last recurrence before the function deactivates itself, and reset to 0 at the start of the next cycle.
LV_DIAG_DYN_S_LSL_UP_STOP[i] is expected to be set to 0 during a homogenous combustion phase to indicate that a diagnostic cycle can be started at the next transition to stratified combustion. It will be set to 1 if the cycle should be stopped, either because a result is available or because required conditions are not fulfilled anymore.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

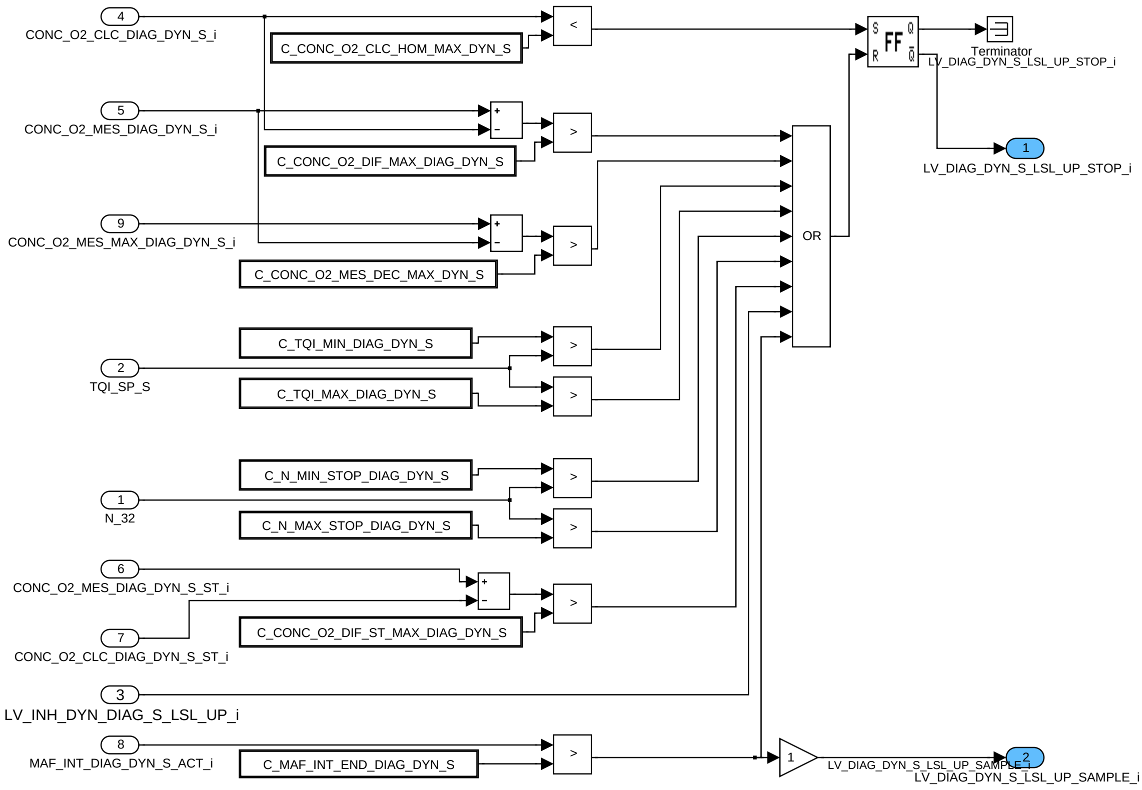

Figure B.29.12:
EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/MON_CHK/MON/CTRL_FLAGS

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/MON_CHK/MON/PO2_CLC

This block calculates the O2 concentrations CONC_O2_MES_DIAG_DYN_S[i] from LAMB_LS_UP[i] and CONC_O2_CLC_DIAG_DYN_S[i] from LAMB_SP_FIL_S[i]. CONC_O2_MES_DIAG_DYN_S[i] can be scaled with a constant factor to improve diagnostic results for good sensors. The CONC_O2 values are used throughout the diagnosis because accuracy and dynamics are more similar across the different lambda ranges than for lambda itself.

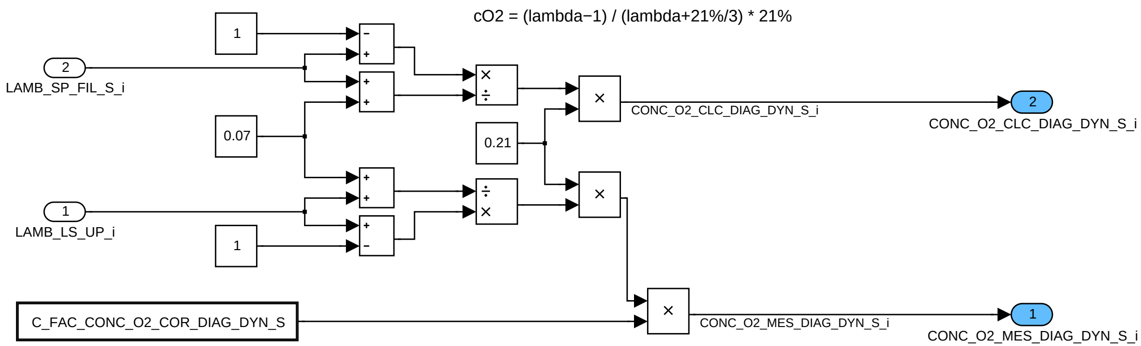

Figure B.29.13: EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/MON_CHK/MON/PO2_CLC

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/MON_CHK/MON/PO2_DIF_INT

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Here, two integrals are produced which are used to calculate the diagnostic value. In CONC_O2_DIF_INT_DIAG_DYN_S[i] integrates the differences between modelled and measured O2 concentration, while CONC_O2_CLC_INT_DIAG_DYN_S[i] integrates the modelled oxygen concentration itself.
Both integrals start only after a calibrateable air mass has passed since the homogenous combustion mode was left. This can be used to avoid signal features shortly after the transition and to focus the diagnostic value on parts of the signal trace that show large and clear deviations between a modelled (fast) and a slow sensor. The integrals are stopped implicitly by calculating a result from them once after a certain air mass was consumed by the engine. After this, the function deactivates itself until the engine enters homogenous combustion mode again.

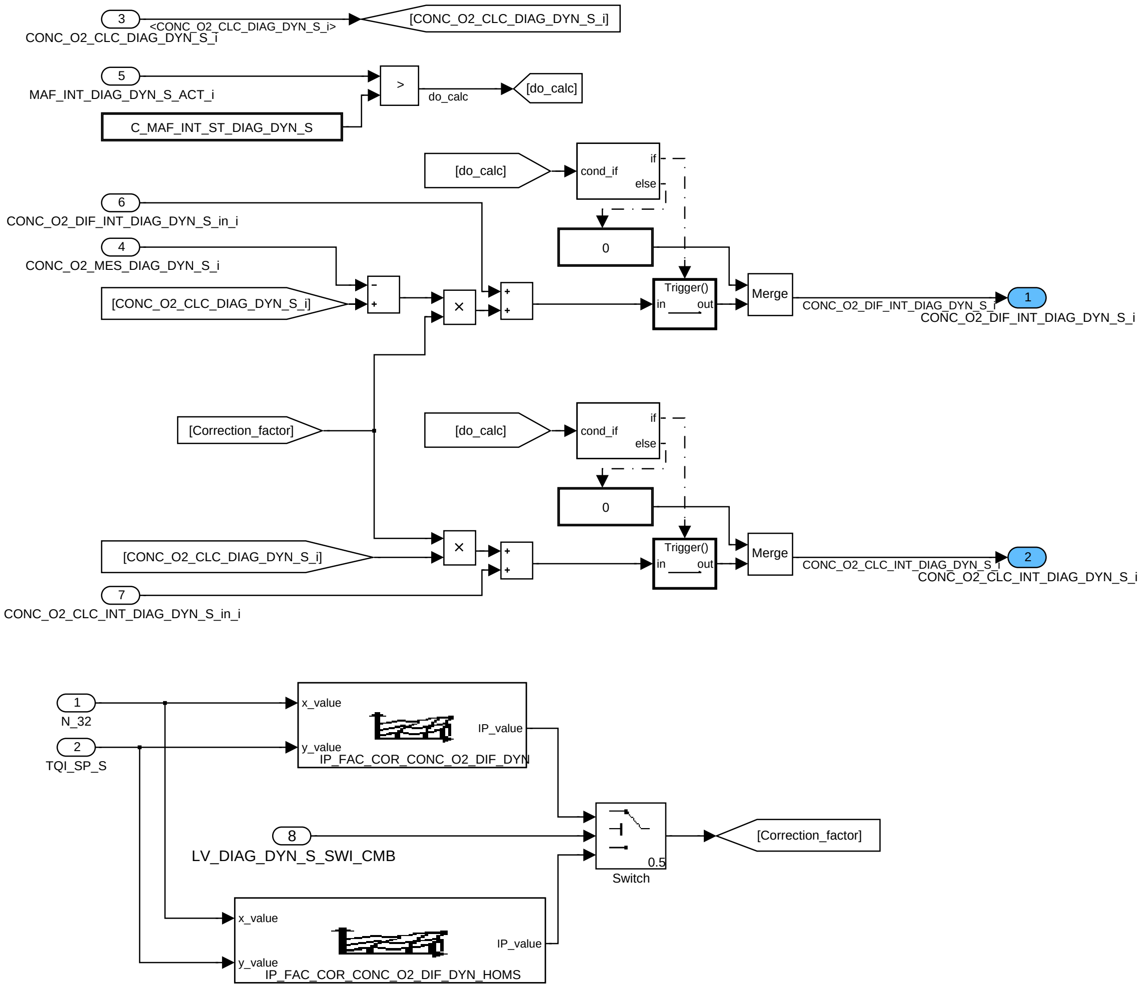

Figure B.29.14:
EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/MON_CHK/MON/PO2_DIF_INT

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/MON_CHK/MON/PO2_EVAL

Here, a mass flow integral is calculated, which starts at the transition out of homogenous combustion and governs start and end points for the calculation of the diagnostic value. CONC_O2_MES_DIAG_DYN_S_ST[i] and CONC_O2_CLC_DIAG_DYN_S_ST[i] receive the values of CONC_O2_MES_DIAG_DYN_S[i] and CONC_O2_CLC_DIAG_DYN_S[i] at the time of the transition, they are used to calculate and validate the diagnostic result of the current transition. CONC_O2_MES_MAX_DIAG_DYN_S[i] is the highest O2 concentration found in the current diagnostic cycle, it is used in validation of the result.

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/RESULT/RESULT_BUS/CLC_RES

The result of one single diagnostic cycle is calculated in one of two ways and stored in FAC_VALUE_DIAG_DYN_S_LSL_UP[i]. It resembles the difference between modelled (i.e. "good") and actual sensor response to the lambda change in the transition from homogenous to lean combustion. If LC_DIAG_DYN_S_LSL_UP_MOD = 1, the difference is normalized to the signal change of the sensor and resembles the time constant of the sensor response. Otherwise it is normalized to the integrated signal change in the model, which makes the result more stable for slow sensors.
FAC_MV_DIAG_DYN_S_LSL_UP[i] is a cumulated average for the current driving cycle, whic is the basis for the decision whether the sensor is good or not.

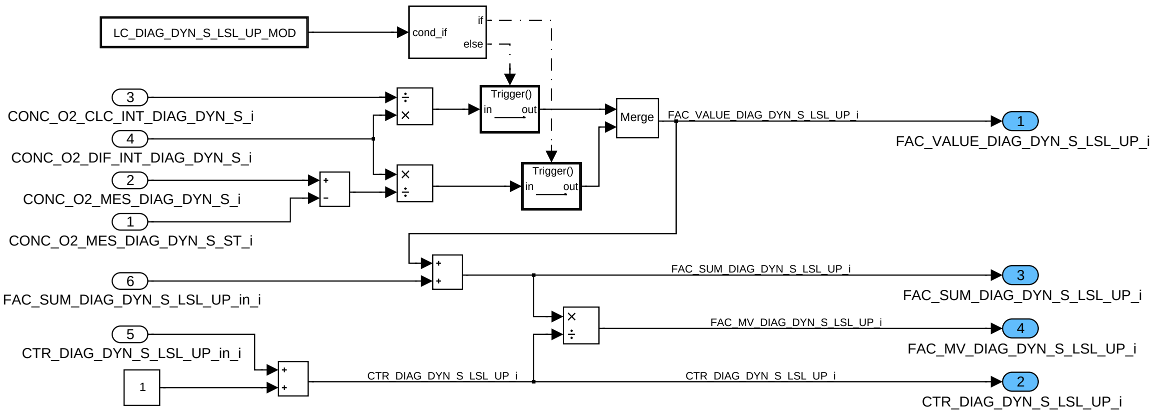

Figure B.29.22:
EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/RESULT/RESULT_BUS/CLC_RES

The block determines the diagnostic decision. With every cycle, the good/bad status in LV_DIAG_DYN_S_LSL_UP_ERR[i] and STATE_SYM_DIAG_DYN_S_LSL_UP[i] is updated, and if enough cycles have been completed, the end of diagnosis is indicated via LV_DIAG_DYN_S_LSL_UP_END[i]. This information is not transmitted to the error memory directly.

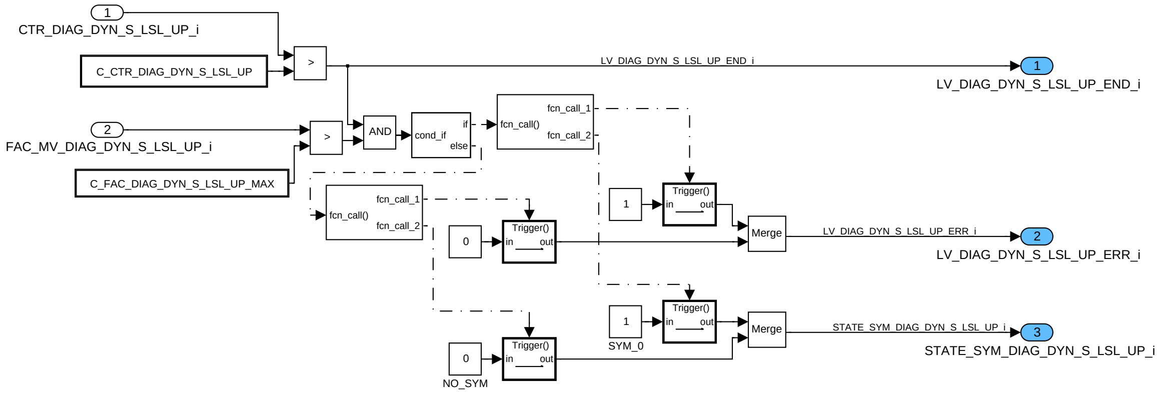

Figure B.29.23: EGCP_PLADGLSL6/operate_10ms/operate_10ms_CBK/RESULT/RESULT_BUS/DET_STATE

EGCP_PLADGLSL6/OPERATE_10MS/OPERATE_10MS_CBK/VECTOR_FEEDBACK

This block selects required values from the last recurrence into a vector used in the functions for the current cylinder bank.

B.30 O2 sensor (lin, up) dynamic diagnosis after NOx CAT reg. (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_DIAG_DYN_S_SWI_CMB	O/V	0... 1H	0 ...1	1	-
Logical variable to switch weighting factor depending on cumbustion mode					
LV_INH_DYN_DIAG_S_LSL_UP [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
Inhibition of linear lambda sensor dynamic diagnosis for stratified combustion					

Input data:

LV_DIAG_DYN_INH_LSL_UP [NC_CBK_EX_NR] {p. 5377}	LV_END_DIAG_DYN_VLD_LS_UP [NC_CBK_EX_NR] {p. 5348}	LV_ERR_CTL_LSL_UP [NC_CBK_EX_NR] {p. 5248}	LV_ERR_MAP_TPS_PLAUS {p. 1062}
LV_ERR_OFS_LSL_UP [NC_CBK_EX_NR] {p. 5248}	LV_ERR_SLV_IVVT_IN {p. 4627}	LV_IGK {p. 906}	LV_ST_END {p. 1720}
OPM_AV {p. 8137}			

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_DIAG_DYN_INH_CMB_TRAN	-	0... 3H	0 ...3	1	-
Inhibition of DYN_DIAG due to switching combustion mode					
LC_INH_DYN_DIAG_S_LSL_UP [NC_CBK_EX_NR]	-	0... 1H	0 ...1	1	-
Manual inhibition of WRAF sensor dynamic diagnosis in stratified operation					

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

With C_DIAG_DYN_INH_CMB_TRAN the diagnosis can be interrupted due to switching of the combustion mode.

Interruption in case of:
Switching CBM from AFL to S and C_DIAG_DYN_INH_CMB_TRAN = 1
Switching CBM from S to AFL and C_DIAG_DYN_INH_CMB_TRAN = 2
Switching CBM from S to AFL and AFL to S and C_DIAG_DYN_INH_CMB_TRAN = 3

Application conditions

Initialisation: At transition LV_IGK = 0 -> 1 or reset LV_INH_DYN_DIAG_S_LSL_UP[i] shall be set to 1.

B.31.1 Delay time calculation after finishing fuel trim diagnosis without failure

FUNCTION DESCRIPTION:

General information:

This function shall deliver information in the no failure case, indicating that the sensor characteristic shift down diagnosis could have finished in the failure case.

Application conditions

Initialisation:

At LV_IGK = 0 to 1, reset **or**at clearing error memory:

T_DLY_DIAG_SHIFT_DOWN[i] = 0
LV_T_DLY_DIAG_SHIFT_DOWN[i] = 0

Recurrence:
The function should be carried out once every 100 ms.

Activation /Deactivation:
The function will be carried out in case of
LV_ST_END = 1

Formula section:

```
    If    T_DLY_DIAG_SHIFT_DOWN[i] >= C_T_DLY_DIAG_SHIFT_DOWN[i]
    then     LV_T_DLY_DIAG_SHIFT_DOWN[i] = 1
else          If          LV_END_DIAG_LAM_ADJ[i] = 1
              and          LV_ERR_LAM_ADJ[i] = 0
              then      increment T_DLY_DIAG_SHIFT_DOWN[i]
              endif
endif
```

B.31.2 Sensor Characteristic Line Shift to Lean (CSD)

FUNCTION DESCRIPTION:

General information:

This function shall deliver information indicating that the sensor characteristic line has a shift to lean **(CSD)**, which shall be done by summarizing all similar failure symptoms of this kind.

It is assumed such deviation from the nominal behavior can be occur due to the poisoning of sensor reference air channel with fuel, but also due to a leak current inside the sensor, a very low reference air pump current (used in some types of wide range oxygen sensors) or a relatively high impedance short circuit to the battery voltage or ground in one of the four sensor lines.

In dependence of the shift strengh that are three different paths followed by this function:

1. Strong shift to lean: lambda controller go to its limit and the plausibility check recognises this error.
2. Middle strong shift to lean: the trim controller goes to its limit but the lambda controller not, the trim controller deviation diagnosis recognises that the system has a problem and the active test detects that the problem is in the upstream sensor, this showing a characteristic line shift to lean.
3. Mild shift to lean: the trim controller goes to its limit but the lambda controller not. The trim controller **I**-share runs to its limit, whereas the trim ctr. deviation diagnosis are not able to recognise that the system has a problem. The trim ctr **I**-share diagnosis triggers the active test which detects that the problem is in the upstream sensor, this showing a characteristic line shift to lean.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

With this module the interface between the SHIFT_AFL_LSL_UP[i] and SHIFT_AFR_LSL_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_SHIFT_AFL_LSL_UP[i] and STATE_RBM_SHIFT_AFR_LSL_UP[i] data.
Within STATE_RBM_SHIFT_AFL/AFR[i], three different informations are defined:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for lean/rich shift diagnosis)

Application conditions

Initialisation:

```
 at ECU reset:
     bit 0, bit 1 and bit 2 of STATE_RBM_SHIFT_AFL_LSL_UP[i]
= 0
     bit 0, bit 1 and bit 2 of STATE_RBM_SHIFT_AFR_LSL_UP[i]
= 0
 LV_DC = 0 - -> 1 transition:
      bit 0 and bit 1 of STATE_RBM_SHIFT_AFL_LSL_UP[i] = 0
      bit 0 and bit 1 of STATE_RBM_SHIFT_AFR_LSL_UP[i] = 0
     bit 2 of STATE_RBM_SHIFT_AFL_LSL_UP[i] = 1
     bit 2 of STATE_RBM_SHIFT_AFR_LSL_UP[i] = 1
 on failure memory reset:
     bit 1 of STATE_RBM_SHIFT_AFL_LSL_UP[i] = 0
     bit 1 of STATE_RBM_SHIFT_AFR_LSL_UP[i] = 0
```

Recurrence: 1 s

Activation: LV_DC = 1

Deactivation: *LV_DC = 0*

Formula section:

At LV_DC 0 - -> 1 transition

The pending status of the following failures has to be checked only once :

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_LS_DIAG_MNG_PRIO_DLY_REQ	V	0... 1H	0 ...1	1	-
Request from dynamic (effect) diagnosis for forced stimulation after priorization					
LV_LS_DIAG_MNG_PRIO_DYN_ACT	-	0... 1H	0 ...1	1	-
Intermediate flag indicating dynamic diag (amplitude diag) request for forced stimulation and lambda control					
LV_LS_DIAG_MNG_PRIO_DYN_END	-	0... 1H	0 ...1	1	-
Intermediate flag indicating dynamic diag (amplitude diag) completion					
LV_LS_DIAG_MNG_PRIO_DYN_REQ	V	0... 1H	0 ...1	1	-
Request from dynamic (amplitude) diagnosis for forced stimulation after priorization					
LV_LS_DIAG_REQ_INH_CAT_DIAG	O/V	0... 1H	0 ...1	1	-
Request from diagnosis priority manager to deactivate catalyst diagnosis					
MAF_KGH_MMV_DYN_LSL_UP_LDC	V	0... FFFFH	0... 2047.96875	0.03125	kg/h
Moving mean value for LDC					
N_MMV_DYN_LSL_UP_LDC	V	0... 1FE0H	0... 8160	1	rpm
Moving mean value for LDC					
STATE_DYN_DIAG [NC_CBK_EX_NR]	O/V	0H 1H 2H 3H	PASSIVE WAIT ACQUISITION END	-	-
State shows the condition of the forced stimulation					
STATE_LAM_GAIN_REQ_LS_DIAG	O/V	0H 1H 2H	NONE DYN_DIAG DLY_DIAG	-	-
Request for specific lambda controller parameters for lambda sensor diagnoses					
STATE_LAMB_PLS_REQ_LS_DIAG	O/V	0H 1H 2H	NONE DYN_DIAG DLY_DIAG	-	-
Request for forced lambda stimulation for lambda sensor diagnoses					
T_CON_LAMB_AFL_DYN_LS_UP [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Timer to detect a local maximum to avoid false diagnosis					
T_CON_LAMB_AFR_DYN_LS_UP [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Timer to detect a local minimum to avoid false diagnosis					
T_DIAG_DYN_LSL_UP_LDC_MAF	V	0... FFH	0... 5.1	0.02	s
Delay timer after MAF dynamics in linear lambda dynamics diagnosis					
T_DYN_DIAG_AFL [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Timer for maximum amplitude measurement duration after LV_AFL 0 -> 1					
T_DYN_DIAG_AFL_COMP [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Timer for real lambda maximum detection (asymmetric failure detection)					
T_DYN_DIAG_AFL_THD [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Start delay limit for maximum amplitude measurement period after LV_AFL 0 -> 1					
T_DYN_DIAG_AFR [NC_CBK_EX_NR]	V	0... FFFFH	0... 1310.7	0.02	s
Timer for maximum amplitude measurement duration after LV_AFL 1 -> 0

General information

Configuration for diagnostic symptoms:

Diagnostic XX	Symptom description	Symptom	Filter type
DYN_VLD_LS_UP[NC_CBK_EX_NR]	Signal dynamic fault (slow response, delay or phase shift)	SYM_1	NO

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

This function shall evaluate the Linear Oxygen Sensor dynamic behaviour once per driving cycle by measuring the sensor output signal damping during the time when the forced stimulation is active with

Copyright (C) Continental AG,2007

the special set of parameters for the Dynamic Diagnosis or for the Catalyst Efficiency Diagnosis. During this time the air-fuel ratio is stimulated with a defined amplitude and period.

The amplitude of the air-fuel oscillation is measured by looking for minimum and maximum signal values in restricted time windows after start of the rich and lean cycles. This amplitude is normalized using the expected amplitudes for new and aged sensors and averaged over a number of measurements. The time window for determination of minimum (or maximum) values starts at the time defined in IP_T_DYN_DIAG_THD after the start of the rich (or lean) cycle, as indicated by LV_AFL edges, and lasts for the time IP_T_DYN_DIAG_COMP. The nominal maximum and minimum lambda value while the Timer T_DYN_DIAG_AFL/AFR is lower than THD and higher 0. The real minimum and maximum (COMP – comparison) is calculated while T_DYN_DIAG_AFL/AFR_COMP $>$ 0 and T_DYN_DIAG_AFL/AFR $<$ THD. The window may extend into the following lean (or rich) cycle, but it is truncated at the end of that cycle. Restriction of the time window makes the diagnosis sensitive to delays in the occurrence of the amplitude maximum and allows focusing on a portion of the signal where the difference between new and aged sensors is high, thus improving over the assessment of only the signal oscillation amplitude. The calculation of a FAC_COMP_VALUE_DIAG_DYN_LSL_UP, done in a map like

$$dif\_ratio = \frac{lamb\_\max\_comp - lamb\_\max}{lamb\_\min - lamb\_\min\_comp}$$

Figure B.33.1:

, shall detect an asymmetric failure earlier by weighting the FAC_MV_DIAG_DYN_LSL_UP[i].
The FAC_COMP_MV_DIAG_DYN_SENS_MDL is an output for the lambda sensor plant model (LACO). The rich to lean or lean to rich transition could be adapted in case of an asymmetric failure to improve the emissions.

Once the diagnosis is active, after every forced stimulation period, the lambda sensor signal amplitude is calculated. This amplitude is normalised versus engine speed and load. After a calibrateable number of normalised amplitude values are available, a mean value is determined. The lambda amplitude mean value is transformed into the relative damping factor FAC_MV_DIAG_DYN_LSL_UP[i] by comparing with the amplitude of a new sensor with the value for the limit aged sensor. Once the relative damping factor FAC_MV_DIAG_DYN_LSL_UP[i] is determined for the current driving cycle, it is compared with a calibrateable threshold to establish a good/bad result.

To make the final decision, results from another diagnosis may be necessary. The results of both diagnoses evaluate different properties of the sensor but share the same symptom. A good result can only be established if both diagnoses have confirmed a good result, but a bad result of any of the diagnoses makes the combined result bad as soon as this result is determined. The other diagnosis is expected to produce the end flag LV_DLY_END_LSL_DIAG[i] and the diagnostic value FAC_DLY_DIAG_LSL_OUT[i], not providing a good/bad result by itself. For historical reasons (to avoid changes in service 06h output), this value is scaled such that the limit to be applied becomes the same as the limit applied to FAC_MV_DIAG_DYN_LSL_UP, and this scaled value is compared to determine the result status of the other diagnosis.

For systems using stratified or other lean combustion modes an alternate diagnosis may be used to evaluate the same sensor dynamic properties as the diagnosis described here. Therefore a good (or bad) result may be established as soon as one of the diagnoses has a result. The alternate diagnosis is expected to supply the error and end flags LV_DIAG_DYN_S_LSL_UP_ERR[i] and LV_DIAG_DYN_S_LSL_UP_END[i] and the diagnostic result FAC_MV_DIAG_DYN_S_LSL_UP[i]. From this result an equivalent FAC_MV_DIAG_DYN_LSL_UP[i] is obtained using IP_FAC_SCA_FAC_MV_DIAG_DYN.

The factor FAC_MV_DIAG_DYN_LSL_UP[i] can also be used to adapt the sensor time constant model T1_LSL_UP[i] for symmetric failure cases by setting the Boolean switch LC_T1_AD_DIAG_DYN_LSL_UP = 1. For asymmetric failure cases the FAC_COMP_MV_DIAG_DYN_SENS_MDL[i] can be used to adapt the plant model for rich to lean or lean to rich transitions with additional time. In that case a simple linear interpolation is done between the time constant for a new sensor and that for the aged

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. limit sensor, which are saved in the correspondent maps IP_T1_LSL_UP_AGI_LIM[i] and IP_T1_LSL_UP[i]. For more information please refer to the function specification *Lambda control (Fuel mass).*

To help the calibration of this function a tuning guide is available.

Application conditions:

Initialisation:

At the transition LV_IGK = 0 ->1, by ECU reset, by clearing the Error Memory or by triggering the EOL test (transition LV_DIAG_EOL_DYN_LS_UP[i] = 0 -> 1) initialise the variables as indicated below:

```
FAC_COMP_VALUE_MIN_DYN_LSL_UP[i] = 32
FAC_VALUE_MAX_DIAG_DYN_LSL_UP[i] = 0
FAC_VALUE_MIN_DIAG_DYN_LSL_UP[i] = 32
LAMB_MIN_DIAG_DYN_LSL_UP[i] = 32
LAMB_MIN_DIAG_DYN_LSL_UP_COMP[i] = 32
LV_LS_DIAG_REQ_INH_CAT_DIAG = 1
STATE_DYN_DIAG[i] = "passive"
STATE_LAM_GAIN_REQ_LS_DIAG = NONE
STATE_LAMB_PLS_REQ_LS_DIAG = NONE
T_DYN_DIAG_AFL[i] = 1310.7
T_DYN_DIAG_AFR[i] = 1310.7
TQ_MMV_DIAG_DYN_LSL_UP = FAC_TQ_REQ
```

set the following variables to zero:

```
CTR_WAIT_DIAG_DYN_LSL_UP[i]
CYCNR_DIAG_DYN_LSL_UP[i]
CYCNR_DIAG_DYN_LSL_UP_ERR[i]
FAC_COMP_SUM_DIAG_DYN_LSL_UP[i]
FAC_COMP_VALUE_DIAG_DYN_LSL_UP[i]
FAC_COMP_VALUE_DYN_LSL_UP_TMP[i]
FAC_COMP_VALUE_MAX_DYN_LSL_UP[i]
FAC_DIAG_DYN_LSL_UP_ERR[i]
FAC_DIAG_DYN_LSL_UP_OK[i]

```
STATE_DYN_DIAG[i] = "passive"
LV_LAM_ADJ_REQ_DYN_LSL_UP[i] = 0
CTR_WAIT_DIAG_DYN_LSL_UP[i] = 0
```

Condition 3:

```
from STATE_DYN_DIAG[i] = "wait" to  "acquisition"

[LC_DIAG_DYN_LSL_UP_CAT_SYN = 1  &
STATE_CAT_DIAG = "cyc_lean"  or   "cyc_rich" ] Or
[LC_DIAG_DYN_LSL_UP_CAT_SYN = 0  &
CTR_WAIT_DIAG_DYN_LSL_UP[i] > C_CTR_WAIT_DIAG_DYN_LSL_UP]
```

Transition actions:

```
STATE_DYN_DIAG[i] = "acquisition"
```

B.33.2.3 STATE_DYN_DIAG[i] = "acquisition"

Actions:

```
If(1)  LV_DIAG_DYN_LSL_UP_CYC_END[i] = 1
```

% both lean and rich monitoring cycles have completed

```
Then(1)
    If(2)     LV_CYCNR_DYN_LSL_UP_VLD[i] = 1 &
              LV_INTR_DIAG_LS_DYN[i] = 0 &
              LAMB_MAX_DIAG_DYN_LSL_UP[i]  ≤ C_LAMB_MAX_DIAG_DYN_LSL_UP &
              LAMB_MIN_DIAG_DYN_LSL_UP[i]   ≥  C_LAMB_MIN_DIAG_DYN_LSL_UP
```

Purpose of this test is to avoid any shift in the lambda set point. Narrow calibration of those constants can reduce strongly the number of valid measured amplitudes. Moreover, the current lean/rich cycle must be marked as valid via LV_CYCNR_DYN_LSL_UP_VLD[i].

```
    Then(2)
```

Calculation of the Lambda-Amplitude

```
              LAMB_AMPL_DIAG_DYN_LSL_UP[i] =
              LAMB_MAX_DIAG_DYN_LSL_UP[i] - LAMB_MIN_DIAG_DYN_LSL_UP[i]

B.33.3 DYNAMIC DIAGNOSIS MANAGER

This section looks at the state of concurrent diagnoses, it shall not depend on the activation condition of the dynamic diagnosis. There may be two additional monitors that link into the same fault symptom:

	Delay "bad"	Delay "good"	Delay "ongoing"
Dyn "bad"	"bad"	"bad"	"bad"
Dyn "good"	"bad"	"good"	wait for delay
Dyn "ongoing"	"bad"	wait for hom/strat	wait for delay + hom/strat

A delay diagnosis, which looks at some other sensor signal property. If this diagnosis is active, a fault may be determined as soon as either of the diagnoses detect a fault, but a good result is confirmed only by good results of both diagnoses.

	Stratified "bad"	Stratified "good"	Strat. "ongoing"

Hom. "bad"	"bad"	"bad"	"bad"
Hom. "good"	"bad"	"good"	"good"
Hom. "ongoing"	"bad"	"good"	wait for at least one of hom/ strat

An alternate dynamic diagnosis for stratified combustion, which evaluates the same properties as the diagnosis described here. If this diagnosis is active, it is just another way to detect good/bad sensor dynamics, so both good and bad sensor dynamics can be confirmed by either of these functions.
On top of this a delay result, as described above, may still be necessary to confirm a good sensor

% Result priority for both fault flag and mode$06 output:
% 1) If dynamic (homogenous or stratified) is bad, set dynamic result, with preference
% for homogenous if both have found a fault at the same time.
% 2) If delay is bad, set delay result.
% 3) If both of delay and at least one of homogenous or stratified dynamic are good,
% set dynamic result. Preference for homogenous, if both dynamic diagnoses
% have finished at this point.

B.33.4 DIAGNOSIS request coordination

This section shall not fall under the activation conditions but be always active. It coordinates the requests for forced stimulation and lambda control parameters that originate in the delay diagnosis, the dynamic diagnosis and the catalyst diagnosis. Each of these diagnoses may need specific parameters to run, but only one set of parameters may be active at the same time.
This section uses calibrateable bit vectors to determine which diagnosis has priority over another one. Delay and dynamic diagnoses are controlled via enable flags that are set when the diagnosis has requested its parameters and the request coordination has found that these parameters are in effect. Catalyst diagnosis is controlled by an inhibition request.

For every involved diagnosis there is one byte of lock flags, and in this byte there is a pair of bits for each diagnosis. If in C_STATE_PRIO_INH_DIAG_<diag1> the bit <diag2>_ACT (denoted as C_STATE_PRIO_INH_DIAG_<diag1>.<diag2>_ACT) is set, then an FLS request of diagnosis <diag2> locks <diag1>, and if bit <diag2>_END is set, then <diag1> cannot run until <diag2> has completed the parts where a specific FLS is needed. The following structure shall be used for the lock bytes:

Lock flag	Bit value	Meaning
CAT_ACT	2ˆ0 = 1	Inhibit if catalyst diagnosis wants to run
CAT_END	2ˆ1 = 2	Inhibit if catalyst diagnosis is not complete
DYN_ACT	2ˆ2 = 4	Inhibit if dynamic (amplitude) diagnosis wants to run
DYN_END	2ˆ3 = 8	Inhibit if dynamic (amplitude) diagnosis is not complete
DLY_ACT	2ˆ4 = 16	Inhibit if dynamic (effect) diagnosis wants to run
DLY_END	2ˆ5 = 32	Inhibit if dynamic (effect) diagnosis is not complete

The structure shall be the same for all lock bytes even though it doesn't make sense to lock a diagnosis against itself. Bits for the diagnosis itself are ignored. The locking is disabled for EOL mode to give EOL a chance to reorder the diagnosis sequence via inhibit flags from the appl. inc.

If[1a] LV_LS_DIAG_MNG_PRIO_EXT = 0
then
Part 1: helper flags to make the structure of the priority manager more clear and symmetric
For each involved diagnosis there is an indication of the FLS request and of its completion.
All banks existing in the ECU as well as an external request (e.g. from another ECU in a master/slave system) are consulted.

Enable dynamic diagnosis even if canister pruge could be critical					

Import actions:

ACTION_ERRM_CheckPendingStatus (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR_PND>)

General information

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.
i = 1, for single exhaust cylinder bank.

B.34.1 No title given

B.34.2 Interface for Rate – Based - Monitoring

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

With this module the interface between the DYN_VLD_LS_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_DYN_VLD_LS_UP[i] data.
Within STATE_RBM_DYN_VLD_LS_UP[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0) (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1) (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2) (not valid for catalyst diagnosis)

Application conditions:

Initialisation:

```
at ECU reset:
        bit 0, bit 1 and bit 2 of STATE_RBM_DYN_VLD_LS_UP[i]
= 0
        LV_DIAG_EOL_DYN_LS_UP_DC[i] = 0
LV_DC 0 ->1 transition:
        bit 0 and bit 1 of STATE_RBM_DYN_VLD_LS_UP[i] = 0
        LV_DIAG_EOL_DYN_LS_UP_DC[i] = 0
on failure memory reset:
        bit 1 of STATE_RBM_STATE_RBM_DYN_VLD_LS_UP[i] = 0
        LV_DIAG_EOL_DYN_LS_UP_DC[i] = 0
```

Activation: `LV_DC = 1`

Deactivation: `-`

Recurrence: `1 s`

Function description:

Formula section:

At LV_DC 0 ->1 transition

`bit 2 of STATE_RBM_DYN_VLD_LS_UP[i] = 1`

The pending status of the following failures has to be checked only once :

Dependence	Error			
	LV_ERR_AMP	LV_ERR_AMP_PLAUS	LV_ERR_CHG_LS_DOWN	LV_ERR_CHG_LS_UP
	LV_ERR_CRK_PLAUS	LV_ERR_CRK_SYN	LV_ERR_CRK_TOOTH	LV_ERR_CRK_TOOTH_PER
	LV_ERR_DIAGCPS	LV_ERR_EL_CPS	LV_ERR_FTL_MIN	LV_ERR_FUP

B.35.1 State machine

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Due to possible oxygen sensor defects (e.g. reference air poisoning) or faults in the injection system (e.g. leaking fuel injector), the oxygen sensors may not provide the expected lean or rich AF signal level during definite conditions (lean or rich). Hence, the oxygen sensor signals shall be checked for plausibility during this engine operating states. The handling is requested and results are utilized by a separate manager for oxygen sensors error.

Description:

If the following conditions are met, then the conditions for plausibility check at lean conditions are determined to be present:

1. The Fuel Trim Diagnosis has detected an error (transmitted by LV_DIAG_OPL_REQ_CBK[1]).

B. No general inhibition observed (LV_DIAG_ACT_INH_LS_UP_DOWN[i]) and no specific inihibition exists (LV_DIAG_AFR_AFL_INH_LS_UP_DOWN[i]= 0).
C. The lean state shall be determined to be stable, as determined by comparing the mass air flow integral calculated after activation (MAF_INT_DIAG_LS_UP_DOWN[i]) with the threshold range (C_MAF_INT_DIAG_LS_UP_DOWN[i]).
D. The lean condition will be maintained until a timer is elapsed or an error was found on the upstream sensor or in case of a 1 bank system also on the downstream sensor.

The rich check follows always the lean test. The procedure is analogous to the lean check.

In case of a two bank system and finished open loop test on bank 1 and if there was no upstream linear lambda sensor fault detected, the bank 2 will be checked (triggered by LV_DIAG_OPL_REQ_CBK[2] which is set in application incidences).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

In case an EOL test the timers shall be initialized with a non-zero calibrateable value to reduce the minimum required time. The same is valid for the initialization of the MAF integral.

Application conditions

Initialisation:

At LV_IGK = 0 to 1, by reset, by clearing error memory or by triggering the EOL test (LV_DIAG_EOL_REQ_LS_UP_DOWN[i] = 0 -> 1; while LV_DIAG_ACT_END_LS_UP_DOWN[i] = 0) initialise the variables as follows:
STATE_DIAG_ACT_LS_UP_DOWN[i] = 0
MAF_INT_DIAG_LS_UP_DOWN[i] = 0
LV_DIAG_ACT_END_LS_UP_DOWN[i] = 0
LV_DIAG_EOL_END_LS_UP_DOWN[i] = 0
LV_DIAG_AFR_CDN_LS_UP_DOWN[i] = 0
LV_DIAG_AFR_END_LS_UP_DOWN[i] = 0
LV_DIAG_AFL_CDN_LS_UP_DOWN[i] = 0
LV_DIAG_AFL_END_LS_UP_DOWN[i] = 0
LAMB_SP_BEG_DIAG_LS_UP_DOWN[i] = 1
LV_LAMB_SP_AFR_REQ_DIAG_ACT[i] = 0
LV_LAMB_SP_AFL_REQ_DIAG_ACT[i] = 0
T_DIAG_ACT_AFR_LS_UP_DOWN[i] = 0
T_DIAG_ACT_AFL_LS_UP_DOWN[i] = 0
LV_LAM_DI_REQ[i] = 0

Recurrence: *T_SAMPLE* = 100ms

Note:

The functions contained in this module shall be carried out according the following sequence:

1. *active test upstream sensor*
2. *active test downstream sensor*
3. *state machine*

Activation:
LV_ST_END = 1

B.35.1.1 Sequence for check of signal plausibility monitoring (state machine)

The state machine shall remain in its current state and carry out the actions specified to occur within that state once per recurrence unless otherwise specified. The state machine shall only move to another state when one of the conditions has been determined to be met.
The priority of the conditions to change between states shall be defined by the order in which these conditions are listed within the appropiate state as described below.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

none

B.35.2 O2 Sensor (up) open loop diag

FUNCTION DESCRIPTION:

This function shall do a plausibility test of the upstream oxygen sensor after the lambda set point was shifted to rich and/or lean. The failure entry will be done by the O2 Sensor diagnosis management (characteristic shift down diagnosis). Consequently the flags LV_ERR_.... and LV_END_DIAG_... are defined there.

Description:

Application conditions

B.35.3 O2 sensor (down) open loop diag

FUNCTION DESCRIPTION:

General information:

This function shall do a plausibility test of the downstream oxygen sensor after the lambda set point was shifted to rich and/or lean. Once the test is complete on all cylinder banks, the symptoms are combined to produce appropriate error entries. The evaluation is different for 1 bank and 2 bank systems, more than 2 banks are not supported.
Here the dynamic error managemer is used to set the flags LV_ERR_.... and LV_END_DIAG_.... LV_ DIAG_CYC_END_LS_DOWN[i] is defined as dummy for global interface reasons.

Description:

Error Symptoms are defined as follows:

ERR_SYM_CHK_LS_DOWN

```
|_|_|_|_|
 | | | └─> downstream oxygen sensor too rich        ( = SYM_0)
 | | └───> downstream oxygen sensor too lean        ( = SYM_1)
 | └─────> (not used)                               ( = SYM_2)
 └───────> (not used)                               ( = SYM_3)
```

ERR_SYM_CHG_LS_DOWN

then          LV_END_DIAG_CHK_LS_DOWN[i] = 1
endif
```

Hint: The constant C_T_END_DIAG_ACT_LS_DOWN[i] must be bigger equal 2* (C_T_MAX_DIAG_AFL_LS_UP_DOWN + C_T_MAX_DIAG_AFR_LS_UP_DOWN + maximum time for the MAF integral C_MAF_INT_DIAG_LS_UP_DOWN[i] times 2).
The reason is to be in line with Rate Based Monitoring requirements (duration of diagnosis in the no failure case not shorter than in the failure case).

B.35.4 Moving Lambda Set Point

FUNCTION DESCRIPTION:

This functions shall move the lambda set point to a calibratable value, in order to do a plausibility test with the upstream and the downstream oxygen sensors separately. To avoid a jump in the lambda value and consequently any problem concernig driving confort, the shift in the lambda set point should be done through a ramp function with calibratable slope. The slope is defined as the diference between desired lambda set point and its value before the active test divided by the number of recurrences to achieve the final set point value, which is calibratable.
While the function is moving the lambda set point the flag LV_LAMB_SP_REQ_DIAG_ACT[i] is active (set in module 708A) to import this new value with high priority to the lambda coordination. To avoid any unbounded value of LAMB_SP[i], it s monitored while the movemnt occurs. As bounds for the lambda set point, it is used the desired AFR and AFL calibration data.

Description:

Application conditions

Initialisation:

At LV_IGK = 0 to 1, reset or at clearing error memory initialize all variables as follows:
LAMB_SP_DELTA_LS_UP_DOWN[i] = 0
LAMB_SP_DIAG_OPL_LS_UP_DOWN[i] = 0

Recurrence:
This function shall be carried out every 100 ms.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation:
This function shall be activated when
LV_LAMB_SP_AFR_REQ_DIAG_ACT[i] = 1 **or**
LV_LAMB_SP_AFL_REQ_DIAG_ACT[i] = 1

Otherwise this function shall be deactivated and *LAMB_SP_DIAG_OPL_LS_UP_DOWN[i]* shall be set to zero.

Formula section:

Manual inhibitation of symptom evaluation for downstream sensor interchanged error					

Import actions:

ACTION_ERRM_CheckPendingStatus (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR_PND>)

FUNCTION DESCRIPTION:

General information:

In this Appl. Incidence the execution order of the AF lean and rich active tests are defined. Also some criteria are defined, which must inhibit each test.
i = 1 ... NC_CBK_EX_NR

Application conditions

Initialisation:

```
If  LV_IGK = 01 or  reset or  clearing the error memory then
 LV_DIAG_ACT_INH_LS_UP_DOWN[i] = 0
 LV_DIAG_AFR_AFL_INH_LS_UP_DOWN[i] = 0
 LV_DIAG_OPL_REQ_CBK[i] = 0
 LV_INH_DIAG_CHG_LS_DOWN = 0
 LV_DIAG_ACT_INH_RBM_LS_UP_DOWN[i] = 0
 LV_DIAG_EOL_REQ_LS_UP_DOWN[i] = 0
 If  LV_IGK = 10
 LV_INH_DIAG_CHG_LS_DOWN = 1
 LV_DIAG_ACT_INH_LS_UP_DOWN[i] = 1
```

Recurrence: *100 ms*

Activation: *LV_IGK = 1*

Deactivation: LV_DIAG_ACT_END_LS_UP_DOWN[i] = 1 orLV_IGK = 0

Formula section:

If the following conditions are true, the active test shall wait until the interferring functions are deactivated in the failure case.

If CPPWM <> 0% *canister purge valve is open*

then LV_DIAG_AFR_AFL_INH_LS_UP_DOWN[i] = 1
else LV_DIAG_AFR_AFL_INH_LS_UP_DOWN[i] = 0
endif

If the following errors/special mode are true the whole function shall be inhibited.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.36.1 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the CHK_LS_DOWN[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_CHK_LS_DOWN[i] data.
Within STATE_RBM_CHK_LS_DOWN[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

(not valid for active- check)

Application conditions

Initialisation:

```
at LV_DC 0  1 transition:
     bit 0 , bit 1 of STATE_RBM_CHK_LS_DOWN[i] = 0
     bit 2 of STATE_RBM_CHK_LS_DOWN[i] = 1
on failure memory reset:
    bit 1 of STATE_RBM_CHK_LS_DOWN[i] = 0
 at ECU reset all bits of STATE_RBM_CHK_LS_DOWN[i] shall be
set to zero.
```

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

B.37.1 Upstream Sensor Banks 1 and 2

FUNCTION DESCRIPTION:

General information:

This function was written for exhaust gas systems having two banks, where a sensor interchange cannot be avoided by hardware measures. In case the upstream sensors were interchanged it is expected that both lambda signals will drift from the set point in different directions and the lambda controllers achieve their maximum.

A symptom can be detected if the lambda controller correction of one bank crosses the min threshold whereas the other one crosses the max threshold.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

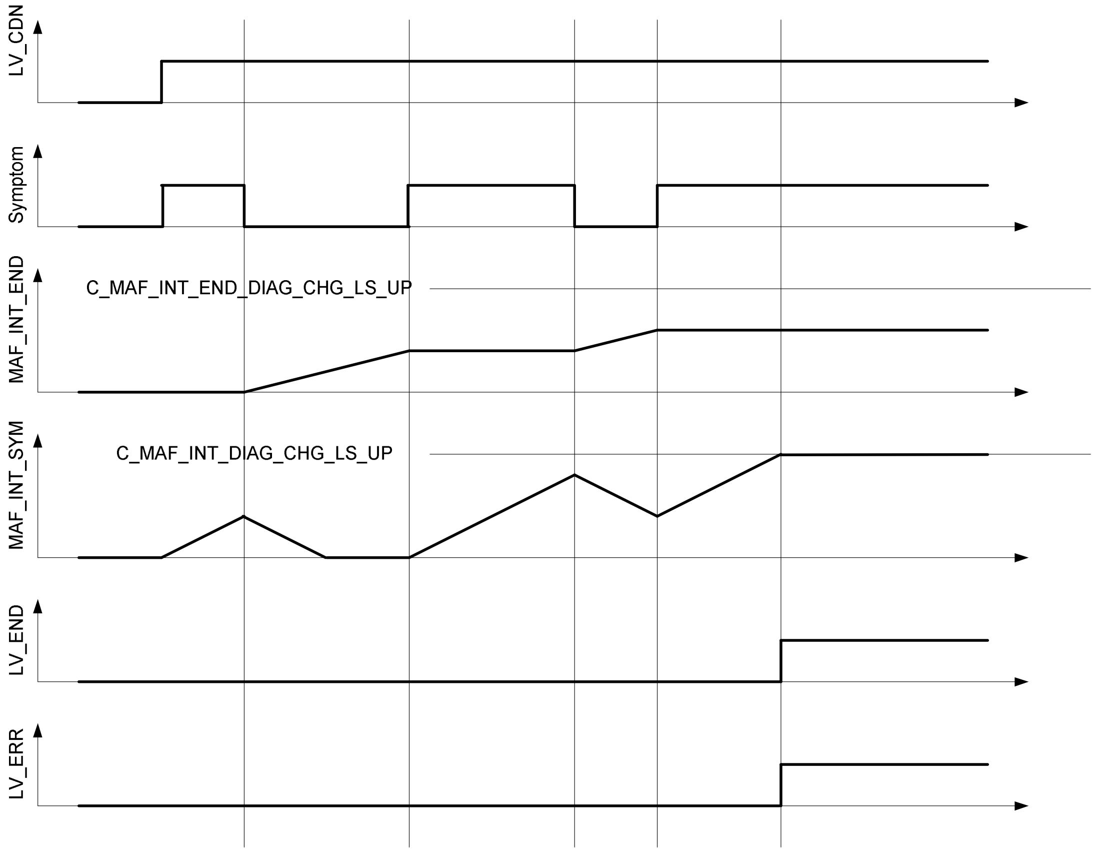

Figure B.37.1: : Basic principle of applied debounce algorithm.

Application conditions

Initialisation: At the transition LV_IGK = 0 -> 1, reset or clearing error memory reset all variables.

Recurrence: This function shall run every T_SAMPLE = 100 ms.

Activation/Deactivation:

IF LV_LAM_LSCL[i] = 1 for all [i]
AND (LV_LAM_STOP[1] = 0 **OR** LV_LAM_STOP_SHO_PER_CDN[1] = 1)
AND (LV_LAM_STOP[2] = 0 **OR** LV_LAM_STOP_SHO_PER_CDN[2] = 1)

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

The plausibility check between the upstream oxygen sensor (WRAF sensor) and the downstream oxygen sensor (binary) signal is done once the expected driving conditions are fulfilled. A non-plausibility symptom detected by this diagnosis indicates that a failure is present in one of both sensors.
Two different symptoms can be detected:

- STATE_SYM_DIAG_PLAUS_LSL_UP[i] = *SYM_0* , if the upstream sensor indicates a rich lambda value, while the downstream sensor signal lean.
- STATE_SYM_DIAG_PLAUS_LSL_UP[i] = *SYM_1* , if the upstream sensor indicates a lean lambda value, while the downstream sensor signal rich.

Once the down- and upstream sensor signals are not mutual plausible first the mass flow integral MAF_SYM_RAW_PLAUS_LSL_UP[i] is calculated to take into account the delay time caused by the oxygen storage capability of the catalyst. If this integral reaches the threshold C_MAF_SYM_RAW_PLAUS_LSL_UP[i] the status in STATE_SYM_DIAG_PLAUS_LSL_UP[i] is set to the respective symptom. If either LV_DIAG_AFR_SYM_PLAUS_LSL_UP[i] or LV_DIAG_AFS_SYM_PLAUS_LSL_UP[i] disappears the MAF integral is decremented. When the integral reaches C_MAF_SYM_RAW_RST_PLAUS_LSL_UP[i] the status flag is taken back.
Second, after STATE_SYM_DIAG_PLAUS_LSL_UP[i] is set to the respective symptom the debounce algorithm is started. If both LV_DIAG_AFR/AFS_SYM_PLAUS_LSL_UP[i] and STATE_SYM_DIAG_PLAUS_LSL_UP[i] are active MAF_SYM_PLAUS_LSL_UP is integrated. In contrast if both symptom indicators are inactive (thus no failure is expected) the integral MAF_END_PLAUS_LSL_UP[i] is integrated. Should the status of flag differ from eachother, then both integrals are frozen. MAF_SYM_PLAUS_LSL_UP is reset when the status of STATE_SYM_DIAG_PLAUS_LSL_UP[i] changes. There is not reset condition for the end integral in order to have a valid end flag also in case of a jittering signal.
LV_DIAG_PLAUS_SYM_LSL_UP[i] is set to one once the symptom integral exceeds C_MAF_SYM_PLAUS_LSL_UP[i] is exceeded. LV_DIAG_PLAUS_END_LSL_UP[i] is set when the end integral exceeds sum of C_MAF_SYM_PLAUS_LSL_UP[i] and C_MAF_SYM_RAW_PLAUS_LSL_UP[i] or when the LV_DIAG_PLAUS_SYM_LSL_UP[i] is set.

Figure B.39.1: : Basic principle of applied debounce algorithm.

The symptom flag LV_DIAG_PLAUS_SYM_LSL_UP is exported to *Sensor Characteristic Line Shift to Lean* and *Shift to Rich* functions to facilitate the detection of the faulty sensor and failure cause. The calibration of this function is described in its Tunning Guide.

Application conditions:

Initialisation:

At transition LV_IGK = 0 to 1, reset or at clearing error memory resetall variables.

Recurrence: 100 ms

Activation:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions

Initialisation: at every transition LV_IGK = 0->1or reset all variables shall be reset to 0.
at every transition LV_IGK = 1->0
LV_DIAG_PLAUS_INH_LSL_UP[NC_CBK_EX_NR] = 1

Recurrence: *the functions shall be carried out once every 1s.*

Activation: *LV_IGK = 1*

Deactivation: *LV_IGK = 0*

Formula section:

This function has to be deactivated, if at least one of the following errors /special modes is active.

B.41.2 Upstream sensor heater OBD2 diagnosis: Interface for rate - based - monitoring

Description:

With this module the interface between the OBD_VLD_LSH_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_OBD_VLD_LSH_UP[i] data.
Within STATE_RBM_OBD_VLD_LSH_UP[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

(no intrusive operation, no short trip)

- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

(not valid for heater diagnosis)

Application conditions

Initialisation:

```
at ECU reset:
    bit 0, bit 1 and bit 2 of STATE_RBM_OBD_VLD_LSH_UP[i]
= 0
LV_DC 0 - -> 1 transition:
     bit 0 and bit 1 of STATE_RBM_OBD_VLD_LSH_UP[i] = 0
    bit 2 of STATE_RBM_OBD_VLD_LSH_UP[i] = 1
on failure memory reset:
    bit 1 of STATE_RBM_OBD_VLD_LSH_UP[i] = 0
```

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0 - ->1 transition

The pending status of the following failures has to be checked only once :

Diagnostic XX	Symptom description	Symptom	Filter type
TTIP_MES_LSH_UP [NC_CBK_EX_NR]	“sensor temperature out of range”	SYM_0	NO
	“sensor readiness delayed”	SYM_1	
	“invalid sensor temperature”	SYM_2	

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

This function shall facilitate the detection of oxygen sensor heater failures that would lead to an increase in emissions beyond the thresholds stated in the appropriate regulations. The diagnosis shall be carried out by determining whether the operative readiness of the sensor exceeds a time threshold or whether the measured oxygen sensor ceramic temperature exceeds or falls below set bounds over a number of measurement cycles, defined to be the actions carried out once per recurrence. The latter evaluation over the diagnosis cycle, defined to be after the completion of the set number of monitoring cycles, shall be carried out statistically.

Description:

Deviations in the oxygen sensor ceramic temperature or the oxygen sensor not being operatively ready in a timely manner can lead to an increase in emissions above the applicable standards or prevent the sensor signal from being used as a diagnostic system monitoring device.
The deviations may occur due to, for example, ageing of the heater element, defective wiring, increased heater circuit connector contact resistance, defective heater driver etc.
The hereafter mentioned diagnosis strategy is based on the detection via one of two methods, both cases being emissions relevant. Firstly the time to operative readiness shall be checked and secondly a statistical evaluation of the oxygen sensor ceramic temperature over a pre-defined number of monitoring cycles shall be carried out, whereby if the temperature should fall out of pre-set bounds a calibrateable number of times during the complete diagnosis cycle, a fault shall be detected as being present.
The oxygen sensor ceramic temperature shall be obtained indirectly via the measured internal resistance of the sensor.
The functionality of the diagnosis may be described in further detail below:
The diagnosis shall be carried out at least once per driving cycle or may be permitted to repeat, dependent on the status of flag LC_OBD_REP_LSH_UP. It shall be clear that only the temperature deviation detection method can repeat as the sensor warm-up phase is usually only carried out once per driving cycle. Due to the requirement, that "good" SAE values are only allowed to be written once per driving cycle (after decision only furhter bad case allowed), repeating the diag is restricted possible with bad case only. The diagnosis shall require a number of monitoring cycles to be carried out to permit statistical evaluation of the results. The function may set
The function shall be activated and deactivated dependent on the engine start state, denoted by flag LV_ST_END. Should the function be deactivated, the diagnosis conditions flags LV_DIAG_OBD_CDN_

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LSH_UP[i], LV_CDN_DIAG_OBD_VLD_LSH_UP[i] and LV_CDN_DIAG_TTIP_MES_LSH_UP[i] and the SW internal timer *TIMER_1* shall be reset and the diagnosis shall be considered to be Not Available .

Additional application conditions shall be met prior to permitting monitoring cycles to take place:

- LC_OBD_LSH_UP shall permit the diagnosis to be enabled or disabled from within the calibration system.
- LV_INH_DIAG_OBD_LSH_UP[i] shall facilitate the interfacing of project specific application conditions.
- STATE_LSH_UP[i] shall neither be in LSH_OFF nor LSH_VB_PROT. See following description for explanation.
- VB shall remain within bounds as indicated by LV_VB_CDN_OBD_2. This shall provide the facility to ensure that the battery voltage is sufficient to carry out OBD II diagnosis.
- LSHPWM_UP[i] shall remain above or equal to C_LSHPWM_MIN_LSH_UP. This shall provide the facility to limit the performing of the diagnosis in a region where the sensor temperature can be controlled. No upper limit is given as should the heater become defective then the closed loop heater voltage controller will tend to drive the LSHPWM_UP[i] to its maximum limit.
- The condition (LV_DIAG_OBD_END_LSH_UP[i] = 0 **or** LC_OBD_REP_LSH_UP = 1) shall permit the diagnosis to be carried out once only per driving cycle (LC_OBD_REP_LSH_UP = 0) or continuously over the whole driving cycle (LC_OBD_REP_LSH_UP = 1). Note: Once a good case have been detected, countinious algorithm is only checking symptoms. (No furhter "good SAE values")
- The dew point shall have passed as denoted by LV_TEMP_DEW_LS_UP[i] = 1.

The function shall determine whether the full operative readiness LV_LS_UP_READY[i] has been detected. If not, then the time to operative readiness detection method shall be carried out. Internal TIMER_1 shall be reset, the diagnosis conditions flag LV_DIAG_OBD_CDN_LSH_UP[i] shall be set and the diagnosis shall be declared as being Available . Timer T_POW_RISE_LSH_UP[i] shall be checked against threshold C_T_DLY_LS_UP_READY_OBD_LSH_UP. Should it equal or exceed the threshold then the operative readiness has not been detected in a timely manner and the symptoms shall be set to READY_ERR, fault flag LV_DIAG_OBD_SYM_LSH_UP[i] and the error flags shall be set and the end of diagnosis flags shall be set. Because of writing the SAE values are only allowed once per driving cycle, setting of SAE values, LV_DIAG_OBD_SYM_LSH_UP[i] and LV_DIAG_OBD_END_LSH_UP is only done in case of no Symptom is already present.

In order to meet Mode 6 diagnosis requirements, the current oxygen sensor ceramic temperature shall be stored in TTIP_OBD_LSH_UP_MES_SAE[i]. (This is used for the detection of the full operative readiness and hence may be used to meet the requirements). The Temperature limits come out of the Readyness check module. Therefore the SAE BOL and TOL are set accordingly.

Once the full operative readiness has been detected, further conditions shall be met prior to determining whether the oxygen sensor temperature falls within bounds, i.e. detection method two.

The function shall determine whether a time to operative readiness fault has been detected by observing LV_DIAG_OBD_SYM_LSH_UP. Provided no error symptom is active, the function shall then wait for STATE_LSH_UP[i] to reach LSH_POW_CTL. Additionally the exhaust gas temperature shall exceed the limit C_TEG_DYN_MIN_OBD_LSH_UP to ensure that in long PUC phases sensor cooling does not lead to false error detection. After this condition has been met, the function shall await the delay C_T_DLY_POW_CTL_OBD_LSH_UP. The delay provides the heater controller sufficient time to regulate the ceramic temperature to the set-point. Furthermore, this condition excludes states LSH_VB_PROT & LSH_TEMP_PROT. In both of these states, the heater power is reduced to prevent damage to the sensor. Under such conditions, it cannot be expected that the sensor temperature remain stable and hence OBDII heater diagnosis shall not be carried out in these instances. The SW internal timer used to await the delay shall be reset whenever STATE_LSH_UP[i] is no longer in LSH_POW_CTL or when the other above listed conditions are no longer met.

Additionally LV_TTIP_MES_VLD_LS_UP[i] shall be set, indicating that the ceramic temperature computation is active. This is the case when either the normal operative readiness has been detected via the raw operative readiness and validated via the ceramic temperature or the conditional operative readiness has been detected (forced operative readiness). These conditions permit the use of the measured ceramic temperature (TTIP_MES_LS_UP[i]) and not its initialised value (0 °C), i.e. the system tries to measure the ceramic temperature even if the heater fails sufficiently such that the normal operative

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

readiness cannot be detected, where the oscillator used to measure the internal resistance and hence the ceramic temperature is only switched on when the sensor shows raw operative readiness. Note that during ceramic temperature reference measurements, the flag LV_TTIP_MES_VLD_LS_UP[i] will be revoked until the reference measurement cycle has been completed. The latter shall not cause TIMER_1 to be reset.
Once the application conditions have been met, this shall be indicated by setting the flag LV_DIAG_OBD_CDN_LSH_UP[i] and the function shall consider the diagnosis to be Available . Should the conditions not be met, then LV_DIAG_OBD_CDN_LSH_UP[i] shall be reset and the diagnosis shall be considered to be Not Available .
The function shall implement a statistical approach to detect a weak sensor heater: If the temperature is outside calibrateable limits, an error accumulator shall be incremented either with normal steps or with large steps, depending on the temperature being above or below a limit where the sensor is not functional. If the temperature is in range, the accumulator shall be decremented slowly. If the accumulator has reached a limit, the diagnosis shall indicate that an error is present. A second increment-only accumulator shall run in parallel to indicate that the diagnosis is done in the "good" case, i.e. that a fault would have been detected if it was permanently present. The diagnosis shall stop once an error has been detected. For Mode $06 SAE values the temperatures values must be stored. In "good" case (no error) the "TCC_END_DIAG_OBD_LSH_UP" counter reaches the "C_TCC_THD_ERR_OBD_LSH_UP - limit" with the "TCC_ERR_OBD_LSH_UP"-counter still counting; even if the current temperature value is "out of good range". Therefore the last stored good temperature "TTIP_MES_OBD_LSH_UP_IT" must be stored as SAE value. In "bad" case (error/symptom) the "TCC_ERR_OBD_LSH_UP" counter reaches the limit and SAE values as well as Symptom and end flags must be set.

TCC_END_DIAG_OBD_LSH_UP	**TCC_ERR_OBD_LSH_UP**	**Requirement for SAE values**	
Counting	Counting	Do not write	1
Reach calibrated Limit	Counting	Write last valid good TTIP	2
Counting	Reach calibrated Limit	Write TTIP (calibrated limit can only be reached if TTIP is out of Temp-Range)	3
Reach calibrated Limit	Reach calibrated Limit	Dto.	4

If the repeat flag LC_OBD_REP_LSH_UP_i is not set, the diagnosis shall stop as soon as the increment-only accumulator has reached or exceeded the required value and the end flag is set. If not, the diagnosis keeps running, but the result shall not change anymore once an error has been indicated.
If the repeat flag LC_OBD_REP_LSH_UP is set, the diagnosis will:

- stop nevertheless in case of Symptom detected
- run only for Symptom detection in case of finished with good case.

Application conditions:

Initialisation:
The following variables shall be initialised after reset, at the transition of ignition key on (i.e. LV_IGK = 0 -> 1) and upon clearing of the error memory:
STATE_SYM_OBD_LSL_LSH_UP[i] = 0
LV_DIAG_OBD_SYM_LSH_UP[i] = 0
LV_DIAG_OBD_CDN_LSH_UP[i] = 0
LV_DIAG_OBD_END_LSH_UP[i] = 0
LV_LAMB_PLS_REQ_DIAG_LSH_UP[i] = 0
TCC_ERR_OBD_LSH_UP[i] = 0
TCC_END_DIAG_OBD_LSH_UP[i] = 0
ACTION_ERRM_NoFilterReset(IN<NC_IDX_DIAG_ OBD_VLD_LSH_UP[i]>, OUT<LV_ERR_ OBD_VLD_LSH_UP[i]>)
ACTION_ERRM_NoFilterReset(IN<NC_IDX_DIAG_ TTIP_MES_LSH_UP[i]>,

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

OUT<LV_ERR_ TTIP_MES_LSH_UP[i]>)

***Reset** all timers*
NOTE: timers refer to internal SW timer and not to output data variable.

Initialisation at clearing error memory (FMY_CLR:) **or in case of EEPROM checksum error or in case of new ECU connection**
The following variable shall be reset **to physical "0"** :

- TTIP_OBD_LSH_UP_MES_BOL_SAE[i]
- TTIP_OBD_LSH_UP_MES_SAE[i]
- TTIP_OBD_LSH_UP_MES_TOL_SAE[i]
- TTIP_MES_OBD_LSH_UP_IT[i]

Recurrence:
The monitoring cycles shall occur every 100 ms providing the conditions are met.

Activation: "in all engine states"

Formula section:

Different datatype definitions can cause inconsistency between diagnosis and Service 06h output. Therefore internal copy is taken, to make sure that diagnosis uses same datatype as Service 06h
TTIP_LSH_UP_MES_TMP[i] = TTIP_MES_LS_UP[i]

If(1) LV_ST_END = 1
and LC_OBD_LSH_UP = 1

Logical calibration data for manual deactivation of all OBD2 diagnosis for upstream oxygen sensor					

B.43.1 Upstream O2 sensor final diagnosis

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

This function shall summarize the diagnostic status of the upstream oxygen sensor delivered from the OBD I & II functions (heater and sensor) through the flag LV_ERR_LS_UP[i].

The ultimate error flag LV_ERR_LS_UP[i] is a component error and no DTC shall be sended to the Error Management.

To reduce the number of variables to be checked by other diagnosis functions, the collecting flag LV_LS_UP_DIAG_END is introduced. It provides the possibility to combine the end flags from almost all the upstream linear lambda sensor diagnosis functions. By a bit mask variable it is calibratable which end flag contributes to the collecting end flag.

Note:
1. If two separate Banks are concerned, then i=1 for cylinder bank 1 and i=2 for cylinder bank 2.

Application conditions

Initialisation:
At LV_IGK = 0 to 1, reset **or**at clearing error memory:

LV_ERR_LS_UP[i] = 0
LV_LS_UP_OBD_1_MAN_DEAC[i] = 0
LV_LS_UP_OBD_2_MAN_DEAC[i] = 0
LV_LS_UP_DIAG_END[i] = 0

Recurrence:
The function should be carried out once every 100 ms.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation/Deactivation:
The diagnosis will be carried out if LV_ST_END = 1

Formula section:

If LV_LS_UP_OBD_MAN_DEAC_EXT = 1
Then LV_LS_UP_OBD_1_MAN_DEAC[i] = 1
LV_LS_UP_OBD_2_MAN_DEAC[i] = 1
Else
LV_LS_UP_OBD_1_MAN_DEAC[i] = LC_LS_UP_OBD_1_MAN_DEAC[i];
LV_LS_UP_OBD_2_MAN_DEAC[i] = LC_LS_UP_OBD_2_MAN_DEAC[i];
Endif

The linear lambda sensor error flag shall be set under the following conditions:

IF
LC_LS_UP_DIAG_ACT[i] = 1 % activation of final diagnosis **AND**
(LV_ERR_EL_LSL_UP[i] = 1 % electrical failure **OR**
LV_ERR_OC_LSL_UP[i] = 1 % open circuit failure **OR**
LV_ERR_LSL_UP_IF[i] = 1 % linear sensor controller failure **OR**

LV_ERR_LSH_UP[i] = 1 % heater electrical failure **OR**
LV_ERR_OBD_VLD_LSH_UP[i] = 1 % heater controller failure **OR**
LV_ERR_LSH_LSL_UP[i] = 1 % heater to sensor signal coupling failure **OR**

LV_ERR_AIR_LSL_UP[i] = 1 % sensor not mounted in exhaust pipe **OR**
LV_ERR_PUC_VLD_LS_UP[i]= 1 % sensor charact. line slope failure **OR**
LV_ERR_SHIFT_AFL_LSL_UP[i]= 1 % sensor charact. line shift to lean failure **OR**
LV_ERR_SHIFT_AFR_LSL_UP[i]= 1 % sensor charact. line shift to rich failure **OR**

LV_ERR_DYN_VLD_LS_UP[i]=1 & LC_ERR_DYN_VLD_LS_UP = 1 **OR**
% sensor dynamic failure (allowed by the project to stop closed loop control)
LV_ERR_CHG_LS_UP =1 & LC_ERR_CHG_LS_UP = 1 **OR**
% sensor interchanged failure (allowed by the project to stop closed loop control)

LC_LS_UP_ERR[i] = 1 **)** % manual activation of lambda sensor error
THEN
LV_ERR_LS_UP[i] = 1
ELSE
LV_ERR_LS_UP[i] = 0
ENDIF

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The general end flag is created according to the following logic:

If the corresponding bit is one, the LV_END_DIAG_XX flag shall be considered for the final end flag.

Copyright (C) Continental AG,2007

Bit position	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit mask variable (example) C_NR_END_DIAG_LSL_UP[i]	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1	1
	Not used	Not used	Not used	Not used	LV_END_DIAG_CHG_LS_UP	LV_END_DIAG_AIR_LSL_UP[i]	LV_END_DIAG_LSH_LSL_UP[i]	LV_END_DIAG_PUC_VLD_LS_UP[i]	LV_END_DIAG_SHIFT_AFR_LSL_UP[i]	LV_END_DIAG_SHIFT_AFL_LSL_UP[i]	LV_END_DIAG_DYN_VLD_LS_UP[i]	LV_END_DIAG_OBD_VLD_LSH_UP[i]	LV_END_DIAG_LSL_UP_IF[i]	LV_END_DIAG_OC_LSL_UP[i]	LV_END_DIAG_EL_LSL_UP[i]	LV_END_DIAG_LSH_UP[i]

For this proposal, the number would be 0000011111111111 binary = 2047 decimal. All end flags except the one from the interchanged diagnosis must be set to 1 to also set the final end flag to 1.

The bitmask shall be combined with the single end flags as follows:

If [(C_NR_END_DIAG_LSL_UP[i].bit 0 = 0 **or** LV_END_DIAG_LSH_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 1 = 0 **or** LV_END_DIAG_EL_LSL_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 2 = 0 **or** LV_END_DIAG_OC_LSL_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 3 = 0 **or** LV_END_DIAG_LSL_UP_IF[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 4 = 0 **or** LV_END_DIAG_OBD_VLD_LSH_UP[i]= 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 5 = 0 **or** LV_END_DIAG_DYN_VLD_LS_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 6 = 0 **or** LV_END_DIAG_SHIFT_AFL_LSL_UP[i]=1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 7 = 0 **or** LV_END_DIAG_SHIFT_AFR_LSL_UP[i]=1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 8 = 0 **or** LV_END_DIAG_PUC_VLD_LS_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 9 = 0 **or** LV_END_DIAG_LSH_LSL_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 10 = 0 **or** LV_END_DIAG_AIR_LSL_UP[i] = 1)
and
(C_NR_END_DIAG_LSL_UP[i].bit 11 = 0 **or** LV_END_DIAG_CHG_LS_UP = 1)
then
LV_LS_UP_DIAG_END[i] = 1
else
LV_LS_UP_DIAG_END[i] = 0

B.43.2 Downstream O2 sensor final diagnosis

FUNCTION DESCRIPTION:

General information:

This function shall summarize the diagnostic status of the downstream oxygen sensor delivered from the OBD I & II (heater and sensor) functions through the flag LV_ERR_LS_DOWN[i].

The ultimate error flag LV_ERR_LS_DOWN[i] is a System Error Flag. It should neither be saved in the Error Management nor a DTC code should be given.

To reduce the number of variables to be checked by other diagnosis functions, the collecting flag LV_LS_DOWN_DIAG_END is introduced. It provides the possibility to combine the end flags from almost all the downstream lambda sensor diagnosis functions. By a bit mask variable it is calibratable which end flag contributes to the collecting end flag.

Note:

1. *If two separate Banks are concerned, then i=1 for cylinder bank 1 and i=2 for cylinder bank 2.*

2. The diagnosis for interchanged lambda sensors is not included in the final error and end flag as this is mainly related to the End of Line test or to a final check after a repair in the garage.

Application conditions

Initialisation:

At LV_IGK = 0 to 1, reset **or**at clearing error memory:

LV_ERR_LS_DOWN[i]= 0
LV_LS_DOWN_OBD_1_MAN_DEAC[i] = 0
LV_LS_DOWN_OBD_2_MAN_DEAC[i] = 0
LV_LS_DOWN_DIAG_END[i] = 0

Recurrence:

The function should be carried out once every 100 ms.

Activation /Deactivation:

The diagnosis will be carried out only if LV_ST_END = 1

Formula section:

If LV_LS_DOWN_OBD_MAN_DEAC_EXT = 1
Then LV_LS_DOWN_OBD_1_MAN_DEAC[i] = 1
LV_LS_DOWN_OBD_2_MAN_DEAC[i] = 1
Else
LV_LS_DOWN_OBD_1_MAN_DEAC[i] = LC_LS_DOWN_OBD_1_MAN_DEAC[i]
LV_LS_DOWN_OBD_2_MAN_DEAC[i] = LC_LS_DOWN_OBD_2_MAN_DEAC[i]
Endif

Calculation of sum error bit for downstream oxygen sensor diagnosis

flag to set catalyst diagnosis condition manually					

B.45.1 EGTR_FCTDGCEFAC0

This function determines the activation flag LV_CAT_DIAG_CDN_ACT[i] for catalyst efficiency diagnosis (OSC method). This flag can be also be set manually by LC_CAT_DIAG_CDN_ACT_MAN.

The recurrence time is defined by T_SAMPLE in [ms].
NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements, the variable extension _i is used in the model instead of [i] as found in the textual description.

For the calculation of the air mass flow integral the unit conversion:
[g] = [kg/h] * [ms] * [(g*h) /(kg*ms)] /3600
has to be considered.

General Information

That catalyst diagnosis function is suitable for single branch (only one exhaust bank) and twin branch exhaust lines (two exhaust banks).
For a twin branch exhaust line the function has the same structure for both exhaust lines. The conversion properties of the two catalysts are monitored separately.
NC_CBK_EX_NR labels the number of exhaust banks.
For vector elements, the variable extension _i is used in the model instead of [i] as found in the textual description.

The signals from the control sensor upstream and the associated monitoring sensor downstream from the catalyst are used for catalyst diagnosis.
If a catalyst has good conversion properties, the oscillating lambda signal upstream from the catalyst generated by the lambda controller (which shall ensure defined O2-load of catalyst) downstream is smoothed by the Oxygen Storage Capacity of the catalyst.
If the conversion provided by the catalyst is low due to aging, poisoning by leaded fuel or misfire, then the oscillating lambda signal upstream of the catalyst also exists downstream of the catalyst. The lambda oscillation downstream of the catalyst is detected by an oxygen sensor (monitoring sensor).
Every monitored catalyst or combination of catalysts shall be indicated when the HC emission exceeds the applicable emission test threshold.

Description:
The diagnosis algorithm is realized with a state machine in order to improve specification understanding and coherence between specification and SW.

Monitoring cycle:(STATE_CAT_DIAG[i]: CYC_LEAN and CYC_RICH)
The first monitoring cycle is started following the rich-lean change (LV_AVL 0->1). A monitoring cycle lasts one complete lambda controller period (2 subsequent lambda richness changes). Several monitoring cycles are needed to finish the diagnosis.
At activation of Catalyst diagnosis the Forced stimulation is switched to higher Cat diag forced stimulation (soft switch in NC_NOM_CAT_DIAG_STEP cycles) and Trim control is switched to Cat diag parameters (P-share and I-share with own calibration, additionally shift of VLS setpoint depends from EFF_CAT_DIAG_HOM value). VLS_DOWN signal from monitoring Lambda sensor is converted with inverse sensor characteristic LAMB_CAT_DOWN_i.
In the wait state before the first cycle after every reactivation (rich-lean change LV_AFL) only LAMB_CAT_DOWN_MV_i is calculated. LAMB_CAT_DOWN_SUM_i is obtained by the summation of the LAMB_CAT_DOWN_i over a complete monitoring cycle. If LAMB_CAT_DOWN_MV_i agree with VLS_DOWN setpoint, catalyst diagnosis could start. WAIT state turns to RAMP_UP state and the O2load (realized by forced stimulation) ramps up from nominal value to catalyst diagnosis value. After ramp up of O2load finished, forced stimulation informs the catalyst diagnosis by forced stimulation state, really evaluated catalyst diagnosis cycles could start (CYC_LEAN/RICH).
LAMB_CAT_DOWN_MV_i is the mean value of the LAMB_CAT_DOWN_i - O2_load downstream the Catalyst calculated as inverse characteristic of binary lambda sensor from VLS_DOWN_i signal for one monitoring cycle. The calculation of MASS_O2_CAT_DIF_CYC_i is based on LAMB_CAT_DOWN_MV_i of the previous monitoring cycle. MASS_O2_CAT_DIF_CYC_i is the integrated difference between actual LAMB_CAT_DOWN_i signal and LAMB_CAT_DOWN_MV_i of the previous monitoring cycle.

Validity check: (STATE_CAT_DIAG_i: Transition CYC_RICH -> CYC_LEAN)
The obtained MASS_O2_CAT_DIF_CYC[i] of a monitoring cycle is only used for the calculation of the diagnosis value if the validity check was passed (STATE_VLD_CAT_DIAG_i reach the minimum value for validity)

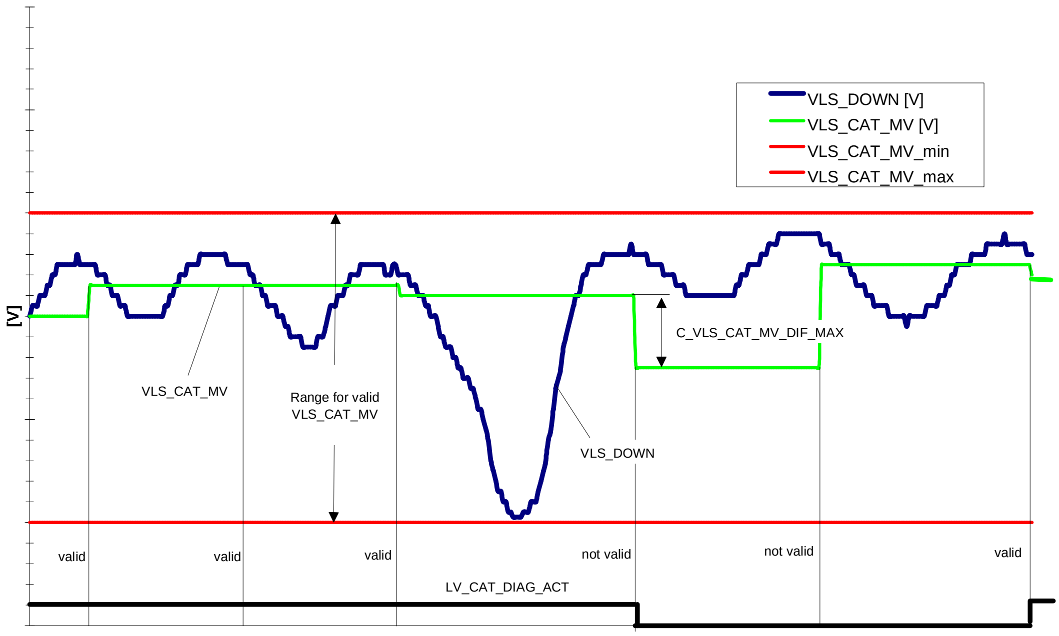
To pass the validity check it is necessary that:
LAMB_CAT_DOWN[i] must cross at least once LAMB_CAT_DOWN_MV[i] of the previous monitoring: 0.bit of STATE_VLD_CAT_DIAG_i is set (bit ’1CROSS’).
OR
The deviation between LAMB_CAT_DOWN[i] and LAMB_CAT_DOWN_MV[i] of the last monitoring cycle is smaller than C_LAMB_CAT_MV_DELTA_MAX: 1.bit of STATE_VLD_CAT_DIAG_i is set (bit ’MVDEL’).
OR
LAMB_CAT_DOWN[i] cross two times LAMB_CAT_DOWN_MV[i] of the previous monitoring (periodically braking down of VLS_DOWN occurs): 2.bit of STATE_VLD_CAT_DIAG_i is set (bit ’2CROSS’).
AND
Difference between actual and the LAMB_CAT_DOWN_MV[i] of the last monitoring cycle is not too high (if LAMB_CAT_DOWN[i] cross two times LAMB_CAT_DOWN_MV[i], higher difference allowed): 3.bit of STATE_VLD_CAT_DIAG_i is set (bit ’DIVMV’).
AND

LAMB_CAT_DOWN_MV[i] is in the right range 4.bit of STATE_VLD_CAT_DIAG_i is set (bit ’RANGE’).
AND

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Catalyst temperature dynamic is limited: 5.bit of STATE_VLD_CAT_DIAG_i is set (bit 'TEMP').

Illustration validity check



Calculation of diagnosis value: (STATE_CAT_DIAG[i]: Transition CYC_RICH -> CYC_LEAN)
Monitoring cycle counter CTR_CAT_DIAG[i] is incremented for each valid monitoring cycle.
MASS_O2_CAT_DIF_CYC[i] is weighted by engine speed and load (IP_FAC_MASS_O2_CAT_DIAG_XX). From that calculation MASS_O2_CAT_DIF_RATIO[i] results. MASS_O2_CAT_DIF_RATIO[i] is summed up for all monitoring cycles. That summation give MASS_O2_CAT_DIF_RATIO_SUM[i]. Finally, the average of MASS_O2_CAT_DIF_RATIO_SUM[i] over all valid monitoring cycles give the diagnosis value EFF_CAT_DIAG_HOM[i]

End of diagnosis: (STATE_CAT_DIAG[i]: Transition CYC_LEAN -> END)
If the necessary number of valid monitoring cycles CTR_CAT_DIAG[i] reaches C_CTR_MIN_CAT_DIAG the diagnosis is ended for that driving cycle and the catalyst diagnosis value EFF_CAT_DIAG_HOM[i] is calculated and stored in the EEPROM.
The monitoring counter CTR_CAT_DIAG[i] is used to set the readiness code. For this reason C_CTR_MIN_CAT_DIAG must be reached in the emission test cycle.

State diagram: STATE_CAT_DIAG[i]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Copyright (C) Continental AG,2007

Note: The priorities of the conditions to change between states are defined by order described in the STATEFLOW diagram below. The condition 8 as transition to PASSIVE is twice available and contain the same conditions each.

The recurence time is defined by T_SAMPLE in [ms].

Application Assistance
For OBD II O2 sensor diagnosis: C_CTR_MIN_CAT_DIAG has to be applied higher then the thresholds C_SUM_CYC_MIN_DIAG and C_SUM_CYCNR_MIN_DIAG
(LV_LS_FRQ_DIAG_READY -> 1 and LV_LS_SWT_DIAG_READY -> 1).
They have to be reached before STATE_CAT_DIAG[i] is set to END.

Hint:
An active catalyst diagnosis can disable the module Downstream Fuel Trim Regulation also a additional lambda offset can be imposed on the basic lambda setpoint in the module Basic Lambda setpoint . When the catalyst diagnosis is completed the above functions return to their normal operation.

Overview: Chronological order of diagnosis algorithm:
Triggering of catalyst diagnosis calculation by LV_AFL[i] 0->1...

%setpoint of the O2-load with CAT DIAG for the lambda controller (output, not used here)
1) LAMB_CAT_DOWN[i] = IP_LAMB_CAT(VLS_DOWN[i]) %every recurrence

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

2) LAMB_CAT_DOWN_SUM[i] n+1 = LAMB_CAT_DOWN_SUM[i] n+ LAMB_CAT_DOWN[i] %every recurrence
3) LAMB_CAT_DOWN_MV[i] = LAMB_CAT_DOWN_SUM[i] / CTR_LAMB_CAT_DOWN_SUM[i]
(after end of current diagnosis period)
4) FLOW_O2_CAT_DIF[i] = 0.23 * (1/3600)[g/ms] * I1/LAMB_CAT_DOWN_MV[i] - 1/LAMB_CAT_DOWN[i] I * MAF_CYL[kg/h]
5) MASS_O2_CAT_DIF_CYC[i]n+1 = MASS_O2_CAT_DIF_CYC[i] n + FLOW_O2_CAT_DIF[i]*T_SAMPLE[ms] %every recurrence
6) RATIO_MASS_O2_CAT_DIF [i] = MASS_O2_CAT_DIF_CYC[i] * IP_FAC_TEMP_CAT_DIF_STAT / (C_O2L_CAT_AFL * IP_FAC_MASS_O2_CAT_DIAG_XX) (with XX for AT or MT (after end of current diagnosis period)

7) RATIO_MASS_O2_CAT_DIF_SUM[i] n+1 = RATIO_MASS_O2_CAT_DIF_SUM[i] n + MASS_O2_CAT_DIF_RATIO[i]
(after end of current diagnosis period and passed validity check)
8) EFF_CAT_DIAG_HOM[i] = MASS_O2_CAT_DIF_RATIO_SUM[i] /CTR_CAT_DIAG[i]
(Catalyst diagnosis value after diagnosis finished)

Scheduling of formulas:
1+2: states WAIT, RAMP_UP, CYC_LEAN, CYC_RICH
3: state WAIT, transitions RAMP_UP or CYC_RICH to CYC_LEAN
4+5: states CYC_LEAN, CYC_RICH
6+7: transition CYC_RICH to CYC_LEAN
8: transition CYC_LEAN to END
Several system events will trigger a function response:

EGTR_FCTDGCEF0__RST (reset): reset
EGTR_FCTDGCEF0__20MS (regular trigger every 20 msec): operate
EGTR_FCTDGCEF0__CLFMY (clear failure memory): reset
EGTR_FCTDGCEF0__STB (standby; ECU programming or fault): reset, init_nvmy
EGTR_FCTDGCEF0__UNVMY (update non volatile memory): save_nvmy
EGTR_FCTDGCEF0__RNVMY (read non volatile memory): read_nvmy

B.46.3.1.1.2.2.1 Transition action RAMP_UP to CYC_LEAN:

Calculation of the downstream lambda mean value of last cycle. Initializing the downstream lambda sum, its counter and the related oxygen mass to zero.

Storing the downstream lambda signal at start of the monitoring cycle and initializing the concerning min/max values to the same value.

Resetting the validity bits with regard to crossing events, setting the validity bit with regard to the permitted difference between the actual downstream lambda signal and the mean value of last cycle.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.46.3.1.1.2.3.1 Transition action CYC_LEAN to END:

Calculation of the new diagnosis value and incrementing the total number of completed diagnosis cycles since ECU programming by one.

Resetting forced stimulation and trim control parameters to nominal values and all validity bits to zero.

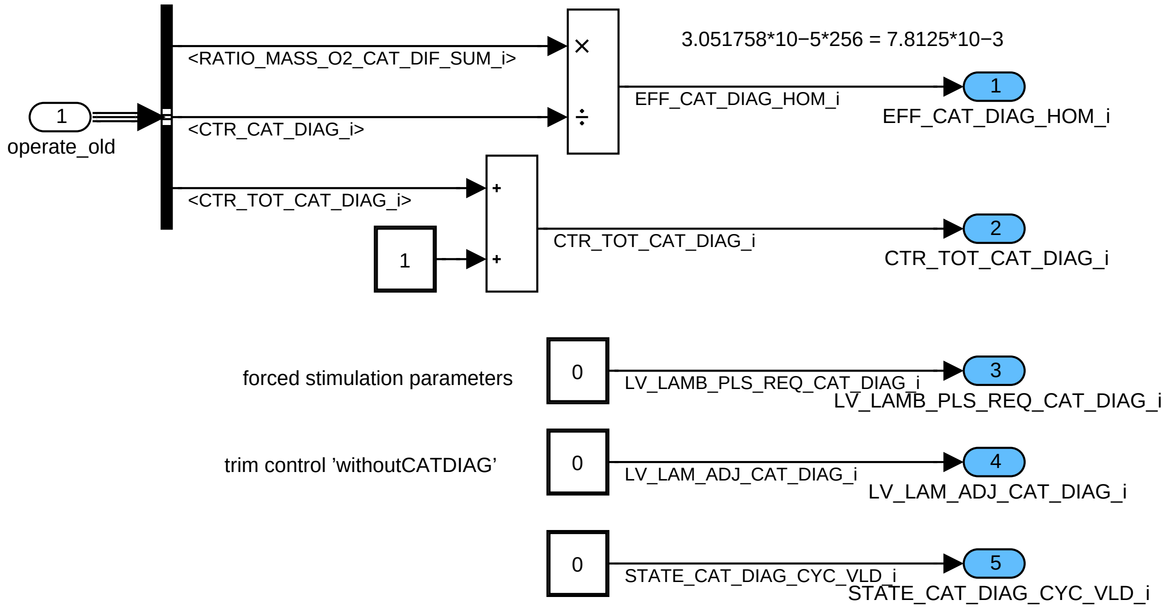

Figure B.46.10: :

B.46.3.1.1.2.4 EGTR_FCTDGCEF0/OPERATE/EGTR_FCTDGCEF0_CBK_MNG/EGTR_FCTDGCEF0_CBK_SPC/TA_CAT_DIAG/TA5_CYC_RICH_2_CYC_LEAN

B.46.3.1.1.2.4.1 Transition action CYC_RICH to CYC_LEAN:

Start of a new monitoring cycle.

Calculation of the downstream lambda mean value of last cycle.

Evaluation of the diagnosis value merely related to last monitoring cycle. Computation of the actual temperature difference between dynamic and stationary catalyst temperature.

Incrementing/resetting the number of cycles showing lambda to be out of range and setting the validity bits. In case of validity sum up the diagnosis value and increment the counter of valid cycles by one.

Initializing the single cycle bound sums and counters for next cycle.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.46.3.1.1.2.4.1.2 Monitoring cycle validity:

Computing the absolute difference between downstream lambda mean value and the corrected lambda setpoint and comparing it to the stored maximally admissible difference. Setting the RANGE bit in dependence on the result. Incrementing/resetting the counter of monitoring cycles showing lambda to be out of range.

Comparing the stat/dyn temperature difference to the stored maximally allowed value and setting the TEMPERATURE bit accordingly.

Computing the difference between downstream lambda min/max and dividing by eight. Adding this to the stored maximum allowed if the temperature range is o.k. Comparing the result to the absolute difference between actual and old mean value and setting the cycle validity bit in correspondence with.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. ACTION_ERRM_CheckPendingStatus (**IN**<PRM_XX>,**OUT**<PRM_PendingStatus>)

General information

B.47.1 Inhibition of diagnosis

General information:

The inhibition of the catalyst diagnosis can be deactivated by :
LC_INH_CAT_DIAG_MAN_DEAC = 1.
For LC_INH_CAT_DIAG_MAN_DEAC = 1 the catalyst diagosis function is not inhibited by a component failure.

Description:

If one of the following components fail the catalyst efficiency diagnosis function is stopped by LV_INH_DIAG_RBM_CAT_DIAG[i] = 1. The inhibition is calculated bank-wise.

Application conditions:

Initialisation: `at reset all Variables shall be set to 0`

Activation: `LV_DC transition 0 -> 1  (start driving cycle)`

Deactivation: `LV_DC transition 1 -> 0  (driving cycle terminated)`

Recurrence: `0.02 sec`

Function description:

Formula section:

```
The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR
= 2), then
       i = 1, for cylinder bank 1
       i = 2, for cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
       i = 1, for single exhaust cylinder bank 1.

    If         LV_ERR_AMP = 1
    or        LV_ERR_AMP_PLAUS = 1
    or        LV_ERR_CHG_LS_DOWN = 1
    or        LV_ERR_CHG_LS_UP = 1
    or        LV_ERR_CRK_PLAUS = 1
    or        LV_ERR_CRK_SYN = 1
    or        LV_ERR_CRK_TOOTH = 1
    or        LV_ERR_CRK_TOOTH_PER = 1
    or        LV_ERR_DIAGCPS = 1

B.47.2 Interface for Rate – Based - Monitoring

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

With this module the interface between the CAT_DIAG_i monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_CAT[i] data.
Within STATE_RBM_CAT[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)
  (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for catalyst diagnosis)

Application conditions:

Initialisation: `at LV_DC 0 ® 1 transition :`
`bit 0, bit 1 and bit 2 of STATE_RBM_CAT[i] = 0`
`on failure memory reset :`
`bit 1 of STATE_RBM_CAT[i] = 0`

Activation: `LV_DC 0 ® 1 transition` **and** `LV_DC = 1`

Deactivation: –

Recurrence: 1 s

Function description:

Formula section:

At LV_DC 0 ® 1 transition
The pending status of the following failures has to be checked only once :

For report value to Scan tool: separate EFF_CAT_DIAG for each catalyst or common, if over OBD emiss. limit					
LC_CAT_DIAG_EOL_LS_USE	-	0... 1H	0 ...1	1	-
Boolean that considers if LS end flags are used for cat-diagnosis EOL test					
LC_CAT_DIAG_RESU	-	0... 1H	0 ...1	1	-
Switch over the failure memory setting: separate for each catalyst or common for OBD emiss. limit					

General Information

For 2 exhaust gas bank system 1 bank (catalyst) could be aged over OBD limit, but if other catalyst is O.K, emissions of whole vehicle need not be over OBD limit, so MIL needn t go on. A separate diagnosis of every cylinder bank(catalyst), or common diagnosis is switchable. A common EFF_CAT_DIAG_SUM is calculated from separate EFF_CAT_DIAG[i] values of separate banks and error memory entered if common value is over the threshold.

Configuration for diagnostic symptoms:

Diagnostic CAT_DIAG[i]	Symptom description	Symptom	Filter type
Catalyst diagnosis	´CAT_EFFIC_LOW´	SYM_0	NO

NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements, the variable extension _i is used in the model instead of [i] as found in the textual description.

LC_O2L_CAT_DIAG_AFL_ENA	-	0... 1H	0 ...1	1	-
Use O2L_CAT_DIAG_AFL from lean cat diagnosis as result EFF_CAT_DIAG					

General Information

This modul coordinates the results of both catalyst diagnosis methods
- lambda=1 catalyst diagnosis (HOM): EFF_CAT_DIAG_HOM[NC_CBK_EX_NR]
- lean catalyst diagnosis (AFL): O2L_CAT_DIAG_AFL[NC_CBK_EX_NR]

The common result is EFF_CAT_DIAG[NC_CBK_EX_NR]

Application Conditions

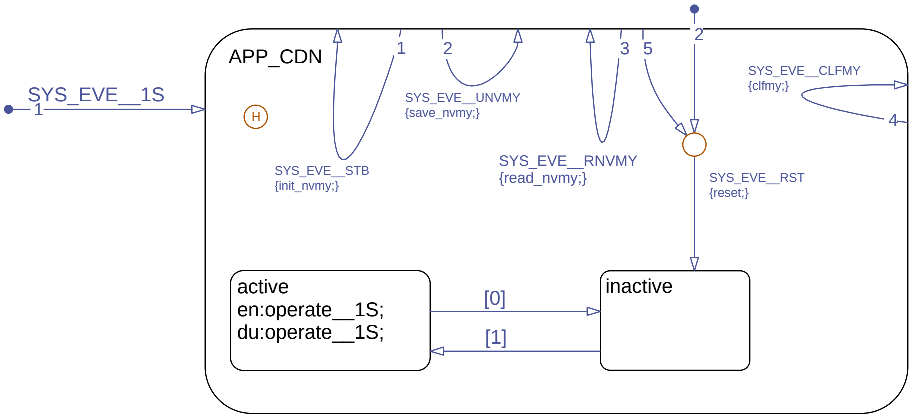

Figure B.49.1: : Path: EGTR_FCTDGCEFC0/APP_CDN/Chart

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.49.2: : Path: EGTR_FCTDGCEFC0

B.49.1 Reset

The old values will be initialized with the regarding inputs, due to avoid an edge detection after reset.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

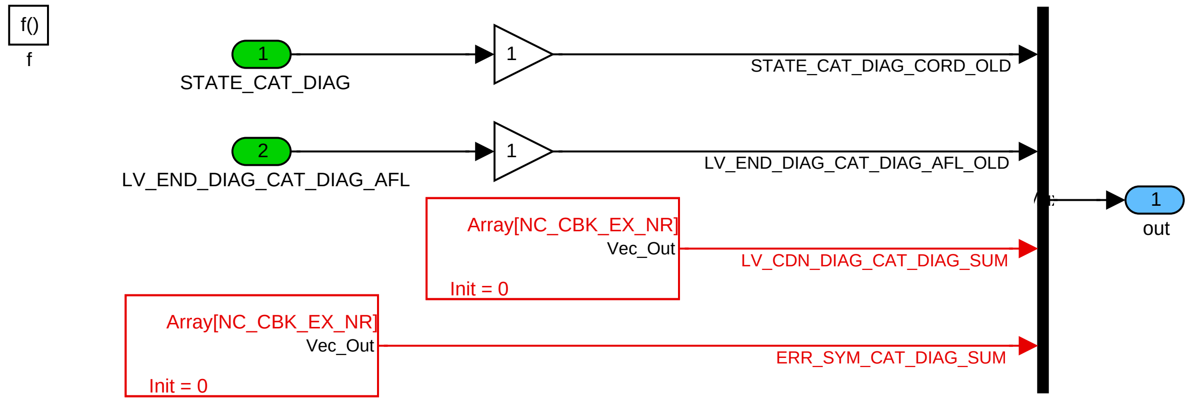

Figure B.49.3: : Path: EGTR_FCTDGCEFC0/reset

B.49.2 Synchronization of the LV_ERR_CAT_DIAG_SUM

Synchronisation between LV_ERR_CAT_DIAG_SUM and its result from ERRM is done using action ACTION_ERRM_GetLvErr() at reset and clrfmy.

B.49.3 EFF_CAT_DIAG[NC_CBK_EX_NR] will be stored in the non-volatile memory

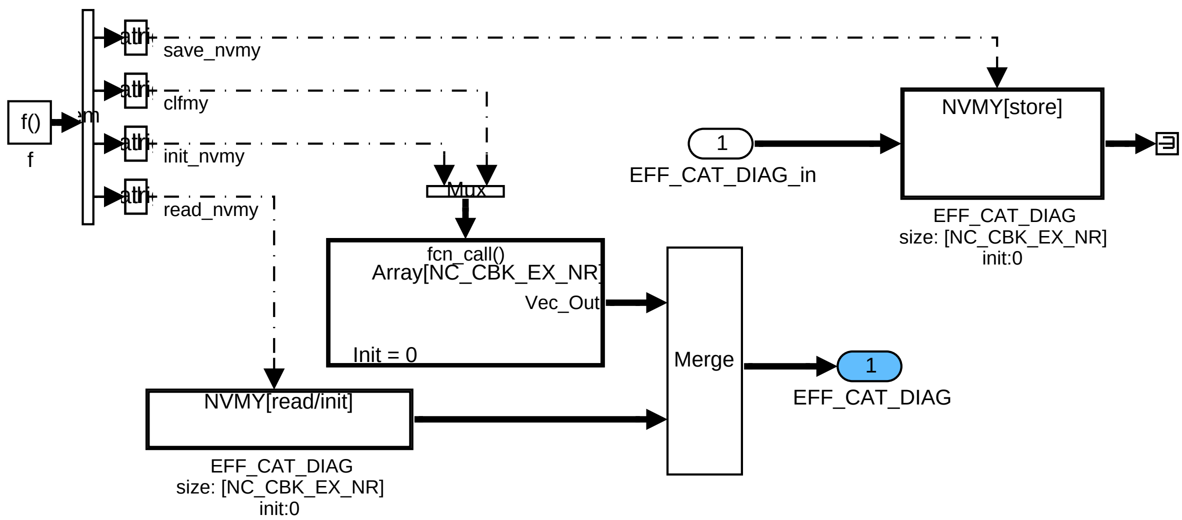

Figure B.49.4: : Path: EGTR_FCTDGCEFC0/NVMYdata

B.49.4 FORMULA SECTION

B.49.4.1 Calculation of the summary diagnosis results

B.49.4.1.1 Calculation of the summary diagnosis "end" and "error symptom" outputs

The summary diagnosis is a combination of the TWC diagnosis of homogeneous and lean combustion modes. Last finished diagnosis saves the summary diagnosis result. When the ABC counter is calibrated to e.g. 2, then both diagnoses can influence the diagnosis result depending on which one is executed.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.49.4.1.1.1 Call of the ERRM

ACTION_ERRM_FilterSymptom(IN<XX>, IN<lv_cdn_diag_XX>, IN<err_sym_XX >, IN<C_ABC_INC_XX >, IN<C_ABC_DEC_XX >, IN<C_ABC_MAX_XX >, OUT<LV_ERR_XX>)
The action computes the elementary anti-bounce filter for one failure treatment and returns filter results

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Configuration for diagnostic symptoms:

Diagnostic CAT_DIAG_SUM[i]	Symptom description	Symptom	Filter type
Catalyst sum diagnosis	´CAT_EFFIC_LOW´	SYM_0	STD
	´CAT_DAMAGED’	SYM_1	
	Not used	SYM_2	
	Not used	SYM_3	

B.49.4.1.2 Calculation of the TWC efficiency

NC_CBK_EX_NR = 1 (one-bank system): calculation for index i = 1
NC_CBK_EX_NR = 2 (two-bank system): calculation for index i = 1 and 2

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.50.1 EGTR_FCTDGCEFLD0

The limited dynamic conditions LV_CAT_LDC[i] for catalyst efficiency diagnosis is set if the limited dynamic conditions for engine speed, mass air flow and lambda controller output exist and a calibration threshold for the integral of the air flow is exceeded.
Moreover the summation of the throttle position gradient LOAD_GRD_SUM_CAT_LDC[i] must not exceed a calibration threshold.

NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements, the variable extension _i is used in the model instead of [i] as found in the textual description.

Function Description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.50.2: EGTR_FCTDGCEFLD0/operate

Cylinder bank independent calculation

Calculation of LOAD_CAT_LDC gradient:

The LOAD_CAT_LDC gradient is calculated with the reccurence T_SAMPLE in [ms].

Copyright (C) Continental AG,2007

To this effect, the LOAD_CAT_LDC values are written into the ring buffer. Thus, the last two LOAD_CAT_LDC values are available in addition to the current LOAD_CAT_LDC value. The LOAD_CAT_LDC gradient is based on a LOAD_CAT_LDC difference of twice T_SAMPLE in [ms].
The LOAD_GRD_CAT_LDC reflects the gradient of the actual driver's demand prior to the corrections. If C_LOAD_GRD_SUM_MIN is larger than C_LOAD_GRD_SUM_MAX the LOAD_CAT_LDC gradient summation LOAD_GRD_SUM_CAT_LDC will be no condition to determine the limited dynamic bit LV_CAT_LDC[i].

Limited engine speed (N) dynamics:
The floating mean value N_MMV_CAT_LDC is computed using the filtering constant C_N_CRLC_CAT_LDC. The limited dynamics condition only exist while the engine speed N lies within the dynamics window around N_MMV_CAT_LDC.
If the above limited dynamics condition is violated, the floating mean value N_MMV_CAT_LDC is set to the current engine speed in order to reach the limited dynamics condition faster.

Limited mass air flow (MAF) dynamics:
The floating mean value MAF_MMV_CAT_LDC is computed using the averaging constant C_MAF_CRLC_CAT. The limited dynamics condition only exist while the air mass MAF stays within the dynamics window around MAF_MMV_CAT_LDC.
If the above limited dynamics condition is violated, the floating mean value MAF_MMV_CAT_LDC is set to the current airmass value in order to reach the limited dynamics condition faster.

Limited mean oxygen value (FAC_LAM_MV[i]) dynamics

The floating mean value FAC_LAM_MV_MMV_CAT_LDC[i] is computed inside the AGGR LACO.

The limited dynamics condition continues to exist while the mean oxygen value FAC_LAM_MV[i] stays within the dynamics window around FAC_LAM_MV_DELTA_CAT_LDC[i].

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

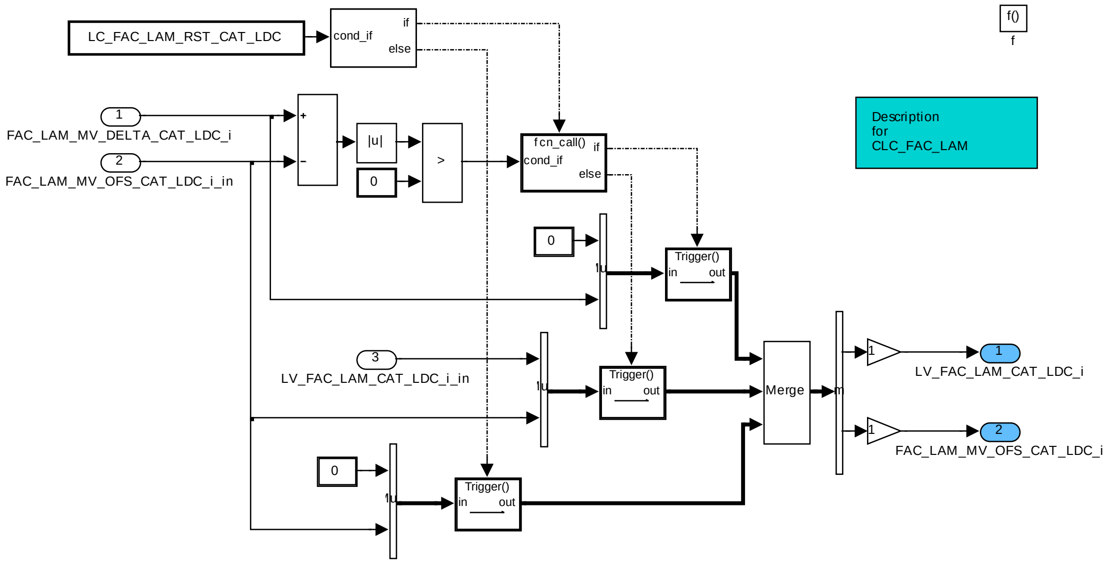

Figure B.50.7: EGTR_FCTDGCEFLD0/operate/EGTR_FCTDGCEFLD0_CBK_MNG/ EGTR_FCTDGCEFLD0_CBK_SPC/CLC_FAC_LAM

Setting of LV_CAT_LDC[i]

When the air mass flow integral exceeds a calibration limit the flag LV_CAT_LDC[i] is set to 1 indicating that the limited dynamics are fulfilled.

The reccurence time is defined by T_SAMPLE in [ms].
For the calculation of the air mass flow integral the unit conversion:
[g] = [kg/h] * [ms] * [(g*h) /(kg*ms)] /3600
has to be considered.

General Information

Activation condition for calculation of OSC values in module "TWC diagnosis at lean operation - OSC calculation".
If two separate exhaust bank systems are concerned, then:
i = 1, for cylinder bank 1
i = 2, for cylinder bank 2
Otherwise:
i = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Application Conditions

Initialization: RST
Recurrence: 10MS
Activation: always
Deactivation: never

Function description

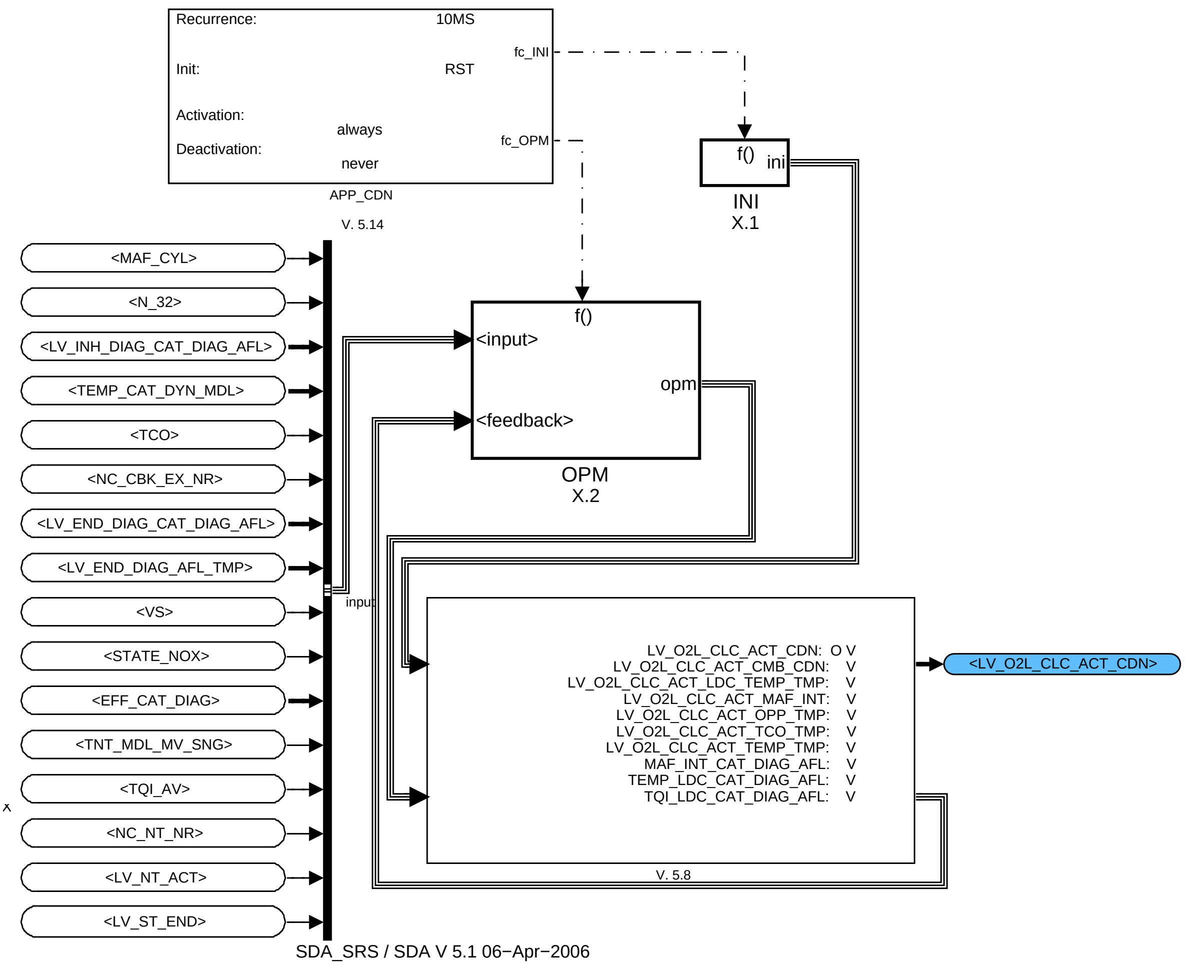

Figure B.51.1: : Overview level

B.51.1 INITIALIZATION

All variables are initialized with "0"

B.51.2 FORMULA SECTION

The bank specific and bank not specific calculations are done separate

B.51.2.1 Function active - bank not specific calculations

In this case are checked:
Operating point
Coolant temperature

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Combustion conditions

B.51.2.1.1 Check of the operating point

Deactivation of the diagnosis, when the mass air flow and rotational speed exceed defined range. Additional, dynamic of the torque request are checken

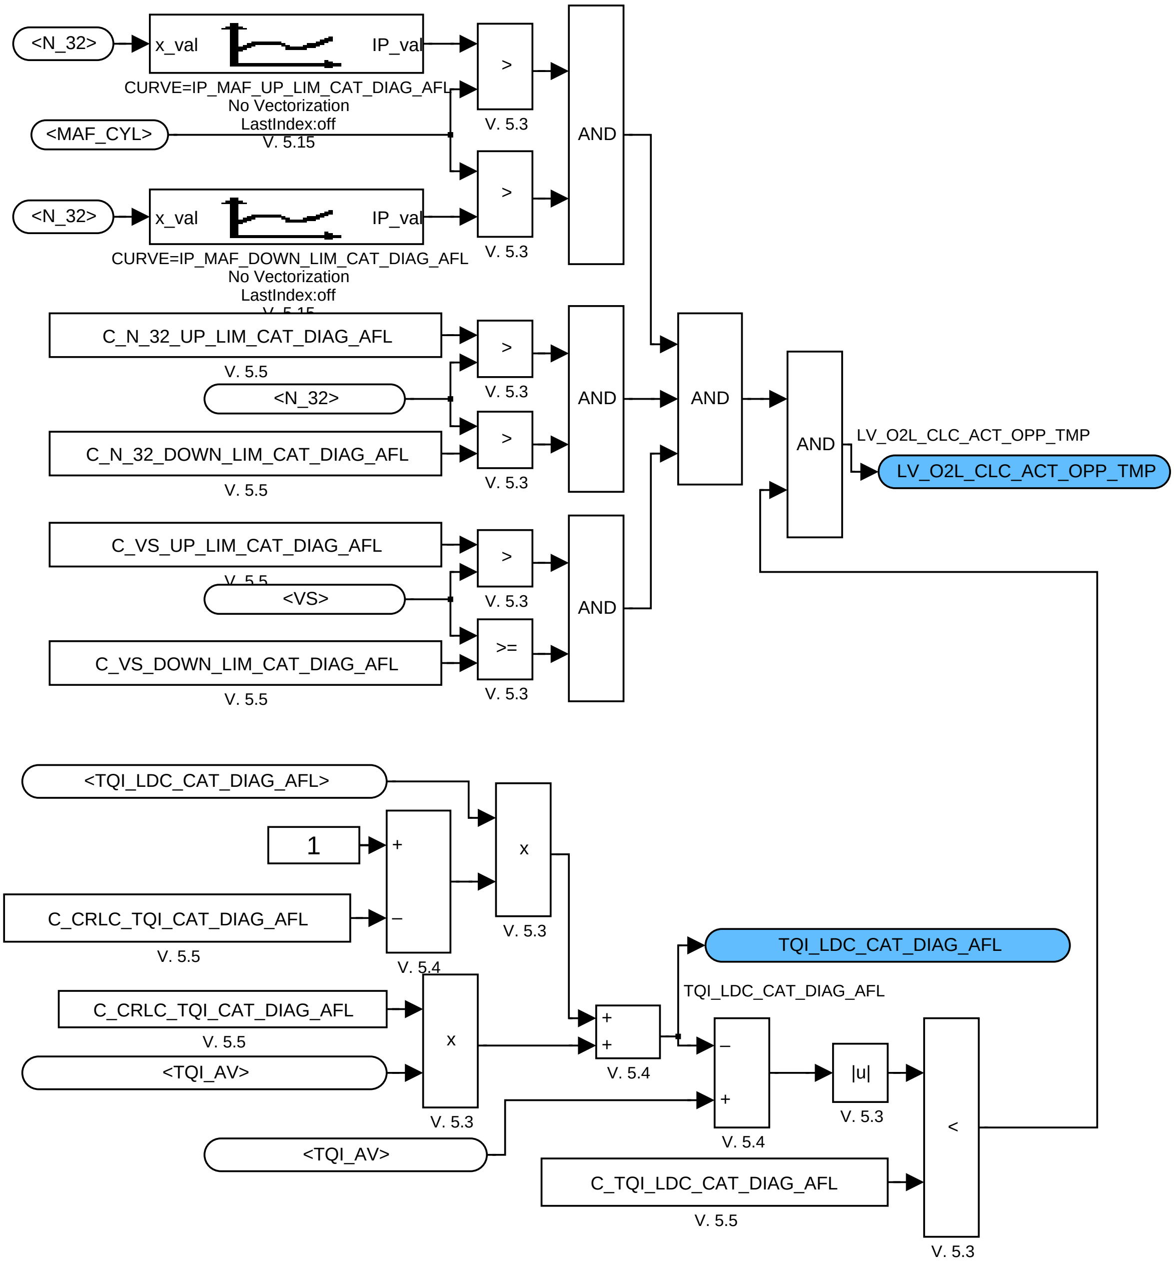

Figure B.51.2: :

B.51.2.1.2 Check of coolant temperature

Deactivation of the diagnosis, when the coolant temperature exceeds defined range

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

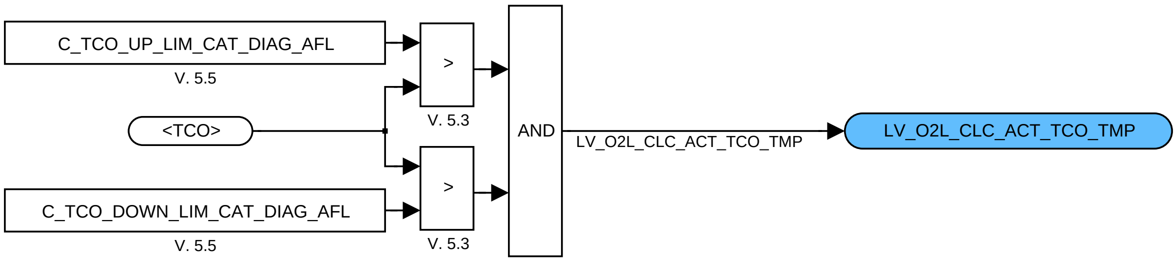

Figure B.51.3: :

B.51.2.1.3 Check of the combustion conditions

Deactivation when the NOx after treatment equipment is not active

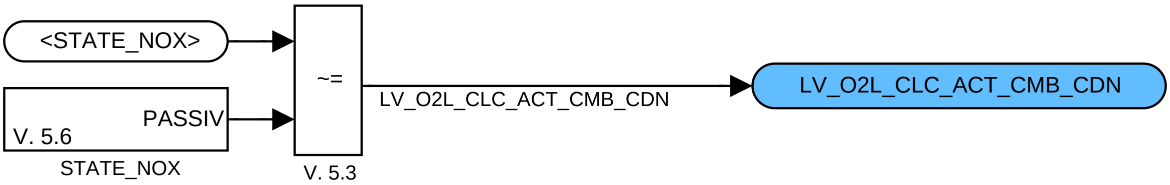

Figure B.51.4: :

B.51.2.2 Function active - bank specific calculations

B.51.2.2.1 Check of bank specific activation conditions

In this case:
The static temperature of TWC monolith is checked
The limited dynamic of TWC monolith temperature is checked
The MAF integral is calculated after high load phase
The final activation condition flag is calculated

B.51.2.2.1.1 Check of the TWC and NT monolith temperatures

Deactivation of the diagnosis, when the monolith temperatures of TWC and NT (NOx Trap) exceed defined range. For the NT, a mean value of the both monolith is used. In case of down limit of the TWC temperature, it can be different for catalysts with different aging state

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

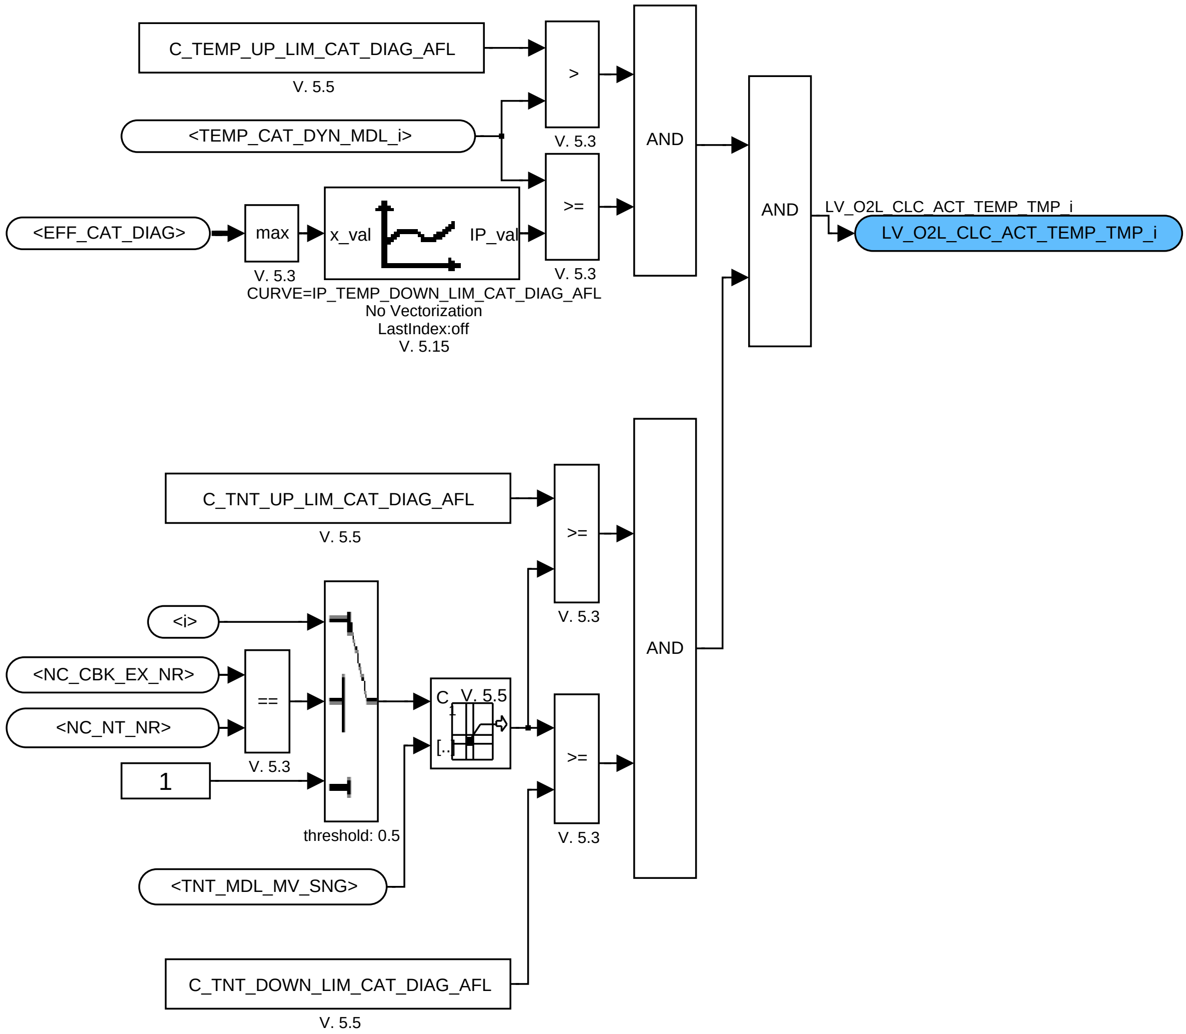

Figure B.51.5: :

B.51.2.2.1.2 Check of the limited dynamic of the TWC monolith temperature

The difference between filtered and not filtered TWC monolith temperature is shall not exceed defined threshold

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

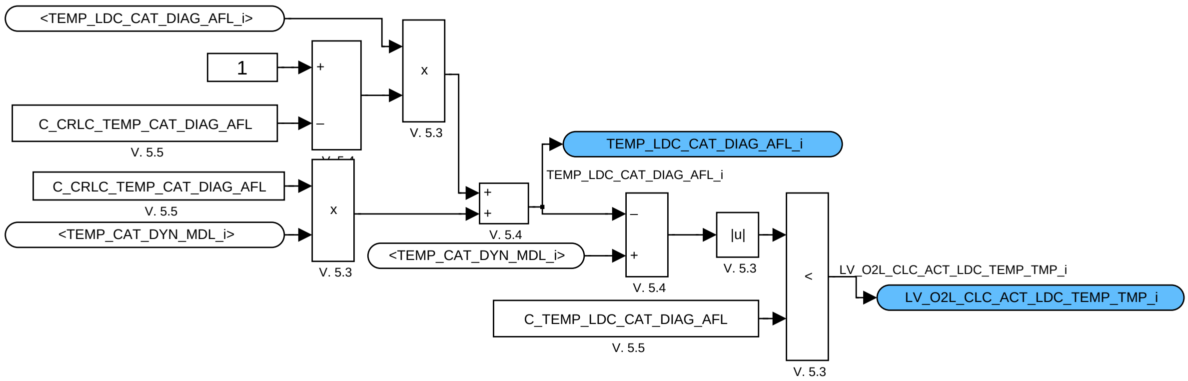

Figure B.51.6: :

B.51.2.2.1.3 Check of the MAF integral

Deactivation of the diagnosis after high load phase till defined MAF integral is not released

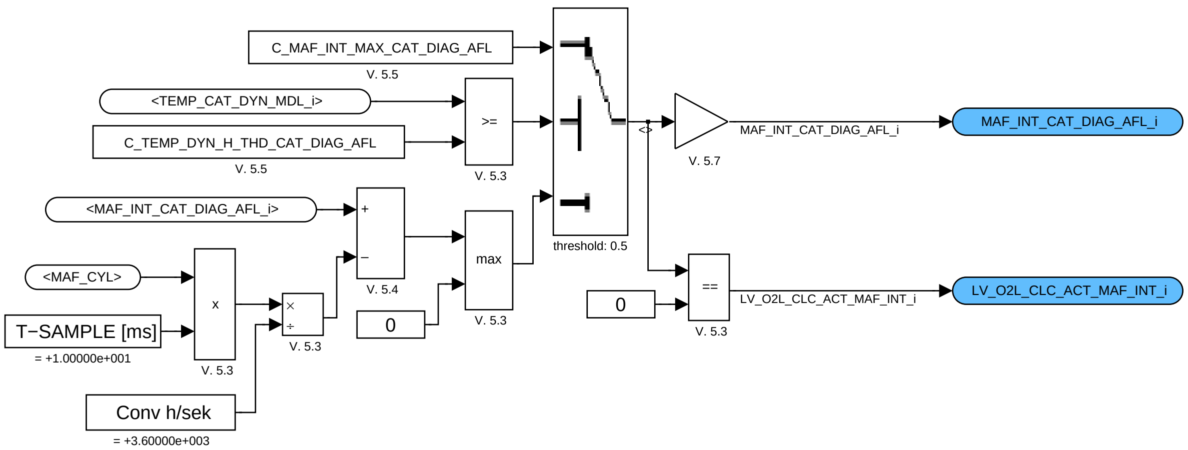

Figure B.51.7: :

B.51.2.2.1.4 Calculation of the final activation flag

The end activation flag results from the condition checked in this module, the inhibition condition and the diagnosis end condition. The diagnosis is deactivated when the calculation of it results is finished

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

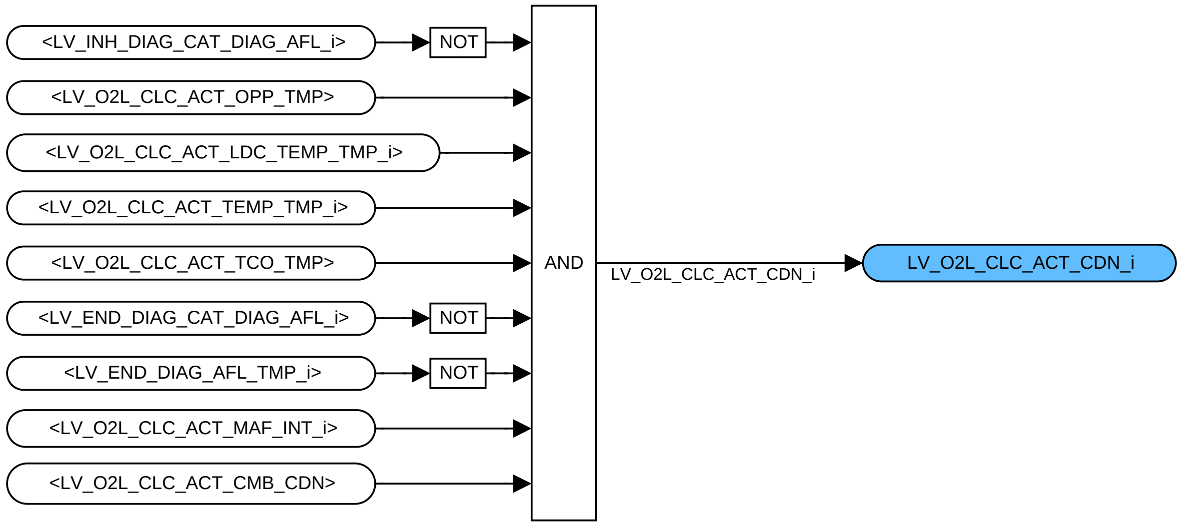

Figure B.51.8: :

B.51.2.3 Check activation conditions

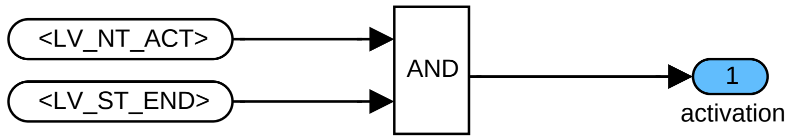

Figure B.51.9: :

B.51.2.4 Function not active

All variables are set to "0"

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.52 TWC diagnosis at lean operation - Diagnosis value determination

Data definition:

Mean value of O2L values					

General Information

In this module the diagnosis values are calculated and the link to the error management is implemented.

The calculation of diagnosis value is possible in several ways. Only one method is taken for calculation of finally diagnosis value. Choice of method is partly depending on exhaust gas configuration and number of regeneration cycles during diagnosis cycle. The finally bank specific diagnosis value is after that taken for calculation of diagonally diagnosis value. At the end the error indicator and the error symptom are calculated using bank specific and bank diagonally diagnosis value and the error management is called with condition "true".

Short description of all methods, numbering is equal to value in C_STATE_O2L_ERR_CLC and bit in STATE_O2L_MV_CLC_VLD:

Method 0: Mean value of O2L calculated during regeneration with high amplitude phase (excepted configuration 2b)

Method 1: Mean value of O2L calculated during regeneration with low amplitude phase (excepted configuration 2b)

Method 2: Mean value of O2L calculated during park phase (excepted configuration 2b)

Method 3: Mean value of O2L calculated during load phase (excepted configuration 2b)

Method 4: Mean value of O2L mean values calculated in all occurred phases (excepted configuration 2b)

Method 5: Corrected O2L value with empirical method to compensate of lambda sensor dynamic using phases with high and low regeneration amplitude (except configuration 2b)

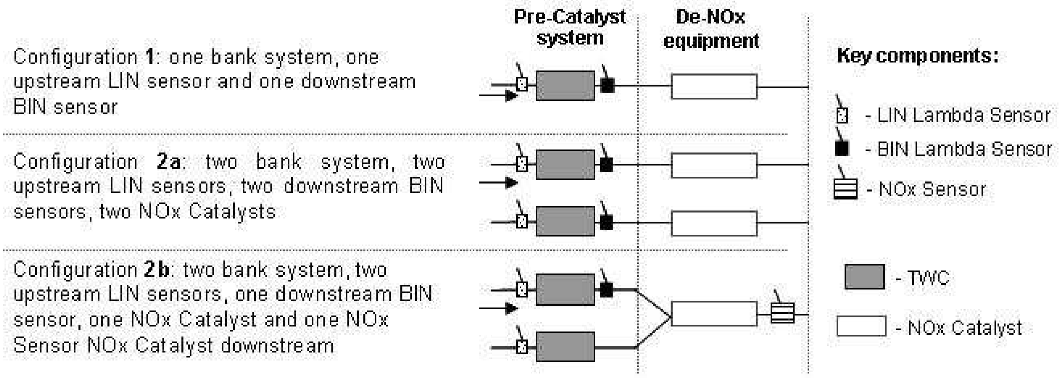
Method 6: Corrected O2L value with mathematical method to compensate of lambda sensor dynamic using phases with high and low regeneration amplitude (except configuration 2b)

Method 7: O2L calculated using TWC- and NOx-Catalyst oxygen storage capacity for calculating of O2L value for bank without downstream Lambda Sensor (only configuration 2b)

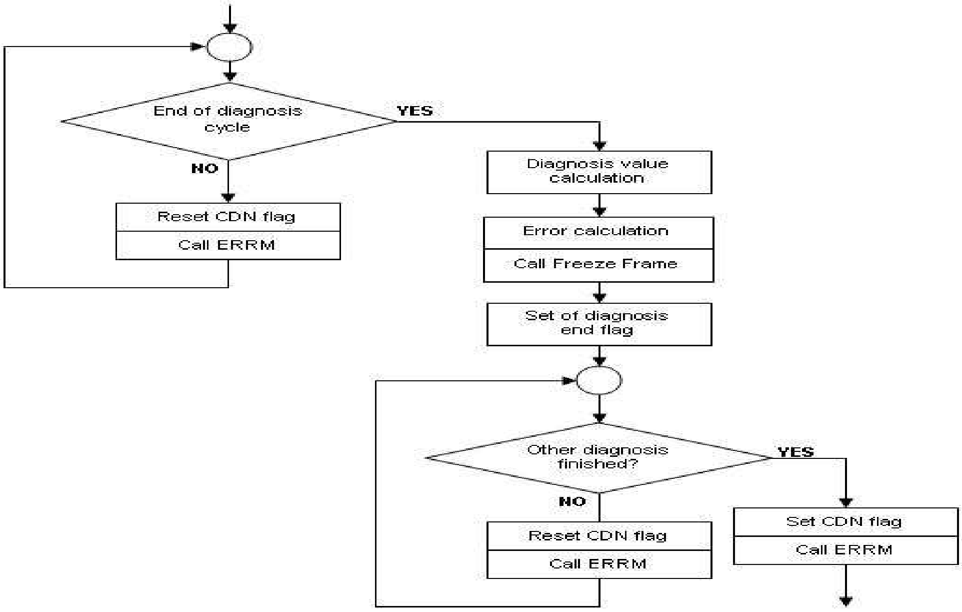
Picture 1: The diagnosis is able for following exhaust gas configurations:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007



Picture 2: Signal flow for calculation of Error Indicator



If two separate exhaust bank systems are concerned, then:
i = 1, for cylinder bank 1
i = 2, for cylinder bank 2
Otherwise:
i = 1

Application Conditions

Initialization: RST, NVMINI, NVMRES, NVMSTO, CLRFMY
Recurrence: 10MS
Activation: LV_DC==1
Deactivation: LV_DC==0

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.52.1.2 Initialization at reset and function activation (start driving cycle)

At reset and function activation (DCON) all variables except NVMY data and diagnostic result are initialized with "0".
The diagnostic result is initialized according the filtering configuration.

B.52.2 FORMULA SECTION

The formula section consists of two main sections:
Regeneration cycles counter, bank diagonally calculations inclusive calculation of method 7 and the final diagnosis result
Methods 1 to 6 and ERRM interface

B.52.2.1 Regeneration cycles counter, bank diagonally calculations inclusive method 7 and final diagnosis value

B.52.2.1.1 Counting of the regeneration cycles

B.52.2.1.1.1 Bank specific calculation of the regeneration cycles counter

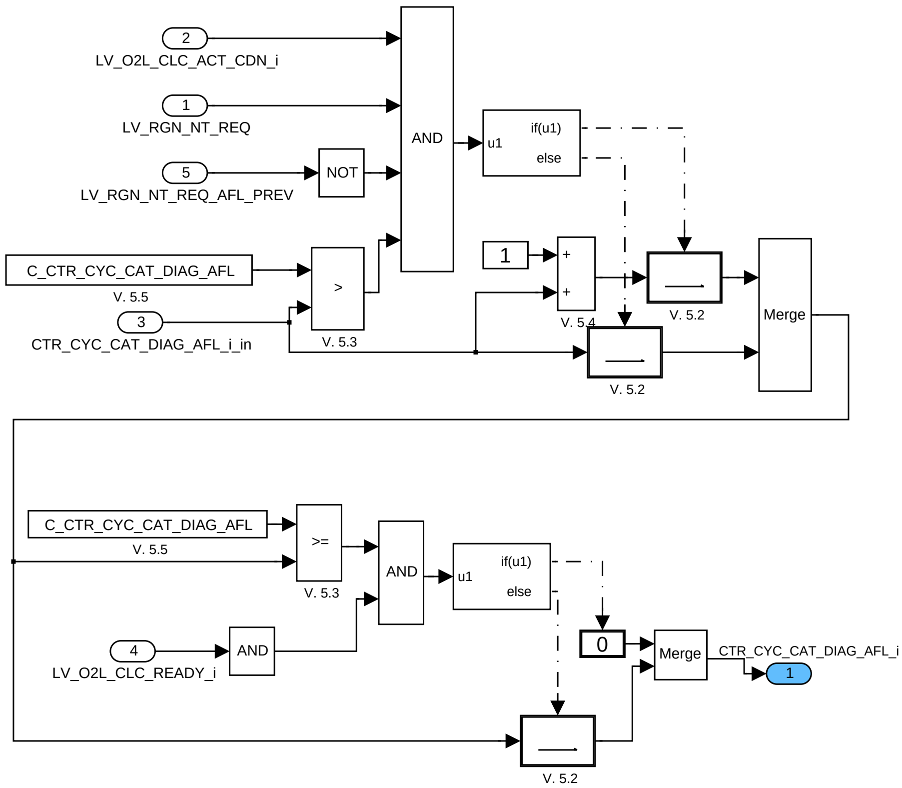

Figure B.52.3: :

B.52.2.1.2 Bank diagonally calculations inclusive method 7 and final diagnosis value

This section consists of:
Calculation of flag indicating, that diagnosis on any bank is finished
Calculation of O2L value of NOx-Catalyst in case of configuration 2b
Calculation of temporary O2L value for bank without binary downstream sensor in case of exhaust gas configuration 2b

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Calculation of finally O2L value for both banks and validation bit in case of exhaust gas configuration 2b
Choice of method for calculation of finally diagnosis value
Calculation of sum diagnosis value over all banks

B.52.2.1.2.1 Calculation of flag indicating, that diagnosis on any bank is finished

The calculation of all banks is synchronized. This flag says that the calculation of all banks is finished. Then first the diagonal calculation and after that the calculation of diagnosis results is done.
This flag is active only for one cycle.

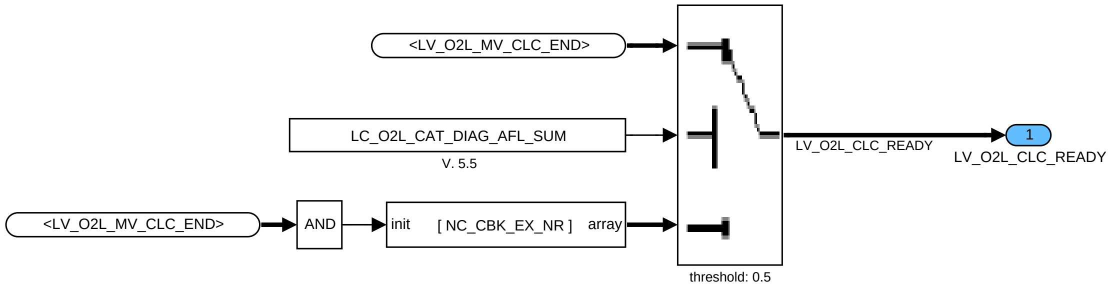

Figure B.52.4: :

B.52.2.1.2.2 Calculation of O2L value of NOx-Catalyst in case of configuration 2

The O2L value of NOx catalyst is a difference between O2L value of the whole line and O2L value of precatalyst calculated at bank with downstream binary sensor. The O2L value calculated at bank with downstream binary sensor is corrected according to the dynamic of this sensor. This is given using the IP_FAC_O2L_AFR_CDN_COR (see also Method 5)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

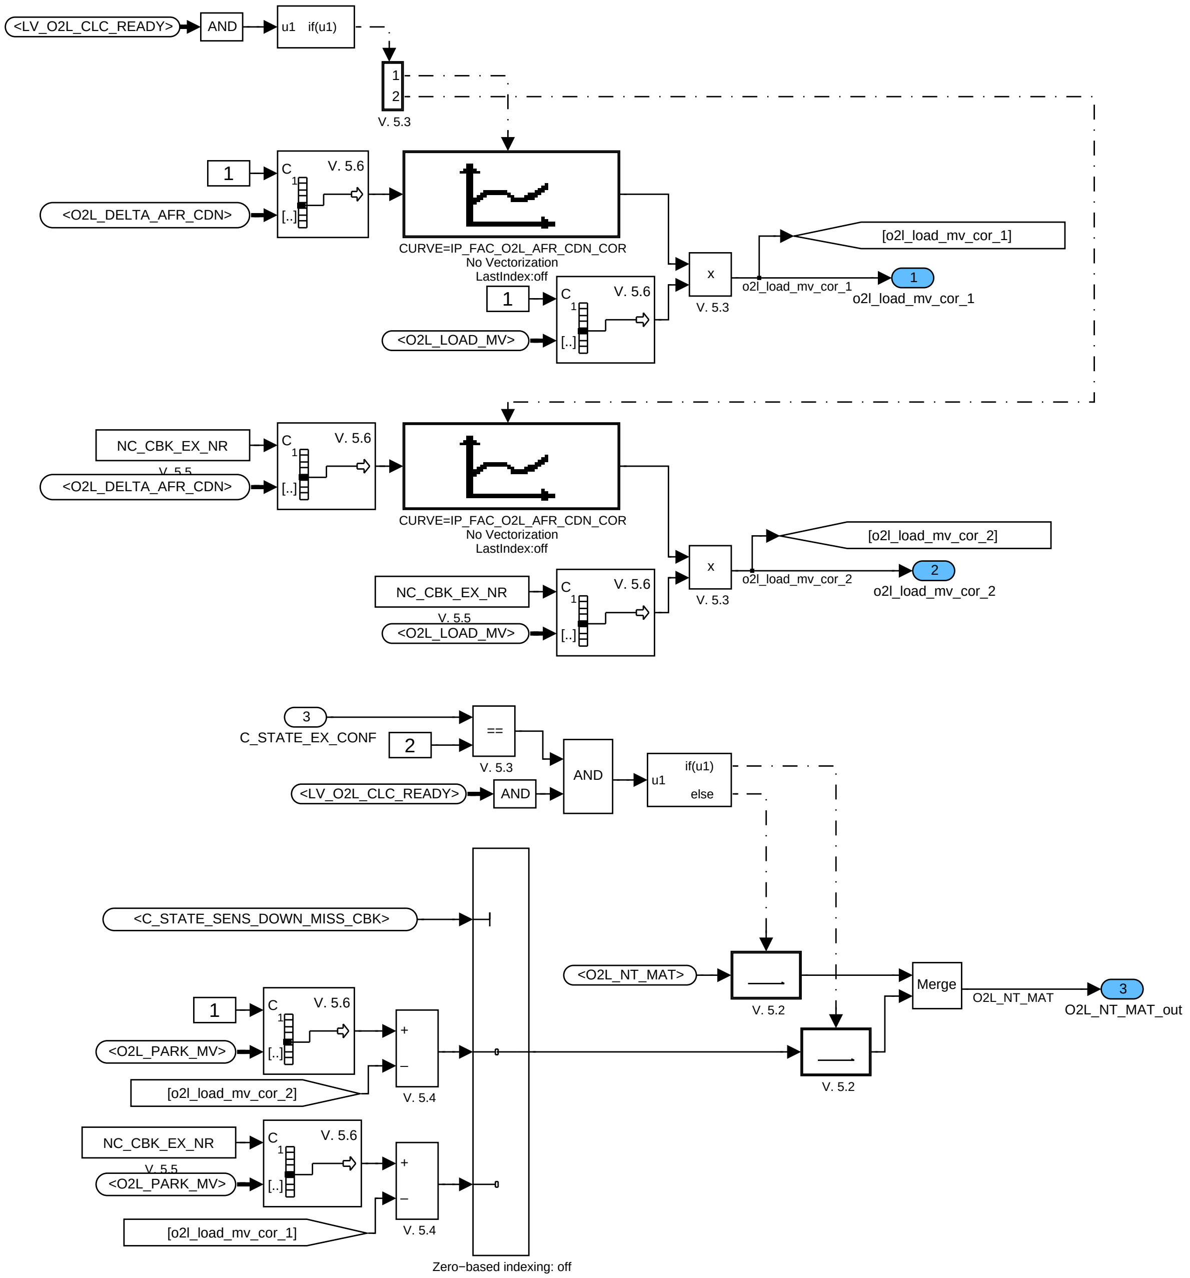

Figure B.52.5: :

B.52.2.1.2.3 Calculation of temporary O2L value for bank without binary downstream sensor in case of exhaust gas configuration 2

The O2L value of precatalyst is a difference between O2L value of the whole line and O2L value of NOx catalyst calculated at bank without downstream binary sensor

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

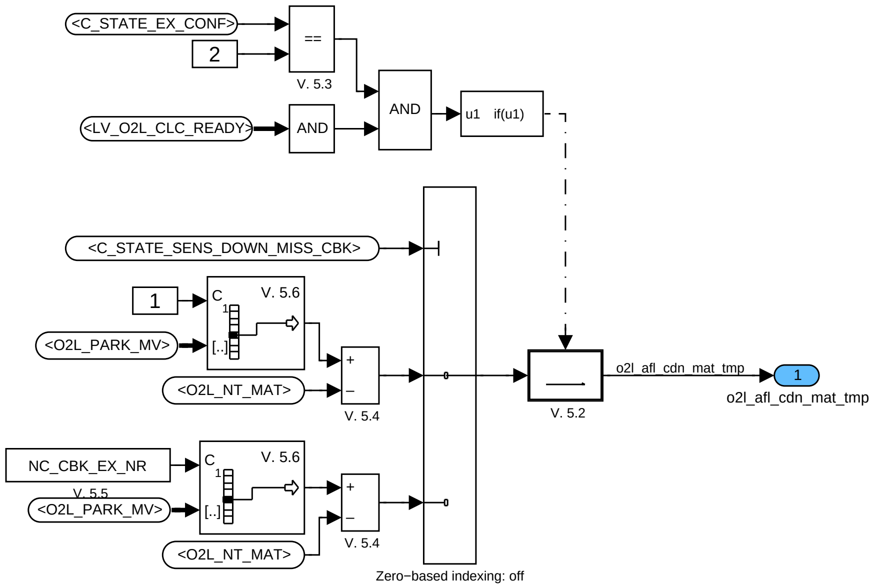

Figure B.52.6: :

B.52.2.1.2.4 Calculation of finally O2L value for both banks and validation bit in case of exhaust gas configuration 2 (Method 7)

After all diagonal calculations the result is checked, the diagnosis value of Method 7 is assigned and the valid flag is set for one recurrence.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

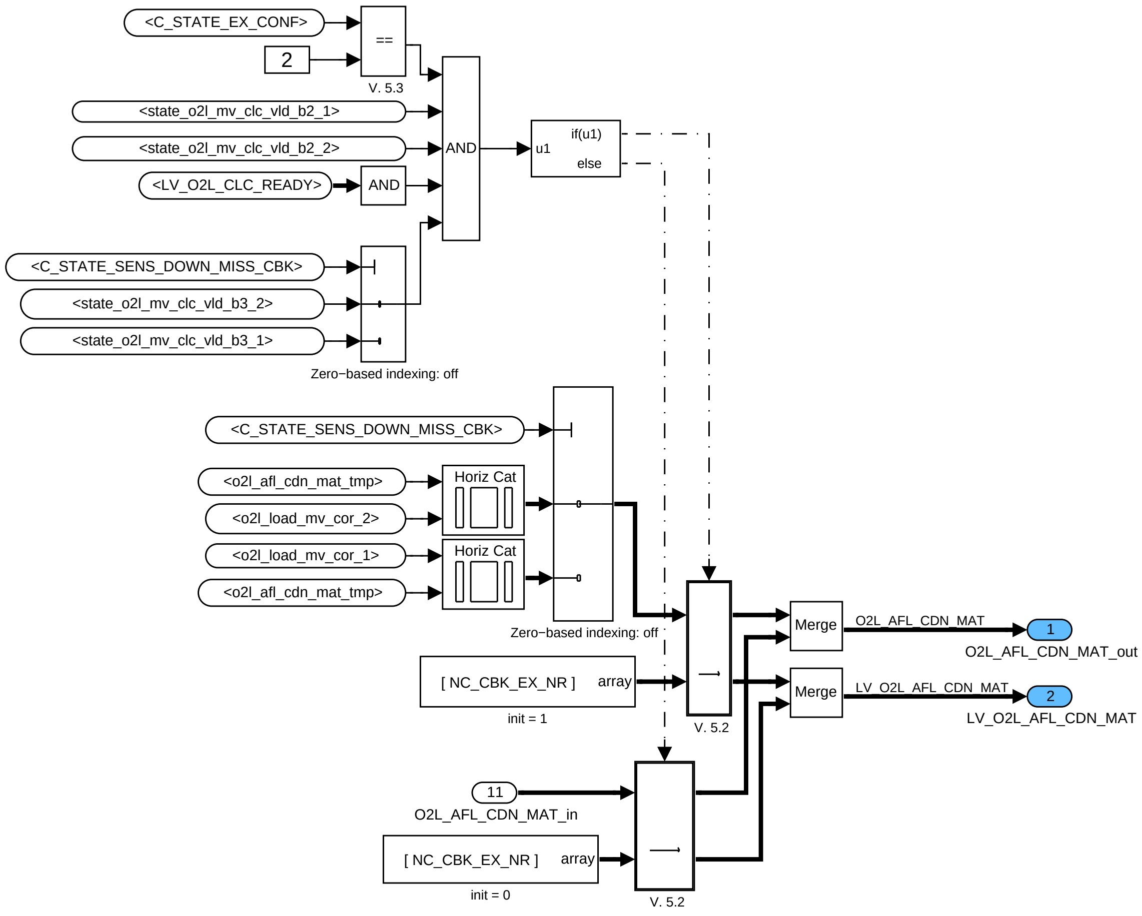

Figure B.52.7: :

B.52.2.1.2.5 Choice of method for calculation of finally diagnosis value

The O2L_CAT_DIAG_AFL used for calculation of diagnosis results is represented by O2L_xxx calculated by chosen method. The LV says that the calculation was plausible. This flag is stored in STATE_ O2L_MV_CLC_VLD (when this diagnosis was finished before others) and the STATE is reset when the diagnosis condition was true.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

B.52.2.1.2.5.1 Choice of the method and calculation temporary diagnosis value

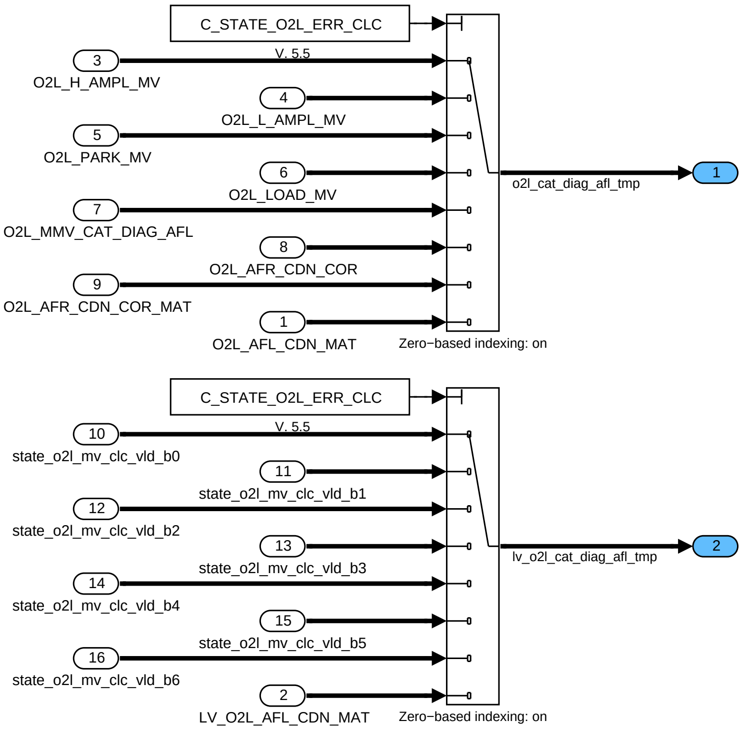

Figure B.52.8: :

B.52.2.1.2.5.2 Final diagnosis value and plausibility indicator

B.52.2.1.2.5.2.1 Calculation

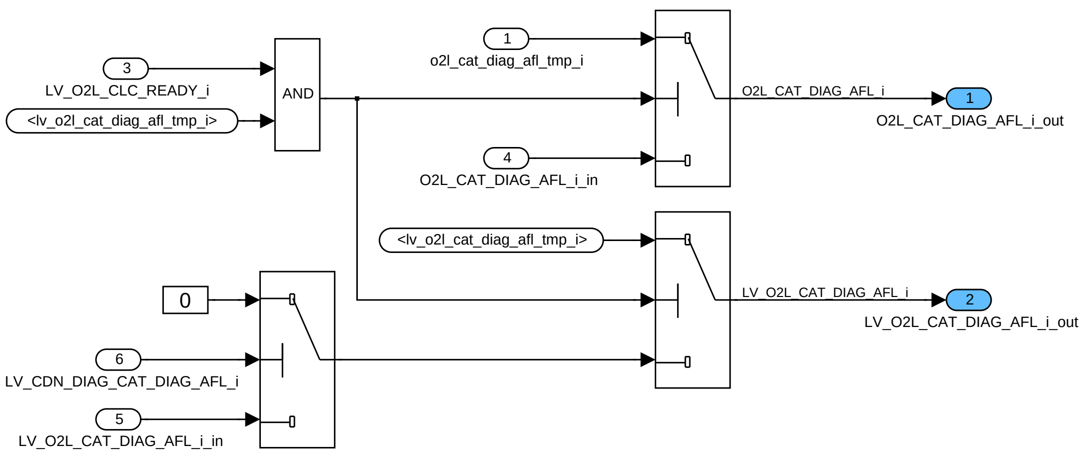

Figure B.52.9: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.52.2.1.2.6 Calculation of sum diagnosis value over all banks

Indexes "1" and "2" are used regarding cylinder bank 1 and 2. Sum diagnosis value considers all banks

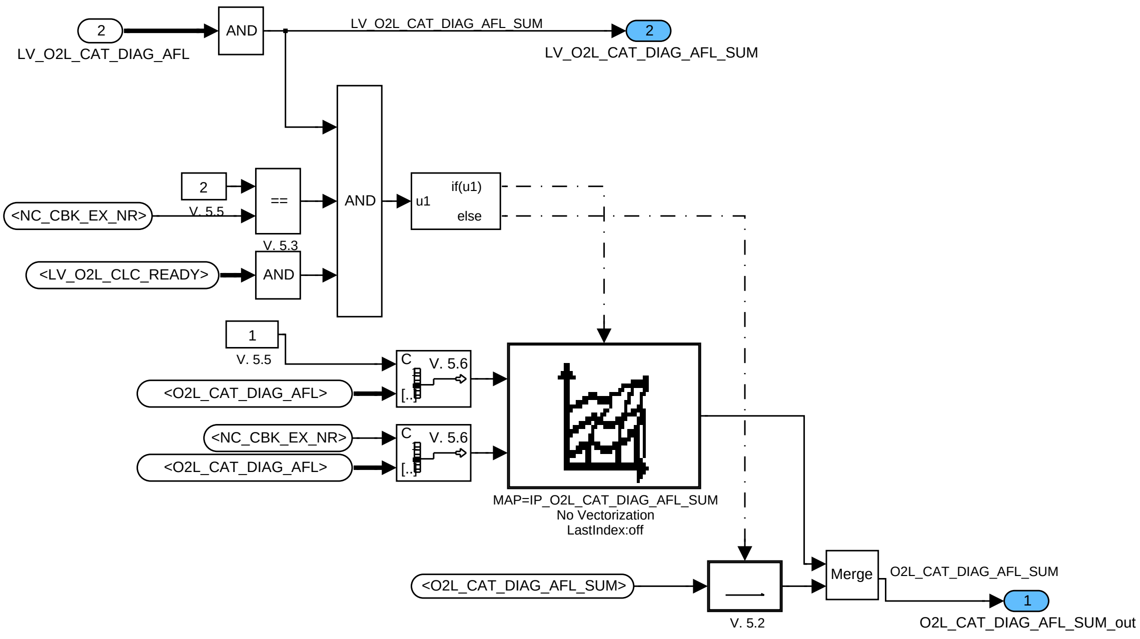

Figure B.52.10: :

B.52.2.2 Multiple bank system calculation

B.52.2.2.1 Methods 1 to 6 and ERRM interface

This section consists of three further sections:
Calculation of O2L sum and mean values
Calculation of corrected O2L values and set up of state including plausibility bits
Calculation of error symptom, condition flag and ERRM interface

B.52.2.2.1.1 Calculation of O2L sum and mean values

This section consists of:
Calculation of flag triggering calculation of mean values
Calculation of phase specific sum and mean values
Calculation of mean value of phase specific mean values (Method 4)

B.52.2.2.1.1.1 Calculation of flag triggering calculation of mean values

At the end of defined diagnosis cycles the flag triggering calculation of mean values (only one recurrence) is set for every bank separate (LV_O2L_MV_CLC_ACT_TMP). The flag LV_O2L_MV_CLC_END saves the LV_O2L_MV_CLC_ACT_TMP and is used in next cycle for calculation of summary flag of all banks (LV_O2L_CLC_READY). After that the diagonal values and diagnosis results are calculated.
The flag triggering calculation of the mean values can be set by checking counter of regeneration cycles (independent of plausibility) or counter of valid O2L calculation cycles

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

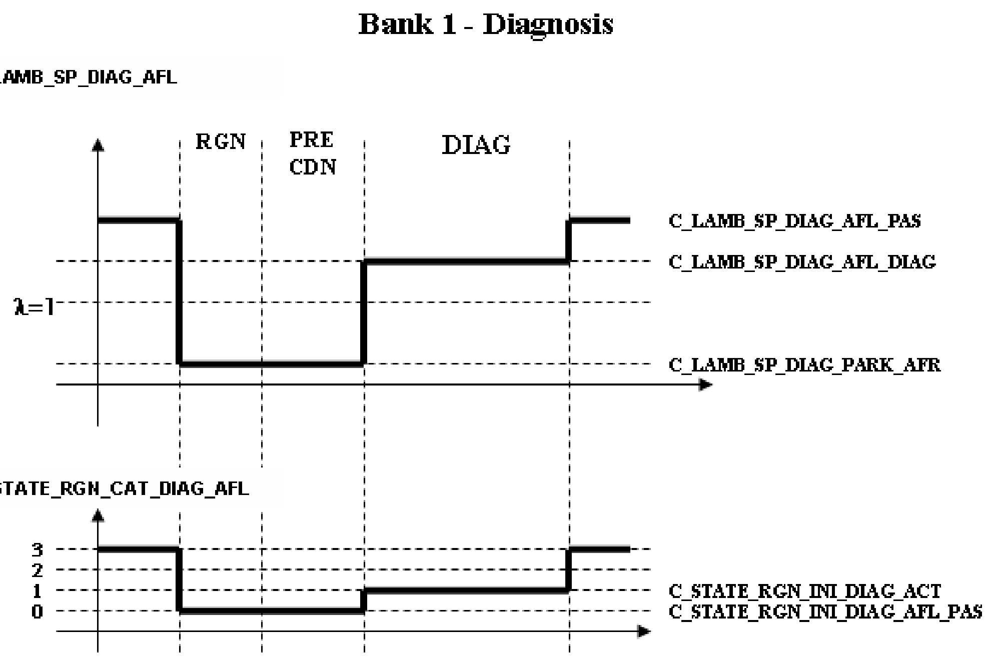
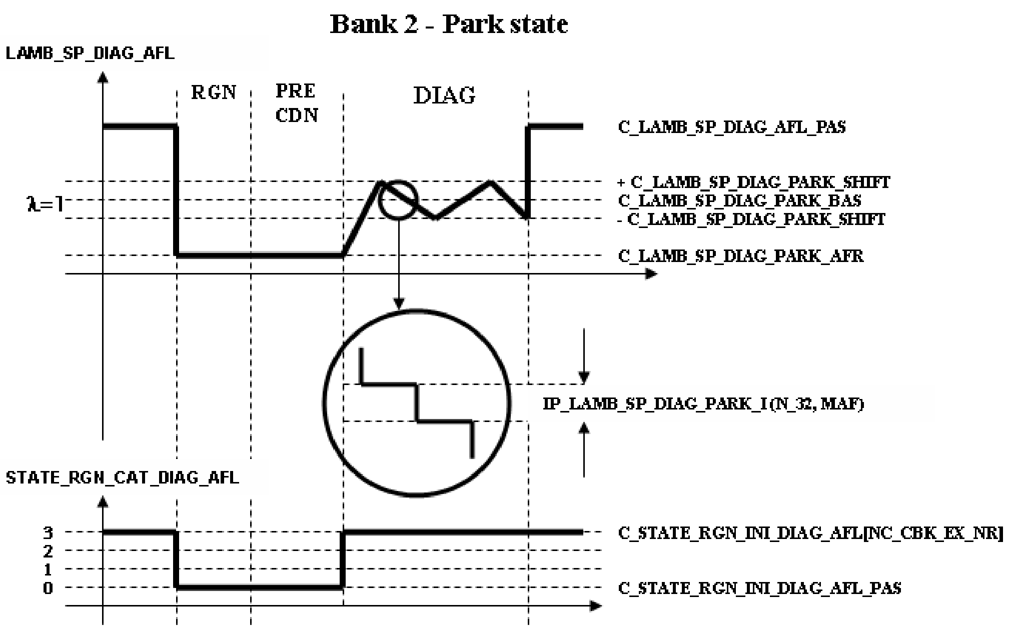
General Information

For the configuration without binary sensor after one bank, phases with rich and lean lambda value are required. When this conditions are not given by NOx Catalyst Regeneration, then a separately lambda setpoint directly after regeneration is generated. Directly before switching to the diagnosis, rich precondition of the catalysts is possible. Moreover, for each bank is used different lambda setpoint strategy. While at first bank (Picture 1, diagnosis) are the O2L values of the precatalyst and of the whole exhaust line (precatalyst + NOx Trap) calculated, the second bank (Picture 2, park state) is parked to minimize it influence to the diagnosed bank. The strategy is successively switched between both banks.

Picture 1: Lambda setpoint strategy for the diagnosed bank:



Picture 2: Lambda setpoint strategy for the parked bank:



Application Conditions

Initialization: RST
Recurrence: 10MS
Activation: LV_ST_END & & LV_NT_ACT
Deactivation: !LV_ST_END || !LV_NT_ACT

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

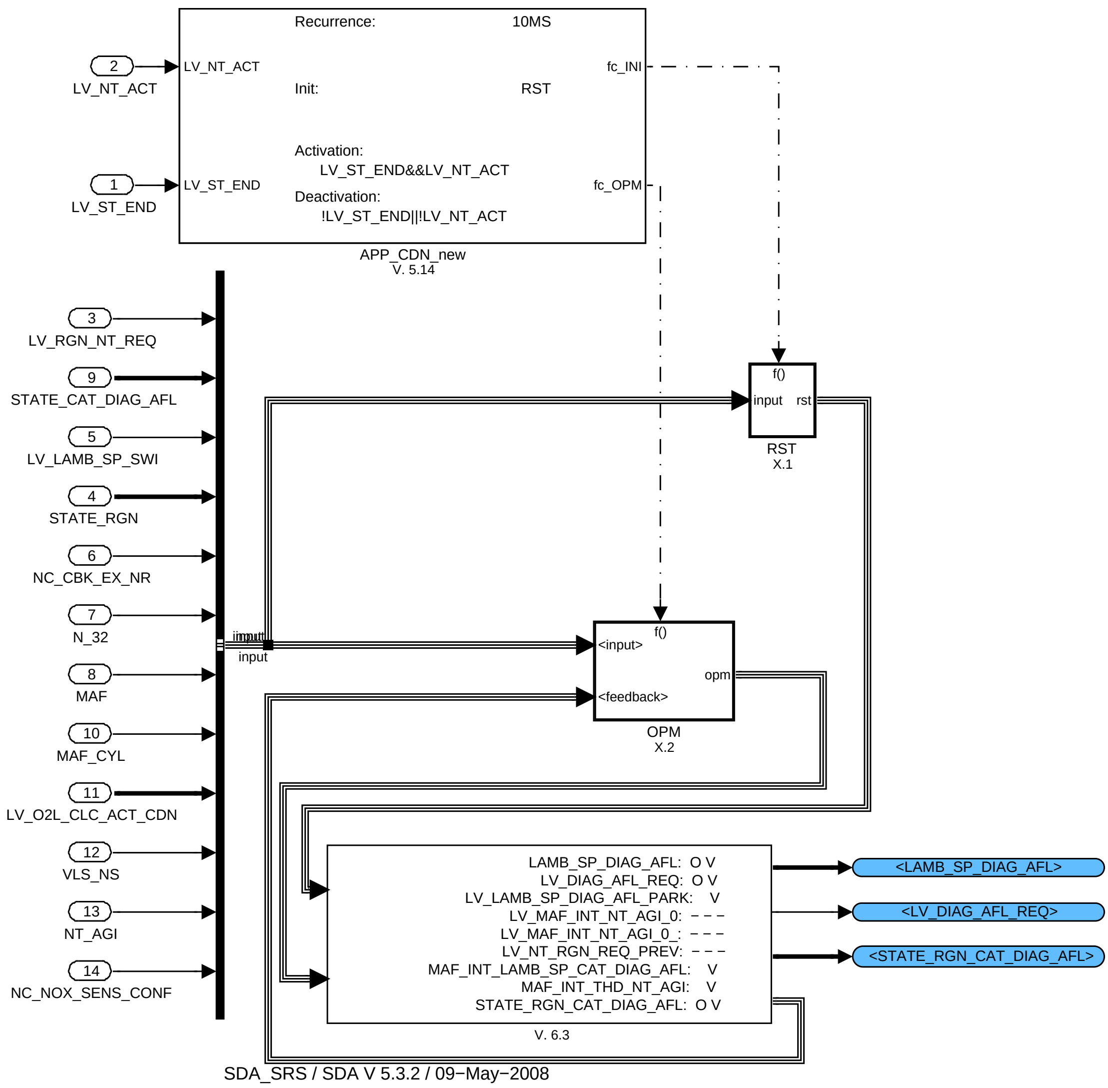


Figure B.53.1: :

B.53.1 FORMULA SECTION

The calculation of the STATE_RGN_CAT_DIAG is only active when the lambda behaviour during regeneration doesn't suit the requirements for the diagnosis. Otherwise the STATE_RGN is taken for the other modules of this diagnosis.
Then the activation flag for calculation of O2L values is checked. If any bank is not active, all variables are initialized.
The function contains of two main sections:
1.2.1: Calculation of the lambda setpoint and the regeneration state for the diagnosis (LAMB_SP_CLC)
1.2.2: Passive state (LAMB_SP_NOT_CLC)
1.2.3: Initialization when the activation conditions are not fulfilled

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

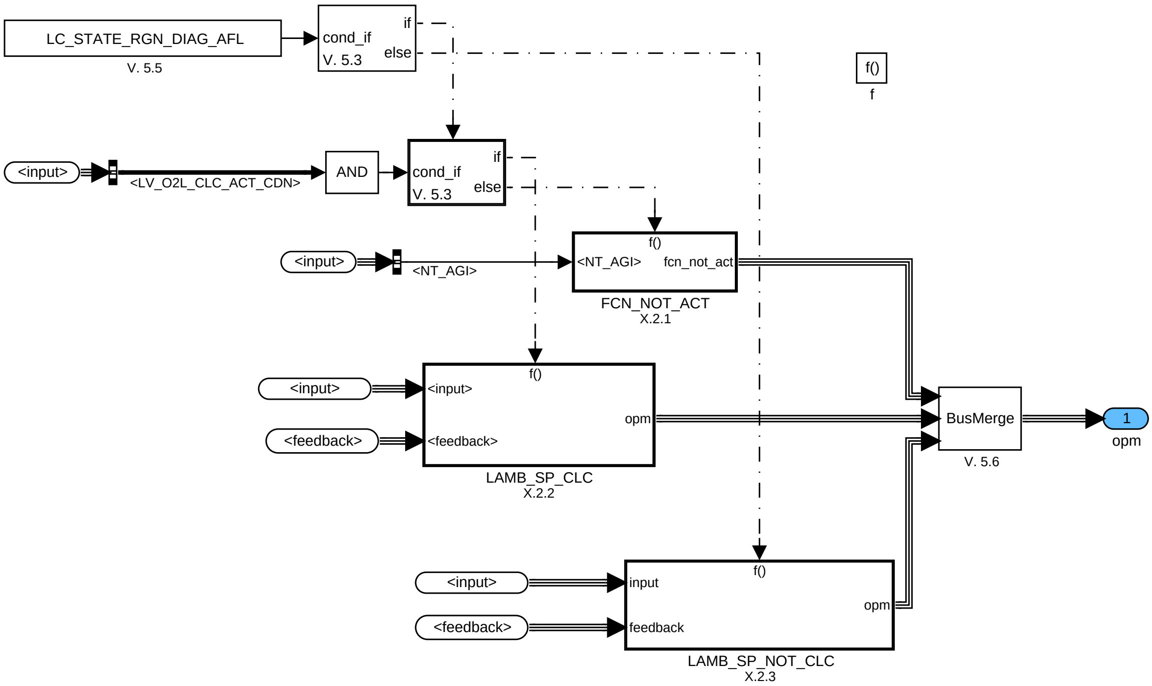

Figure B.53.2: :

B.53.1.1 Initialization when the activation flag for O2L calculation at any bank is false

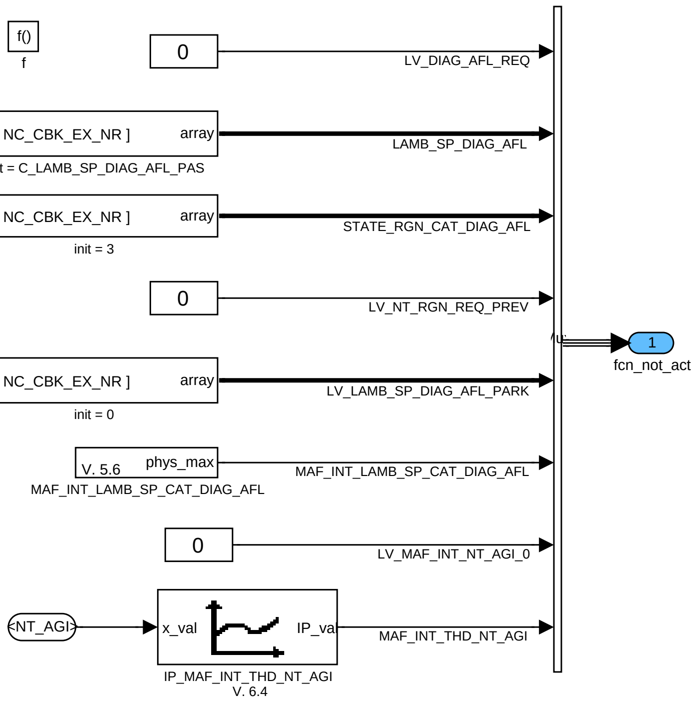

Figure B.53.3: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.53.1.2 CALCULATION OF THE LAMBDA SETPOINT AND THE REGENERATION STATE FOR THE DIAGNOSIS (LAMB_SP_CLC)

The calculation is split up into following sections:
- Request for the diagnosis
- Calculation of the regeneration state for the diagnosis
- Calculation of the lambda setpoint
- Calculation of MAF-integral in dependence of the age from the NOx trap
- Calculation of the old variables

B.53.1.2.1 Request for the diagnosis

As long as the request LV_DIAG_AFL_REQ is set, the lambda set point for the system is defined by this function directly after regeneration is finished. This request is reset, when either all, or just any bank (depending on calibration) switches to STATE_CAT_DIAG_AFL=PASSIVE

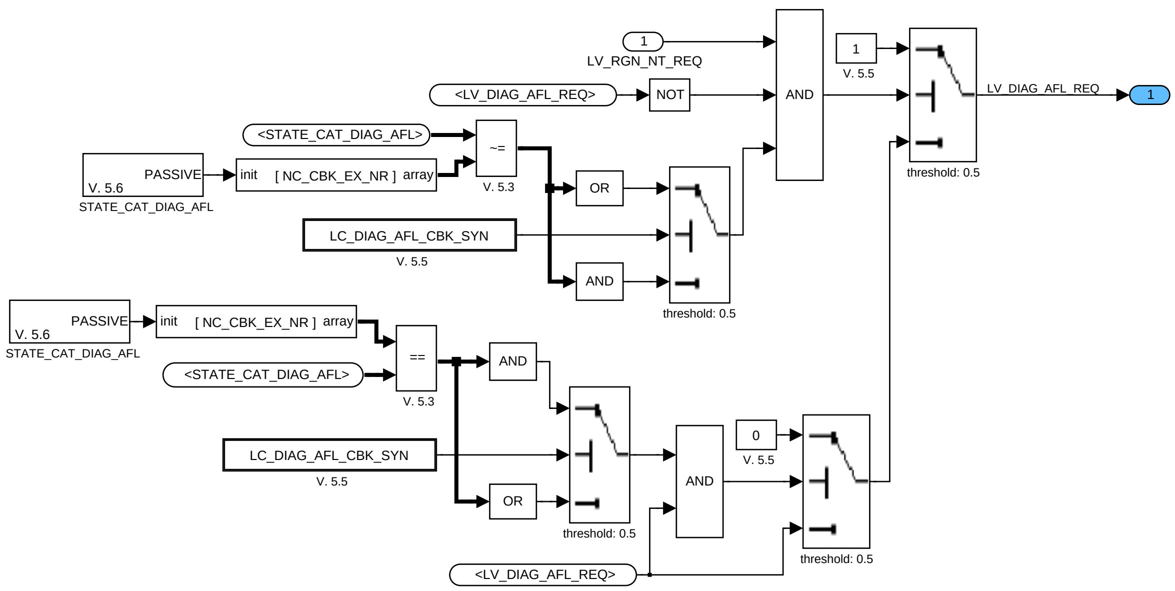

Figure B.53.4: :

B.53.1.2.2 Calculation of the regeneration state for the diagnosis

The own regeneration state for the diagnosis is initialized at the beginning of the NOx Trap regeneration. When the Nox Trap regeneration is finished, then depending on calibration a precondition phase is started. When the precondition is finished, then the own regeneration state is initialized accordingly for activation of the diagnosis at relevant bank and neutral park of the other

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

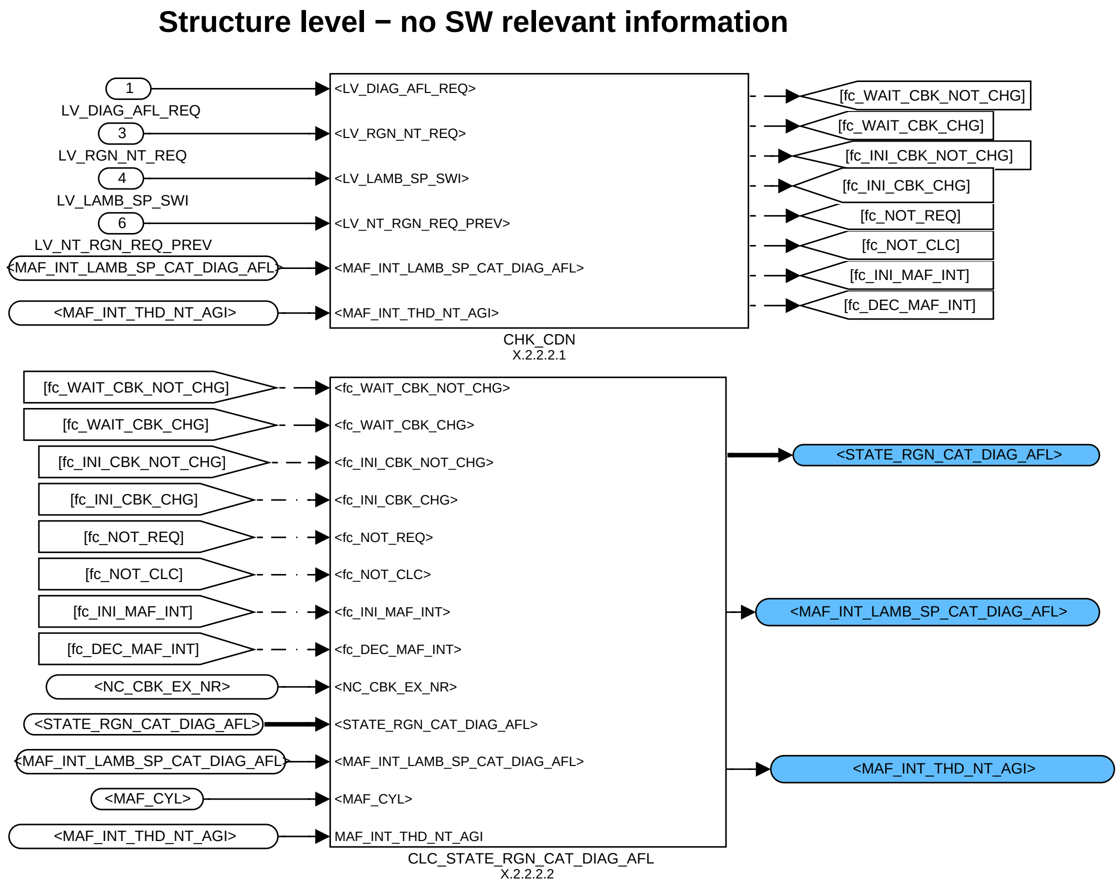

Figure B.53.5: :

B.53.1.2.2.1 Check conditions

Check of the NOx Trap regeneration state, precondition state and bank alternate bit. The calculations follow in next picture

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

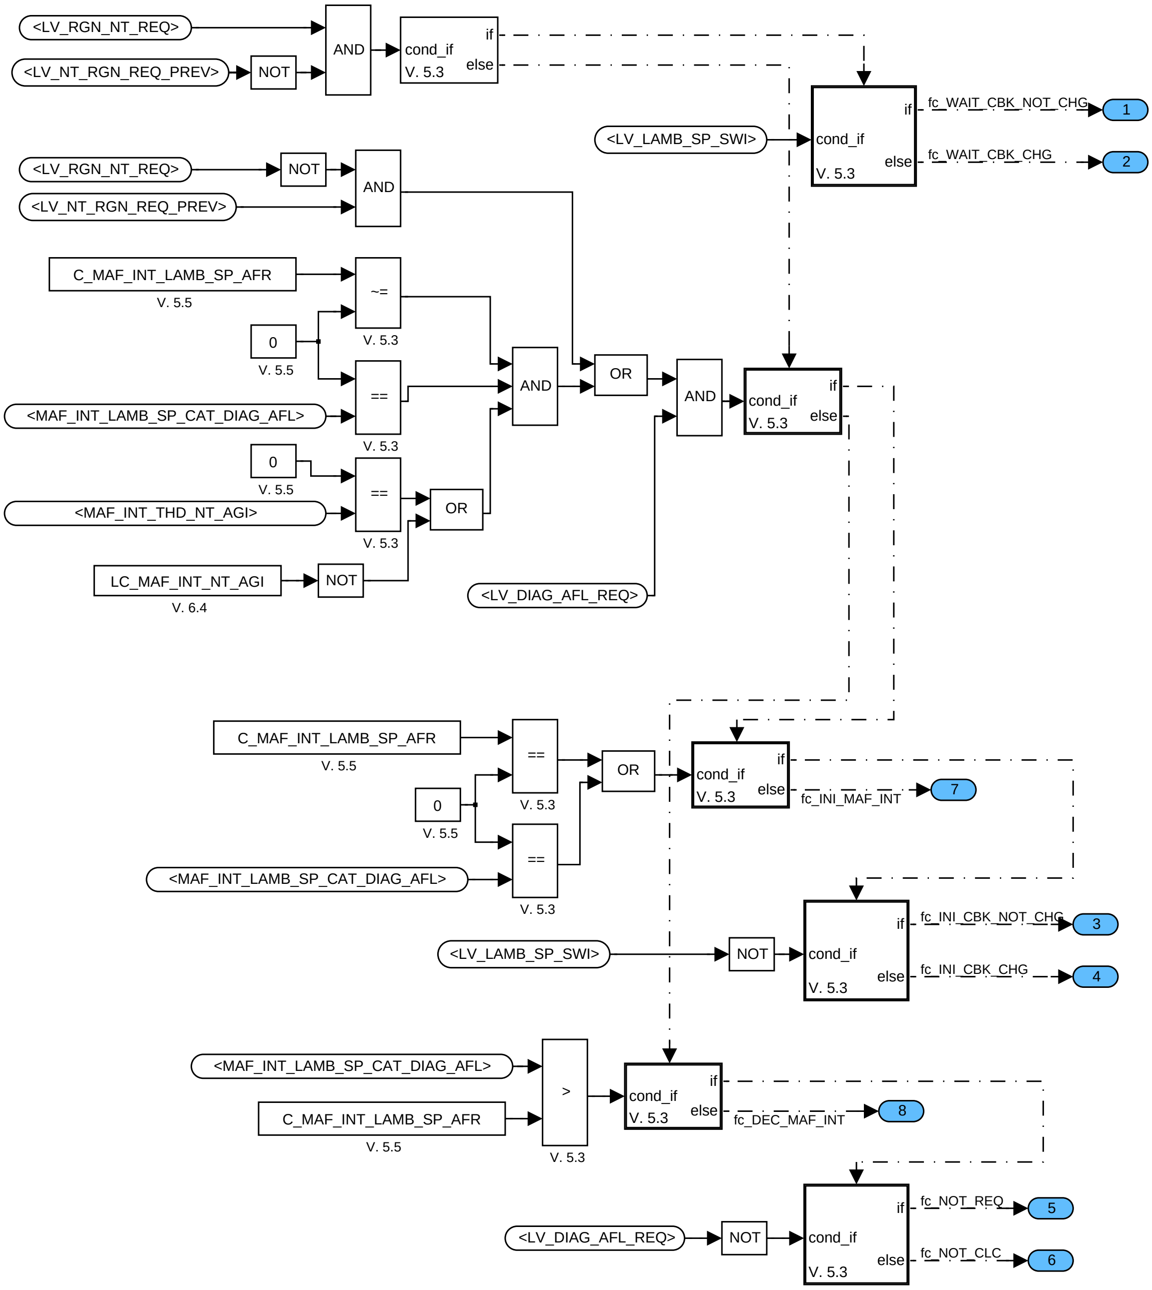

Figure B.53.6: :

B.53.1.2.2.2 Calculations

Calculation of the own regeneration state, lambda set point and MAF integral is done in following cases:

a) Waiting for the end of the Nox Trap regeneration and precondition, banks not interchanging

b) Waiting for the end of the Nox Trap regeneration and precondition, banks interchanging accordingly to C_STATE_RGN_INI_DIAG_AFL_PAS

c) Initialization for diagnosis state without interchanging of the banks

d) Initialization for diagnosis state with interchanging of the banks accordingly to C_STATE_RGN_INI_DIAG_AFL

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

e) Request for the diagnosis doesn't exist
f) Request for the diagnosis exists, but initializations don't take place
g) Initialization of the MAF integral for precondition phase
h) Decrementing of the MAF integral during precondition phase

B.53.1.2.3 Multiple bank system

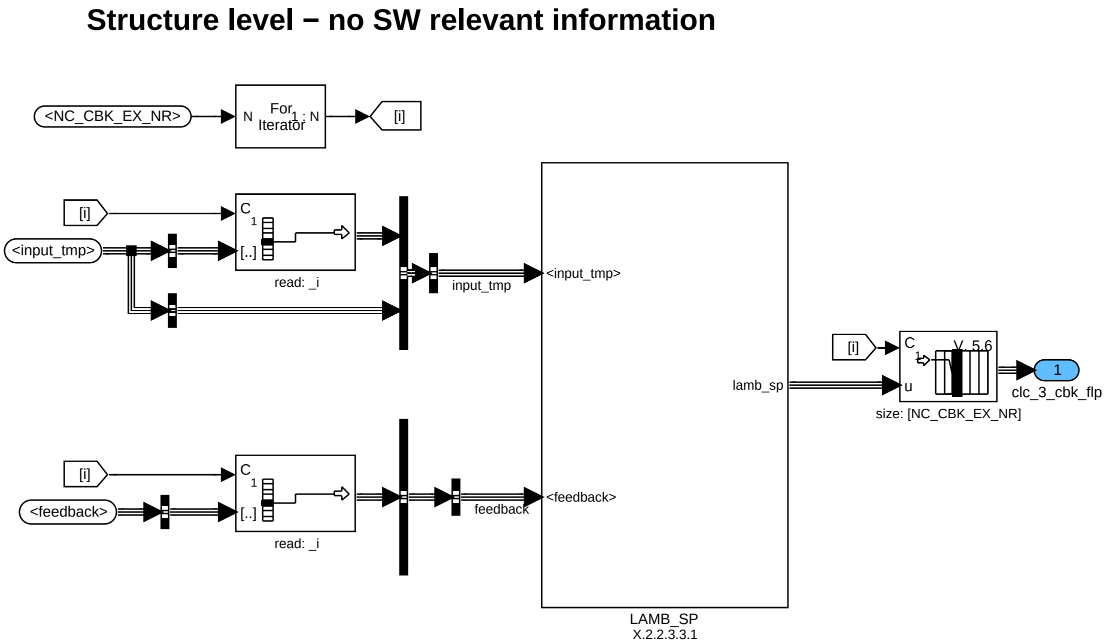

Figure B.53.10: :

B.53.1.2.3.1 Bank specific calculations - Lambda set point

The lambda set point for the precondition phase is active directly after Nox Trap regeneration. During this regeneration "WAIT" is active. After precondition the lambda set point for the diagnosed bank is calculated ("DIAG"), for the parked bank ("PARK") the calculations are done inside CLC_LAMB_PARK. When the request for the diagnosis isn’t active, PASSIVE is called

Integral of O2L					

General Information

For calculation of O2L the fresh gas per cylinder, linear lambda signal (TWC upstream), binary lambda signal (TWC downstream or NOx-Trap downstream) are used. The O2L removal is calculated when the linear lambda signal upstream shows the rich mixture (less then 1) and the binary lambda signal downstream shows the lean mixture (less then 500 [mV]). The O2L addition is calculated when the linear lambda signal upstream shows lean mixture (greater then 1) and the binary lambda signal downstream shows the rich mixture (greater then 500 [mV])

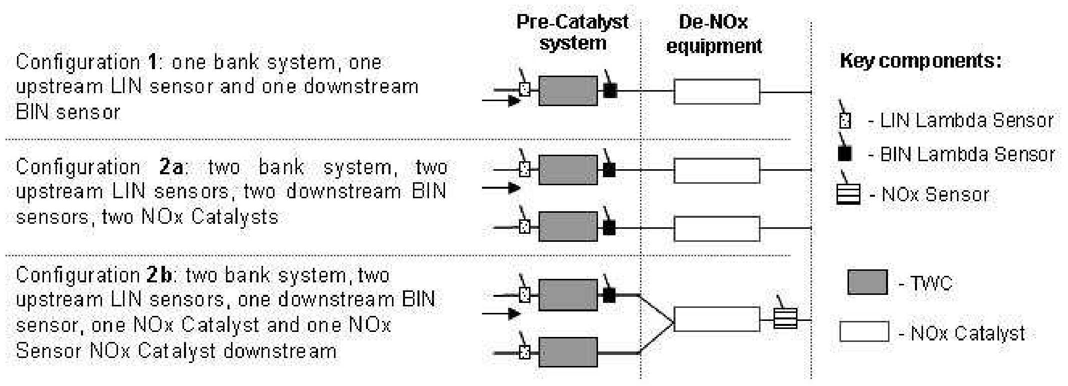
If two separate exhaust bank system are concerned, the diagnosis is relevant for two exhaust gas configurations switched with C_STATE_EX_CONF:

CONF_1: Exhaust gas configuration equipped with DeNOx technology, with two LIN-Sensors upstream TWC, two BIN-Sensors downstream TWC, two NOx Traps (NT) and one NOx-Sensor downstream NT (Picture 1, configuration 2a)

CONF_2: Exhaust gas configuration equipped with DeNOx technology, with two LIN-Sensors upstream TWC, one BIN-Sensor downstream TWC, one NOx Traps (NT) and one NOx-Sensor downstream NT (Picture 1, configuration 2b)

Picture 1: Exhaust gas configurations

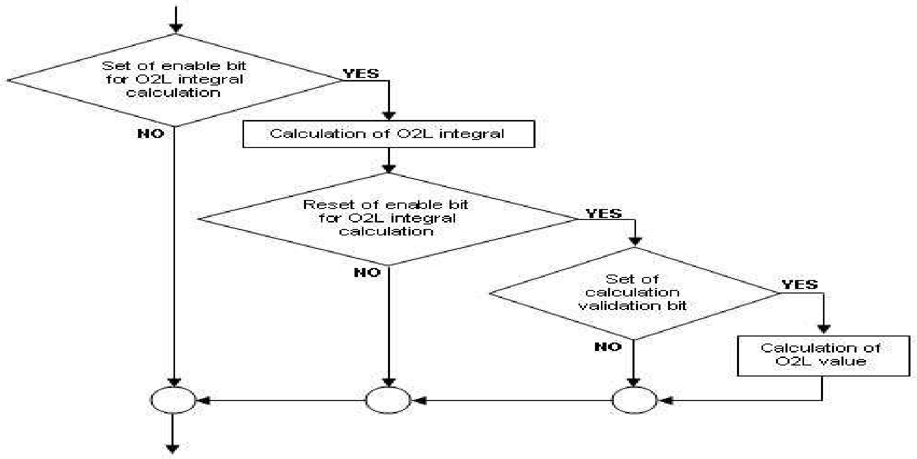
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



The O2L-values are calculated in four cases:
Case 1: Regeneration with high amplitude
Case 2: Regeneration with low amplitude
Case 3: Park phase (for CONF_1 calculated O2L concerns TWC, for CONF_2 calculated O2L concerns sum of TWC and NT)
Case 4: Load phase

For each case for the calculation of O2L is one validation bit in STATE_O2L_CLC_VLD[NC_CBK_EX_NR] defined:
Bit 0 (STATE_O2L_CLC_VLD_B0): Case 1
Bit 1 (STATE_O2L_CLC_VLD_B1): Case 2
Bit 2 (STATE_O2L_CLC_VLD_B2): Case 3
Bit 3 (STATE_O2L_CLC_VLD_B3): Case 4

Picture 2: Signal flow for calculation of O2L values:



If two separate exhaust bank systems are concerned, then:
i = 1, for cylinder bank 1
i = 2, for cylinder bank 2
Otherwise:
i = 1

NC_NOX_SENS_CONF is the number of NOx-Sensors. Therefore
NC_NOX_SENS_CONF = 0, for no NOx-Sensor
NC_NOX_SENS_CONF = 1 (n = 1), for one NOx-Sensor

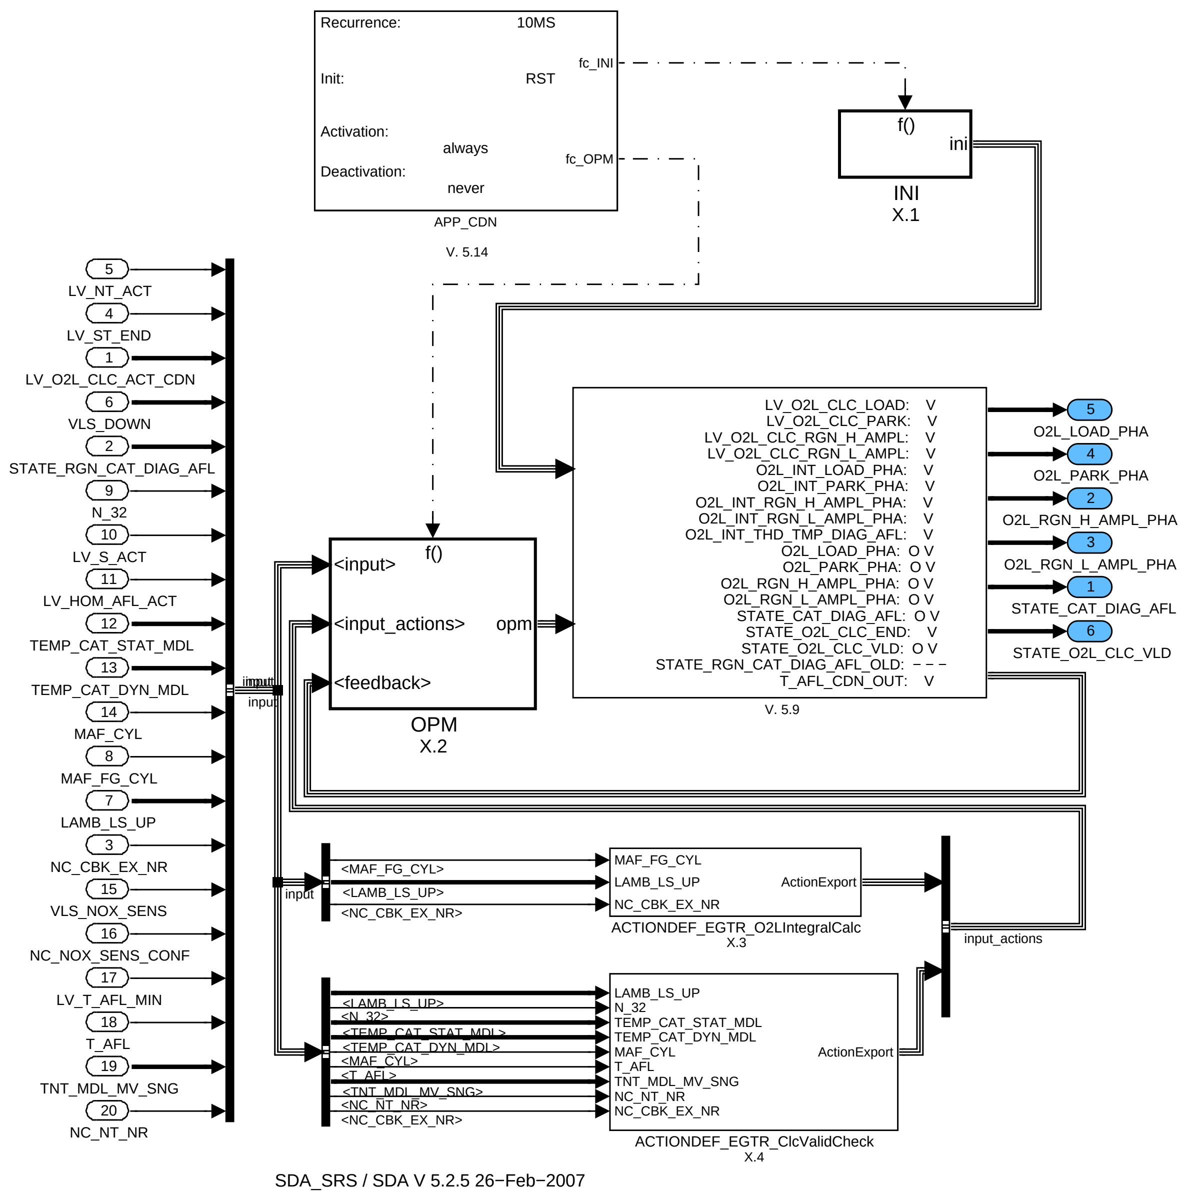
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

NC_NOX_SENS_CONF = 2 (n = i), for two NOx-Sensors

Application Conditions

Initialization: RST
Recurrence: 10MS
Activation: always
Deactivation: never

Function description



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.54.1: :

B.54.1 Initialization

O2L_INT_THD_TMP_DIAG_AFL=C_O2L_INT_THD_TMP_DIAG_AFL

All other variables are initialized with "0"

B.54.2 Formula section

All calculations are bank specific
Additional information:
"i" is an indicator for current bank within of for loop depending on NC_CBK_EX_NR.
"n" is an indicator for signals of NOx-Sensor. Therefore:
Case 1: If NC_CBK_EX_NR=1 then n=1 (in system the number of NOx-Sensors can not be greater then number of exhaust bank).
Case 2a: If NC_CBK_EX_NR=2 and NC_NOX_SENS_CONF=1 then n=1
Case 2b: If NC_CBK_EX_NR=2 and NC_NOX_SENS_CONF=2 then n=i

B.54.2.1 Check of the activation condition

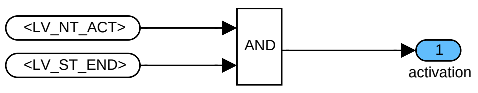


Figure B.54.2: :

B.54.2.2 Activation condition fulfilled

B.54.2.2.1 Overview of the function structure

At first, checking of transition condition and generation of function call for the active state of state machine "STATE_CAT_DIAG_AFL" are done. When the transition conditions are not fulfilled, the same state as in previous cycle is executed. In one calculation cycle only one state can be executed. The old value of STATE_RGN (for each bank separate) is also calculated after calculating of STATE_CAT_DIAG_AFL

B.54.2.2.1.1 STATE FLOW

Calculation of STATE_CAT_DIAG_AFL and generation of the function call for execution of one of it states

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.54.2.2.1.1.1 STATE_CAT_DIAG_AFL

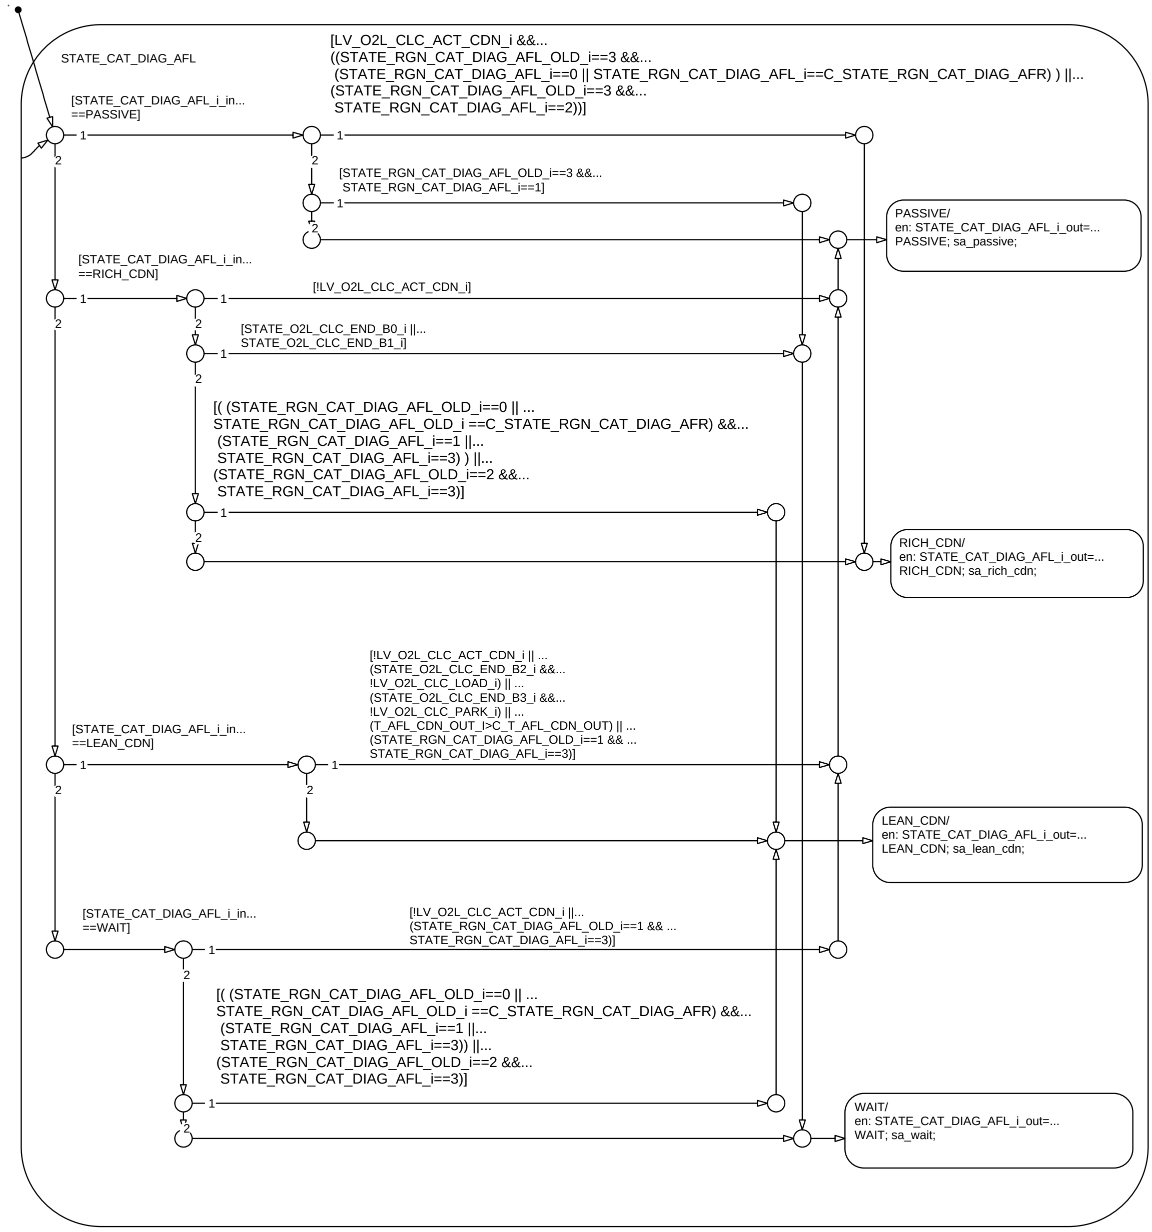

Figure B.54.3: :

B.54.2.2.1.2 EXECUTION OF THE STATES OF "STATE_CAT_DIAG_AFL"

STATE_CAT_DIAG_AFL = PASSIVE: Calculation of OSC is not active
STATE_CAT_DIAG_AFL = RICH_CDN: Calculation of OSC is done under rich operation conditions, O2L removal is calculated
STATE_CAT_DIAG_AFL = LEAN_CDN: Calculation of OSC is done under lean operation conditions, O2L addition is calculated
STATE_CAT_DIAG_AFL = WAIT: OSC calculation in RICH conditions is done, the system is waiting for change from rich to lean conditions

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.54.2.2.1.2.1 STATE ACTION: STATE_CAT_DIAG_AFL="PASSIVE"

B.54.2.2.1.2.1.1 Calculations

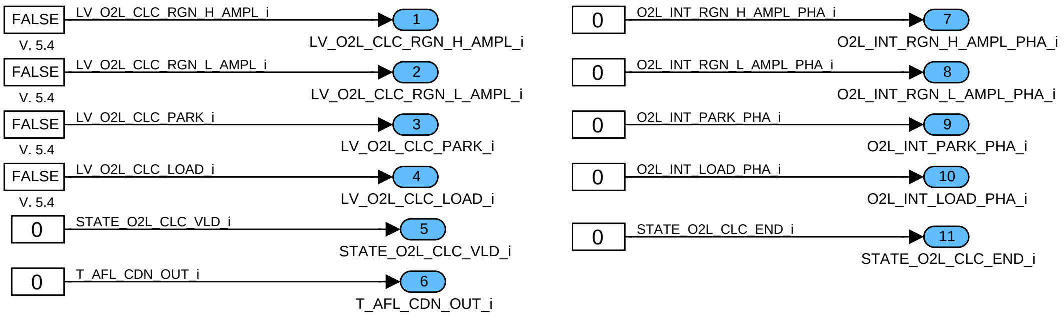

Figure B.54.4: :

B.54.2.2.1.2.2 STATE ACTION: STATE_CAT_DIAG_AFL="RICH_CDN"

In this states the O2L is calculated in one of two cases: either during high regeneration phase or during low regeneration phase.
For every of these phases are calculated separately:
a) Activation flag
b) O2L removal

For both phases:
a) Validation bits of O2L is calculated (BIT 0 for high amplitude phase and BIT 1 for low amplitude phase, BIT 2 and 3 are not calculated)
b) Counter for exit from LEAN-CDN is not changed
c) Outputs of not active state are calculated (LEAN_CDN)

B.54.2.2.1.2.2.1 OSC calculation in high amplitude regeneration - activation flag

Switching between exhaust gas configurations for calculation of the activation flag is done using C_ STATE_EX_CONF

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.54.17: :

B.54.2.2.1.2.3 STATE ACTION: STATE_CAT_DIAG_AFL="LEAN_CDN"

In this states the O2L is calculated in one of two cases: either during park phase or during load phase. For every of these phases are calculated separately:
a) Activation flag
b) O2L addition

For both phases:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

a) Validation bits of O2L (BIT 2 for park phase and BIT 3 for load phase, BIT 0 and BIT 1 are not calculated)
b) Counter for exit from LEAN-CDN phase
c) Outputs of not active state (RICH_CDN)

B.54.2.2.1.2.3.1 OSC calculation in park phase - activation flag

Switching between exhaust gas configurations for calculating of activation flag

Minimum coolant warm up temperature for coolant thermostat diagnosis					

FUNCTION DESCRIPTION:

General information:

Task of the coolant thermostat is to effect a quick engine warm up after start. The thermostat is closed after engine start to limit the cooling-liquid circulation until the thermostat regulating temperature is reached. The thermostat opens at this temperature and the limitation of the cooling-liquid circulation is finished. If an opened stuck thermostat occurs, the cooling-liquid circulation will not be limited after start. That means an increase of the engine warm up time and can cause emission increase as well.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

To take this behaviour into consideration, an opened stuck thermostat must be detected if either other diagnosis functions are inhibited or the coolant temperature does not reach its operating temperature within 20°F. The conditions for inhibiting the diagnosis are described in the chapter Application incidences for coolant thermostat monitoring . The coolant temperature model (TCO_SUB) must simulate the worst engine warm up temperature behaviour for a normal working thermostat (heating on. A/C on. etc.) after start until the thermostat opening temperature is reached.

Description:

The error detection is done by a comparison between the raw value of the coolant temperature sensor and the value of the coolant temperature substitute model.

Error-symptoms are defined to this diagnosis function as following:

```
□□□□
| | | └> -                          (= SYM_0)
| | └──> -                          (= SYM_1)
| └────> -                          (= SYM_2)
└──────> TH open stuck              (= SYM_3)
```

B.56.1 Activation condition for thermostat monitoring

FUNCTION DESCRIPTION:

General information:

The initialization of the function is performed as soon as EXIT_ST is detected. In this case it is regardless if the actual thermostat diagnosis status is set to enabled or canceled.
Thermostat diagnosis is performed as soon as all conditions below are fulfilled at the same time. The function is enabled at once if LV_ST_END is set to 1 . A minimum and a maximum threshold for the coolant temperature at start are limiting the diagnosis activation range as well as a minimum threshold for the intake air temperature at start.
Thermostat monitoring is finished if either the logical value for thermostat diagnosis finished or the logical value for thermostat diagnosis cancelled equals to 1 . In this case the diagnosis activation bit is set to 0 (LV_ACT_DIAG_TH = 0).

Application conditions

Initialisation at EXIT_ST:

```
LV_ERR_TH = 0
LV_CDN_DIAG_TH = 0
LV_END_DIAG_TH = 0
ERR_SYM_TH = NO_SYM
   LV_END_DIAG_RBM_TH = 0
   LV_END_DIAG_RBM_TH_TMP = 0
   LV_ACT_DIAG_RBM_TH = 0
   LV_CNL_DIAG_TH = 0
   LV_ACT_DIAG_TH = 0
TCO_DIAG_TH = -48°C
LV_TCO_DE_MAX_DIAG_TH = 0
```

Recurrence: *1000 ms*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. B.56.2 Coolant thermostat functionality check

FUNCTION DESCRIPTION:

General information:

Task of the functionality check is to detect a stuck open thermostat. Correct functionality is not guaranteed if the coolant temperature does not reach a specified warmed up temperature.
The thermostat functionality check is enabled as long as the boolean for coolant thermostat diagnosis activated is set to "1". As soon as EXIT_ST is detected, all timers and initialization values are set to neutral values.

Application conditions

Initialisation at EXIT_ST:
TIA_DE_DIAG_TH = 0°C
T_TCO_DE_DIAG_TH = 0s
TCO_DE_INI_DIAG_TH = 0°C
TCO_DE_DIAG_TH = 0°C
TIA_MIN_DIAG_TH = TIA_THR_ST

Recurrence: *1000 ms*

Activation: LV_ACT_DIAG_TH = 1
(Coolant thermostat functionality check enabled)

Deactivation: LV_ACT_DIAG_TH = 0
(Coolant thermostat functionality check disabled)

FUNCTION DESCRIPTION:

General information:

The coolant thermostat diagnosis is performed at transition from the logical value for engine stop from 1 to 0 . If the engine stalls or one of the conditions for inhibiting the diagnosis is present, it will be stopped and starts again at the next engine start.
The diagnosis is finished as soon as the boolean for end of coolant thermostat diagnosis is set to 1 . In this case the boolean for coolant thermostat error indicates either an open stuck thermostat (= 1) or a normal working thermostat (= 0).
Depending on project specific requirements, the coolant thermostat diagnosis can be inhibited by setting of LV_INH_DIAG_TH.
Interface of thermostat monitoring with the RBM statistics:
Bit 0: cond. for monitoring are met long enough to detect malfunction (bit0=1)
Bit 1: inhib. of the monitor because of system failure(s) (bit1=1)
Bit 2: individual RBM cond. of the monitor were encountered within this DC (bit2=1)

Application conditions

Initialisation:
```
at RESET or  EXIT_ST or  LV_IGK = 0->1 or  FMY clear:
   LV_INH_DIAG_TH = 0

B.57.2 Rate Base Monitoring interface for thermostat monitoring.

FUNCTION DESCRIPTION:

General information:

With this module the interface between the thermostat monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TH data.
Within STATE_RBM_TH, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for TH diagnosis)

Application conditions:

Initialisation :
at ECU reset :
bit 0, bit 1 and bit 2 of STATE_RBM_TH = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

at LV_DC 0   1 transition :

bit 0 and bit 1of STATE_RBM_TH = 0

bit 2 of STATE_RBM_TH = 1

on failure memory reset :

bit 1 of STATE_RBM_TH = 0

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0   1 transition

The pending status of the following failures has to be checked only once :

LV_ERR_TCO_EL	LV_ERR_TCO_GRD	LV_ERR_TCO_STUCK	LV_ERR_TCO_PLAUS
LV_ERR_TIA_EL	LV_ERR_TIA_PLAUS	LV_ERR_MAF_FRQ_RNG	LV_ERR_VS
LV_ERR_TAM_CAN	LV_ERR_TAM_PLAUS	LV_ERR_ECT_EL	LV_ERR_MAF_FRQ_GRD
LV_ERR_BN_T_ICL	LV_ERR_TIA_GRD	LV_ERR_TCO_STUCK_RNG	LV_ERR_MAF_FRQ_EL
LV_ERR_CAN_BOFF	LV_ERR_LOAD_TPS_PLAUS		

If(1) { CPU optimization at LV_DC 0   1 transition }
CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn t empty }
Then(1)
While bit 1 of STATE_RBM_TH = 0 **do**
with each XX failure of the above list :
ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<C

If(2) XX has a pending status
Then(2)
bit 1 of STATE_RBM_TH = 1
Endif(2)
Endwhile
Else(1)
{ the dynamic failure memory is empty }
No action
Endif(1)

Every 1 s :

If bit 0 of STATE_RBM_TH = 0
Then
If LV_END_DIAG_RBM_TH = 1
Then bit 0 of STATE_RBM_TH = 1
Endif
Endif
If bit 1 of STATE_RBM_TH = 0
Then
If LV_INH_DIAG_RBM_TH = 1
Then bit 1 of STATE_RBM_TH = 1
Endif
Endif

FUNCTION DESCRIPTION:

General information:

The diagnosis is based on monitoring the alteration of TCO_2_MES (positive and negative change) at:

- During warm - up phase (long term check, no error detection)
- After opening of thermostat (long term check with error detection)
- Just after start (short test with error detection)

LV_TCO_2_PLAUS_ENA = 0
TCO_2_DIF_TCO_2_PLAUS = 0 °C
TCO_2_PLAUS_H = -48°C
TCO_2_PLAUS_L = 142,5°C
CTR_DLY_TCO_2_PLAUS = C_CTR_DLY_TCO_2_PLAUS
T_DLY_TCO_2_PLAUS = C_T_DLY_TCO_2_PLAUS

Recurrence: 1000 ms

Activation: LV_ST_END = 1

Deactivation: LV_ST_END = 0

Description:

- During warm - up phase (long term check, no error detection)

The TCO_2 rationality diagnostic function will only run if TCO_ST and TIA_THR_ST are within a tunable range after engine start. TCO_2_PLAUS_H and TCO_2_PLAUS_L are continuously updated from engine start, after first being initialized to TCO_2_ST at power up. The difference between these two values, TCO_2_DIF_TCO_2_PLAUS, is also calculated. When this value exceeds a minimum threshold C_TCO_2_DIF_MIN_TCO_2_PLAUS then the diagnosis is finished with a positive rationality check result.

- After opening of thermostat (long term check with error detection)

The error detection is based on a change of TCO_2_MES after the opening temperature of the thermostat is reached and following the vehicle/engine is driven under certain conditions (vehicle speed, part load, engine speed, opening of thermostat) for the delay time CTR_DLY_TCO_2_PLAUS. However, should one condition drop below the threshold or the engine exit part load state during this tunable period, then the timer is reinitialized/incremented.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Additional, at CTR_DLY_TCO_2_PLAUS = 0 a second delay timer is started (T_DLY_TCO_2_PLAUS) to wait for the change of TCO_2_MES. If the delay time is over and there s still no change in TCO_2_MES then the error is set.

- Just after start (short test with error detection)

Apart from the long term checks, an extra rationality check is carried out at engine start; if TCO_ST is smaller than a threshold and TCO_2_MES_ST - TCO_ST is greater than a threshold then a fault is also detected.

Error-symptoms are defined to this diagnosis function as following:

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> TCO_2 to high after ST     (= SYM_0)
 │ │ └───> -                          (= SYM_1)
 │ └─────> -                          (= SYM_2)
 └───────> TCO_2 not plausible        (= SYM_3)
```

B.59.1 Interface parameter

General information:

Depending on project specific requirements, the plausibility diagnosis of the coolant temperature sensor at radiator outlet can be inhibited by setting of the logical variable LV_INH_DIAG_TCO_2_PLAUS. As a default value LV_INH_DIAG_TCO_2_PLAUS is set as shown below.

Application conditions

Initialisation

```
at RESET or  EXIT_ST or  LV_IGK = 0 ->  1 or  FMY clear:
   LV_INH_DIAG_TCO_2_PLAUS = 0
   LV_INH_DIAG_RBM_TCO_2_PLAUS = 0
   LV_TCO_2_PLAUS_ENA_EXT = 0
```

Recurrence: *1000 ms*

Copyright (C) Continental AG,2007

Activation: `LV_ST_END = 1`
(Calculation of the TCO_2 plausi. diagnosis interface parameter enabled)

Deactivation: `LV_ST_END = 0`
(Calculation of the TCO_2 plausi. diagnosis interface parameter disabled)

Formula section:

Calculation of diagnosis interface parameter:

If LV_ERR_TCO = 1 **or**
LV_ERR_TCO_2_EL = 1 **or**
LV_ERR_TCO_2_GRD = 1 **or**
LV_ERR_TIA = 1 **or**

Else LV_TCO_2_PLAUS_ENA_EXT = 0
Endif

B.59.2 Interface for Rate-based-monitoring

General information:

With this module the interface between the TCO_2 plausibility monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TCO_2_PLAUS data.
Within STATE_RBM_TCO_2_PLAUS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions:

Initialisation :

at ECU reset :
bit 0, bit 1 and bit 2 of STATE_RBM_TCO_2_PLAUS = 0
at LV_DC 0 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_TCO_2_PLAUS = 0
on failure memory reset :
bit 1 of STATE_RBM_TCO_2_PLAUS = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

The purpose of the signal stuck in range diagnosis is to detect a measured coolant temperature signal, which is stuck in range above the lowest maximum enable temperature. The diagnosis function checks, if the cooling behavior of the coolant temperature is plausible in comparison to the engine off time.

The diagnosis is performed only once per engine run.The symptom of the error code is not handled by an antibounce counter.

Description:

Error-symptoms are defined to this diagnosis function as following:

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> -                                              (= SYM_0)
 │ │ └───> -                                              (= SYM_1)
 │ └─────> -                                              (= SYM_2)
 └───────> Coolant temperature signal stuck in range error (= SYM_3)
```

Application conditions

LC_TCO_PLAUS_TCO_SUB_DIAG_INH	-	0... 1H	0 ...1	1	-
Logical calibration data to inhibit the use of TCO_SUB condition for error detection					

FUNCTION DESCRIPTION:

General information:

To monitor the activation of the lambda control after start above a coolant temperature threshold (OBD II requirement), a plausibilization between the coolant temperature increase (TCO) and the calculated coolant temperature increase (TCO_SUB) is made.
The coolant temperature plausibility diagnosis is performed once per engine run.
If the engine stalls and the coolant temperature plausibility diagnosis has not run out, then at the next engine start the timer will be initialized new and the diagnosis starts again. When the diagnosis is finished, the Boolean for end of coolant temperature plausibility diagnosis is set.
Remark: At the time when the TCO-plausibility diagnosis is performed, it is not possible to distinguish between a TCO-plausibility error and a Thermostat error (which can only be detected later). Therefore a TCO-plausibility error is entered, even if the problem may be related to the Thermostat (in order to activate the limp home in case there is really a problem with the coolant temperature sensor).
That means, if additionally to the TCO- plausibility error a Thermostat diagnosis error is detected, the TCO-plausibility error can be ignored.

Description:

Error-symptoms are defined to this diagnosis function as following:

```
|_|_|_|_|
 | | | └─> -                                      (= SYM_0)

B.63.1 Diagnosis inhibition

FUNCTION DESCRIPTION:

General information:

The coolant temperature sensor plausibility diagnosis is performed at transition from the logical value for Start from 1 to 0 . If the engine stalls or one of the conditions for inhibiting the diagnosis is present, it will be stopped and starts again at the next engine start.
The diagnosis is finished as soon as the boolean for end of coolant temperature sensor plausibility diagnosis is set to 1 . In this case the boolean for coolant temperature plausibility error indicates either a not plausible (= 1) or a normal (= 0) coolant temperature sensor signal.
Depending on project specific requirements, the coolant temperature sensor plausibility diagnosis can be inhibited by setting of LV_INH_DIAG_TCO_PLAUS.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.63.2 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the TCO_PLAUS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TCO_PLAUS data.
Within STATE_RBM_TCO_PLAUS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The purpose of the signal stuck diagnosis is to detect a stuck measured coolant temperature sensor signal. The diagnosis function checks if after a variation of the calculated coolant temperature substitute value (TCO_SUB) also a variation of the measured coolant temperature value (TCO_MES) is detected.
The diagnosis is performed only once per engine run. The symptom of the error code is not handled by anti-bouncing.

Description:

Error-symptoms are defined to this diagnosis function as following:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> -                                          (= SYM_0)
 │ │ └───> -                                          (= SYM_1)
 │ └─────> -                                          (= SYM_2)
 └───────> Coolant temperature signal stuck error     (= SYM_3)
```

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_STATE_READY_CMPL_OBD_1	-	0... FFH	0... 255	1	-
Readiness MIS, FSD, CC directly set to ready					
C_STATE_READY_OBD_1	-	0... FFH	0... 255	1	-
Status configuration for readiness code (continuous tests)					
C_STATE_READY_OBD_2	-	0... FFH	0... 255	1	-
Status configuration for readiness code (non continuous tests)					
C_STATE_READY_OBD_3	-	0... FFH	0... 255	1	-
Status configuration for customer specific readiness code					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_ERR_DTC_REQ_CUS	-	0... 1H	0 ...1	1	-
This bit shall be set to 0 (SYMPTOM) to read customer DTC by symptomThis bit shall be set to 1 (FAILURE) to read customer DTC by failure					
NC_ERR_DTC_REQ_OBD	-	0... 1H	0 ...1	1	-
This bit shall be set to 0 (SYMPTOM) to read OBD DTC by symptomThis bit shall be set to 1 (FAILURE) to read OBD DTC by failure					
NLC_OBD_FRF_PND	-	0... 1H	0 ...1	1	-
Defines freeze frame strategy for OBD freeze frame for Mode 02h (0: FRF on confirmed error /1: FRF on pending error)					

Action definition

ACTION_ERRM_ActivateMarkedMode (<IN>,<MarkedMode>)	Mode: O
This API shall be used to activate/deactivate the marked mode.	

ACTION_ERRM_ClearRbmStatistics (<OUT>,<PRM_RESULTCLRINFO>)	Mode: O
This action clears all the Rate-Based Monitoring statistics	

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

ACTION_ERRM_ClrInfoByDtc (<IN>,<DtcIdentifier>,<IN>,<LevelOfDtc>,<OUT>,<ResultClrInfo>)	Mode: O
This action clear the failure in dynamic memory associated to a DTC number.	

ACTION_ERRM_ClrInfoByTypeOfDtc (<IN>,<TypeOfDtc>,<OUT>,<ResultClrInfo>)	Mode: O
This action clear all the failure in dynamic memory associated to DTC with a certain type.	

ACTION_ERRM_ControlDtcSettings (<IN>,<MarkedMode>)	Mode: O
This action allows to activate or deactivate the marked mode. In this mode all new failure which appears are marked and then erased when we leave this mode.	

ACTION_ERRM_ReadDtcByDtc (<IN>,<DtcIdentifier>,<IN>,<LevelOfDtc>,<OUT>,<ResultDtc>)	Mode: O
This action returns a result to learn if a DTC number of a certain level is stored in memory.	

ACTION_ERRM_ReadDtcByTypeOfDtc (<IN>,<TypeOfDtc>,<IN>,<LevelOfDtc>,<INOUT>,<ListOfDtc>,<OUT>, <ResultDtc>)	Mode: O
This action returns a list of DTC. All the DTC returns have the same type defined by the parameter TypeOfDtc	

ACTION_ERRM_ReadDtcLevelByDtcLevel (<IN>,<DtcIdentifier>,<IN>,<LevelOfDtc>,<INOUT>,<ListofDtc>, <OUT>,<ResultDtc>)	Mode: O
This action returns a Customer DTCLevel of Law DTCLevel which is stored in dynamic memory or returns a Law DTCLevel of Customer DTCLevel which is stored in dynamic memory.	

ACTION_ERRM_ReadFrfByDtc (**IN**<PRM_TYPEOFFF>,**IN**<PRM_FFIDENTIFIER>,**IN**<PRM_DTCIDENTIFIER>, **IN**<PRM_LEVELOFDTC>,**INOUT**<PRM_FRF>,**OUT**<PRM_RESULTFRF>)	Mode: O
This API returns a freeze frame or a part of freeze frame.	

Parameter	**Type**	**Hex.Limits**	**Phys.Limits**	**Resol.**	**Unit**
PRM_TYPEOFFF	in	0... FFFFH	0... 65535	1	-
Type of Freeze Frame					
PRM_FFIDENTIFIER	in	0... FFH	0... 255	1	-
Freeze frame number					
PRM_DTCIDENTIFIER	in	0... FFH	0... 255	1	-
DTC number					
PRM_LEVELOFDTC	in	01H 02H	LAW CUS	-	-
OBD or Customer DTC					
PRM_FRF	inout	0... FFH	0... 255	1	-
Pointer to buffer for Freeze frame					
PRM_RESULTFRF	out	0... FFH	0... 255	1	-
Result of Freeze frame reading					

ACTION_ERRM_ReadInfoByDtc (<IN>,<DtcIdentifier>,<IN>,<LevelOfDtc>,<IN>,<InfoIdentifier>,<INOUT>, <ListOfDtcInfo>,<OUT>,<ResultDtc>)	Mode: O
This action returns a structure of data of a DTC, which is stored in dynamic memory.	

ACTION_ERRM_ReadInfoByTypeOfDtc (<IN>,<TypeOfDtc>,<IN>,<InfoIdentifier>,<INOUT>,<ListOfDtcInfo>, <OUT>,<ResultDtc>)	Mode: O
This action returns a structure of data of DTCs. All the data returned are related to DTC, which have the same type defined by the parameter TypeOfDtc and which are stored in dynamic memory.	

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_ReadQuantityOfDtc (**IN**<PRM_TYPEOFDTC>,**IN**<PRM_LEVELOFDTC>,**INOUT**<PRM_QUANTITY>, **OUT**<PRM_RESULTQUANTITY>)	Mode: O
This API returns the quantity of DTC with a certain type, which are stored in memory	

Parameter	**Type**	**Hex.Limits**	**Phys.Limits**	**Resol.**	**Unit**
PRM_TYPEOFDTC	in	1H 8H 10H 20H 40H 80H 100H 200H 400H	ALL PRESENT PENDING CONFIRMED DISAPPEARED MARKED NOT_MARKED OBD PERMANENT	-	-
Type of Dtc					
PRM_LEVELOFDTC	in	01H 02H	LAW CUS	-	-
Allowing to access to OBD error codes or customer error codes.					
PRM_QUANTITY	inout	0... FFH	0... 255	1	-
Software structure filled up with a quantity of DTC					
PRM_RESULTQUANTITY	out	0H 1H	NO_DTC_ PRESENT DTC_PRESENT	-	-
Result to say if the result of the API is valid					

ACTION_ERRM_ReadReadinessCodCus (<INOUT>,<ReadinessCode>,<OUT>,<ResultReadinessCode>)	Mode: O
This action allows to read the customer specific readiness code information CARB_OTHER/NO_CARB	

ACTION_ERRM_ReadReadinessCode (**INOUT**<PRM_READINESSCODE>,**OUT**<PRM_RESULTREADINESSCODE>)	Mode: O
This API returns the readiness code information required for service01h, PID01h, data B-D	

Parameter	**Type**	**Hex.Limits**	**Phys.Limits**	**Resol.**	**Unit**
PRM_READINESSCODE	inout	0... FFFFFFFFH	0... 4294967295	1	-
Software structure filled up with readiness code					
PRM_RESULTREADINESSCODE	out	0H 1H	NEGATIVE_ RESPONSE POSITIVE_ RESPONSE	-	-
Result to say if the API is done or not					

ACTION_ERRM_SelectRbmByGroup (<IN>,<PRM_GROUPNAME>,<INOUT>,<PRM_NUMERATOR>,<INOUT>, <PRM_DENOMINATOR>,<OUT>,<PRM_RESULTRBMDATABYGROUP>)	Mode: O
This action determines within one single group, the data with lowest ratios.	

ACTION_ERRM_SelectRbmData (<INOUT>,<PRM_CTR_MOD_9_RBM[36]>,<OUT>,<PRM_RES_MOD_9>)	Mode: O
This API calculates and returns the Rate-Based Monitoring data to be transmitted to the Scan-Tool, when requested by the Mode 09$ (InfoType $08).	

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Configuration data detailed description:

NC_ERR_DTC_REQ_OBD : This bit shall be set to 0 (SYMPTOM) to read OBD DTC by symptom.
This bit shall be set to 1 (FAILURE) to read OBD DTC by failure.

NC_ERR_DTC_REQ_CUS : This bit shall be set to 0 (SYMPTOM) to read Customer DTC by symptom.
This bit shall be set to 1 (FAILURE) to read Customer DTC by failure.

NLC_OBD_FRF_PND : Definition the EOBD/CARB freeze frame strategy, as follow :
0 : EOBD/CARB freeze frame data of Mode 02h will be returned after detection of a confirmed failure.
1 : EOBD/CARB freeze frame data of Mode 02h will be returned :

- after detection of a confirmed emission relevant failure if confirmed in memory
- after pending emission relevant detection if not confirmed in memory

B.65.1 Import Actions

ACTION_ERRM_EraseErr (IN <IDX>)
ACTION_ERRM_InitReadiness ( )
ACTION_ERRM_ClcPermanentByErr (IN <PRM_IDX_ERR>)
ACTION_ERRM_GetReadyClass (IN <PRM_IDX_ERR >, OUT <PRM_READY_CLAS>)
ACTION_ERRM_ClcPermanentIniErrm ( )

FUNCTION DESCRIPTION:

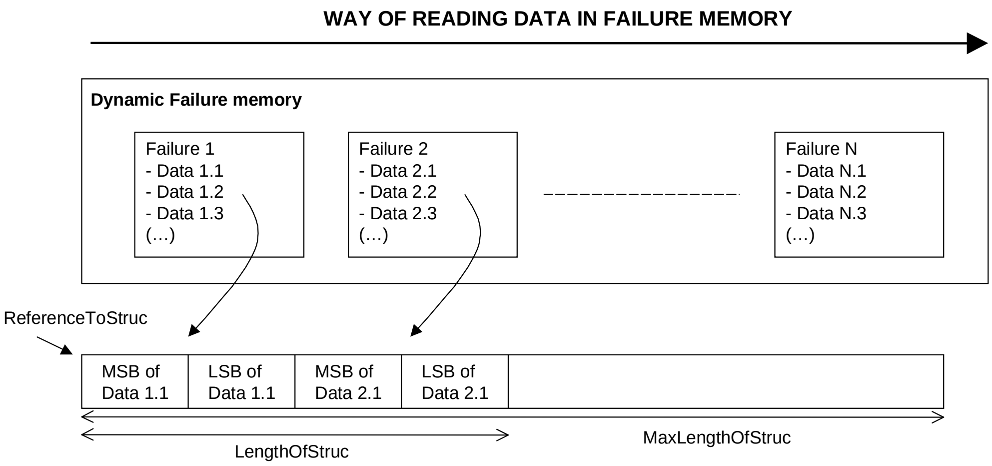
General information:

This chapter provides an open interface for other module which have link with error management functionality (communication module for instance). This interface is described with API (Application Programming Interface) to provide access to dynamic data flow in contrast to static data flow accessed directly through variable names.
By calling API, you can access in failure memory data related to Error Management such freeze frame and DTC stored, readiness code state and so on.
An API can have some input parameters.
Results returns by the API are defined as output parameters.
To returns functional results, a software structure (buffer) is used that allows to returns some data with not fixed size (a list of data for instance).
This structure is defined by the parameter in INOUT.
In the output parameter, a flag indicate if the software buffer is full or not.

Way of reading the failure memory :
API has to read through the failure memory to access some data related to Error Management.
In this case the failure memory is read in the order following the first failure entry, that means the oldest one. Thus the software structure is fill in first with data related to first failure entry (if need), then with data related to second failure entry (if need) and so on.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

 Copyright (C) Continental AG,2007



GENERAL IMPORTANT REMARK:

Please take care that the parameter PERMANENT is only linked to permanent memory (e.g. no impact on dynamic memory). For all services err_sym_dtc is still calculated with err_sym_mem and err_sym_lst (no link to err_sym_perm)

Fot the APIs :
- ACTION_ERRM_ReadDtcByDtc,
- ACTION_ERRM_ReadInfoByTypeOfDtc,
- ACTION_ERRM_ReadInfoByDtc,
- ACTION_ERRM_ReadDtcLevelByDtcLevel,
- ACTION_ERRM_ClrInfoByTypeOfDtc

It's forbidden to use the parameter PERMANENT for TypeOfDTC

For Mode 0Ah, the two APIs which must be used are
- ACTION_ERRM_ReadQuantityOfDtc with PERMANENT parameter for TypeOfDtc
- ACTION_ERRM_ReadDtcByTypeOfDtc with PERMANENT parameter for TypeOfDtc

Description of parameters IN, OUT, INOUT used by API:

The INPUT parameters used by API and their authorised value are defined below :

TypeOfDtc : Type of Dtc

Authorised values for TypeOfDtc are :

- ALL : all the DTC stored in Dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1

- ALL FIRST: all the DTC stored at the first time in Dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1

- ALL LAST: all the DTC stored at the last time in Dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1

- PRESENT : all the DTC of present failure stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_XX = 1

- PENDING : all the DTC of pending failure stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

and LV_ERR_PND[IDX] = 1

- TEMPORARY : all the DTC of temporary failure stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_TMP[IDX] = 1

- CONFIRMED : all the DTC of confirmed failure stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_CFM[IDX] = 1

- DISAPPEARED : all the DTC of disappeared failure stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_DISA[IDX] = 1

- MARKED : all DTC of failure marked and stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_MKD[IDX] = 1

- NOT MARKED : all DTC of failure not marked and stored in dynamic memory.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and LV_ERR_MKD[IDX] = 0

- OBD : all DTC related to emission relevant failure.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and a Carb/EOBD failure :
(emission relevant)
(definition see failure class specification)

- OBD FIRST: all the DTC stored at the first time in Dynamic memory related to emission relevant failure.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and a Carb/EOBD failure :
(emission relevant)
(definition see failure class specification)

- OBD LAST: all the DTC stored at the last time in Dynamic memory.related to emission relevant failure.

Failures concerned in error management : LV_ERR_MEM_XX = 1
and a Carb/EOBD failure :
(emission relevant)
(definition see failure class specification)

- PERMANENT : all the DTC of permanent fault memory
  Failures concerned in error management : LV_ERR_PERM[IDX_PERM] = 1

- Logical AND combination between these values.

For instance : PRESENT and CONFIRMED are failure in error management with flags : LV_ERR_MEM_XX = 1 and LV_ERR_XX = 1 and LV_ERR_CFM[IDX] = 1.

Calculation of ERR_SYM_DTC[IDX] and SYM_CYL_DTC_XX following the TypeOfDtc parameter:

For all failure except the misfiring failure treated by type :

case TypeOfDtc

ALL : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX] **or** ERR_SYM_MEM[IDX]
ALL FIRST: ERR_SYM_DTC[IDX] = ERR_SYM_MEM[IDX]
ALL LAST : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX]
PRESENT : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX]
PENDING : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX]
TEMPORARY : ERR_SYM_DTC[IDX] = ERR_SYM_MEM[IDX]
CONFIRMED : ERR_SYM_DTC[IDX] = ERR_SYM_MEM[IDX]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

DISAPPEARED : ERR_SYM_DTC[IDX] = ERR_SYM_MEM[IDX]
MARKED : ERR_SYM_DTC[IDX] =
ERR_SYM_LST[IDX] **or** ERR_SYM_MEM[IDX]
NOT MARKED : ERR_SYM_DTC[IDX] =
ERR_SYM_LST[IDX] **or** ERR_SYM_MEM[IDX]
OBD : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX] **or** ERR_SYM_MEM[IDX]
OBD FIRST : ERR_SYM_DTC[IDX] = ERR_SYM_MEM[IDX]
OBD LAST : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX]
(!! independant of dynamic memory !!)
PERMANENT : ERR_SYM_PERM[IDX_PERM]

End case

For the misfiring failure treated by type (XX = MIS_A, MIS_B1 or MIS_B4)

IF NLC_TREAT_DIAG_MIS = 0

case TypeOfDtc

ALL : SYM_CYL_DTC_XX = SYM_CYL_LST_XX **or** SYM_CYL_MEM_XX
ALL FIRST : SYM_CYL_DTC_XX = SYM_CYL_MEM_XX
ALL LAST: SYM_CYL_DTC_XX = SYM_CYL_LST_XX
PRESENT: SYM_CYL_DTC_XX = SYM_CYL_LST_XX
PENDING : SYM_CYL_DTC_XX = SYM_CYL_LST_XX
TEMPORARY : SYM_CYL_DTC_XX = SYM_CYL_MEM_XX
CONFIRMED : SYM_CYL_DTC_XX = SYM_CYL_MEM_XX
DISAPPEARED : SYM_CYL_DTC_XX = SYM_CYL_MEM_XX
MARKED : SYM_CYL_DTC_XX = SYM_CYL_LST_XX **or** SYM_CYL_MEM_XX
NOT MARKED : SYM_CYL_DTC_XX =
SYM_CYL_LST_XX **or** SYM_CYL_MEM_XX
OBD : SYM_CYL_DTC_XX = SYM_CYL_LST_XX **or** SYM_CYL_MEM_XX
OBD FIRST: SYM_CYL_DTC_XX = SYM_CYL_MEM_XX
OBD LAST: SYM_CYL_DTC_XX = SYM_CYL_LST_XX
PERMANENT : SYM_CYL_DTC_XX = SYM_CYL_MEM_XX

End case

ENDIF { NLC_TREAT_DIAG_MIS = 0 }

For the logical AND combination between the different TypeOfDtc values, the ERR_SYM_DTC[IDX] or SYM_CYL_DTC_XX will be calculated with a binary logical AND from the associated carrier symptom.

For instance : PRESENT and CONFIRMED are failure in error management with flags : LV_ERR_MEM_XX = 1 and LV_ERR_XX = 1 and LV_ERR_CFM[IDX] = 1.

It means : ERR_SYM_DTC[IDX] = ERR_SYM_LST[IDX] **&** ERR_SYM_MEM[IDX],
SYM_CYL_DTC_XX = SYM_CYL_LST_XX **&** SYM_CYL_MEM_XX.

Calculation of ERR_SYM_DTC[IDX] and SYM_CYL_DTC_XX in case the API doesn't use the TypeOfDtc parameter :

ERR_SYM_DTC[IDX] = ERR_SYM_LST **or** ERR_SYM_MEM[IDX]
SYM_CYL_DTC_XX = SYM_CYL_LST_XX **or** SYM_CYL_MEM_XX

<u>DtcIdentifier :</u> Number of the DTC (identifier)

Authorised value for DtcIdentifier are : NO_DTC, ...<integer>

<u>TypeOfFF :</u> Type of Freeze Frame

Authorised values for TypeOfFF are :

- LAW : part of the freeze frame defined by the law (Carb)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- CUS_CMN : part of the freeze frame defined for the customer and not in the set
- CUS_SET : part of the freeze frame defined for the customer and in the set
- All combination of these values.

LevelOfDtc : Allowing to access to OBD error codes or customer error codes.
Authorised values for LevelOfDtc are :

- LAW : the DTC corresponds to a OBD DTC (Carb)
- CUS : the DTC corresponds to a specific customer DTC

FFIdentifier : Number of FF (identifier)
Authorised values for FFIdentifier are :

- FIRST : first freeze frame is requested
- SECOND : second freeze frame is request
- ...

MarkedMode : State of the marked mode
Authorised values for MarkedMode are :

- ON : marked mode activation : all failure stored are marked.
- OFF : marked mode deactivation (normal mode)

InfoIdentifier : Identifier for the diagnosis related information which is returned by the API (only words are returned)
Authorised information for InfoIdentifier are (only one information is returned by the API):

- CTR_ABC_XX
- CTR_ABC_END_DIAG_XX
- LV_END_DIAG_XX
- LV_READY_XX
- LV_CDN_DIAG_XX
- ERR_SYM_XX
- LV_ERR_XX
- LV_ERR_MEM_XX
- CTR_FRC[IDX]
- CTR_DC[IDX]
- CTR_WUP_CYC[IDX]
- ERR_SYM_MEM[IDX]
- ERR_SYM_LST[IDX]
- ERR_SYM_DTC[IDX]
- LV_ERR_CFM[IDX]
- LV_ERR_DISA[IDX]
- LV_ERR_TMP[IDX]
- LV_ERR_PND[IDX]
- LV_ERR_PERM[IDX]
- LV_DC_MAX[IDX]
- LV_ERR_DC[IDX]
- LV_ERR_MKD[IDX]
- C_ERR_CLAS_XX
- WAL_CONF_XX
- PRI_CONF_XX
- DC_INC_XX
- DC_DEC_XX
- DC_MAX_XX
- ID_ERR_DTC_XX[0][0]
- ID_ERR_DTC_XX[0][1]
- ID_ERR_DTC_XX[0][2]
- ID_ERR_DTC_XX[0][3]
- ID_ERR_DTC_XX[0][4]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

if NC_NR_DTC_FMT = 0

- ID_ERR_DTC_XX[0][5]

else
(Manage 10 DTC per failure)

- ID_ERR_DTC_XX[1][0]
- ID_ERR_DTC_XX[1][1]
- ID_ERR_DTC_XX[1][2]
- ID_ERR_DTC_XX[1][3]
- ID_ERR_DTC_XX[1][4]

endif
Please note that some application incidences can provide additional project specific informations.

The OUTPUT parameters used by API and their authorised value are defined below :

ResultDtc : Result to say if there is some DTC in memory corresponding to the API request
Authorised values for ResultDtc are :
1st bit of ResultDtc :

- (0) NO_DTC_PRESENT : there is no DTC in memory corresponding to the API request
- (1) DTC_PRESENT : there is some DTC in memory corresponding to the API request

2nd bit of ResultDtc :

- (0) NO_BUFFER_FULL : The software buffer used to return data is not full
- (1) BUFFER_FULL : The software buffer used to return data is full

ResultFrf : Result to say if there is some Freeze Frame in memory corresponding to the API request
Authorised values for ResultFrf are :
1st bit of ResultFrf :

- (0) NO_FRF_PRESENT : there is no freeze frame in memory corresponding to the API request
- (1) FRF_PRESENT : there is some freeze frame in memory corresponding to the API request

2nd bit of ResultFrf :

- (0) NO_BUFFER_FULL : The software buffer used to return data is not full
- (1) BUFFER_FULL : The software buffer used to return data is full

ResultQuantity : Result to say if the result of the API is valid.
Authorised values for ResultQuantity are :
1st bit of ResultQuantity :

- (0) NO_DTC_PRESENT : there is no DTC in memory corresponding to the API request
- (1) DTC_PRESENT : there is some DTC in memory corresponding to the API request

ResultClrInfo : Result to say if the clear DTC made by the API is done or not.
Authorised values for ResultClrInfo are :
1st bit of ResultClrInfo :

- (0) INFO_CLEARED : DTC are cleared by the call of the API
- (1) INFO_NOT_CLEARED : no DTC is cleared by the call of the API

ResultReadinessCode : Result to say if the API is done or not.
Authorised values for ResultReadinessCode are :
1st bit of ResultReadinessCode :

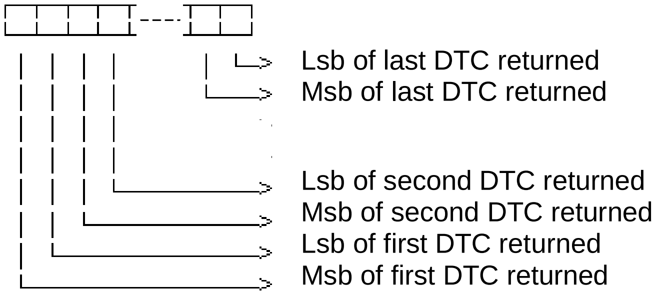
- (0) POSITIVE_RESPONSE : the call of the API is successful
- (1) NEGATIVE_RESPONSE : the call of the API is not successful

The INPUT/OUTPUT parameters used by API and their authorised value are defined below :

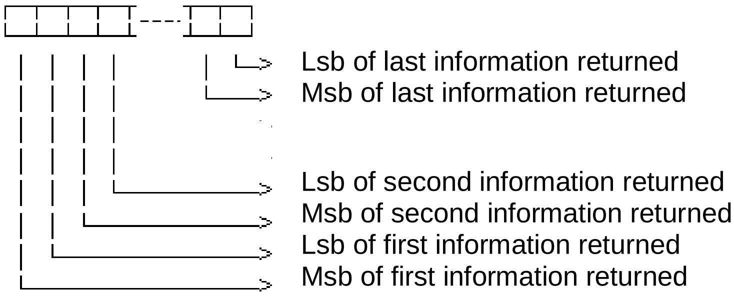
- ListOfDtc : Software structure filled up with a list of DTC

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

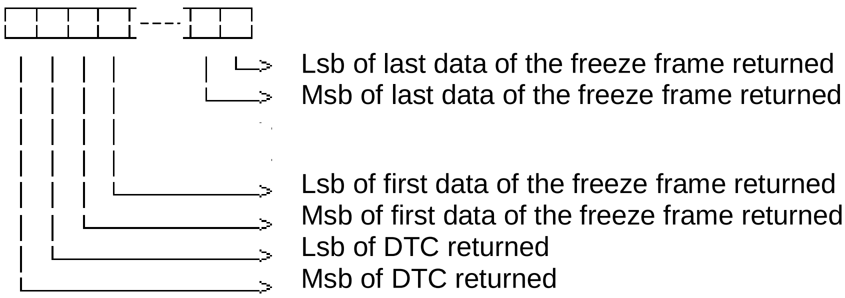
Copyright (C) Continental AG,2007



- ListOfDtcInfo : Software structure filled up with a list of DTCInfo



- Quantity : Software structure filled up with a quantity of DTC
- Frf : Software structure filled up with a freeze frame



- ReadinessCode : Software structure filled up with readiness code

B.65.2 API for reading Diagnostic Trouble Code (DTC)

B.65.2.1 Request a list of DTCs by type of DTC.

Description :

Syntax : ACTION_ERRM_ReadDtcByTypeOfDtc (
IN <TypeOfDtc>,
IN <LevelOfDtc>,
INOUT <ListOfDtc>,
OUT <ResultDtc>)

Parameter(in) :	TypeOfDtc	Type of DTC which is requested by the API.
	LevelOfDtc	OBD or customer DTC is requested by the API
Parameter(out) :	ResultDtc	Boolean to say if some DTC is in memory

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter(inout) : ListOfDtc Software structure fills up with a ListOfDtc
Short Description : This API returns a list of DTCs. All the DTC returns have the same type defined by the parameter TypeOfDtc and the same level defined in LevelOfDtc.

For each failure, if NC_NR_DTC_FMT = 0 then 6 DTC are defined : one DTC for each symptom (OBD or Customer), one OBD global DTC, one customer global DTC else 10 DTC are defined : one OBD DTC for each symptom, one OBD global DTC, one customer specific DTC number for each symptom and one customer global DTC.
When LevelOfDtc = LAW : OBD Dtc is request

If NC_ERR_DTC_REQ_OBD = SYMPTOM, the DTC is build up following the detected symptom. If more than one symptom is detected, a DTC per symptom detected is returned. There is a particular case for Misfiring failure. For this failure, the DTC number is built up following the cylinder where the misfiring is detected.

If NC_ERR_DTC_REQ_OBD = FAILURE, the OBD global DTC is returned.

When LevelOfDtc = CUS : Customer Dtc is request

If NC_ERR_DTC_REQ_CUS = SYMPTOM, the DTC is build up following the detected symptom. If more than one symptom is detected, a DTC per symptom detected is returned. There is a particular case for Misfiring failure. For this failure, the DTC number is built up following the cylinder where the misfiring is detected.

If NC_ERR_DTC_REQ_CUS = FAILURE, the customer global DTC is returned.

B.65.3 API for reading the status of Diagnostic Trouble Code

B.65.3.1 Request a list of status of DTCs by type of DTC

Description :

Syntax : ACTION_ERRM_ReadInfoByTypeOfDtc (
IN <TypeOfDtc>,
IN <InfoIdentifier>,
INOUT <ListOfDtcInfo>,
OUT < ResultDtc>)

Parameter(in) : TypeOfDtc Type of DTC which is requested by the API.
InfoIdentifier Information which is returned by the API
Parameter(out) : ResultDtc Boolean to say if there is the DTC in memory
Parameter(inout) : ListOfDtcInfo Software structure fill up with ListOfDtcInfo
Short Description : This API returns a diagnosis information. All the information returned are related to DTC which have the same type defined by the parameter TypeOfDtc and which are stored in memory. Diagnosis information returned is defined by InfoIdentifier parameter.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

1^{st} bit of ResultDtc = NO_DTC_PRESENT
2^{nd} bit of ResultDtc = NO_BUFFER_FULL
For each failure stored in dynamic memory,
If the failure belongs to group defined by the parameters TypeOfDtc
Then 1^{st} bit of ResultDtc = DTC_PRESENT
ListOfDtcInfo is fill up with data of this failure corresponding to InfoIdentifier.
Endif
EndFor

During all the software structure filling-in, if the software buffer is full then 2^{nd} bit of ResultDtc is set to BUFFER_FULL, software process is aborted.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.65.3.2 Request a status of a DTC by DTC number

Description :

Syntax : ACTION_ERRM_ReadInfoByDtc (
IN <DtcIdentifier>,
IN <LevelOfDtc>,
IN <InfoIdentifier>,
INOUT <ListOfDtcInfo>,
OUT <ResultDtc>)

Parameter(in) : DtcIdentifier Number of the DTC (identifier) which is requested.
LevelOfDtc OBD or customer DTC is requested by the API
InfoIdentifier Information which is returned by the API

Parameter(out) : ResultDtc Boolean to say if there is the DTC in memory

Parameter(inout) : ListOfDtcInfo Software structure fill up with ListOfDtcInfo

Short Description : This API returns a structure of diagnosis information related to a DTC which is stored in dynamic memory.
Diagnosis information returned is defined by InfoIdentifier parameter.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

1^{st} bit of ResultDtc = NO_DTC_PRESENT
2^{nd} bit of ResultDtc = NO_BUFFER_FULL

```
For each failure IDX stored in dynamic memory,
    ACTION_ERRM_GetReadyClass(XX, PRM_READY_CLAS)
    If          PRM_READY_CLAS <> 00h (CARB_MIS)

               For each cylinder bit i which is set in        SYM_CYL_DTC_XX
                    If DtcIdentifier = ID_ERR_DTC_MIS[1][i]
                    Then   1st bit of ResultDtc = DTC_PRESENT
                           ListOfDtc is fill up with ID_ERR_DTC_MIS[0][i]
                           Exit
                    Endif
               Endfor
      Endif
   Endif
Endfor
```

During all the software structure filling-in, if the software buffer is full then 2^{nd} bit of ResultDtc is set to BUFFER_FULL, software process is aborted.

When a failure is found in dynamic memory with the right DtcIdentifier, the treatment is stopped. That means that only the status of the first DTC found (oldest DTC) is returned.

B.65.4 API for reading the number of Diagnostic Trouble Code

B.65.4.1 Request the quantity of DTC with a certain type stored in memory

Description :

Syntax : ACTION_ERRM_ReadQuantityOfDtc (
IN <TypeOfDtc>,
IN <LevelOfDtc>,
INOUT <Quantity>,
OUT <ResultQuantity>)

Parameter(in) :	TypeOfDtc	Type of DTC which is requested by the API.
	LevelOfDtc	OBD or customer DTC is requested by the API
Parameter(out) :	ResultQuantity	Boolean to say if there is at least 1 DTC in memory
Parameter(inout) :	Quantity	Software structure fill up with quantity of Dtc

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Short Description : This API returns the quantity of DTCs with a certain type, which are stored in memory. Quantity of DTCs is the number of failures in memory. If failures have same DTC values then they are counted once.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

          Endif
       Endif
   Endif
 EndFor
Endif
```

For each duplicated DTC, the corresponding quantity will be subtracted. Duplicated DTC will be counted once.

B.65.5 API for reading the Freeze Frame

B.65.5.1 Request a freeze frame with a certain type by DTC

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description :

Syntax : ACTION_ERRM_ReadFrfByDtc(
IN <TypeOfFF>,
IN <FFIdentifier>,
IN <DtcIdentifier>,
IN < LevelOfDtc>
INOUT <Frf>
OUT <ResultFrf>)

Parameter(in) :	TypeOfFF	Type of freeze frame which are request by the API
	FFIdentifier	Identifier of freeze frame requested
	DtcIdentifier	Identifier of DTC of the freeze frame requested
	LevelOfDtc	OBD or customer DTC is requested by the API
Parameter(out) :	ResultFrf	Boolean to say if requested freeze frame is present
Parameter(inout) :	Frf	Software structure fill with Freeze frame

Short Description : This API returns a freeze frame or a part of freeze frame.
With the parameter TypeOfFF, some different part of a freeze frame (defined by the law or by the customer - including set or not) can be returned.
The parameter FFIdentifier is not used (reserved for future improvement).
The freeze frame can be requested :

- by DTC ; in this case the parameters DtcIdentifier and LevelOfDtc should be fulfilled.
- for the CARB/EOBD request (mode 02h) ; in this case, the parameter DtcIdentifier has to be set to NO_DTC, the parameter TypeOfFF has to be set to LAW, and the parameter FFIdentifier has to be set to FIRST.

The freeze frame associated to the oldest Carb failure among highest priority Carb failure is returned.

See definitions of freeze frame in module “Environmental data” module in “Error management” aggregate.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

1^{st} bit of ResultFrf = NO_FRF_PRESENT
2^{nd} bit of ResultFrf = NO_BUFFER_FULL

If (FFIdentifier = FIRST **and** TypeOfFF = LAW **and** DtcIdentifier = NO_DTC)
Then (Law freeze frame is requested)
If NLC_OBD_FRF_PND = 0
Then
Find oldest Carb/EOBD failure (emission relevant, LC_OBD_ERR = 1) failure stored in dynamic memory and confirmed (LV_ERR_CFM[IDX] = 1). If a misfire or fuel system failure is in the memory with LV_ERR_CFM[IDX] = 1, then the oldest of these failures must be chosen.
Else
Find oldest Carb/EOBD failure (emission relevant, LC_OBD_ERR = 1) failure stored in dynamic memory and confirmed (LV_ERR_CFM[IDX] = 1). If a misfire or fuel system failure is in the memory with LV_ERR_CFM[IDX] = 1, then the oldest of these failures must be chosen.
If this failure isn’t existing, find oldest Carb/EOBD failure (emission relevant, LC_OBD_ERR = 1) failure stored in dynamic memory and pending (LV_ERR_PND[IDX] =1). If a misfire or fuel system failure is in the memory with LV_ERR_PND[IDX] = 1, then the oldest of these failures must be chosen.

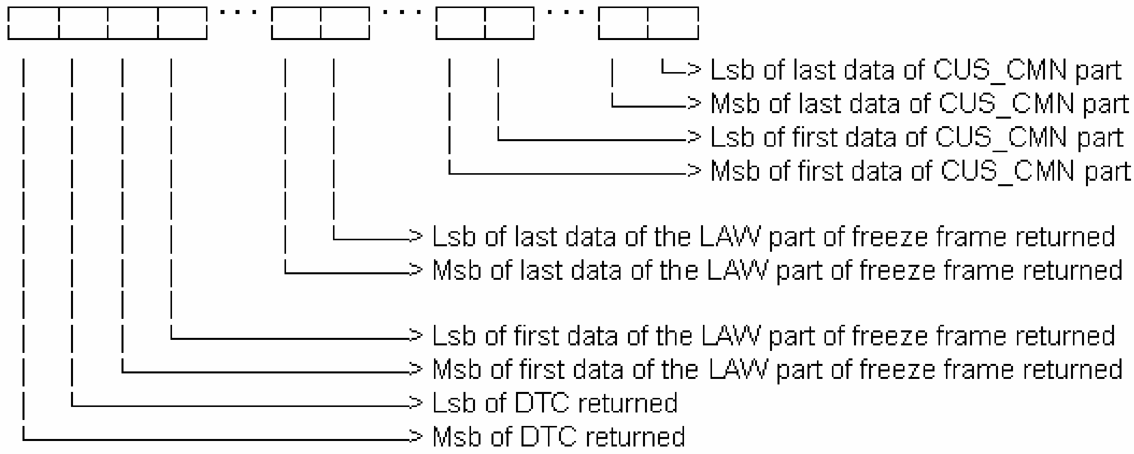
Then        Software structure is fill up with ENVD_OBD[u][IDX]
Endif
If          TypeOfFF = CUS_CMN
Then        Software structure is fill up with ENVD_CUS_CMN[v][IDX]
Endif
If          TypeOfFF = CUS_SET
Then        Software structure is fill up with
                    ENVD_CUS_SET_CMN[w][z][IDX] + ENVD_CUS_SET_SPC[y][z][IDX]
Endif
```

Combination of parameter Type OfFF is possible. For instance if TypeOfFF is equal to LAW and CUS_CMN, both part are returned. In case of multiple part of freeze frame to returned, , the following order is respected :

- Part LAW of the freeze frame is returned first ;
- Part CUS_CMN of the freeze frame is then returned ;
- Part CUS_SET of the freeze frame is then returned .

Example : In the case of a request with TypeOfFF = LAW and CUS_CMN then the following structure is returned :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



When a failure is found in dynamic memory with the right DtcIdentifier, the treatment is stopped. That means that only the freeze frame of the first DTC is found (oldest DTC) and returned by the API.
During all the software structure filling-in, if the software buffer is full then 2^{nd} bit of ResultFrf is set to BUFFER_FULL, software process is aborted.

B.65.6 API for erasing Diagnostic information

B.65.6.1 Clear the failure associated to DTC with a certain type.

Description :

Syntax : ACTION_ERRM_ClrInfoByTypeOfDtc (
IN <TypeOfDtc>,
OUT < ResultClrInfo>)

Parameter(in) : TypeOfDtc Type of DTC which is requested by the API
Parameter(out) : ResultClrInfo Indicate if some DTC are cleared or not
Short Description : This API clear all the failure in dynamic memory associated to DTC with a certain type. It permits also to reinitialised all readiness code.
Remark :
For reason of design, and time resource, it's recommended to activate this API when engine stop. (Ref. SAE Mode $04).

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

ResultClrInfo = INFO_NOT_CLEARED
For each failure stored in dynamic memory,
If the failure belongs to failures group defined by the parameter TypeOfDtc
Then ACTION_ERRM_EraseErr (IN<IDX>, SYNCHRONIZATION<CALL>)
All data in static memory related to failure XX (with XX = F(IDX)) is also cleared
ACTION_ERRM_ClcPermanentByErr(XX)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ResultClrInfo = INFO_CLEARED

Endif
Endfor
In the case TypeOfDTC = All, then, the whole static memory shall be cleared (same behavior as clear failure memory using LC_ERR_FMY_CLR calibration bit)
{ Permanent calculation at ERRM clearing }
In case of TypeOfDTC = All, then call also ACTION_ERRM_ClcPermanentIniErrm( )
{ All readiness bit are reinitialised }
ACTION_ERRM_InitReadiness (SYNCHRONIZATION<CALL>)
Retransmit “failure erase service received”

B.65.6.2 Clear the failure associated to a DTC

Description :

Syntax : ACTION_ERRM_ClrInfoByDtc (
IN <DtcIdentifier>,
IN <LevelOfDtc>,
OUT < ResultClrInfo>)

Parameter(in) : DtcIdentifier Number of DTC which is requested (identifier)
LevelOfDtc OBD or customer DTC is requested by the API
Parameter(out) : ResultClrInfo to say if some DTC are cleared or not
Short Description : This API clear all the failure in dynamic memory associated to a DTC. The erasing is also applicable when there are identical DTC identifiers in the memory.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

ResultClrInfo = INFO_NOT_CLEARED
{ All readiness bit are reinitialised }
ACTION_ERRM_InitReadiness (SYNCHRONIZATION<CALL>)
For each failure stored in dynamic memory **do**
ACTION_ERRM_GetReadyClass(XX, PRM_READY_CLAS)
If PRM_READY_CLAS <> 00h (CARB_MIS)
Then Condition for failure traitment is true
Endif
If NLC_TREAT_DIAG_MIS = 1
Then Condition for failure traitment is true
Endif
If Condition for failure traitment is true
Then **If** LevelOfDtc = LAW (OBD DTC)
Then **If** NC_ERR_DTC_REQ_OBD = SYMPTOM (access by symptom)
Then **For** each bit i which is set in ERR_SYM_DTC[IDX]

When a failure is found in dynamic memory with the right DtcIdentifier, the treatment is not stopped. That means that all failure with the right DTC are erased.

B.65.7 API to manage the entry or exit of Marked Mode

B.65.7.1 Activate/deactivate the marked mode with clear failure

Description :

Syntax : ACTION_ERRM_ControlDtcSettings (IN <MarkedMode>)
Parameter(in) : MarkedMode State of marked mode
Short Description : This API permits to activate or deactivate the marked mode. In this mode all new failure which appears are marked and then erased when we leave this mode (useful in End Of Line phase). For errm inhibition, please refer to ACTION_ERRM_ActivateMarkedMode ().

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

If MarkedMode = ON
Then LV_MKD_MOD = 1
Else LV_MKD_MOD = 0
For each failure (IDX) stored in dynamic memory,
If LV_ERR_MKD[IDX] = 1
Then ACTION_ERRM_EraseErr (IN<IDX>)
All data in static memory related to failure XX (with XX = F(IDX)) is also cleared
ACTION_ERRM_ClcPermanentByErr(XX)
Endif
EndFor
Endif

B.65.7.2 Activate/deactivate the marked mode without clearing failures

Description :

Syntax : ACTION_ERRM_ActivateMarkedMode (IN <MarkedMode>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter(in) : MarkedMode State of marked mode ON or OFF
Short Description : This API shall be used to activate/deactivate the marked mode. In this mode, each new occuring failure is marked.
This is useful for ERRM inhibition. This inhibition may be used during a reprogramming phase.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

If MarkedMode = ON
Then LV_MKD_MOD = 1
Else LV_MKD_MOD = 0
Endif

B.65.7.3 Deactivation of marked mode (security mechanism)

Description:

Purpose of this module is to add a security mechanism regarding marked mode. Because marked mode permits to inhibit error management, a strategy shall be introduced to avoid wrong inhibition.
This strategy is to deactivate marked mode at the end of driving cycle or at the next reset.

Application conditions

Initialisation: *none*

Recurrence: *none*

Activation: *at DCOFF event* ***or*** *at RST event*

Deactivation: *none*

Formula section:

If LV_MKD_MOD = ON
Then
MarkedMode = OFF
ACTION_ERRM_ControlDtcSettings (IN<MarkedMode>)
Endif

B.65.8 API for reading readiness code

B.65.8.1 Read the readiness code information

Description :

Syntax : ACTION_ERRM_ReadReadinessCode (
INOUT <ReadinessCode>,
OUT <ResultReadinessCode>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter(inout) : ReadinessCode Software structure fill with readiness code

Short Description : This API calculate and returns the readiness code information in the software structure.

Readiness code information are build from readiness flags.

Please see “Readiness Code” module of the “Error management” aggregate for more details.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

ResultReadinessCode = NEGATIVE_RESPONSE

(Calculation of STATE_READY_OBD_1)

STATE_READY_OBD_1 :

```
|_|_|_|_|_|_|_|_|

 | | | | | | | └-> bit0 : Misfire monitoring supported
 | | | | | | └---> bit1 : Fuel system monitoring supported
 | | | | | └-----> bit2 : Comprehensive component monitoring supported
 | | | | └-------> bit3 : GS/DS vehicle (NLC_OBD_DSL = 1 for DS, 0 for GS)
 | | | └---------> bit4 : Misfire monitoring status
 | | └-----------> bit5 : Fuel system monitoring status
 | └-------------> bit6 : Comprehensive component monitoring status
 └---------------> bit7 : Reserved
```

4 less significant bit of STATE_READY_OBD_1 = 4 less significant bit of C_STATE_READY_OBD_1
4 most significant bit of STATE_READY_OBD_1 = 4 less significant bit of C_STATE_READY_OBD_1
STATE_READY_OBD_2:

```
|_|_|_|_|_|_|_|_|    GS name / DS name

 | | | | | | | └-> bit 0 : Catalyst / NMHC Catalyst monitoring
 | | | | | | └---> bit 1 : Heated catalyst / NOx Cat-Adsorber monotoring
 | | | | | └-----> bit 2 : Evaporative system / reserved monitoring
 | | | | └-------> bit 3 : Secondary air system / Boost pressure monitoring
 | | | └---------> bit 4 : reseved by ISO/SAE
 | | └-----------> bit 5 : Oxygen sensor / Exhaust Gaz sensor monitoring
 | └-------------> bit 6 : Oxygen sensor heater / PM Filter monitoring
 └---------------> bit 7 : EGR system monitoring
```

STATE_READY_OBD_2 = C_STATE_READY_OBD_2

The readiness code calculation is performed in two steps:

1. setting of readiness of a specific group CARB_YY (e.g. CARB_SA, CARB_EVAP), depending on the dynamic Error Management. If at least one failure XX is confirmed with bit 4 of WAL_CONF_XX = 1 of the group CARB_YY, then the readiness of this group can be set to ready.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

2. setting of readiness of a specific group CARB_YY, depending on the failure XX individual readiness information LV_READY_XX. E.g. in case of a failure free system only step 2 is used for the readiness code calculation.

Step 1:

```
If CTR_ERR_DYN_NR != 0          (at least one failure stored in Error Management)
Then   For  IDX = 0 to CTR_ERR_DYN_NR - 1
            If      bit 4 of WAL_CONF_XX = 1   (failure is emission relevant)
                    with XX = DIAG_INST[IDX]
            and     LV_ERR_CFM[IDX] = 1                (failure is confirmed)
            Then    ACTION_ERRM_GetReadyClass(XX, PRM_READY_CLAS)
                    case PRM_READY_CLAS
                     00h (CARB_MIS) :                Bit 4 of STATE_READY_OBD_1 = 0
                     01h (CARB_FSD) :                Bit 5 of STATE_READY_OBD_1 = 0
                     02h (CARB_CC) :                 Bit 6 of STATE_READY_OBD_1 = 0
                     03h (CARB_CAT/CARB_NMHC) :  Bit 0 of STATE_READY_OBD_2 = 0
                     04h (CARB_HC/CARB_NT) :       Bit 1 of STATE_READY_OBD_2 = 0
                     05h (CARB_EVAP) :               Bit 2  of STATE_READY_OBD_2 = 0
                     06h (CARB_SA/CARB_BPA) :      Bit 3 of STATE_READY_OBD_2 = 0
                     07h             :              Bit 4 reserved by ISO/SAE always   0
                     08h (CARB_LS/CARB_EG) :              Bit 5 of STATE_READY_OBD_2 = 0
                    09h (CARB_LSH/CARB_PF) :        Bit 6 of STATE_READY_OBD_2 = 0
                    0Ah (CARB_EGR) :                Bit 7 of STATE_READY_OBD_2 = 0
            Endif
       Endfor
Endif
```

Step 2:

Distinction between GS vehicle and DS vehicle
Bit 3 of STATE_READY_OBD_1 = NLC_OBD_DSL

For each failure XX call ACTION_ERRM_GetReadyClass(XX, PRM_READY_CLAS) to retrieve the readiness code group.

Misfire monitoring status bit4 :

```
    If        Bit 4 of C_STATE_READY_CMPL_OBD_1 = 0
    Then
        if    (LV_READY_XX) = 0
                         Take into account all LV_READY_XX which fulfill the following condition:
                   PRM_READY_CLAS = 00h (CARB_MIS) and
                   the bit 4 of WAL_CONF_XX = 1 (CARB/EOBD failure)
        then       Bit 4 of STATE_READY_OBD_1 = 0
        endif
    Else
          Readiness for Misfire monitoring status is set
          Bit 4 of STATE_READY_OBD_1 = 0
    EndIf
```

Fuel system monitoring status bit5 :

```
    If        Bit 5 of C_STATE_READY_CMPL_OBD_1 = 0

Then Bit 7 of STATE_READY_OBD_2 = 0
Endif

ReadinessCode structure is filled up with : C_STATE_READY_OBD_2, STATE_READY_OBD_1 and STATE_READY_OBD_2.
ResultReadinessCode = POSITIVE_RESPONSE

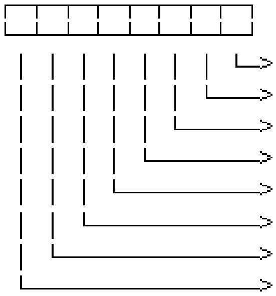
Definition of Readiness Code:
In C_STATE_READY_OBD_1, a bit set to 1 means that corresponding test is supported according to the J1979 standard.
C_STATE_READY_OBD_1 :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

bit0 : Misfire monitoring supported
bit1 : Fuel system monitoring supported
bit2 : Comprehensive component monitoring supported
bit3 = 0 (reserved)
bit4 = 0 (reserved)
bit5 = 0 (reserved)
bit6 = 0 (reserved)
bit7 = 0 (reserved)

With C_STATE_READY_OBD_CMPL_OBD_1, it's possible to set directly Misfire, Fuel system, and comprehensive component readiness codes to "ready" status.

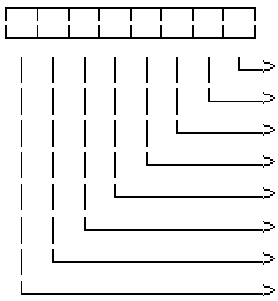
In C_STATE_READY_OBD_2, a bit set to 1 means that corresponding test is supported according to the J1979 standard.
C_STATE_READY_OBD_2:



GS name / DS name
bit 0 : Catalyst / NMHC Catalyst monitoring
bit 1 : Heated catalyst / NOx Cat-Adsorber monotoring
bit 2 : Evaporative system / reserved monitoring
bit 3 : Secondary air system / Boost pressure monitoring
bit 4 : reserved by ISO/SAE bit4 always 0
bit 5 : Oxygen sensor / Exhaust Gaz sensor monitoring
bit 6 : Oxygen sensor heater / PM Filter monitoring
bit 7 : EGR system monitoring

Calibration data detailled description for C_STATE_READY_CMPL_OBD_1 :
Readiness code calculation for CARB_MIS, CARB_FSD, CARB_CC diagnosis :
0: readiness of conserned group is calculated based on the readiness of each comprehensive component diagnostic
1: readiness of conserned group always indicates "ready"

C_STATE_READY_CMPL_OBD_1:



bit0 : 0
bit1 : 0
bit2 : 0
bit3 : 0
bit4 : set directly readiness for Misfire monitoring
bit5 : set directly readiness Fuel system monitoring
bit6 : set directly readiness Comprehensive component monitoring
bit7 : 0

B.65.8.2 Read the readiness code information for customer specific purpose

Description :

Syntax : ACTION_ERRM_ReadReadinessCodCus(

INOUT <ReadinessCode>,
OUT <ResultReadinessCode>)

Parameter(inout): ReadinessCode Software structure filled-up with customer specific readiness code

Short Description : This API calculates and returns the readiness code information in the software structure.
Readiness code information are built thanks to readiness flags.
Please see “Readiness Code” module of the ERRM aggregate for more details.

Application conditions:

Deactivation : -
Initialization: -
Recurrence : -

Formula section :

ResultReadinessCode = NEGATIVE_RESPONSE

(Calculation of STATE_READY_OBD_3)

STATE_READY_OBD_3 :

```
|_|_|_|_|_|_|_|_|
 | | | | | | | └─> bit0 : for diagnosis classified as CARB_OTHER
 | | | | | | └───> bit1 : for diagnosis classified as NO_CARB
 | | | | | └─────> bit2 : 0
 | | | | └───────> bit3 : 0
 | | | └─────────> bit4 : 0
 | | └───────────> bit5 : 0
 | └─────────────> bit6 : 0
 └───────────────> bit7 : 0
```

STATE_READY_OBD_3 = C_STATE_READY_OBD_3

For each failure XX call ACTION_ERRM_GetReadyClass(XX, PRM_READY_CLAS) to retrieve the readiness code group.

Diagnosis classified as CARB_OTHER bit0:
If (LV_READY_XX) = 0
Take into account all LV_READY_XX which fulfill the following condition:
PRM_READY_CLAS = 0Bh (CARB_OTHER) **and**
the bit 4 of WAL_CONF_XX = 1 (CARB/EOBD failure)
Then Bit 0 of STATE_READY_OBD_3 = 0
Endif

Diagnosis classified as NO_CARB bit1
If (LV_READY_XX) = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Take into account all LV_READY_XX which fulfill the following condition:
PRM_READY_CLAS = 0Ch (NO_ CARB) **and**
the bit 4 of WAL_CONF_XX = 0 (CARB/EOBD failure)
Then Bit 1 of STATE_READY_OBD_3 = 0
Endif

ReadinessCode structure is filled-up with : C_STATE_READY_OBD_3, STATE_READY_OBD_3.
ResultReadinessCode = POSITIVE_RESPONSE

Definition of Readiness Code:
This readiness code does not follow existing J1979 standard.
C_STATE_READY_OBD_3 :

```
|_|_|_|_|_|_|_|_|
 | | | | | | | └─> bit0 : for diagnosis classified as CARB_OTHER
 | | | | | | └───> bit1 : for diagnosis classified as NO_CARB
 | | | | | └─────> bit2 : 0

 | | | └─────────> bit4 : 0
 | | └───────────> bit5 : 0
 | └─────────────> bit6 : 0
 └───────────────> bit7 : 0
```

B.65.9 Rate-Based Monitoring - Communication interface

FUNCTION DESCRIPTION:

Description:

The Rate-Based Monitoring statistics shall be reported to the Scan-Tool via the Mode $09.
The data to be transmitted are :

- Ignition cycle counter
- General denominator
- For each group of monitors, individual numerator and denominator of the monitor which has the lowest In-Use Performance ratios.

These statistics are required and transmitted within Mode $09 for the monitors of the following groups :

Gasoline system	*Diesel system*
Catalyst bank 1	NMHC catalyst
Catalyst bank 2	NOx reduction catalyst
Oxygen sensor upstream bank 1	NOx adsorber
Oxygen sensor upstream bank 2	Particulate matter filter
EGR system and/or VVT system	Exhaust gas sensor bank 1
Secondary air system	EGR system and/or VVT system
Evaporating system	Boost pressure control
Oxygen sensor downstream bank 1	
Oxygen sensor downstream bank 2	

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The selection of data to be displayed on Scan-Tool shall respect some rules :

- For each group of monitors, the individual numerator and denominator of monitor which has the lowest numerical In-Use Performance ratio shall be reported.
- If two or more specific monitors of the same group have identical ratios, the corresponding numerator and denominator for the specific monitor that has the highest denominator shall be reported.
- Depending on system configurations, some components might not exist (e.g. O2 Sensor for bank 2 on vehicles with 1 bank engine). In this case the numerator and denominator shall be set to 0.

B.65.9.1 API to select Rate-Based Monitoring data to be transmitted via Mode $09

The following paragraph descibes the data selection algorithm to be executed only once (for CPU load saving reason), upon external tool request via Mode $09.

Description for action:

ACTION_ERRM_*SelectRbmData* (<PRM_CTR_MOD_9_RBM[36]>, <PRM_RES_MOD_9>)					
This API calculates and returns the Rate-Based Monitoring data to be transmitted to the Scan-Tool, when requested by the Mode 09$ (InfoType $08).					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_CTR_MOD_9_RBM[36]	INOUT	0...FFFFH	0...65535	1	[-]
Table of counters to be reported to Scan Tool with Mode $09					
PRM_RES_MOD_9	OUT	0H 1H	NEGATIVE_RESPONSE POSITIVE_RESPONSE	1	[-]
Indicates if action has been executed or not					

PRM_CTR_MOD_9_RBM[36] detailled description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.65.9.2 API to select RBM statistic with lowest in-use performance ratio within one single group

General information:

This API shall be used to determine, within one single group (see specification “Rate-Based Monitoring (Appl. Inc.)”), the counters of the monitor which has the lowest in-use performance ratio.

Description for action:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_*SelectRbmByGroup*(<PRM_GROUPNAME>,<PRM_NUMERATOR>,<PRM_DENOMINATOR>,<PRM_RESULTRBMDATABYGROUP>)					
This API calculates and returns the Rate-Based Monitoring data with lowest ratios, within one single group.					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_GROUPNAME	IN	0...FFH	0...255	1	[-]
Group name					
PRM_NUMERATOR	INOUT	0...FFFFH	0...65535	1	[-]
Numerator of monitor with lowest ratio in the required group					
PRM_DENOMINATOR	INOUT	0...FFFFH	0...65535	1	[-]
Denominator of monitor with lowest ratio in the required group					
PRM_RESULTRBMDATA BYGROUP	OUT	0H 1H	NEGATIVE_RESPONSE POSITIVE_RESPONSE	1	[-]
Indicates if the Action has been executed or not

B.65.9.3 API to clear all Rate-Based Monitoring statistics

General information:

Regulation text :
*"Each number shall be reset to zero only when a non-volatile memory reset occurs (e.g., reprogramming event, etc.) or, if the numbers are stored in keep-alive memory (KAM), when KAM is lost due to an interruption in electrical power to the control module (e.g., battery disconnect, etc.). Numbers may not be reset to zero under any other circumstances including
when a scan tool command to clear fault codes or reset KAM is received."*

The service provided in this paragraph shall be used to clear all the Rate-Based Monitoring statistics after a reprogramming session of ECU software and/or calibration data.

This service shall not be called when a Scan Tool command to clear faults (Mode 04$) is received.

Description for action:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_*ClearRbmStatistics* (< PRM_RESULTCLRINFO>)					
This function clears Rate-Based Monitoring statistics. Remark : For design and CPU resource reasons, this API shall be called while engine is stopped.					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_RESULTCLRINFO	OUT	0H 1H	NOT_CLEARED CLEARED	1	[-]
This data informs about rate-based monitoring statistics clearing completion status

B.66.1 Communication interface for BMW diagnosis tool

FUNCTION DESCRIPTION:

General information:

This communication interface is to define the data contents needed for the BMW diagnosis information. The Information in the Fault-type-byte and Fault-type-extension-byte is bit-coded and requested via KWP communication.

Application conditions

Initialisation: *managed in the specific chapters*

Recurrence: *managed in the specific chapters*

Activation: *see chapter KWP communication*

Formula section:

Definition of ERR_TYPE_BYTE[x]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Bit No:	Description	Input
0	Specifies the error symptom: 0001-Short circuit to VBATT or signal / value above threshold (Max)	**IF** ENVD_CUS_SET_CMN[1][x] = 1H
1	Specifies the error symptom: 0010-Short circuit to ground or signal / value below threshold (Min)	**IF** ENVD_CUS_SET_CMN[1][x] = 2H
2	Specifies the error symptom: 0100-Open circuit or no signal (Sig)	**IF** ENVD_CUS_SET_CMN[1][x] = 4H
3	Specifies the error symptom: 1000-Implausible signal / condition (Plaus)	**IF** ENVD_CUS_SET_CMN[1][x] = 8H
4	BMW Readiness flag. The bit is set to 0 if the test conditions are met and the diagnostic runs to completion at least once after the fault memory has been cleared, or after power failure	**IF** LV_READY_XX = 0
5	This bit is set when the fault has been saved to the fault memory as OBD debounced.	**IF** LV_DC_MAX[x] = 1
6	This bit is set when the fault is currently present	**IF** LV_ERR_XX = 1
7	MIL calibration status, specifies wheather the MIL is to be activated	**IF** MIL_ON bit of WAL_CONF_XX =1

Definition of ERR_TYPE_EXT_BYTE[x]

Bit No:	Description	Input
0	Only for Diagnostic diagnosis; This bit is set if the diagnosis is currently running	**For diagnostic diagnosis**** LV_END_DIAG_XX = 0 **AND** LV_CDN_DIAG_XX = 1
1	Only for Diagnostic diagnosis; This bit is set if the diagnosis is interrupted for this driving cycle	**For diagnostic diagnosis**** Not defined yet
2	Cycle flag. The bit is set if the diagnosis runs to completion in this driving cycle	**IF** LV_END_DIAG_XX = 1
3	This bit is to be set if the fault is stored as a result of an action by an tester	**IF** LV_ERR_MKD[x] = 1
4	This bit is to be set if the fault is currently requesting the MIL to be illuminated.	**IF** LV_DC_MAX[x] = 1 **AND** MIL_ON bit of WAL_CONF_XX =1
5	This bit is set if MIL debouncing has been achieved, the MIL is not currently being requested for this fault and output via the Scan Tool interface has not yet occured (HLC =0 & DLC >0). (former OBDII error)	**IF** LV_ERR_CFM[x] = 1 **AND** CTR_DC[x] = 0 **AND** MIL_ON bit of WAL_CONF_XX =1 **AND** CTR_WUP_CYC[x] > 0
6	Not yet defined	
7	Not yet defined	

**Diagnostic diagnosis are all sequential diagnosis (see Table of failures - CARB status)

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.67.1 Driving cycle

FUNCTION DESCRIPTION:

Copyright (C) Continental AG,2007

General information:

Description:

A driving cycle consists of a vehicle operation phase from engine startup to engine shutoff and includes the power-lach phase after the engine running phase (In order manage all OBD failures set only in PWL phase).
After key is on, the flag LV_DC is set when the engine exits from “engine start” state.
The flag LV_DC is reset at the end of the power-latch phase before the NVMY management. In case of a LV_IGK 0→1 transition during the powerlatch phase or at ECU reset LV_DC is also reseted.

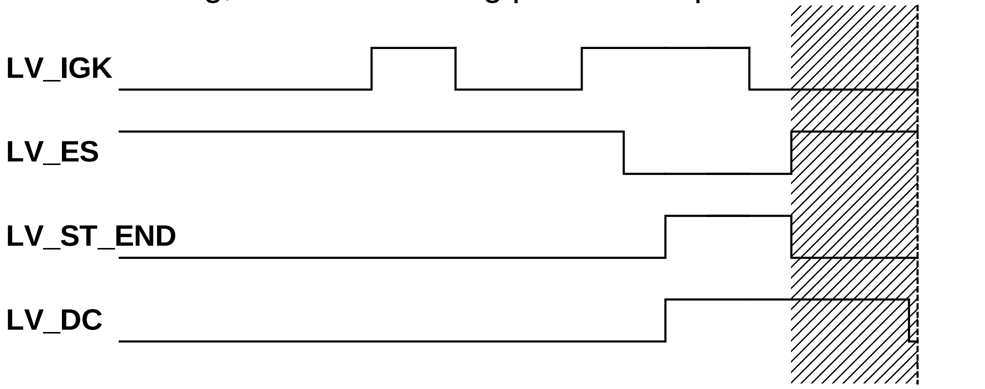
Remark :
For simplification and global coherence, the following rule is applied:
Engine stalling is ignored (if engine restarts after stalling, without key-off/key-on transition, the cycle is considered as the same driving cycle).

Signal flow diagram:

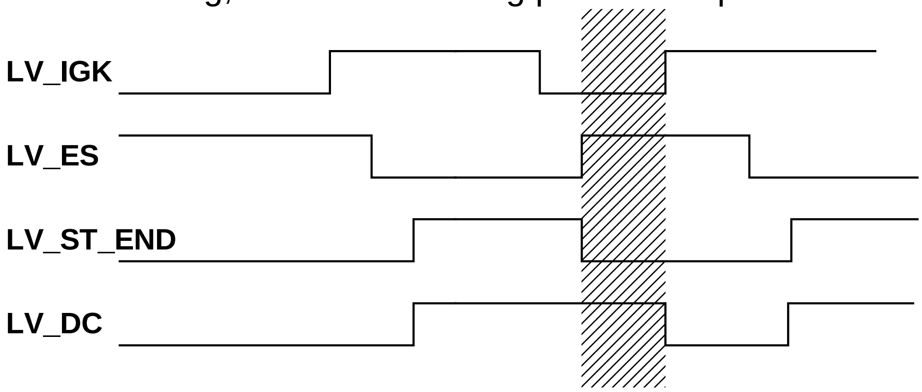
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

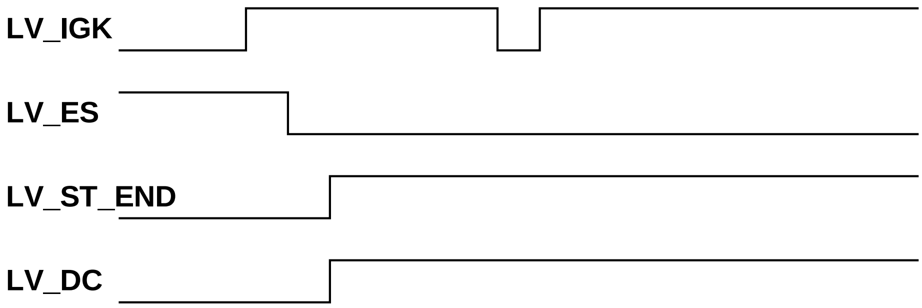
Normal cranking, no restart during powerlatch phase



Normal cranking, with restart during powerlatch phase



Short key off/on while engine is running



Application conditions

Initialisation:

```
At RST system event
     LV_DC = 0
   Before storage of data of the error management within the
NVMY
 the driving cycle is finished.
```

Recurrence: –

Activation: *see Formula section*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Activation:

If LV_ST_END 0→1 transition

Then

LV_DC = 1

Endif

Deactivation:

If LV_IGK 0→1 transition

and

LV_ES =1

Then

LV_DC = 0

Before clearing static and dynamic memory (e.g. LV_END_DIAG_XX) call :

ACTION_ERRM_*ClcPermanentResetDC*()

Endif

If End of power-latch phase is reached (before NVMY storing)

Then

LV_DC = 0

Before clearing static and dynamic memory (e.g. LV_END_DIAG_XX) call :

ACTION_ERRM_*ClcPermanentResetDC*()

Endif

B.67.2 Warm-Up Cycle and Warm-Up Status

FUNCTION DESCRIPTION:

General information:

The detection of the warm-up cycle is based on the coolant temperature. The warm-up cycle is detected as soon as the coolant temperature reaches C_TCO_WUP_THD and the change with regard to the starting temperature exceeds C_TCO_WUP_INC. These values are defined by law, so a change of these values is only for development validation commodity.

The application must guarantee warm-up cycle detection when a coolant temperature sensor error exists.

Therefore if a coolant temperature sensor error has been debounced, the threshold for warm-up cycle detection are referred to the backup coolant temperature value computed by the engine control (see chapter “Diagnosis and emergency operation”).

The warm-up status is needed for similar driving conditions test.

Application conditions

Initialisation: *At RST system event* **or** *LV_DC 1→0 transition (after warm-up cycle counter management)*

LV_WUP_CYC =0
LV_STATE_WUP = 0

Recurrence: *1 s*

Activation: *LV_DC = 1*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If LV_INH_WUP_CYC = 0
Then
    If TCO_DSL_CMN > C_TCO_WUP_THD
    Then
        LV_STATE_WUP = 1
        If TCO_DSL_CMN > (TCO_ST_DSL_CMN + C_TCO_WUP_INC)
        and
        TCO_ST_DSL_CMN < C_TCO_ST_MAX_INH_WUP_CYC
        Then
            LV_WUP_CYC = 1
        Endif
    Endif
Endif

Calibration hint:

C_TCO_WUP_THD = at least 72 °C for gasoline engines (OBD II requirement)
at least 70 °C for gasoline engines (EOBD requirement)
at least 60 °C for diesel engines (OBD II requirement)
C_TCO_WUP_INC = at least 23 °C for gasoline engines (OBD II requirement)
at least 22 °C for gasoline engines (EOBD requirement)

Customer specific requirement for gasoline and diesel to inhibit the warm up cycle in case of TCO at engine start > C_TCO_ST_MAX_INH_WUP_CYC

C_TCO_ST_MAX_INH_WUP_CYC = 71,1 °C (customer specific requirement)

C_TCO_ST_MAX_INH_WUP_CYC = 142.5°C (generic no inhibition)

B.67.3 Standardized vehicle operation for permanent fault code erasing after Mode $04

FUNCTION DESCRIPTION:

General information:

A special driving cycle (LV_DC_PERM) for permanent fault code clearing after Mode $04 is defined, which is set, if the following standardized vehicle operations are fulfilled:

- Cumulated trip length (time since engine start) T_AST_PERM >= C_T_AST_RBM

(CARB : 600 s)

- Cumulative vehicle operation >= C_VS_THD_RBM for minimum of C_T_VS_RBM

(CARB : >= 40 km/h (25mph) for at least 300 s)

- Continuous vehicle operation in idle equal or longer than C_T_IS_RBM (accelerator pedal released and vehicle speed less or equal than 1 mph)

(CARB : 30 s)

wathever

- altitude condition is (no criteria for ambient pressure si defined)
- ambient temperature is (no criteria on ambient temperature is defined)

Within STATE_DC_PERM the different conditions necessary to set LV_DC_PERM are visualized.
STATE_DC_PERM

General information

B.68.1 Inhibition of standardized vehicle operation operation for permanent fault code erasing after Mode $04

General information:

With the value LV_INH_DC_PERM the inhibition of the standardized vehicle operation calculation for permanent fault code erasing after Mode $04 is controlled. The OBD II system shall disable it if a malfunction of any component used to determine if the following criteria are satisfied (i.e., vehicle speed, idle operation, time of operation, ...) has been detected. Calculations shall resume as soon as the malfunction is no longer present.

Criteria required to set LV_DC_PERM (standardized vehicle operation for permanent code)

- Cumulated trip length (time since engine start) T_AST_PERM >= C_T_AST_RBM
  (CARB : 600 s)

- Cumulative vehicle operation >= C_VS_THD_RBM for minimum of C_T_VS_RBM
  (CARB : >= 40 km/h (25mph) for at least 300s)

- Continuous vehicle operation in idle equal or longer than C_T_IS_RBM
  (accelerator pedal released and vehicle speed less or equal than 1 mph)
  (CARB : 30 s)

whatever
- altitude condition is (no criteria for ambient pressure is defined)
- ambient temperature is (no criteria on ambient temperature is defined)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.68.2 Standardized vehicle operation adaptations

General information:

Due to new vehicles configurations encountered (Stop& Start, conventional combustio engine), CARB standardized vehicle operations (LV_DC_RBM) defined for conventional vehicles may be difficult to reach, mainly because some engine states are no more covered (idle mode).

CARB regulation:

"For hybrid vehicles, vehicles that employ alternate engine start hardware or strategies (e.g., integrated starter and generators), or alternate fuel vehicles (e.g., dedicated, bi-fuel, or dual-fuel applications), the manufacturer may request Executive Officer approval to use alternate criteria to that set forth in section (d)(4.3.2)(B) above for incrementing the denominator. In general, the Executive Officer shall not approve alternate criteria for vehicles that only employ engine shut off at or near idle/vehicle stop conditions. Executive Officer approval of the alternate criteria shall be based on the equivalence of the alternate criteria to determine the amount of vehicle operation relative to the measure of conventional vehicle operation in accordance with the criteria in section (d)(4.3.2)(B) above."

The purpose of the following formula section is to povide or re-build missing data so as to keep CARB standardized vehicle operation definition.

Application conditions:

Initialisation: at RST system event
LV_IS_PERM = 1

Activation: all ECU states

Deactivation: -

Recurrence: 100 ms

DTC table declaration for the diagnosis instance XX, J2012 shall be applied on OBD/CARB part					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_ERR_DTC_CONF	-	0... 5H	0 ...5	1	-
Type of DTCs displayed through ERR_DTC[IDX]					
NC_LDP_1_DTC_TABLE_SIZE	-	0... FH	0... 15	1	-
Table size definition for ID_ERR_DTC_XX; set to NC_NR_DTC_FMT+1					
NC_LDP_2_DTC_MIS_TABLE_SIZE	-	0... FH	0... 15	1	-
Table size definition for ID_ERR_DTC_MIS; set to NC_CYL_NR+2					
NC_LDP_2_DTC_TABLE_SIZE	-	0... FH	0... 15	1	-
Table size definition for ID_ERR_DTC_XX; set to 6-NC_NR_DTC_FMT					
NC_NR_DTC_FMT	-	0... 1H	0 ...1	1	-
Selection of 6 or 10 DTCs configurations					

Action definition

ACTION_ERRM_EraseDtc (**IN**<IDX>)	Mode: O
This action erases the memorized symptom of the failure IDX	

ACTION_ERRM_StoreDtc (**IN**<IDX>)	Mode: O
This action stores the memorized symptom of the first occurrence of the failure IDX to build the DTC	

ACTION_ERRM_StoreDtcLst (**IN**<IDX>)	Mode: O
This action stores the memorized symptom of the last occurrence of the failure IDX to build the DTC	

FUNCTION DESCRIPTION:

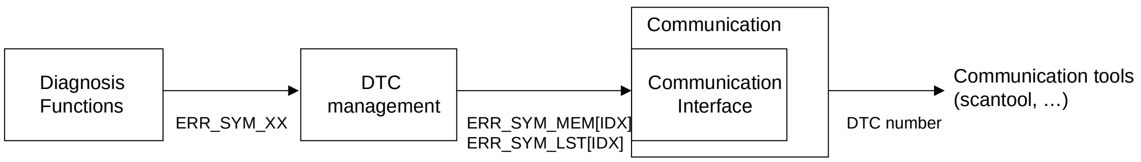
General information:

Purpose of this module is to catch some data (ERR_SYM_XX) when a failure occurs. Then, these data (ERR_SYM_MEM[IDX] and ERR_SYM_LST_[IDX]) are used to generate a code called DTC upon

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

communication tool request (see Communication interface module). Additionally, for visualization (for communication tool, developpment purposes), a DTC code is stored in memory (ERR_DTC_[IDX]).
The DTC is a code used to identify the symptom of the failure or the failure (global failure). It is an interface between the diagnosis and the communication.
The customer and/or EOBD/CARB according to the standard J2012 define this DTC.
DTC encoding for regulation EOBD/CARB shall be done using J2012 definition (2 bytes interpreted [0000h to FFFFh] in hex, [P0000 to U3FFF] in J2012).
DTC encoding for customer is free. It can be in decimal, or applying J2012 definition, or any other encoding definition.

Signal flow diagram:



B.69.1 DTC Storage

B.69.1.1 DTC Storage /First occurence

Description:

When the failure IDX gets present (1^{st} occurrence), the detected of the first symptom is stored in the 2^{nd} layer memory by calling the action ACTION_ERRM_StoreDtc (IN<IDX>). Additionally, a DTC code is stored in dynamic memory for visualization :

- related to the symptom DTC if NC_ERR_DTC_CONF = 0
- related to the failure OBD DTC if NC_ERR_DTC_CONF = 1
- related to the customer specific symptom DTC if NC_ERR_DTC_CONF = 2
- related to the customer specific failure DTC if NC_ERR_DTC_CONF = 3

Syntax : ACTION_ERRM_StoreDtc (IN <IDX>)
Parameter (in) : IDX Index of failure in 2^{nd} layer memory to store the DTC
Parameter (out) : -
Short description : This action stores the memorised symptom of the first occurrence of the failure IDX to build the DTC

Application conditions

Initialization:

```
ERR_SYM_MEM[IDX] is restored from the NVMY
 SYM_CYL_MEM_MIS_A, SYM_CYL_MEM_MIS_B1 and
 SYM_CYL_MEM_MIS_B4 are restored from NVMY
    In case of damaged NVMY, ERR_SYM_MEM[IDX] = 0
         SYM_CYL_MEM_MIS_A = 0,
         SYM_CYL_MEM_MIS_B1 = 0,
         SYM_CYL_MEM_MIS_B4 = 0,
         ERR_DTC[IDX] = 0
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.69.1.2 DTC Storage /Last occurence

Description:

For each occurence of the failure IDX (Last occurrence), the detected of the last symptom is stored in the 2^{nd} layer memory by calling the action ACTION_ERRM_StoreDtcLst (IN<IDX>).

Syntax : ACTION_ERRM_StoreDtcLst (IN<IDX>)
Parameter (in) : IDX Index of failure in 2^{nd} layer memory to store the DTC
Parameter (out) : -
Short description : This action stores the memorised symptom of the last occurrence of the failure IDX to build the DTC

Application conditions

Initialization:
```
ERR_SYM_LST[IDX] is restored from the NVMY
 SYM_CYL_LST_MIS_A, SYM_CYL_LST_MIS_B1 and
 SYM_CYL_LST_MIS_B4 are restored from NVMY
    In case of damaged NVMY, ERR_SYM_LST[IDX] = 0

B.69.2 DTC storage for the Misfiring (with NLC_TREAT_DIAG_MIS = 0, Misfire by type)

Description:

As describe above, the cylinder in default is memorised at the first occurrence. In this part each new cylinder in default will be memorised.

Application conditions

Initialization: treated above

Recurrence: For Misfire A, B1 and B4:
Misfire segmentsynchronous

Activation: –

Formula section:

For a misfiring A diagnosis :
SYM_CYL_MEM_MIS_A is updated with the new additional bits (cylinder, multiple and random) of SYM_CYL_MIS_A
For a misfiring B1 diagnosis :
SYM_CYL_MEM_MIS_B1 is updated with the new additional bits (cylinder, multiple and random) of SYM_CYL_MIS_B1
For a misfiring B4 diagnosis :
SYM_CYL_MEM_MIS_B4 is updated with the new additional bits (cylinder, multiple and random) of SYM_CYL_MIS_B4.

B.69.3 DTC deleting

Description:

When the failure IDX is erased from 2^{nd} layer memory, the memorised detected symptom is also erased by calling the action ACTION_ERRM_EraseDtc (IN <IDX>).
Syntax : ACTION_ERRM_EraseDtc (IN <IDX>)
Parameter (in) : IDX Index of failure in 2^{nd} layer memory to store the DTC
Parameter (out) : -
Short description : This action erases the memorised symptom of the failure IDX

Application conditions

Initialization: –

Recurrence: –

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation: `at Action request`

Formula section:

If NLC_TREAT_DIAG_MIS = 0
(Misfire are treated by type (LV_ERR_MIS_A, MIS_B1 and MIS_B4 is defined))
Then For a misfiring A diagnosis :
SYM_CYL_MEM_MIS_A = 0
SYM_CYL_LST_MIS_A = 0
ERR_DTC[IDX] = 0
For a misfiring B1 diagnosis :
SYM_CYL_MEM_MIS_B1 = 0
SYM_CYL_LST_MIS_B1 = 0
ERR_DTC[IDX] = 0
For a misfiring B4 diagnosis :
SYM_CYL_MEM_MIS_B4 = 0
SYM_CYL_LST_MIS_B4 = 0
ERR_DTC[IDX] = 0
Endif

For other diagnoses, including misfire diagnoses if treated by cylinder (LV_ERR_MIS_x is defined) :
ERR_SYM_MEM[IDX] = 0
ERR_SYM_LST[IDX] = 0
ERR_DTC[IDX] = 0

B.69.4 Calibratable DTC number

Description:

The DTC numbers are defined by a calibration table called ID_ERR_DTC_XX.
This table defined for each failure XX :

a) with NC_NR_DTC_FMT = 0

- a DTC number for each symptom of the failure XX
- a global OBD DTC number for the failure XX
- a global customer specific DTC number

b) with NC_NR_DTC_FMT = 1

- a OBD DTC number for each symptom of the failure XX
- a global OBD DTC number for the failure XX
- a customer specific DTC number for each symptom of the failure XX
- a global customer specific DTC number

When a DTC is request by a diagnostic tool, the Communication Interface module build up the DTC number with information :

- ERR_SYM_MEM[IDX] and /or ERR_SYM_LST[IDX] stored in 2^{nd} layer memory ;
- Contents of table ID_ERR_DTC_XX .

There is a particular case for misfiring (MIS_A, MIS_B1, MIS_B4) diagnosis. The DTC numbers are defined by cylinder in a calibration table called ID_ERR_DTC_MIS.
(used if NLC_TREAT_DIAG_MIS = 0; Misfire by type)

- ID_ERR_DTC_MIS[0] [i] is the DTC for misfiring detection on the cylinder number i +1
- ID_ERR_DTC_MIS[0] [NC_CYL_NR] is the DTC for multiple misfiring
- ID_ERR_DTC_MIS[0] [NC_CYL_NR +1] is the DTC for random misfiring

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- ID_ERR_DTC_MIS[1] [i] is the customer DTC for misfiring detection on the cylinder number i+1
- ID_ERR_DTC_MIS[1] [NC_CYL_NR] is the customer DTC for multiple misfiring
- ID_ERR_DTC_MIS[1] [NC_CYL_NR +1] is the customer DTC for random misfiring

Example 1:

The failure TCO (coolant temperature) is stored in the 2nd layer memory. The calibratable table of DTC has the following value :

a) with NC_NR_DTC_FMT = 0

DTC of the 1st symptom	DTC of the 2nd symptom	DTC of the 3rd symptom	DTC of the 4th symptom	Global DTC of the failure	Specific customer code
ID_ERR_DTC_TCO [0] [0] = 0118h (P0118)	ID_ERR_DTC_TCO [0] [1] = 0117h (P0117)	ID_ERR_DTC_TCO [0] [2] = 0119h (P0119)	ID_ERR_DTC_TCO [0] [3] = 0116h (P0116)	ID_ERR_DTC_TCO [0] [4] = 0115h (P0115)	ID_ERR_DTC_TCO [0] [5] = 30

b) with NC_NR_DTC_FMT = 1

	DTC of the 1st symptom	DTC of the 2nd symptom	DTC of the 3rd symptom	DTC of the 4th symptom	Global DTC of the failure
OBD DTC	ID_ERR_DTC_TCO [0] [0] = 0118h (P0118)	ID_ERR_DTC_TCO [0] [1] = 0117h (P0117)	ID_ERR_DTC_TCO [0] [2] = 0119h (P0119)	ID_ERR_DTC_TCO [0] [3] = 0116h (P0116)	ID_ERR_DTC_TCO [0] [4] = 0115h (P0115)
Customer DTC	ID_ERR_DTC_TCO [1] [0] = 31	ID_ERR_DTC_TCO [1] [1] = 32	ID_ERR_DTC_TCO [1] [2] = 33	ID_ERR_DTC_TCO [1] [3] = 34	ID_ERR_DTC_TCO [1] [4] = 30

Upon request from the diagnosis tool, the DTC number sent to the tool will be one of the numbers defined in ID_ERR_DTC_TCO regards the symptom detected.

Example 2 :

One failure misfiring (LV_ERR_MIS_A, LV_ERR_MIS_B1 or LV_ERR_MIS_B4) is stored in the 2nd layer memory. The application is a NC_CYL_NR -cylinder engine. The calibratable table of DTC has the following value :

	Misfiring on 1st cylinder	Misfiring on 2nd cylinder	Misfiring on 3rd cylinder	Misfiring on 4th cylinder	...	Misfiring on NC_CYL_NR th cylinder	Multiple Misfiring	Random Misfiring
OBD DTC	ID_ERR_DTC_MIS [0] [0] = 0301h (P0301)	ID_ERR_DTC_MIS [0] [1] = 0302h (P0302)	ID_ERR_DTC_MIS [0] [2] = 0303h (P0303)	ID_ERR_DTC_MIS [0] [3] = 0304h (P0304)	...	ID_ERR_DTC_MIS [0] [NC_CYL_NR - 1] = 03xxh (P03xx)	ID_ERR_DTC_MIS [0] [NC_CYL_NR] = 0300h (P0300)	ID_ERR_DTC_MIS [0] [NC_CYL_NR + 1] = 0300h (P0300)
Customer DTC	ID_ERR_DTC_MIS [1] [0] = 11	ID_ERR_DTC_MIS [1] [1] = 12	ID_ERR_DTC_MIS [1] [2] = 13	ID_ERR_DTC_MIS [1] [3] = 14	...	ID_ERR_DTC_MIS [1] [NC_CYL_NR - 1] = 16	ID_ERR_DTC_MIS [1] [NC_CYL_NR] = 10	ID_ERR_DTC_MIS [1] [NC_CYL_NR + 1] = 10

Upon request from the diagnosis tool, the DTC number sent to the tool will be one of the numbers defined in ID_ERR_DTC_MIS regards the symptom detected.
With :

NC_LDP_1_DTC_TABLE_SIZE = NC_NR_DTC_FMT +1

B.70 Diagnostic trouble code management (Appl. Inc.)

B.70.1 Definition of additional DTC information

FUNCTION DESCRIPTION:

General information:

For several diagnosis services it is necessary to transmit an additional information for each symptom.

Description:

These additional information can be calibrated for each symptom of a failure XX with the table ID_ERR_DTC_INFO_XX.

For this project it s used to define the DTCFailureTypeByte according to ISO 14229.

Example for diagnostic instance V_TCO_RNG:

additional Info for SYM_0	additional Info for SYM_1	additional Info for SYM_2	additional Info for SYM_3
ID_ERR_DTC_INFO_V_TCO_RNG[0] = 05h	ID_ERR_DTC_INFO_V_TCO_RNG[1] = 01h	ID_ERR_DTC_INFO_V_TCO_RNG[2] = 00h	ID_ERR_DTC_INFO_V_TCO_RNG[3] = 00h

Formula section:

not used yet

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.71 Dynamic error management core

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CTR_DC [NC_NR_ERR_DYN]	O/V/S	0... FFH	0... 255	1	-
Counter for driving cycle					
CTR_ERR_DYN_NR	O/V/S	0... FFH	0... 255	1	-
Number of failures stored in dynamic memory (2nd layer)					
CTR_FRC [NC_NR_ERR_DYN]	O/V/S	0... FFH	0... 255	1	-
Frequency counter : number of occurrences of present failure					
CTR_OCC [NC_NR_ERR_DYN]	O/V/S	0... FFH	0... 255	1	-
Occurences number of transitions between diagnostic executed without fault and diagnostics with fault (pass -> fail)					
CTR_WUP_CYC [NC_NR_ERR_DYN]	O/V/S	0... FFH	0... 255	1	-
Counter for warm-up cycle					
DIAG_INST [NC_NR_ERR_DYN]	V	0... FFFFH	0... 65535	1	-
Index of diagnosis instance XX with XX = F(IDX)					
LV_DC_MAX [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Flag for the MIL state (on or off) related to failure IDX					
LV_ERR_CFM [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Confirmed failure status flag					
LV_ERR_DC [NC_NR_ERR_DYN]	O/V	0... 1H	0 ...1	1	-
Failure present status for this driving cycle					
LV_ERR_DC_PREV [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Error failure present at end of last driving cycle					
LV_ERR_DISA [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Disappeared failure status flag					
LV_ERR_LST_CLR_XX	O/V/S	0... 1H	0 ...1	1	-
Failure set at least once since last failure memory clear					
LV_ERR_MEM_XX	O/V/S	0... 1H	0 ...1	1	-
Failure is stored in dynamic memory (2nd layer)					
LV_ERR_MKD [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Marked failure status flag					
LV_ERR_PND [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Pending failure status flag					
LV_ERR_TMP [NC_NR_ERR_DYN]	O/V/S	0... 1H	0 ...1	1	-
Temporary failure status flag

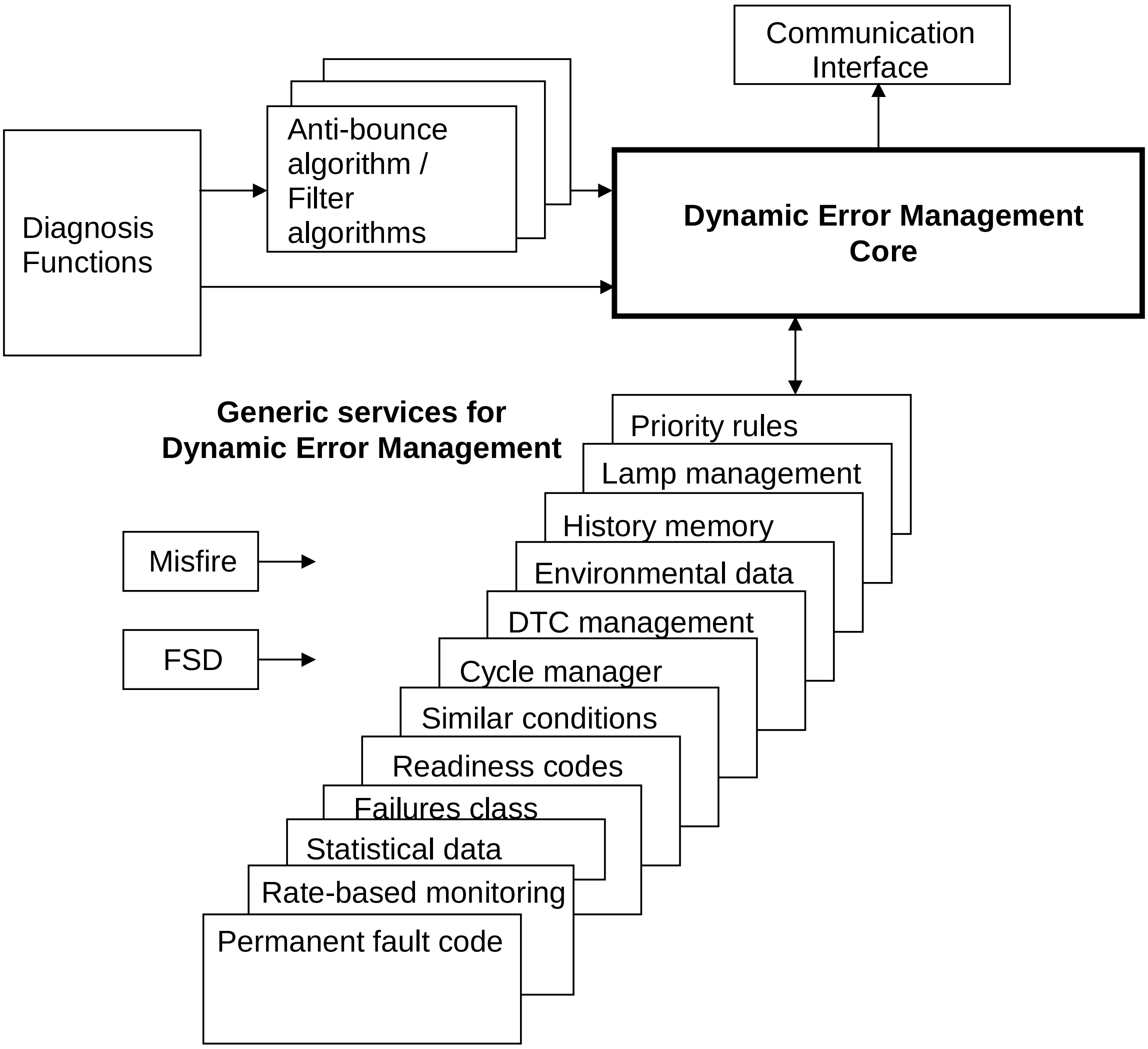
FUNCTION DESCRIPTION:

General information:

This module is the heart of the dynamic error management function. It defines statement of principles and mechanism of dynamic error management function.
Dynamic error management receives results from diagnosis function (may be filtered by antibounce algorithm). These results are, in this module, managed as diagnosis failure following **CARB** and **EOBD** standards.
In addition, this module uses generic services defined by others modules (priority rules for example).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



B.71.1 Diagnosis failure description

B.71.1.1 Failures definition

Description:

Dynamic error management manages failures, which have different states.

Detected failure

The detected failure is provided by a defective system (the error provided by this system is basic). It occurs when the diagnosis test and diagnosis condition of at least one symptom or more are true and disappears in other cases.

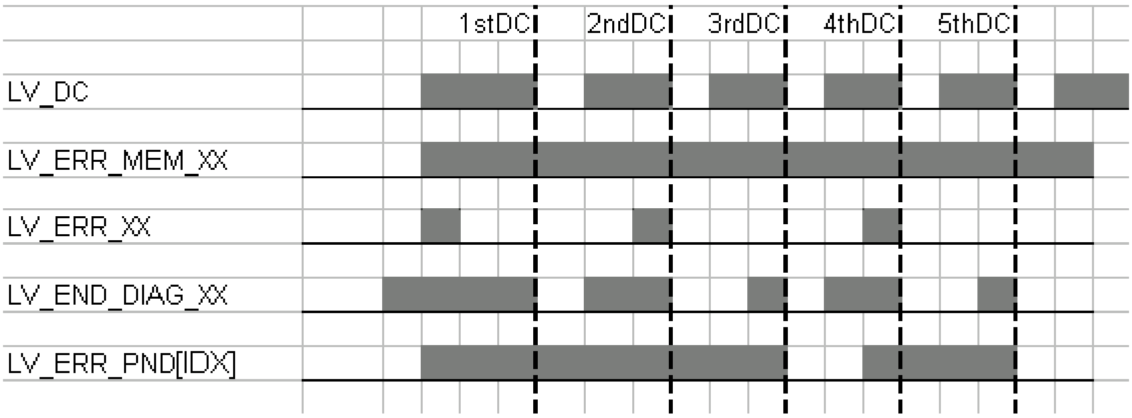
Present failure

The present failure is the detected failure after filtering. The real entry point of the error management is the present failure.

Pending failure

The pending failure is the detected failure after filtering. The failure shall stay pending until detection of a whole driving cycle without the failure present and the diagnosis done.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Temporary failure

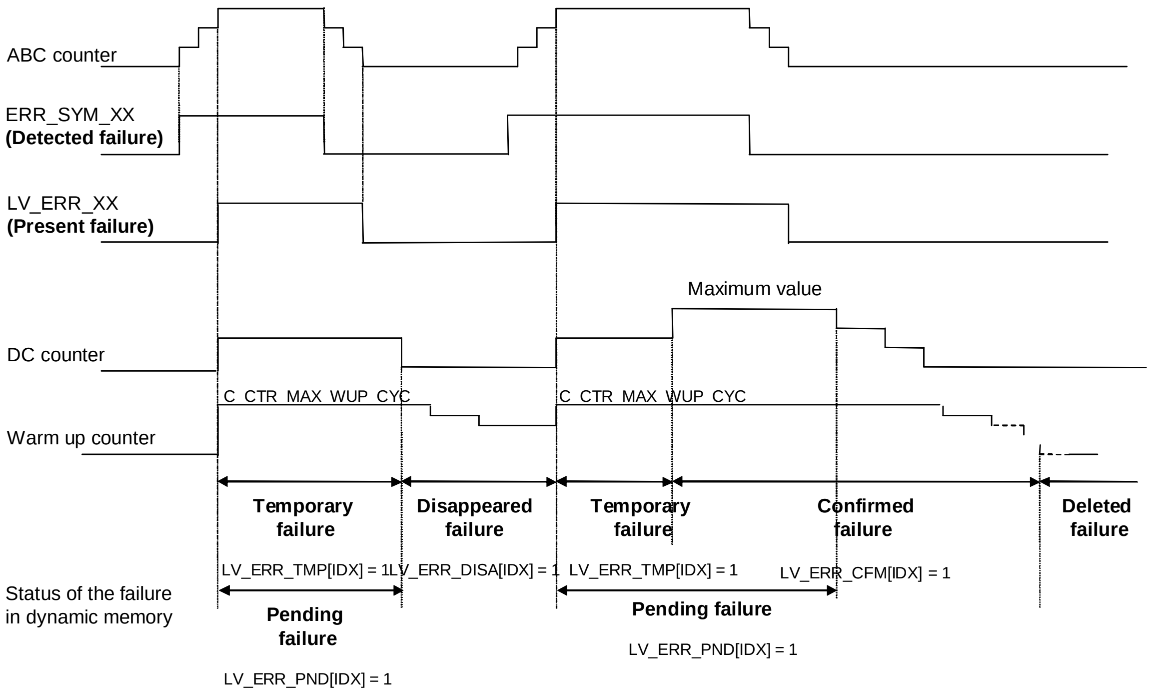
A failure is considered as temporary when this failure is present and leaves this state either when this failure is confirmed or disappeared (in this case, this failure isn't confirmed).

Disappeared failure

A failure is considered as disappeared, when no failure was detected during a complete driving cycle and the failure wasn't confirmed. It leaves this state either when the failure reoccurs or when the warm-up counter reaches 0.

Confirmed failure

A failure is considered as confirmed when the driving cycle counter reaches the maximum value and leaves this state when the warm-up counter reaches 0.



with XX = F(IDX)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.71.1.2 Failures information

Copyright (C) Continental AG,2007

Description:

Each failure is constituted of informations, which are stored in the memory.
Some informations are allocated in the static memory. It means that these informations are available for each failure.
Static memory: XX represents any failure defined in the application (index of XXξ[1...65535])

- ABC counter CTR_ABC_XX
- End of diagnosis counter CTR_ABC_END_DIAG_XX
- End of diagnosis flag LV_END_DIAG_XX
- Readiness flag LV_READY_XX
- Diagnosis condition LV_CDN_DIAG_XX
- Detected symptom ERR_SYM_XX
- Present failure LV_ERR_XX
- Failure is stored in dynamic memory LV_ERR_MEM_XX
- Failure present at least one time since failure memory cleared LV_ERR_LST_CLR_XX

Some informations are allocated in the dynamic memory. It means that these informations are created in memory in case of a new dynamic failure entry (limited number of dynamic entries managed with priority rules).
Dynamic memory : IDXξ [0...NC_NR_ERR_DYN-1]

- Frequency counters CTR_FRC[IDX]
  CTR_OCC[IDX]
- Driving cycle counter CTR_DC[IDX]
- Warm up counter CTR_WUP_CYC[IDX]
- Memorized the first symptom (DTC) ERR_SYM_MEM[IDX]
- Memorized the last symptom (DTC) ERR_SYM_LST[IDX]
- Environmental data (Freeze frame) ENVD_OBD[u][m]
  ENVD_CUS_CMN[v][m]
  ENVD_CUS_SET_CMN[W][x][m]
  ENVD_CUS_SET_SPC[y][z][m]
- Confirmed failure LV_ERR_CFM[IDX]
- Disappeared failure LV_ERR_DISA[IDX]
- Memorized MIL activation flag LV_DC_MAX[IDX]
- Failure during DC LV_ERR_DC[IDX]
- Temporary failure LV_ERR_TMP[IDX]
- Pending failure LV_ERR_PND[IDX]
- Marked failure LV_ERR_MKD[IDX]
- Error present at end of last DC LV_ERR_DC_PREV[IDX]

Remark :
To keep the link between the index of the failure in dynamic memory and the index of the failure in static memory, a transfer function is defined by : XX = F (IDX)

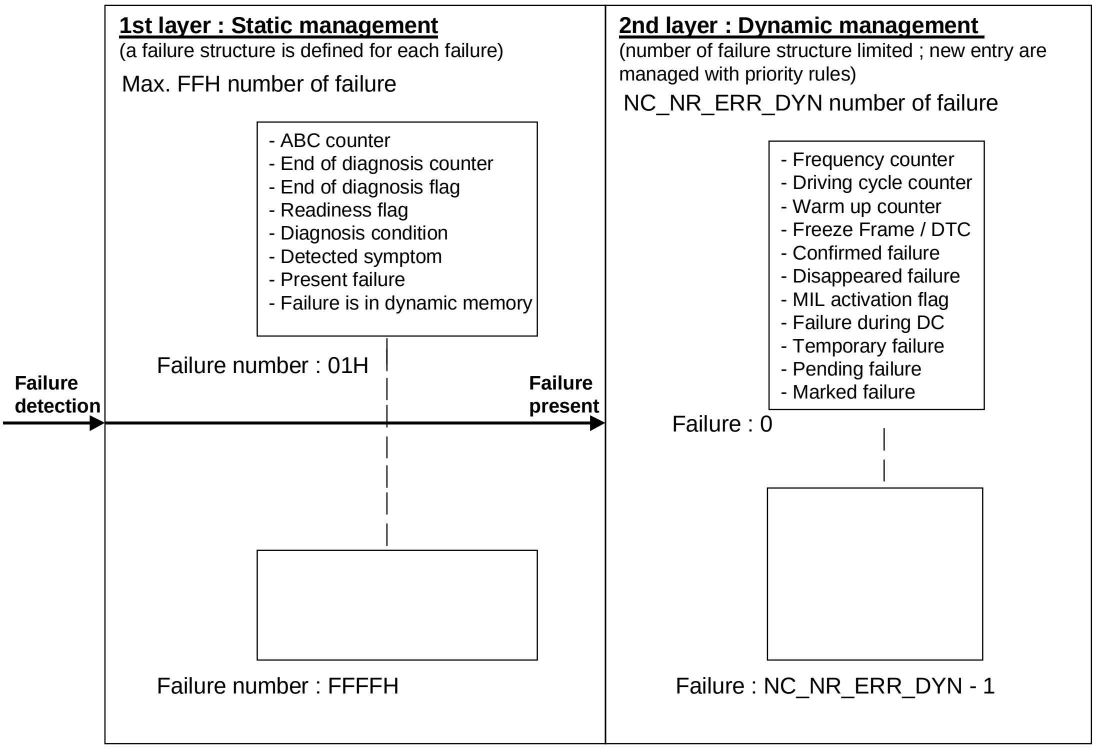
with m=IDX_FRF[IDX]

B.71.2 Memory management

Description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

As explained above, the memory is managed as two layers.
The first layer is managed as static memory. According to failure detection, ABC counter and end of diagnosis counter are incremented or decremented. Present failure information is the output of this layer. All failures are managed in the first layer.
When a present failure appears, it may provoke a dynamic entry in the second layer (dynamic) of the memory. In this second layer, only present failures are managed. The number of failure structure is limited to a maximum value defined by NC_NR_ERR_DYN.



B.71.2.1 Failures configuration

Description:

For every diagnosis two bytes exist to configure the failure. The following items can be influenced :

- control of dashboard lamp (MIL and/or Warning lamp 1 and/or Warning lamp 2)
- the emission relevance of a failure
- failure priority, used for failure storage

The definition of these bytes is done in Failure Class module.

B.71.2.2 Store /Erase a failure in 2nd layer memory

Description:

This module manages the “Entry” (storage) and “Exit” (deleting) of failures in the 2^{nd} layer memory.
Storage :
Syntax : ACTION_ERRM_StoreErr (IN <XX>)
Parameter (in) : XX number of the failure to store in dynamic memory

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter (out) : -

Short description :

If other modules call the action to store the failure XX with ACTION_ERRM_StoreErr (IN<XX>) then the failure XX (with XX = F(IDX)) is taken into the 2^{nd} layer memory and :

- frequency counter (number of occurrences of present failure) is updated ;
- the DTC is stored with ACTION_ERRM_StoreDtc (IN<IDX>) (if needed) ;
- the Freeze Frame is stored with ACTION_ERRM_StoreFrf (IN<IDX>) ;
- the index of diagnosis instance XX is stored in DIAG_INST[IDX] for visualisation

Deleting :

Syntax : ACTION_ERRM_EraseErr (IN <IDX>)

Parameter (in) : IDX index of failure in 2^{nd} layer memory to erase

Parameter (out) : -

Short description :

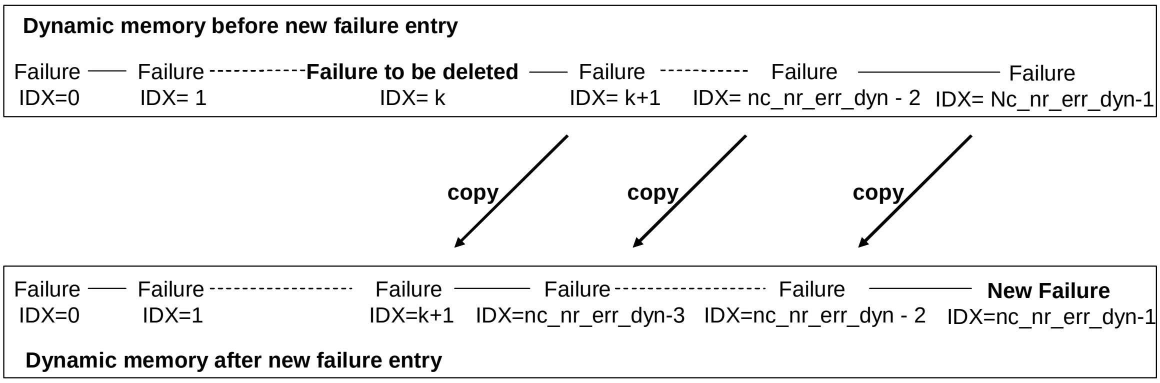
If other modules call the action to erase the failure XX with ACTION_ERRM_EraseErr (IN<IDX>) then the failure IDX is taken out of the 2^{nd} layer memory and :

- the failure is stored in history memory with ACTION_ERRM_StoreHistory (IN<IDX>) ;
- the DTC of the failure is erased with ACTION_ERRM_EraseDtc (IN<IDX>) ;
- the Freeze Frame of the failure is erased with ACTION_ERRM_EraseFrf (IN<IDX>) ;
- similar conditions of the failure are erased with ACTION_ERRM_EraseScdn (IN<XX>) if existing

2^{nd} layer memory description :

It is useful to sort the failures in the sequence in which they occurred ; first failure has index (IDX) number zero, second failure has index (IDX) number one, ... For example, when a new failure entry is accepted (memory is full), one failure is deleted, sorting algorithm is respected and the new failure entry is stored in last position.

In any case, sorting algorithm must be always respected.



Application conditions

Initialization :

```
On saved RAM lost
   CTR_ERR_DYN_NR = 0 ; LV_ERR_MEM_XX = 0
   CTR_FRC[IDX] = 0; CTR_OCC[IDX] = 0;
 LV_ERR_TMP[IDX] = 0; LV_ERR_MKD[IDX] = 0
   DIAG_INST[IDX] = 0; LV_ERR_DC_PREV[IDX] = 0;
 LV_ERR_LST_CLR_XX = 0
```

Recurrence: –

Activation: *at Action request*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Store the failure in 2^{nd} layer memory :
ACTION_ERRM_StoreErr (IN <XX>) :

```
LV_ERR_LST_CLR_XX = 1
   If      LV_ERR_MEM_XX = 0
   Then    Failure XX is stored in 2nd layer memory in position IDX = CTR_ERR_DYN_NR
           LV_ERR_MEM_XX = 1
        LV_ERR_TMP[IDX] = 1
           DIAG_INST[IDX] = index of diagnosis instance XX   (with XX=F(IDX))
           ACTION_ERRM_StoreDtc (IN<IDX>)
           CTR_ERR_DYN_NR = CTR ERR_DYN_NR +1
           If       LV_MKD_MOD = 1
        Then
                    LV_ERR_MKD[IDX] = 1
           Endif
Else    ( IDX compliant with XX = F(IDX) )
Endif
CTR_FRC[IDX] = CTR_FRC[IDX] + 1
If       CTR_FRC[IDX]  > 255
Then   CTR_FRC[IDX] = 255
Endif
If       NLC_CTR_OCC_ENA = 1
Then
         If       LV_ERR_DC_PREV[IDX] = 0
         Then   CTR_OCC[IDX] = CTR_OCC[IDX] + 1
                If       CTR_OCC[IDX]  > 254 (saturation to 254 : value 255 forbidden)
                Then   CTR_OCC[IDX] = 254
                Endif
         Endif
Endif
ACTION_ERRM_StoreFrf (IN<IDX>)
(previous failure status (if disappeared) necessary for freeze frame calculation)
If       LV_ERR_DISA[IDX] = 1
Then   LV_ERR_DISA[IDX] = 0
          LV_ERR_TMP[IDX]  = 1
          ACTION_ERRM_StoreDtc (IN<IDX>)
          (Store DTC corresponding of the first occurrence of the failure)
Endif
LV_ERR_PND[IDX] = 1
ACTION_ERRM_StoreDtcLst (IN<IDX>)
(Store DTC corresponding of the last occurrence of the failure)
```

Clear the failure out of 2^{nd} layer memory

```
ACTION_ERRM_EraseErr (IN<IDX>) :
ACTION_ERRM_StoreHistory (IN<IDX>)
ACTION_ERRM_EraseDtc (IN<IDX>)
ACTION_ERRM_EraseFrf (IN<IDX>)
  If       failure is using similar conditions functionality (see Similar conditions Appli.Inc.)
           (LC_ENA_SCDN=1 and NLC_ENA_SCDN=1)
Then   ACTION_ERRM_EraseScdn (IN<XX>)
        (with XX=F(IDX))
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Endif
Failure XX (with XX=F(IDX)) is cleared (all data in 2^{nd} layer memory related to failure IDX are filled with 0 ; all data in static memory related to failure XX are unchanged)
LV_ERR_MEM_XX = 0 (with XX = F(IDX))
CTR_ERR_DYN_NR = CTR_ERR_DYN_NR -1

Temporary flag management :
For each failure in 2^{nd} layer memory
If LV_ERR_CFM[IDX] = 1
or
LV_ERR_DISA[IDX] = 1
Then
LV_ERR_TMP[IDX] = 0
Endif

B.71.2.3 Clear failure memory

Description:

For development conveniences, it is often useful to reinit all failure in the memory. This is possible by setting the calibration bit LC_ERR_FMY_CLR to 1.

Application conditions

Initialisation: –

Recurrence: –

Activation: *LC_ERR_FMY_CLR 0 → 1 transition*

Formula section:

Treatment performed at global clearing request (e.g. Mode$04) :
If LC_ERR_FMY_CLR = 1
Then Reset failure memory (all data in 2^{nd} layer memory and all data in static memory, e.g. LV_ERR_LST_CLR)
CTR_ERR_DYN_NR = 0
ACTION_ERRM_*ClcPermanentIniErrm*()
Endif

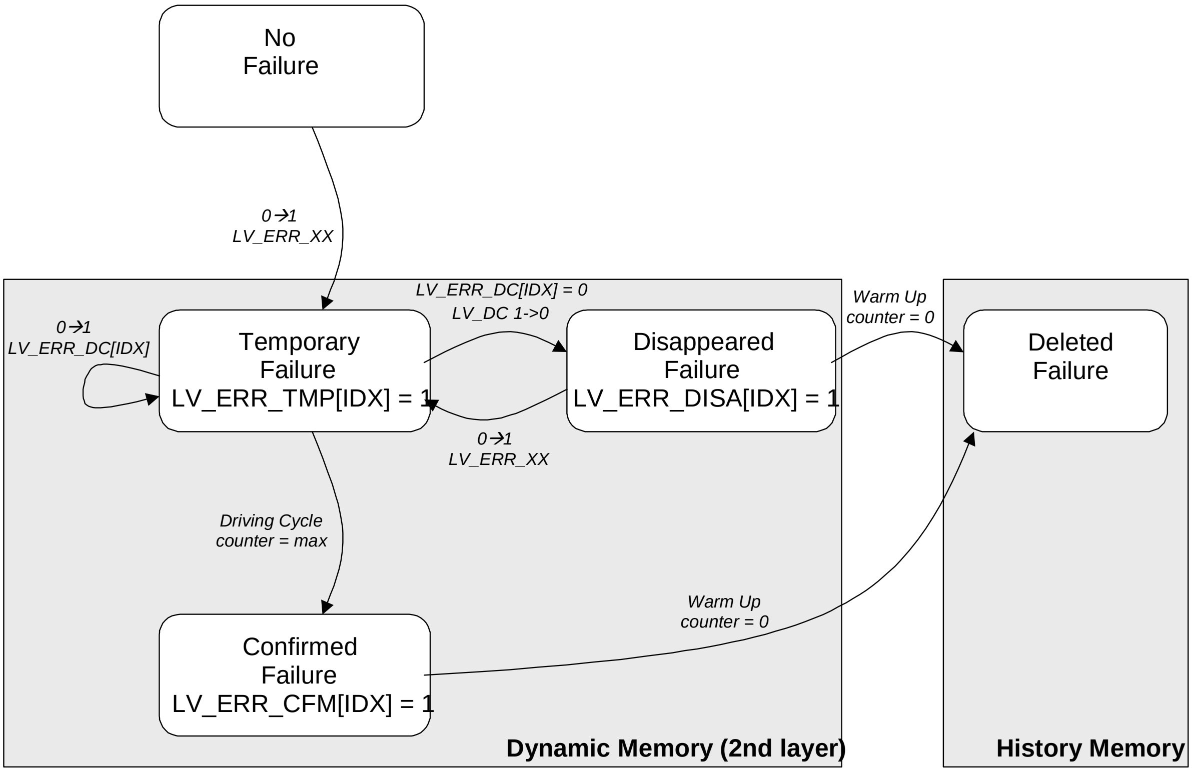
B.71.3 Failure management

B.71.3.1 State diagram

Description:

In the following diagram, the failure state progress is described.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



There are also additional transitions possible due to :
- Overwriting/Erasement by priority rule or Tool Request :

Temporary Failure Deleted Failure
Disappeared Failure Deleted Failure
Confirmed Failure Deleted Failure

	Driving Cycle counter value	Warm Up counter value
No Failure	0	0
Temporary Failure	[0, Max [without having reached Max	Max
Confirmed Failure	[0, Max] with having reached Max	] 0, Max]
Disappeared Failure	0	] 0, Max]
Deleted Failure	0	0

B.71.3.2 Present failure occurred

Description:

When a failure occurs (becomes present), this failure shall be stored in the 2^{nd} layer memory (if possible). If the 2^{nd} layer memory is full and marked mode is not set, a choice is made in the module “Priority rules” :

- RESP is set to OK by priority rules, if the failure can be stored in the 2^{nd} layer memory ; in this case IDX gives the index of the failure to be replaced into dynamic memory;

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- RESP is set to NOK by priority rules if the failure can't be stored in the 2^{nd} layer memory.

To monitor the failure, ACTION_ERRM_TrigErrDyn shall be called when the failure occurs (the failure is evaluated or re-evaluated) or the failure is removed.

Application conditions

Initialisation: –

Recurrence: –

Activation:
```
at LV_END_DIAG_XX 0 → 1 transition
 with  ( LV_ERR_XX = 1  and  LV_ERR_MEM_XX = 1 )
  or
at LV_ERR_XX 1 → 0 transition
(due to the physical default disappears only:  it means that
a clear failure memory or diagnosis initialization aren't  activation
condition)
```

Formula section:

ACTION_ERRM_TrigErrDyn (IN<XX>)
This action is called to indicate that a new failure has occurred, although failure is not stored.

Application conditions

Initialisation: –

Recurrence: –

Activation:
```
LV_ERR_XX 0 → 1 transition with LV_END_DIAG_XX = 1
  or
LV_END_DIAG_XX 0 → 1 transition
with  ( LV_ERR_XX = 1 and  LV_ERR_MEM_XX = 0 )
```

Formula section:

If (1) CTR_ERR_DYN_NR < NC_NR_ERR_DYN
 or LV_ERR_MEM_XX = 1
Then (1) ACTION_ERRM_StoreErr (IN<XX>)
Else (1) **If (2)** LV_MKD_MOD = 0
 Then (2) ACTION_ERRM_PrioRule (OUT<RESP>, OUT<IDX>)
  If (3) RESP = OK
  Then (3) ACTION_ERRM_EraseErr (IN<IDX>)
   ACTION_ERRM_StoreErr (IN<XX>)
  Endif (3)
 Endif (2)
Endif (1)
ACTION_ERRM_TrigErrDyn (XX)
This action is called to indicate that a new failure has occurred.

B.71.3.3 Diagnostic passed without failure

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialisation: –

Recurrence: –

Activation: `at LV_ERR_XX 1 → 0 transition (whatever LV_END_DIAG_XX value)`
or
`at LV_END_DIAG_XX 0 → 1 with LV_ERR_XX = 0`

Formula section:

If NLC_CTR_OCC_ENA = 1
Then
  If LV_ERR_MEM_XX = 1
  Then
    LV_ERR_DC_PREV[IDX] = 0
  Endif
Endif

B.71.3.4 Present failure occurred

Description:

FARM treatments are performed last

Application conditions

Initialisation: –

Recurrence: –

Activation: *at LV_END_DIAG_XX 0 → 1 transition (independant of LV_ERR value)*

Formula section:

call ACTION_ERRM_TrigFarm(XX)

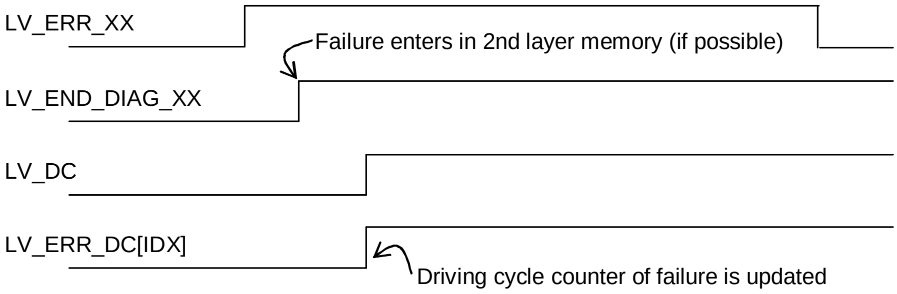
B.71.3.5 Error occurred during present driving cycle

Description:

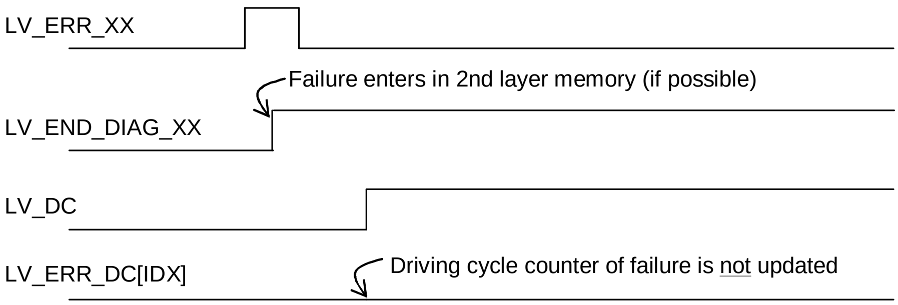
An active flag called LV_ERR_DC[IDX] indicates that an error XX (with XX = F(IDX)) has occurred during a driving cycle.
Even if the error disappears during the driving cycle, the flag remains active during the whole driving cycle.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Failure present, then driving cycle is recognized, then failure not present



Failure present, then failure not present, then driving cycle is recognized



Application conditions

Initialisation: `at ECU reset` **`or`** `transition LV_DC 1->0 after treatment done at this event`
`LV_ERR_DC[IDX] = 0`

Recurrence: `same as the diagnosis routine`
`all failures are updated at transition 0->1 of LV_DC`

Activation: *`at every engine operating state`*

Formula section:

If LV_ERR_XX = 1 (failure is present)
and
LV_END_DIAG_XX =1 (current diagnosis is available)
and
LV_DC = 1 (within driving cycle)
and
LV_ERR_MEM_XX =1 (failure is stored in dynamic memory)
Then
LV_ERR_DC[IDX] = 1 (it remains 1 until the next initialization)
Endif

B.71.3.6 Driving Cycle Counter management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

The driving cycle counter CTR_DC[IDX] is associated to each failure which has a structure defined in second layer of memory.
This counter is incremented at each driving cycle in the following way:

- for all failures not using SCDN functionality (withLC_ENA_SCDN=0 or NLC_ENA_SCDN=0), when the associated failure gets present (LV_ERR_DC[IDX]).
- for failures using SCDN functionality (with LC_ENA_SCDN=1 and NLC_ENA_SCDN=1)
- when the failure gets present the first time (and stored)
- when the failure gets present again in a following driving cycle
- when the failure gets present again in another driving cycle (not previous) (driving cycle counter of this failure is != 0/max before new occurrence), if the similar conditions functionality decides, that the incrementation is possible

The driving cycle counter is decremented at the end of a driving cycle in the following cases:

- for all failures not using SCDN functionality (or LC_ENA_SCDN=0 or NLC_ENA_SCDN=0), when the associated failure was not present the complete DC (LV_ERR_DC[IDX] = 0).
- for failures using SCDN functionality (with LC_ENA_SCDN=1 and NLC_ENA_SCDN=1)
- when similar conditions are encountered without failure (for failure with present MIL illumination)
- when the similar conditions functionality decides that the decrementation is possible (for temporary failure or confirmed failure with no present MIL illumination)

The driving cycle counter is useful for MIL management and warm-up counter management (see specific chapter).

With the calibration LC_ENA_SCDN it's possible to enable/disable the similar conditions functionality. If LC_ENA_SCDN = 0 the failures using SCDN functionality (see similar conditions Appl.Inc) are treated like normal failures in the driving cycle counter management.

Application conditions

Initialization:

```
On saved RAM lost
    LV_DC_MAX[IDX] = 0
    CTR_DC[IDX] = 0
    LV_ERR_DISA[IDX] = 0
    LV_ERR_CFM[IDX] = 0
```

Recurrence: –

Activation: –

Formula section:

           Endif
Endif
```

Treatment for failures using SCDN functionality (LC_ENA_SCDN=1 and NLC_ENA_SCDN=1) (running within DC) stored in 2^{nd} layer memory.

Conditions to increment the driving cycle counter :

Done upon ACTION_ERRM_IncrementDCctrSCDN call:

(see also similar conditions specification)

Description:

Syntax : ACTION_ERRM_IncrementDCctrScdn (IN <XX>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter (in) : XX failure in static memory with XX=F(IDX)
Parameter (out) :
Short description:
With the ACTION_ERRM_IncrementDCctrScdn (IN <XX>) the driving cycle counter for the failure XX stored in 2^{nd} layer memory at position IDX, which is using similar conditions functionality, is incremented. This action is called at the end of a diagnosis window in the following cases :

- failure occurred and similar conditions are recorded
- failure already stored in a previous driving cycle. Now failure gets present again and was also present in last driving cycle.
- failure already stored in a previous driving cycle. Now failure gets present again with SCDN recognition for detected failure.
- failure already stored in a previous driving cycle and LV_DC_MAX[IDX] = 1 (MIL is illuminated, if LC_MIL_ON =1).

For details see similar conditions specification.

Application conditions

Initialization: –

Recurrence: –

Activation: *at action request*

Formula section:

Endif
Else (for temporary failure)
CTR_DC[IDX] = 0
LV_ERR_DISA[IDX] = 1 (failure disappeared)
Endif
Endif
Endif

B.71.3.7 Warm-Up counter management

Description:

As soon as the failure gets present and stored in the memory, the warm-up cycle counter is initialized. With every valid warm-up cycle with no error occurrence, the warm-up cycle counter is decremented by 1. If the warm-up cycle counter reaches zero the error is deleted from the 2^{nd} layer memory.

Application conditions

Initialization: `on saved ram lost`
`CTR_WUP_CYC[IDX]= 0`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Recurrence: –

Activation: `only at transition LV_DC 1 -> 0`

Formula section:

Treatment for all failures not using SCDN functionality (or LC_ENA_SCDN = 0) stored in 2^{nd} layer memory :

Condition to decrement the warm up counter :
The following treatment is done for all failure stored in 2^{nd} layer memory **and only at transition LV_DC 1 -> 0** (**before** treatment of driving cycle counter decrementing at end of driving cycle):

If (LV_WUP_CYC = 1 **and** C_CTR_MAX_WUP_CYC != 255)
the warm-up cycle is recognised and failure healing is possible
Then **If** (CTR_DC[IDX] = 0 **and** LV_ERR_DC[IDX] = 0)
the MIL is extinguished and no failure in this driving cycle
or
(CTR_DC[IDX] != 0 **and** LV_DC_MAX[IDX] = 0
case before the MIL may be illuminated
and LV_ERR_DC[IDX] = 0 **and** LV_END_DIAG_XX = 1)
the failure is no more pending
Then CTR_WUP_CYC[IDX] = CTR_WUP_CYC[IDX] - 1
If CTR_WUP_CYC[IDX] = 0
Then ACTION_ERRM_EraseErr (IN<IDX>)
Endif
Endif
Endif

Treatment for failures using SCDN functionality (and LC_ENA_SCDN = 1) (running within DC) stored in 2^{nd} layer memory.

Condition to decrement the warm up counter :
The following treatment is done for all failure stored in 2^{nd} layer memory **and only at transition LV_DC 1 -> 0** (**before** treatment of driving cycle counter decrementing at end of driving cycle):

If LV_WUP_CYC = 1
Then **If** CTR_DC_IDX = 0
and LV_ERR_DC_IDX = 0
Then CTR_WUP_CYC_IDX = CTR_WUP_CYC_IDX - 1
If CTR_WUP_CYC_IDX = 0
Then ACTION_ERRM_EraseErr (IDX)
Endif
Endif
Endif

Condition to reload the warm up counter :
The following treatment is done for failure XX when it is stored in 2^{nd} layer memory **when ACTION_ERRM_StoreErr (IN<XX>) is called :**
CTR_WUP_CYC[IDX] = C_CTR_MAX_WUP_CYC

B.71.3.8 Treatments at end of driving cycle

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

End of driving cycle is reached when power-latch is ended, or in case on key off/on transition before the end of power-latch phase.
For CTR_OCC[IDX] computation, some treatments are executed each time a driving cycle is ended.

Application conditions

Initialisation: –

Recurrence: –

Activation: at end of power-latch phase (before NVMY storage) whatever LV_DC value
or
(LV_IGK 0→1 transition **and** LV_ES = 1 **and** LV_DC = 1)

Formula section:

ACTION_ERRM_*ClcLvErrDcPrev*( )

B.71.3.9 Calculation of LV_ERR_XX state at end of driving cycle

Description for ACTION_ERRM_ClcLvErrDcPrev

ACTION_ERRM_*ClcLvErrDCPrev* ()					
This action indicates if a failure was set at the end of previous driving cycle					
Parameter	**Type**	**Hex. Limits**	**Phys. limits**	**Resol.**	**Unit**
No Parameter					

General information:

This action indicates if a failure was set at the end of previous driving cycle.
Only when NLC_CTR_OCC_ENA = 1, this action must be called before any other treatment from ERRM.

Formula section:

For IDX = 0 to CTR_ERR_DYN_NR
with XX = f(IDX)
If LV_END_DIAG_XX = 1
THEN LV_ERR_DC_PREV[IDX] = LV_ERR_XX
ENDIF
Endfor

B.71.4 Miscellaneous services to get information

B.71.4.1 API for determination of pending status of failures

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This API shall be called to determine if any XX failure is pending or not.

Description:

Syntax: ACTION_ERRM_CheckPendingStatus (IN <PRM_IDX_DIAG>, OUT <PRM_LV_ERR_PND>)
Parameter(in): PRM_IDX_DIAG Diagnostic instance of the XX failure
Parameter(out): PRM_LV_ERR_PND State of the failure :
= 1 failure is pending (or it's impossible to determine its status)
= 0 failure is not pending

Short Description: This API shall be used to verify if a failure stored in the dynamic memory has the pending status or not. When it impossible to determine if the fault is pending or not (failure not store because the dynamic memory is full), this failure should be considered as pending anyway.

Application conditions

Initialisation: –

Recurrence: –

Activation: `at action call`

Deactivation: –

Formula section:

If (1) *{ the XX failure analysed is present in the dynamic memory }*
LV_ERR_MEM_XX = 1 (with XX = F(IDX))
Then (1)
If (2) *{ IDX is the failure index, in the dynamic memory }*
LV_ERR_PND[IDX] = 1
Then (2)
PRM_LV_ERR_PND = 1
Else (2)
PRM_LV_ERR_PND = 0
Endif (2)
Else (1)
{ failure not stored in the dynamic memory }
If (2) LV_ERR_XX = 1
Then (2)
{ the failure is stored in the static memory but it's not present in the dynamic memory : impossible to determine its status }
{ then the failure shall be considered as pending }
PRM_LV_ERR_PND = 1
Else (2)
{ the failure is neither stored in the static memory nor in the dynamic memory }
PRM_LV_ERR_PND = 0
Endif (2)
Endif (1)

B.71.4.2 Get the "Failure set since last clear" state

Description for ACTION_ERRM_GetErrLastClr

ACTION_ERRM_*GetErrLastClr* (<PRM_IDX_ERR>, <PRM_LV_ERR_LST_CLR>)					
This action indicates if a failure has been set already once since the last failure memory clear.					
Parameter	**Type**	**Hex. Limits**	**Phys. limits**	**Resol.**	**Unit**
PRM_IDX_ERR	IN	0...FFFFH	0...65535	1	[-]
Diagnostic failure instance					
PRM_LV_ERR_LST_CLR	OUT	0...1H	0...1	1	[-]
Failure set at least once since last failure memory clear					

General information:

This API shall be called to determine if any XX failure has been set at least one time since memory clear

Formula section:

If PRM_IDX_ERR != 0
Then
with XX = PRM_IDX_ERR
PRM_LV_ERR_LST_CLR = LV_ERR_LST_CLR_XX
Else
PRM_LV_ERR_LST_CLR = 0
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Number of different environment data groups (set) which can be store for one freeze frametypical value is 3 ; the value 0 is forbidden					

Action definition

ACTION_ERRM_EraseFrf (IN<IDX>)	Mode: O

ACTION_ERRM_StoreFrf (IN<IDX>)	Mode: O

ACTION_ERRM_StorePrevFrf (IN<XX>)	Mode: O
This action stores the prestored freeze frame for the diagnosis instance XX	

Note:
The link between the failure stored in the dynamic error mangement at position *IDX* is made with IDX_FRF[*IDX*]. E. g. a failure stored at the position *IDX* = 2 belongs to freeze frame

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ENVD_..._[m] with m = IDX_FRF[2]

FUNCTION DESCRIPTION:

General information:

This module describes the structure of the freeze frame and manages the storage and deleting of the freeze frame.
A freeze frame is a group of vehicle environment data catched when a failure occurs.
Freeze frame is filled up with variables, which are not limp home values : the variables are set up before going to the limp home.
A freeze frame is made of many parts :

- FRF_OBD: Environmental data, which are common to all failures and stored on time. It s only updated, if the failure has disappeared before and occurs again.

The content is defined by law. It s called usually CARB Freeze Frame and the content is according to SAE J1979.
Size of this part is defined by configuration data NC_NR_ENVD_OBD affected value is in the Environmental data (Appl. Inc.) module.
Contents of this part is fixed and defined in Environmental data (Appl. Inc.) module.

- FRF_CUS_CMN : Environmental data, which are common to all failure.

It s stored one time, if NC_ ENVD_CUS_CMN_UPD = 0.
With NC_ ENVD_CUS_CMN_UPD = 1, FRF_CUS_CMN is updated, if the failure was disappeared before and occurs again.
The content is not required by law.
Size of this part is defined by configuration data NC_NR_ENVD_CUS_CMN; affected value is in the Environmental data (Appl. Inc.) file.
Contents of this part is fixed and defined in the Environmental data (Appl. Inc.) module.

- FRF_CUS_SET_CMN : Environmental data, which are common to all failure and stored many times. The content is not required by law. For each failure occurrence several catches (called sets) can be done.

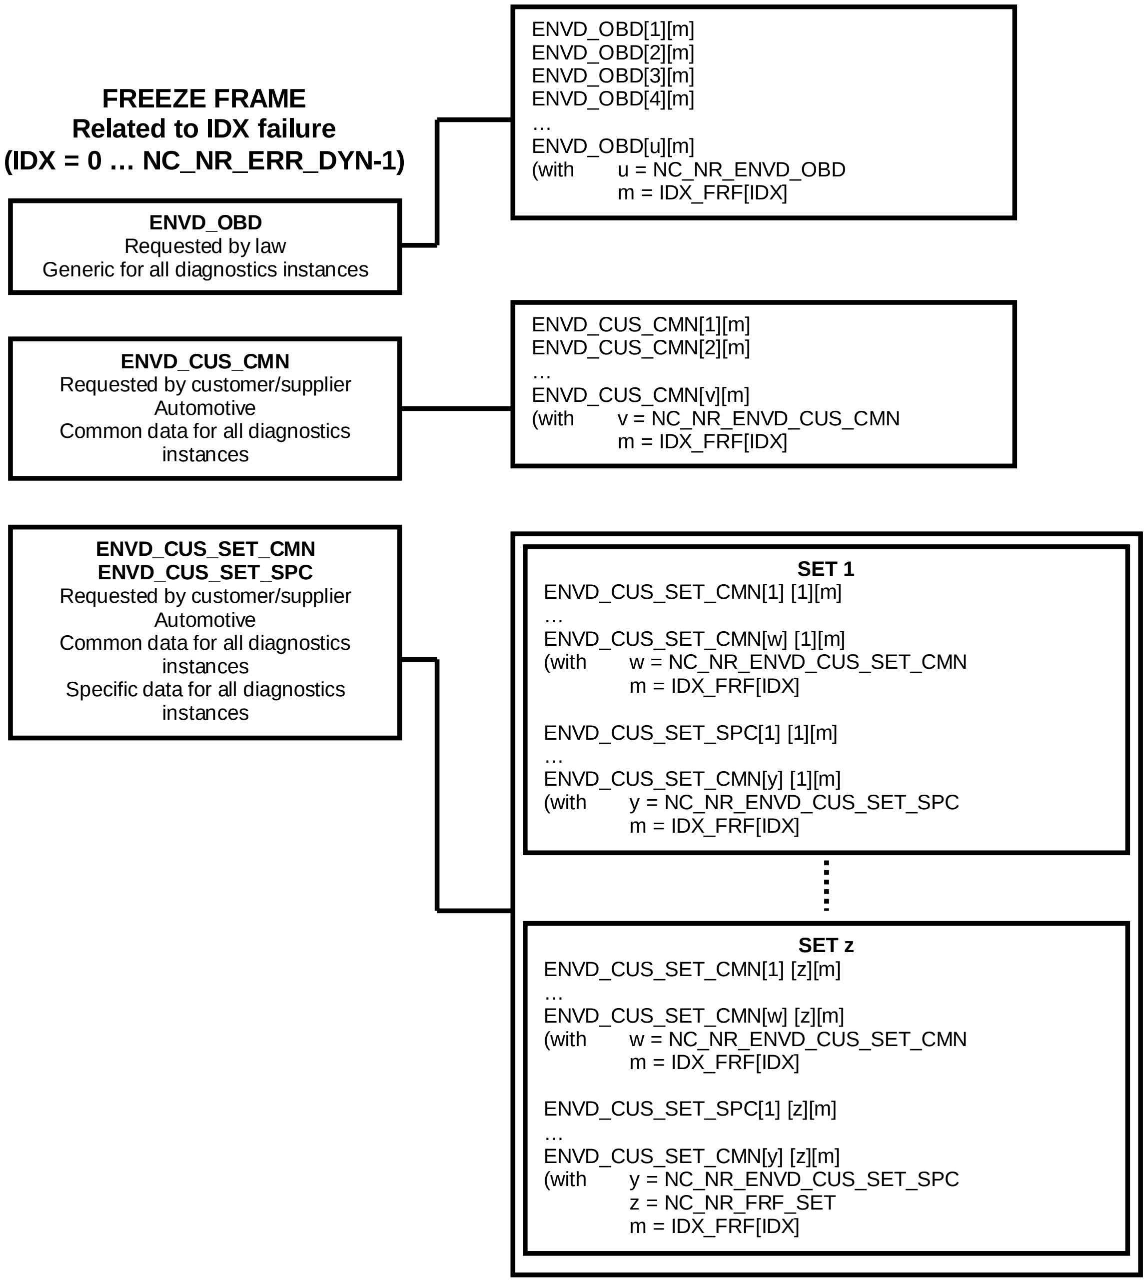
Size of this part is defined by configuration data, affected value is in the Environmental data (Appl. Inc.) module :
NC_NR_FRF_SET for number of sets per freeze frame
NC_NR_ENVD_CUS_SET_CMN for number of common data (in bytes) in each set
Contents of this part is fixed and defined in the Environmental data (Appl. Inc.) module.

- FRF_CUS_SET_SPC : Environmental data, which are specific to each failure and stored many times. The content is not required by law. For each failure occurrence several catches (called sets) can be done.

Size of this part is defined by configuration data, affected value is in Environmental data (Appl. Inc.) module :
NC_NR_FRF_SET for number of sets per freeze frame
NC_NR_ENVD_CUS_SET_SPC for number of specific data (in bytes) in each set
Contents of this part is defined by calibration, process is described in the last chapter of this module.

Signal flow diagram:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Remark: This signal flow diagram doesn t include the prestored freeze frame functionality described in chapter 1.4.

B.73.1 Freeze frame storage

Description:

Syntax : ACTION_ERRM_StoreFrf (IN <IDX>).
Parameter (in) : IDX Index of failure in 2^{nd} layer memory to store the freeze frame
Parameter (out) : -
Short description :
When the failure IDX gets present, the storage of a freeze frame is done in the 2^{nd} layer memory by calling the action ACTION_ERRM_StoreFrf (IDX).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If several failures occur (TCO sensor, injector 1, injector 4), a freeze frame is stored for each failure. For ram memory limitation, the number of freeze frame is limited to NC_NR_ERR_DYN.
If same failure occurs several times (occurrence of the failure is defined by the frequency counter CTR_FRC[IDX]), the following rules are applied :

- 1^{st} occurrence :

Store FRF_OBD +FRF_CUS_CMN +FRF_CUS_SET_CMN + FRF_CUS_SET_SPC

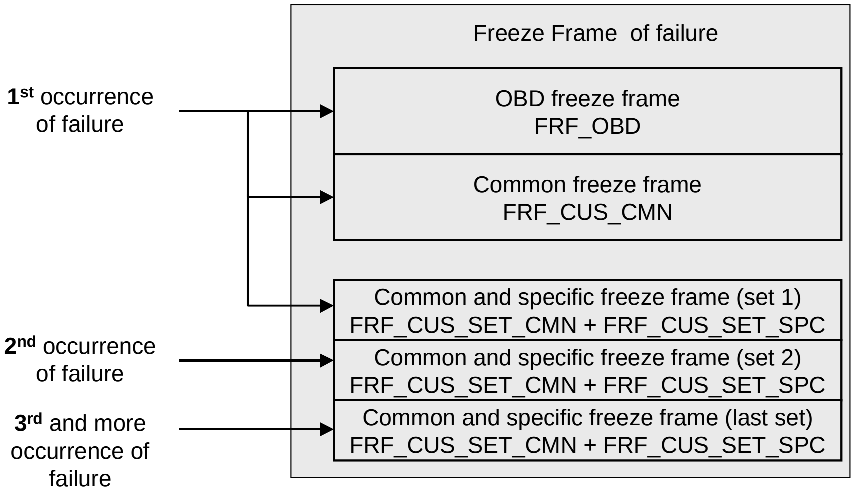
- occurrence [2 to NC_NR_FRF_SET]

Store FRF_CUS_SET_CMN + FRF_CUS_SET_SPC

- occurrence $>$ NC_NR_FRF_SET

Replace last FRF_CUS_SET_CMN + FRF_CUS_SET_SPC

Example with NC_NR_FRF_SET set to 3



Freeze frame informations are available as long as the failure is not erased in 2^{nd} layer memory.
Remark: Special behavior for FRF_OBD and FRF_CUS_CMN in case of failure status change from disappeared to temporary/confirmed.

Application conditions

Initialization: *after system initialization the freeze frame is restored from non volatile memory or in case of a damaged non volatile memory the freeze frame is with zero*

Recurrence: –

Activation: *at Action request*

Formula section:

ACTION_ERRM_StoreFrf (IDX) :
If CTR_FRC[IDX] = 1
Then (1^{st} occurrence : storage
With u = 1 ... NC_NR_ENVD_OBD
v = 1 ... NC_NR_ENVD_CUS_CMN
w = 1 ... NC_NR_ENVD_CUS_SET_CMN
y = 1 ... NC_NR_ENVD_CUS_SET_SPC)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. ENVD_CUS_SET_SPC[y][z][m] = ID_ERR_ENVD_XX [y]
(with XX = F(IDX))
Endif
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.73.2 Freeze frame deleting

Description:

Syntax : ACTION_ERRM_EraseFrf (IN <IDX>).
Parameter (in) : IDX Index of failure in 2^{nd} layer memory to store the freeze frame
Parameter (out) : -
Short description :
When the failure IDX is erased from 2^{nd} layer memory, the freeze frame of this failure is also erased by calling the action ACTION_ERRM_EraseFrf (IDX).

Application conditions

Initialization: –

Recurrence: –

Activation: `at Action request`

Formula section:

ACTION_ERRM_EraseFrf (IDX) :
(Erase OBD freeze frame, common freeze frame and all specific freeze frame
With u = 1 ... NC_NR_ENVD_OBD
v = 1 ... NC_NR_ENVD_CUS_CMN
w = 1 ... NC_NR_ENVD_CUS_SET_CMN
y = 1 ... NC_NR_ENVD_CUS_SET_SPC
z = 1 ... NC_NR_FRF_SET)
ENVD_OBD[u][m] = 0
ENVD_CUS_CMN[v][m] = 0
ENVD_CUS_SET_CMN[w][z][m] = 0
ENVD_CUS_SET_SPC[y][z][m] = 0

B.73.3 Calibratable set of environmental data

Description:

The freeze frame part called FRF_CUS_SET_SPC contains environmental data, which are :

- specific to each failure, not required by law ;
- and calibratable.

This chapter describes how to define by calibration the contents of FRF_CUS_SET_SPC .
The calibratable system of environmental data is managed via tables defined as following:
ID_ENVD_FAC : Configuration table, which describes all possible environmental data, which can be stored in a freeze frame (specific part) ;
Affected value defined in Environmental data (Appl. Inc.) module.

ID_ERR_ENVD_XX : Calibration table, which defines for each failure XX a maximum of NC_NR_ENVD_CUS_SET_SPC environmental data, which should be stored.

Example :
To store the environmental data TIA and TCO_ST in case of TCO failure ;
MAP and AMP in case of EGR failure ;

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

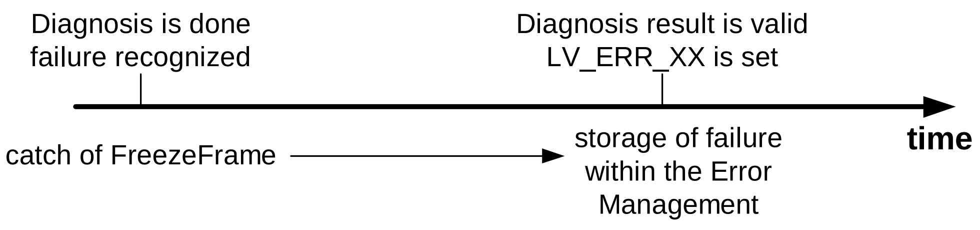
First, you should defined the possible environmental data in ID_ENVD_FAC table :
ID_ENVD_FAC[1] = & TIA
ID_ENVD_FAC[2] = & TCO_ST
ID_ENVD_FAC[3] = & MAP
ID_ENVD_FAC[4] = & AMP
Then, you should declare for each failure, the environmental data to stored :
ID_ERR_ENVD_TCO[1] = 1 ; ID_ERR_ENVD_TCO [2] = 2
ID_ERR_ENVD_EGR[1] = 3 ; ID_ERR_ENVD_EGR [2] = 4

B.73.4 Prestored freeze frame

FUNCTION DESCRIPTION:

General information:

Usually the content for the freeze frame is catched, when the failure is stored within the failure memory. In special cases, when the entry of a failure within the failure memory is delayed, it s necessary to catch the content for the freeze frame at the same time as the failure information is available.
Example:



Description:

Syntax : ACTION_ERRM_StorePrevFrf (IN <XX>).
Parameter (in) : XX diagnosis instance
Parameter (out) : -
Short description :
If ACTION_ERRM_StorePrevFrf (XX) is called by the diagnosis instance XX, a prestored freeze frame for diagnosis instance XX is stored. It s used as content for the freeze frame, if the failure is entered in the failure memory later.

Application conditions

Initialization: –

Recurrence: –

Activation: at Action request

Formula section:

ACTION_ERRM_StorePrevFrf (XX) :
with t related to failure XX, see Environmental data Appli.Inc.

ENVD_PREV_OBD[u][t] = ENVD_CONF_OBD[u]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ENVD_PREV_CUS_CMN[v][t] = ENVD_CONF_CUS_CMN[v]
ENVD_PREV_CUS_SET_CMN[w][t] = ENVD_CONF_CUS_SET_CMN[w]
ENVD_PREV_CUS_SET_SPC[y][t] = ID_ERR_ENVD_XX[y] (with XX = F(IDX))

Configuration data detailed description:

NC_NR_ENVD_CUS_SET_SPC : Typical value is 4.

NC_NR_FRF_SET : Typical value is 3.
The value 0 is forbidden.

NC_ ENVD_CUS_CMN_UPD 0: FRF_CUS_CMN is not updated when failure status changes from "disappeared" to "temporary/confirmed".

1: FRF_CUS_CMN is updated when failure status changes from "disappeared" to "temporary/confirmed".

NC_NR_ENVD_PREV 0: No pre-stored freeze frame functionality required

Size of ID_ENVD_FAC is defined according number of data in the table ; maximum size is 65535.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LDPM_CLAS_A_ID_CLAS_FMY	16	0... FFFFH	0... 65535	1	-
Sub Class B definition					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_ERR_PRI_H	-	0... 7H	0 ...7	1	-
Failures with priority greater or equal than NC_ERR_PRI_H are considered as high priority failures					

Action definition

ACTION_ERRM_GetMILRelevant (**IN**<PRM_IDX_ERR>,**OUT**<PRM_LV_MIL_RLV>)	Mode: O
This action is used to know if the failure is MIL relevant or not	

ACTION_ERRM_GetOBDRelevant (**IN**<PRM_IDX_ERR>,**OUT**<PRM_LV_OBD_RLV>)	Mode: O
This action is used to know if the failure is OBD relevant or not (visible via scantools or not)	

ACTION_ERRM_GetReadyClass (**IN**<PRM_IDX_ERR>,**OUT**<PRM_READY_CLAS>)	Mode: O
This action returns the readiness code group	

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

Because the diagnosis system becomes more and more complex, to avoid multiplication of calibrations and to help the tuning team for simplifying the calibration process, each failure is defined via classes of failure.
Each class defines the type of this failure as emission relevant or not, as MIL handling or not, as using driving cycle for MIL illumination, and so on. It allows too to affect a readiness code group for each failure.
The configuration of a failure is defined by WAL_CONF_XX, PRI_CONF_XX, CTR_DC_INC_XX, CTR_DC_DEC_XX and CTR_DC_MAX_XX.

Format of WAL_CONF_XX		
Bit	Logical value	Description
0	LC_WAL_1_ON	Enable WAL_1 (0 : Off / 1 : On) See details in “Lamp management” module.
1	LC_WAL_2_ON	Enable WAL_2 (0 : Off / 1 : On) See details in “Lamp management” module.
2	LC_MIL_ON	Enable MIL (0 : Off / 1 : On) See details in “Lamp management” module.
3	LC_MIL_FLL	Enable flash mode for MIL (0 : Off / 1 : On) See details in “Lamp management” module.
4	LC_OBD_ERR	Defines failure as a “CARB/EOBD failure” (emission relevant). (failure visible via scantool) 0 : failure is not considered as a “CARB/EOBD failure” 1 : failure is considered as a “CARB/EOBD failure”

Figure B.75.1: Format of PRI_CONF_XX

Format of PRI_CONF_XX		
Bit	Logical value	Description
0	LC_ERR_PRI_1	This option defines the priority of the XX diagnosis.
1	LC_ERR_PRI_2	It is used for storage of failure and freeze frame.
2	LC_ERR_PRI_3	000: lowest priority for errors which are not significant for emission 011: highest priority for errors, which are not significant for emission 100: lowest priority for errors, which are significant for emission 111: highest priority which are significant for emission See details in “Priority rules” module. For emission relevant (EOBD, CARB) failure : LC_ERR_PRI_3 = 1 For non emission relevant failure : LC_ERR_PRI_3 = 0

B.75.1 Failure assignation

For each failure XX, a failure class is allocated. The failure class number makes this affectation, which are the calibrations named C_ERR_CLAS_XX and C_ERR_CLAS_2_XX.
(The calibration C_ERR_CLAS_2_XX is present inside the SW but "hard coded" and not visible in INCA)

This table is defined in the General Diagnosis Information .

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Diagnosis instance	Failure Class number Class A / Class B / Class C
Failure XX	C_ERR_CLAS_XX / C_ERR_CLAS_2_XX
Failure YY	C_ERR_CLAS_YY / C_ERR_CLAS_2_YY
...	...

The failure class number is a byte divided in two subclasses named class B (defined by the most significant quartet) and class A (defined by the less significant quartet).
Failure class number for failure XX

C_ERR_CLAS_XX =

(Class B) (Class A)

C_ERR_CLAS_2_XX =

Reserved				Class C			

B.75.2 Failure class definition

A failure class defines for a failure, which belongs to this failure class :

Part sub-class A :

- if the failure have impact on MIL illumination or not ;
- if the failure have impact on MIL blinking or not ;
- if the failure have impact on Warning Lamp 1 or not ;
- if the failure have impact on Warning lamp 2 or not ;
- if the failure is considered as a CARB/EOBD failure (emission relevant)

(failure visible with scantool, failure can set OBD freeze frame for mode 2h)

Part sub-class B :

- the increment value for driving cycle counter management ;
- the maximum value of driving cycle counter ;
- the decrement value for driving cycle counter management ;
- the priority of the failure.

Part sub-class C :

- Readiness code group.

Each subclass of a failure class is composed of 4 bits, so 16 different values are possible for each subclass. For each subclass, some values are predefined and some values are reserved for improvement/validation and are managed by calibration.

Sub Class A definition : ID_ERR_CLAS_A_FMT (1 byte x 16)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Subclass A Value (i) in hex / Name	Description	ID_ERR_CLAS_A_FMT [i]
0 / NO_LAMP	*- Predefined value -* Failure without impact on any lamp	%0000 0000 (in binary)

B.75.3 Example

To define the failure MIS_A (Misfiring A) as :

- a failure with high priority
- with only impact on MIL (On and Blinking)
- with CARB_MIS readiness class

Set the failure MIS_A in class number 64 (in hex) with C_ERR_CLAS_MIS_A = 64H and C_ERR_CLAS_2_MIS_A = 00H

That means :

- The value of sub class A is 4H => Failure with impact on MIL (On and blinking) (failure visible via scantool):

  WAL_CONF_MIS_A = %0001 1100 (in binary)

- The value of sub class B is 6H => "Carb/EOBD failure with high priority":

  DC_INC_MIS_A = 3
  DC_MAX_MIS_A = 6
  DC_DEC_MIS_A = 2
  PRI_CONF_MIS_A = %0000 0110 (in binary)

- The value of sub class C is 0H => The value of sub class C is 0 ;

The readiness code group of the failure is "MIS" group (Misfire monitoring system)

B.75.4 MIL relevant

Description for actions:

ACTION_ERRM_*GetMILRelevant* (<PRM_IDX_ERR >, <PRM_LV_MIL_RLV>)					
- This actions returns: 0 if the failure is not MIL relevant 1 if the failure is MIL relevant					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_IDX_ERR	IN	0...FFFFH	0...65535	1	[-]
Diagnostic failure instance					
PRM_LV_MIL_RLV	OUT	0...1H	0...1	1	[-]
Mil relevant failure					

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

PRM_LV_MIL_RLV = 0
If PRM_IDX_ERR ! = 0
Then
MIL relevant means enable MIL or enable flash mode for MIL and CARB/EOBD failure (visible via scantool)
If (bit 2 **or** bit 3 of WAL_CONF_XX = 1) **and** bit 4 of WAL_CONF_XX = 1
Then PRM_LV_MIL_RLV = 1
Endif
Endif

B.75.5 OBD relevant

Description for actions:

ACTION_ERRM_*GetOBDRelevant* (<PRM_IDX_ERR >, <PRM_LV_OBD_RLV>)					
- This actions returns: 0 if the failure is not OBD relevant (failure not visible via scantool) 1 if the failure is OBD relevant (failure visible via scantool)					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_IDX_ERR	IN	0...FFFFH	0...65535	1	[-]
Diagnostic failure instance					
PRM_LV_OBD_RLV	OUT	0...1H	0...1	1	[-]
OBD relevant failure (failure visible via scantool)					

Formula section:

PRM_LV_OBD_RLV = 0
If PRM_IDX_ERR ! = 0
Then
OBD relevant means CARB/EOBD failure (failure visible via scantool)
If bit 4 of WAL_CONF_XX = 1
Then PRM_LV_OBD_RLV = 1
Endif
Endif

B.75.6 Readiness code class

Description for actions:

ACTION_ERRM_*GetReadyClass* (<PRM_IDX_ERR >, <PRM_READY_CLAS>)					
- This actions returns: The readiness code group					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
PRM_IDX_ERR	IN	0...FFFFH	0...65535	1	[-]
Diagnostic failure instance					
PRM_READY_CLAS	OUT	0...FH	0...15	1	[-]
Readiness code group

B.76 Failure classes (Appl. Inc.)

B.76.1 Readiness class affectation

General information:

In this section, the calibrations C_ERR_CLAS_2_XX are "hard coded" inside the SW for this project. The list below describes how CARB class to affect for each failure.

Description:

For generation of the readiness-status of the OBD system in MODE 01h (only done if the diagnosis instance is calibrated as emission relevant /visible for SCAN - tool => LC_OBD_ERR = 1 /C_ERR_CLAS_xx , see Failure classes) all diagnosis must be clasified as:

- CARB_CC - Comprehensive component, continuous test
- CARB_MIS - Misfire monitoring, continuous test
- CARB_FSD - Fuel system monitoring, continuous test
- CARB_CAT - Catalyst monitoring, sequential test
- CARB_EVAP - Evaporative system monitoring, sequential test
- CARB_SA - Secondary air monitoring
- CARB_LS - Oxygen sensor monitoring
- CARB_LSH - Oxygen sensor heater monitoring
- CARB_EGR - EGR /IVVT system monitoring, sequential test

Formula section:

All diagnosis instances are configured as **CARB_CC**,
ecxept the list below

Diagnostic Instance Name(xx)	CARB clasification for Readiness
MIS_0	CARB_MIS
MIS_1	
MIS_2	
MIS_3

B.77 History memory

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CTR_ERR_HIS_NR	O/V/S	0... FFH	0... 255	1	-
Number of failures stored in the history memory					
ERR_HIS [NC_NR_ERR_HIS] [NC_NR_HIS]	O/V/S	0... FFH	0... 255	1	-
Array for data to be stored in history memory					
ERR_HIS_DTC [NC_NR_ERR_HIS]	O/V/S	0... FFFFH	0... 65535	1	-
DTC of failure in history memory					

Input data:

ERR_DTC [NC_NR_ERR_DYN] {p. 5756}	ERR_HIS_CONF [NC_NR_HIS] {p. 5825}		

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LC_ERR_FMY_HIS_CLR	V	0... 1H	0 ...1	1	-
Calibration to clear the history memory (when set to 1)					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_NR_ERR_HIS	-	0... FFH	0... 255	1	-
Max number of failure in the historic memory					
NC_NR_HIS	-	0... FFH	0... 255	1	-
Max number of data (in bytes) to stored for a failure in the historic memory					

General information

Export actions:

ACTION_ERRM_StoreHistory (IN <IDX>)
This action stores the failure IDX in the history memory

Output data detailed description:

ERR_HIS_DTC[NC_NR_ERR_HIS] array counts NC_NR_ERR_HIS elements (1... NC_NR_ERR_HIS).

ERR_HIS[NC_NR_ERR_HIS][NC_NR_HIS] array counts NC_NR_ERR_HIS x NC_NR_HIS elements (1... NC_NR_ERR_HIS, 1... NC_NR_HIS).

B.77.1 History memory

General information:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

This module is called by the dynamic error management module just before erasing a failure in the 2^{nd} layer memory (dynamic memory).

The principle is to copy some data related to this failure in a separate memory, called history memory. So the failure become historic failure.

The number of historic failure is limited to a maximum of NC_NR_ERR_HIS. When this maximum number is reach, new historic failure entry deletes the oldest historic failure in memory ("first in first out" principle).

History memory is defined by :

- ERR_HIS_DTC[x] with : x = index of failure in history memory

  A DTC number related to the failure.

- ERR_HIS[x][y] with : x = index of failure in history memory
  y = index of data stored for failure x in history memory

  Some others data.

  Contents of history memory is the same for each failure and defined in History memory (Appl. Inc.) module.

The history memory can be read and erased separately by dedicated diagnosis tool service.

The history memory can be deleted by setting the calibration LC_ERR_FMY_HIS_CLR to 1.

Application conditions:

Initialisation: –

Activation: –

Deactivation: –

Recurrence: –

Function description:

Formula section:

B.77.2 Store a failure in history memory

General information:

Description:

Syntax : ACTION_ERRM_StoreHistory (IN <IDX>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter (in) : IDX Index of failure to store in history memory

Parameter(out) : -

Short description : This action stores a failure in history memory

Application conditions:

Initialisation: after system initialization the history memory is restored from non-volatile memory or in case of a damaged non volatile memory the history memory is initialized with zero

Activation: at action request

Deactivation: –

Recurrence: –

Function description:

Formula section:

```
If    CTR_ERR_HIS_NR < NC_NR_ERR_HIS
Then   CTR_ERR_HIS_NR = CTR_ERR_HIS_NR + 1
Else  ERR_HIS_DTC[x] = ERR_HIS_DTC[x+1]  ("first in first out" principle)
      ERR_HIS[x][y] = ERR_HIS[x+1][y]    (with x = 1...CTR_ERR_HIS_NR-1, y
                                          = 1..NC_NR_HIS)
Endif
ERR_HIS_DTC[x] = ERR_DTC[IDX]
ERR_HIS[x][y] = ERR_HIS_CONF[y]
(with x = 1..  NC_NR_HIS, y = CTR_ERR_HIS_NR)
```

B.77.3 Clear the History Memory

General information:

The history memory can be erased by setting the calibration bit LC_ERR_FMY_HIS_CLR at 1

Application conditions:

Initialisation: after system initialization the history memory is restored from non-volatile memory or in case of a damaged non volatile memory the history memory is initialized with zero

Activation: at LC_ERR_FMY_HIS_CLR 0→1 transition

Deactivation: –

Recurrence: –

Import actions:

ACTION_ERRM_ MilOffToOnTrans (???<No Name available>)

FUNCTION DESCRIPTION:

General information:

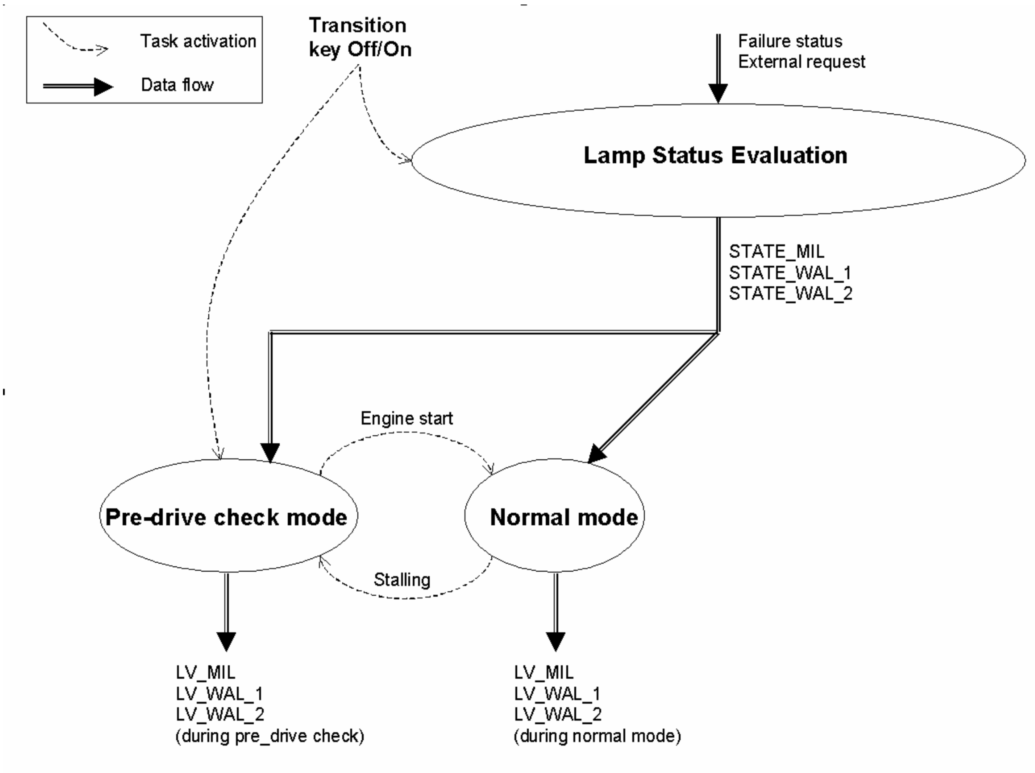
It is possible to manage up to three different lamps. They are called:

- MIL: Malfunction Indicator Lamp; this lamp is used to inform the vehicle driver in case of failures which can affect emissions.
- WAL_1: Warning Lamp 1 and WAL_2: Warning Lamp 2; these lamps are used to inform the vehicle driver in case of others failures.

For each lamp, a task evaluated the state of MIL, WAL_1 and WAL_2. These states STATE_MIL, STATE_WAL_1 and STATE_WAL_2 are respectively what error management commanded to the lamps regard to failure status.
Then, the real physical state of each lamp (LV_MIL for MIL, LV_WAL_1 for WAL_1 and LV_WAL_2 for WAL_2) is build related to the mode in which they are. Lamps behavior is based on two modes:

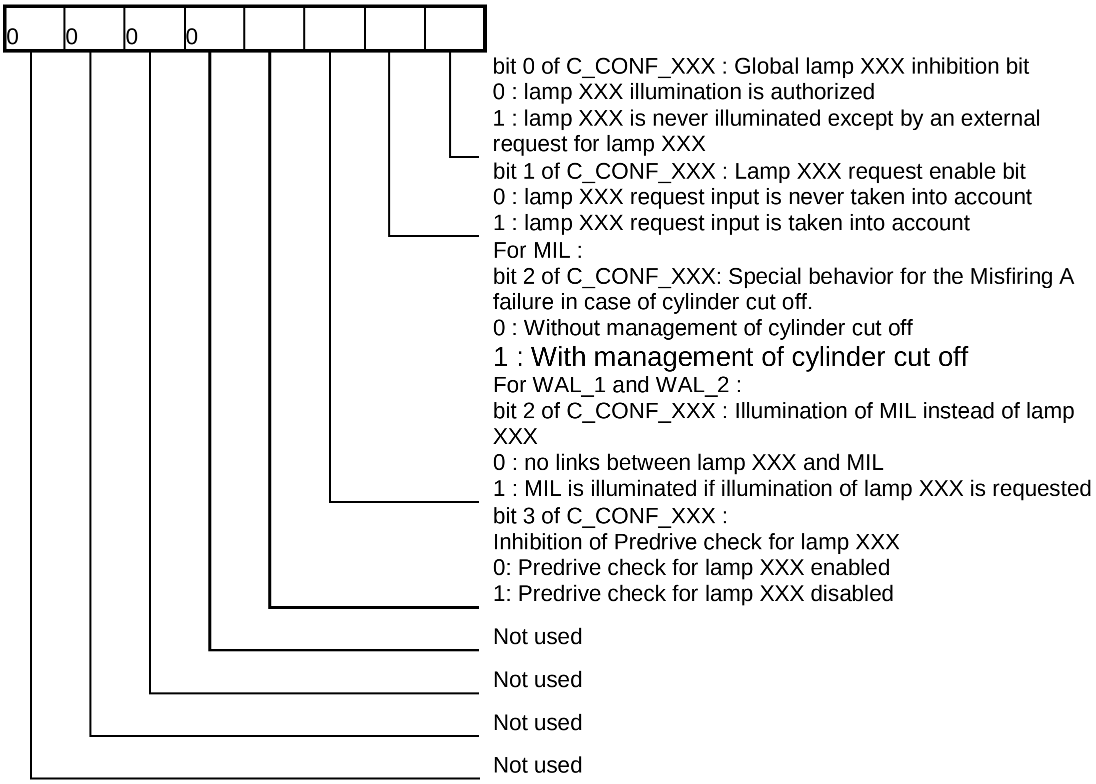
- A predrive check mode between transition LV_IGK 0->1 and engine start; this mode is used to check the correct lamps working.
- A normal mode for the rest of the time.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



A configuration byte is defined for each lamp: C_CONF_XXX (with XXX = MIL C_CONF_MIL, WAL_1 or WAL_2, C_CONF_WAL_1 C_CONF_WAL_2).
It is then possible to inhibit a lamp illumination, to allow or not external request for lamp illumination and to link lamp illumination each other's.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Impact of each failure on lamp is defined in WAL_CONF_XX byte:

- bit 0 : if set, the present failure may caused a WAL_1 illumination ;
- bit 1 : if set, the present failure may caused a WAL_2 illumination ;
- bit 2 : if set, the failure may caused a MIL illumination when driving cycle counter reaches maximum ;
- bit 3: if set, the present failure may cause a MIL blinking.

B.79.1 Lamp Status Evaluation

Description:

Management of WAL_1 and WAL_2

Behavior of WAL_1 and WAL_2 are identical. WAL_1 and WAL_2 may be illuminated (state is ON) or not (state is OFF). When the global lamp inhibition bit is not set, the lamp is requested to illuminate:

- if at least one failure is present (LV_ERR_XX) with the corresponding bit of WAL_CONF_XX (bit 0 for WAL_1, bit 1 for WAL_2) in enable position and this failure is stored in 2^{nd} layer memory ;
- or in case of allowed lamp request.

Management of MIL

MIL internal management is based on 3 states:

- STATE_MIL = OFF (MIL is requested continuously off)
- STATE_MIL = ON (MIL is requested continuously on)
- STATE_MIL = MIL_FLL (MIL is requested blinking at 1 Hz)

When the global MIL inhibition bit is not set, the MIL is requested to illuminate (ON):

- if at least one failure has reached its driving cycle maximum value and is unequal to zero (LV_DC_MAX[IDX]) with the corresponding bit of WAL_CONF_XX (bit 2) in enable position and this failure is stored in 2^{nd} layer memory ;
- or in case of allowed lamp request ;

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- or WAL_1 is requested to be illuminated and WAL_1 is link with MIL ;
- or WAL_2 is requested to be illuminated and WAL_2 is link with MIL ;

When the global MIL inhibition bit is not set, the MIL is requested to be blinking at 1hz (MIL_FLL):

- if at least one failure is present (LV_ERR_XX) with the corresponding bit of WAL_CONF_XX (bit 3) in enable position and this failure is stored in 2^{nd} layer memory ;

A special calculation can be enabled for Misfire A failure with the management of cylinder shut off (bit 2 of C_CONF_MIL):

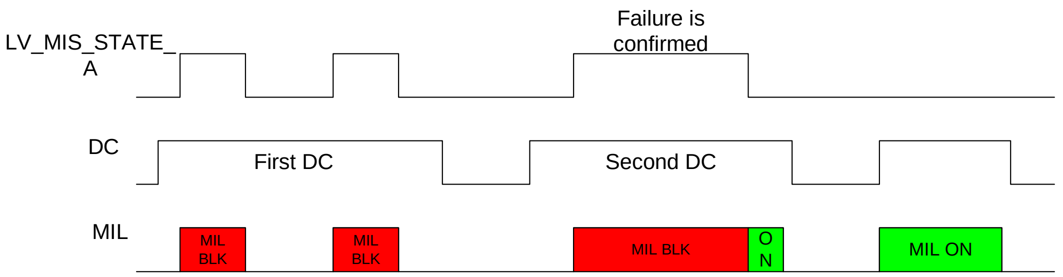
- bit 2 of C_CONF_MIL = 0: When a misfire A failure (LV_MIS_STATE_A) is present, the MIL is blinking.
- bit 2 of C_CONF_MIL = 1: If Misfire A failure (LV_MIS_STATE_A) is present with cylinder cut off, the MIL is blinking only for a calibratable time (C_DLY_INH_IV_MIS). After this time, the MIL is ON again.

Beware: The “blinking mode” is priority mode compared to “continuous on mode”.

Signal flow diagram:

Special behavior for Misfire A failure with bit LC_MIL_INH_IV_MIS of C_CONF_MIL:

Behavior of Misfiring failure MIS_A without management of cylinder cut off (LC_MIL_INH_IV_MIS = 0)



Behavior of Misfiring A failure with management of cylinder cut off (LC_MIL_INH_IV_MIS = 1) :

        Then   STATE_MIL = ON      (MIL is requested continuously on)
      Else   STATE_MIL = OFF     (MIL is requested continuously off)
        Endif
        If      LV_MIS_STATE_A = 1
                (CARB A misfire failure criterion)
        then    if      bit 2 of C_CONF_MIL = 0
                        (Without management of cylinder shut off for the misfiring A)
                then    STATE_MIL = MIL_FLL
                     (MIL is requested blinking at 1Hz)
                else    (Management of cylinder shut off for the misfiring A)
                        If      (any cylinder bit within SYM_CYL_MIS_A 0 -> 1
                        and     corresponding bit within INH_IV_MIS is set to 1)
                        Then    STATE_MIL = MIL_FLL only during C_DLY_INH_IV_MIS
                                After C_DLY_INH_IV_MIS, STATE_MIL = ON
                                mode = 'blink mode during a delay + continuous ON'
                        Endif
                        if      any cylinder bit within SYM_CYL_MIS_A 0 -> 1
                                and corresponding bit within INH_IV_MIS is set to 0
                        then    mode = 'blink mode'
                        Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If mode = 'blink mode'
Then **if** any cylinder bit SYM_CYL_MIS_A is set
And
corresponding bit within INH_IV_MIS remains to 0
(no transition 1-> 0 of the corresponding bit during the failure)
Then mode = 'blink mode'
Else mode ='blink mode during a delay + continuous ON'
Endif
Endif
If mode = 'blink mode'
Then STATE_MIL = MIL_FLL
(MIL is requested blinking at 1Hz)
else **if** C_DLY_INH_IV_MIS isn't achieved
Then STATE_MIL = MIL_FLL
(MIL is requested blinking at 1Hz)
Else STATE_MIL = ON
(MIL is requested continuously on)
Endif
Endif
Endif
Endif
If at least one failure in 2nd layer memory has :
(LV_ERR_XX and bit 3 of WAL_CONF_XX) = 1
(at least one failure request to blink the MIL)
Then STATE_MIL = MIL_FLL
(MIL is requested blinking at 1Hz)
Endif
Endif

Remark:
For the misfiring A failure (treated as a particular case), the Bit 3 of WAL_CONF_XX mustn't be set to 1 by calibration (only bit 2 for continuous MIL illumination).

B.79.1.1 MIL transition from Off to On

Formula section:

IF ((STATE_MIL transition OFF -> MIL_FLL or OFF -> ON) **AND**
LV_MIL_ACT_REQ = 0)
or (NLC_MIL_ACT_REQ = 1
and LV_MIL_ACT_REQ transition 0 -> 1 **AND** STATE_MIL = OFF
and bit 1 of C_CONF_MIL = 1**)**
(Hint: LV_MIL_ACT_REQ is stored in NVMY (defined in the Lamp managenment Appl. Inc.)). To check the transition LV_MIL_ACT_REQ 0->1 the old value of this flag (*LV_MIL_ACT_REQ_OLD*) has to be initialised with the value from NVMY at reset !!!)
THEN
ACTION_ERRM_MilOffToOnTrans()
ENDIF

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.79.2 Lamp mode

B.79.2.1 Predrive Check mode

Description:

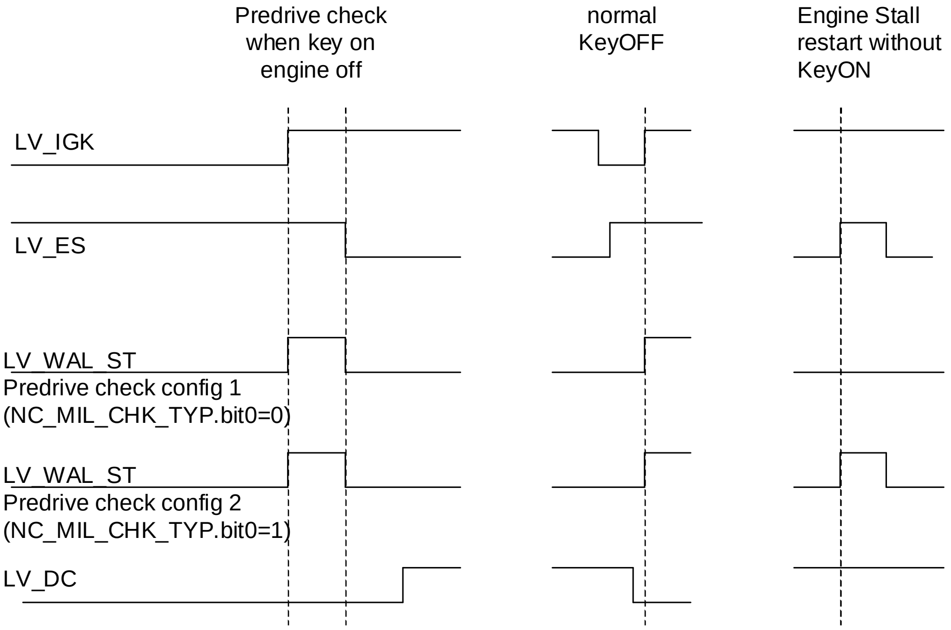
Predrive check mode is used to enable a visual check of the correct lamp working. Additionally it can be used to display readiness status as an option (MIL blinking).

Nevertheless a failure may also illuminate a lamp. Illumination of lamp during pre-drive check mode is performed only when :

- the global lamp inhibition bit is not set (bit 0 of C_CONF_XXX = 1) and the lamp individual predrive check inhibition is not set (bit 3 of C_CONF_XXX = 1)
- or error management commands a lamp
- or no inhibition because of active StartStop cycle LV_STST_STOP_CYC = 1
- Configuration of predrive check behaviour in case of stalling event:

  with NC_MIL_CHK_TYP (bit 0)

Predrive check mode phase can be defined in 2 ways:
- between key on transition LV_IGK 0->1 and engine start (bit 0 of NC_MIL_CHK_TYP=0)
- or between key on transition LV_IGK 0->1 and engine start, plus between an engine stall event and engine start (bit 0 of NC_MIL_CHK_TYP=1)

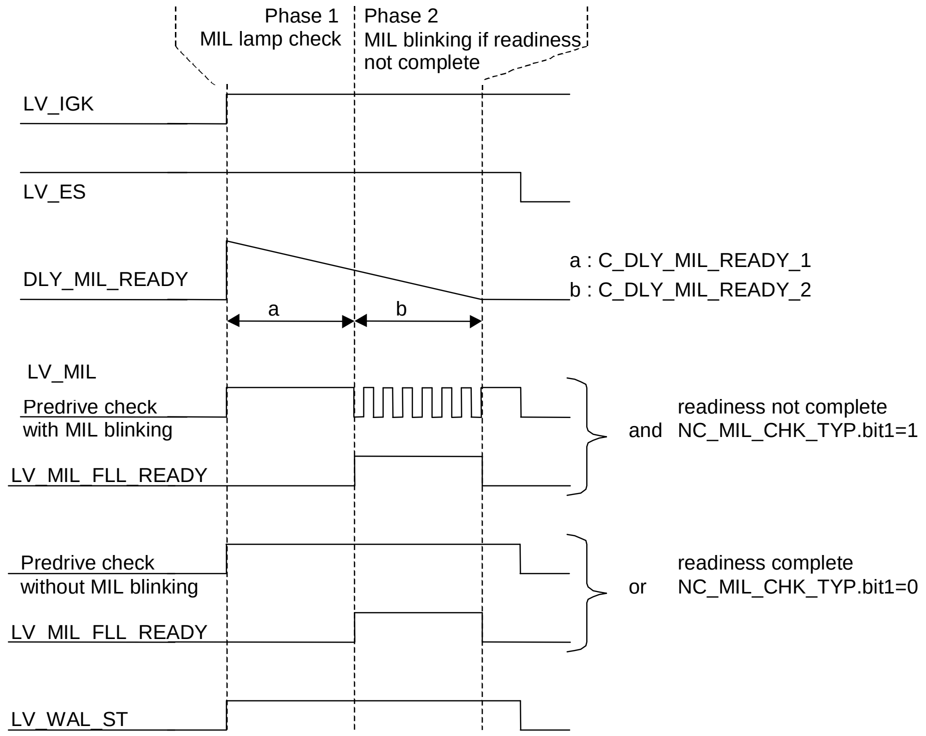


1. Configuration of MIL blinking readiness status functionality:

   with NC_MIL_CHK_TYP (bit 1)

During predrive check mode, you can display the status of readiness codes through the MIL warning lamp : the MIL is blinking if readiness not complete.
This strategy is part of predrive check and does not affect the MIL status (STATE_MIL).

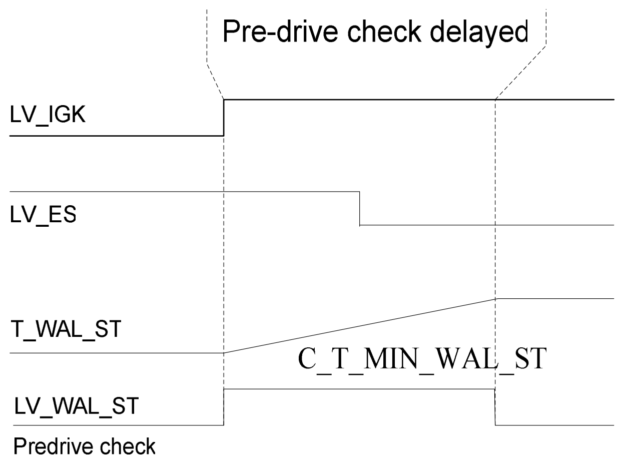
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



1. Management of minimum time of predrive check duration

-> only relevant after engine cranking (LV_ES 1->0)

Wih the calibration C_T_MIN_WAL_ST it's possible to set a minimum time for the predrive check duration independant of engine cranking (LV_ES 1->0). This gives the possibility to illuminate the Mil for predrive check (e.g. in case of a quick start).



1. Management of maximum time of predrive check duration

-> only relevant before engine cranking (LV_ES = 0)

With the calibration LC_T_MAX_WAL_ST_ENA, it's possible to activated the maximum time of predrive check functionality. If this functionality is activated (LC_T_MAX_WAL_ST_ENA = 1) the maximum predrive check duration before engine cranking is C_DLY_MIL_READY_1 + C_DLY_MIL_READY_2. This gives the possibility to finish the predrive check before engine cranking e.g. in case of a long key on engine stop phase.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

Any DTC that is commanding MIL on must be logged as a permanent fault code in non-volatile memory. A Permanent DTC can only be erased by the vehicle's OBD II system.
Vehicle owners and technicians would not be able to clear or erase permanent fault codes by any generic or manufacturer specific scan tool command (or by disconnecting the battery). Instead, these fault codes would only be allowed to be self-cleared by the OBD II system itself (ERRM), once the monitor responsible for setting that fault code has run enough times to confirm that the fault was no longer present.

The permanent fault code is set as soon as the failure gets the confirmed status (MIL is switched on).
The permanent fault code is erased after self-healing of the failure, when the MIL goes off.

Subsequent to a clearing of the failure memory (e.g. Mode $04), the permanent fault code is erased if the diagnostic that caused the permanent fault code to be stored has been fully executed and determined the malfunction is no longer present and special vehicle operation has been encountered (defined by LV_DC_PERM) such as :

- Cumulated trip length (time since engine start) T_AST_PERM >= 600 s
- Cumulative vehicle operation >= 40 km/h (25mph) for at least 300 s
- Continuous vehicle operation in idle >= 30 s (accelerator pedal released and vehicle speed less or equal than 1 mph)

wathever

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. - Altitude condition is (no criteria for ambient pressure si defined)
- Ambient temperature is (no criteria on ambient temperature is defined)

A minimum of four permanent fault codes shall be retained by by the OBD II system (ERRM). But the permanent failure memory may be adjusted over the four elements size thanks to NC_NR_ERR_PERM configuration data.
Permanent fault codes may not be erased when ECU is reprogrammed unless the readiness status for all monitored components is set to “not complete” in conjunction with the reprogramming event.

The permanent failure memory structure is defined as follow:
Index: IDX_PERM ξ [1...NC_NR_ERR_PERM]

- Permanent fault index	ERR_PERM[IDX_PERM]
- Permanent fault code	LV_ERR_PERM[IDX_PERM]
- Failure is only permanent due ERRM data clearing	LV_ERR_CLR[IDX_PERM]
- Permanent Fault symptom	ERR_SYM_PERM[IDX_PERM]
- Permanent memorized cylinder with misfire A, B1, B4	SYM_CYL_PERM_XX

B.81.1 Permanent failure memory

FUNCTION DESCRIPTION:

General information:

The permanent failure memory is a data structure containing NC_NR_ERR_PERM elements.
Permanent faults codes are stored there, with a chronological order, but the clearing is done randomly, because it is based on the natural failure healing. When the data structure is full, no additional permanent fault code can be entered, until an empty space is freed within the structure.
The permanent failure memory must retain at least four permanent faults codes.

Application conditions

Initialisation:

```
at NVMINI system event
 CTR_ERR_PERM_NR = 0
 LV_DC_PERM_MEM = 0
   For  IDX_PERM = 1 to NC_NR_ERR_PERM

B.81.4 Impact of error management data clearing inside permanent memory

Description for actions:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_*ClcPermanentIniErrm* ( )					
This action is called when all error management data is cleared (e.g. Mode $04 executed by scan tool). After an overall data clearing of error management data, permanent errors are marked in order to allow a self clearing at the end of next driving cycle, if the following conditiong are gathered: - diagnosis has run long enough to detect a possible malfunction - malfunction not present					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
No parameter					

Formula section:

LV_DC_PERM_MEM = 0

For IDX_PERM = 1 to NC_NR_ERR_PERM
If(1) LV_ERR_PERM[IDX_PERM] = 1
Then(1)

B.81.8 Clearing of permanent failure memory, in development

FUNCTION DESCRIPTION:

Description:

For development conveniences, it is often useful to reinitialise the permanent failure memory. This is possible by setting the calibration bit LC_ERR_PERM_CLR to 1.

Application conditions

Initialisation: *at RST system event*
LV_ERR_PERM_CLR_OLD = LC_ERR_PERM_CLR
at IGKON system event
LV_ERR_PERM_CLR_OLD = LC_ERR_PERM_CLR

Recurrence: *1 s*

Activation: *Always*

Formula section:

(Detection of LC_ERR_PERM_CLR 0 → 1 transition)
If (LV_ERR_PERM_CLR_OLD = 0
and
LC_ERR_PERM_CLR = 1)
Then
For IDX_PERM = 1 to NC_NR_ERR_PERM
ERR_PERM[IDX_PERM] = 0
LV_ERR_CLR[IDX_PERM] = 0
LV_ERR_PERM[IDX_PERM] = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
            ERR_SYM_PERM[IDX_PERM] = 0 (NO_SYM)
    Endfor
    If NLC_TREAT_DIAG_MIS = 0
    Then
            (XX stands for MIS_A, MIS_B1, and MIS_B4)
            SYM_CYL_PERM_XX = 0
    Endif
  CTR_ERR_PERM_NR = 0
    LV_DC_PERM_MEM = 0
Endif
LV_ERR_PERM_CLR_OLD = LC_ERR_PERM_CLR
```

B.82 Priority rules

Input data:

LV_DC_MAX [NC_NR_ERR_DYN] {p. 5767}	LV_ERR_CFM [NC_NR_ERR_DYN] {p. 5767}	LV_ERR_DISA [NC_NR_ERR_DYN] {p. 5767}	NC_ERR_PRI_H {p. 5811}
PRI_CONF_XX {p. 5811}	WAL_CONF_XX {p. 5811}		

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NLC_INC_ERR_PRI	-	0... 1H	0 ...1	1	-
Enable(1)/disable(0) increased failure priority strategy					
NLC_OBD_ENA_PRI_PERM	-	0... 1H	0 ...1	1	-
Activation/deactivation of special priority rule treatment for failures which are permanent (0: permanent failures are not protected, 1: permanent failures are protected)					
NLC_OLD_ERR_PRI	-	0... 1H	0 ...1	1	-
Set this bit to 1 to give priority to old failure regards to new failureSet this bit to 0 to give priority to new failure regards to old failure					

Import actions:

ACTION_ERRM_GetErrPerm (**OUT**<PRM_LV_ERR_PERM>,**IN**<PRM_IDX_ERR>)

General information

Export actions:

ACTION_ERRM_PrioRule (OUT <RESP>, OUT <IDX>)
This action performs priority rules, when failure memory is full, to say if the new failure is accepted or not.

B.82.1 Priority rules

General information:

The dynamic error management module calls this module in case of present failure occurrence when the 2^{nd} layer memory is full.

It defines criteria to store or not this failure in the 2^{nd} layer memory (dynamic memory). Only one failure occurrence is stored.

Results of this module is either:

- "storage of new failure not possible"
- or ("storage of new failure possible" ; index of failure to delete in 2^{nd} layer memory)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

In case of new failure entry whereas the dynamic memory is full (number of stored failure = NC_NR_ERR_DYN), different criteria are applied to prioritize the failure:

- A new failure is more important than a disappeared failure

- Failure priority as defined in PRI_CONF_XX ;
  - Chronological failure order

    If NLC_OLD_ERR_PRI = 1: old failure has priority regards of new failure;
    (Failure i older than failure j means failure i has entered 2^{nd} layer memory before failure j)

    If NLC_OLD_ERR_PRI = 0: new failure has priority regards of old failure;
    (Failure i newer than failure j means failure i has entered 2^{nd} layer memory after failure j)

- NLC_OBD_ENA_PRI_PERM

  - Set this bit to 1 in order to protect permanent failures within priority rules algorithm: permanent faults cannot be deleted by priority rules

  - NLC_OBD_ENA_PRI_PERM = 1 : Permanent faults are protected.
    Must be used with US applications

  - Set this bit to 0 to apply always priority rules even if failure to be removed is permanent.

  - NLC_OBD_ENA_PRI_PERM = 0 : Permanent faults not protected.

  - When the ERRM memory is full, this action manages failure entry based on priority rules.
    Then, based on action result, failure entry is authorized or rejected.

.

Additional features of this functionality:

- MIL can never be switched off

- Failure setting the OBD freeze frame (e.g. used for diagnostic communication with scantool /mode 2h) cannot be erased.

- The “increased priority” can be enabled with the configuration NLC_INC_ERR_PRI. This priority is a final rule, which is used, if it’s not possible to enter a failure with any of the other possibilities. Then it’s possible (only for failure with priority $>=$ 4) to store the failure, if a confirmed failure not of the highest priority (priority $<$ NC_ERR_PRI_H), which is not illumination the MIL anymore, can erased instead.If the new failure entry is not accepted because of the priority, this failure will not be stored in the 2^{nd} layer memory but limp home is activated, thus the freeze frame is not memorized and also no lamp management for this failure is possible.

Application conditions:

Initialisation: –

STATE_CTR_RBM[NC_NR_DIAG_RBM] : Information data for CTR_COMP_RBM[NC_NR_DIAG_RBM] and CTR_CDN_RBM[NC_NR_DIAG_RBM] calculations.

bit 0: incrementation of monitor individual numerator done in this DC

bit 1: incrementation of monitor individual denominator done in this DC

FUNCTION DESCRIPTION:

General information:

To gain more information about the monitoring performance under real world conditions, CARB required to implement software algorithms to track and report in-use performance for the following monitors in a standardized format: Catalyst, Oxygen sensor, Evaporating system, EGR system, VVT system and Secondary air system.

For this kind of statistic different counters are necessary:

- Ignition cycle counter

Counter that indicates the number of ignition cycles a vehicle has experienced

- General denominator

Measures the number of times a vehicle is operated under standardized conditions

- Monitor individual numerator

Measures the number of driving cycles in which the monitor was done

- Monitor individual denominator

Counter that indicates the number of times a vehicle is operated under monitor indiividual conditions.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

All these counters are set to zero only when a non-volatile memory reset occurs (e.g. reprogramming). They will not be initialized with zero on any other circumstances including when a scan-tool command to clear fault codes is received.

B.83.1 Ignition cycle counter

Description:

The number of ignition cycles since the first ECU power up are counted within CTR_IGK_CYC_RBM. The counter is incremented each time a driving cycle with engine running for at least 2 seconds ($\pm$1s)

Copyright (C) Continental AG,2007

(C_DLY_AST_RBM) is detected. This value is only initialized with 0 on saved RAM lost (or reprogramming). If CTR_IGK_CYC_RBM is incremented LV_IGK_CYC_RBM is set to 1 to indicate that counter is already incremented within this driving cycle.
If the counter reaches its maximum value, the value is set to 0 on the next calculation.

Application conditions

Initialisation: at first ECU power up / on saved RAM lost (or reprogramming)
CTR_IGK_CYC_RBM = 0
at reset
CTR_IGK_CYC_RBM = restored from NVMY
at LV_DC 0 → 1 transition and ECU reset
LV_IGK_CYC_RBM = 0

Recurrence: *1 s*

Activation: *LV_DC = 1* ***and*** *LV_IGK_CYC_RBM = 0*

Formula section:

Quantity of driving cycles calculation:
If T_AST >= C_DLY_AST_RBM (time after start at least C_DLY_AST_RBM)
Then
If CTR_IGK_CYC_RBM = 65535 (maximum value of CTR_IGK_CYC_RBM)
Then
CTR_IGK_CYC_RBM = 0
Else
CTR_IGK_CYC_RBM = CTR_IGK_CYC_RBM + 1
Endif
LV_IGK_CYC_RBM = 1 (CTR_IGK_CYC_RBM incremented this DC)
Endif

B.83.2 General denominator calculation

Description:

The counter for the general denominator CTR_CDN_OBD_RBM is incremented each time a valid DC with standardized vehicle operation (LV_DC_RBM = 1) is recognized. The numbers of driving cycles are counted since the first ECU power up. This value is only initialized with 0 on saved RAM lost (or reprogramming).
If the counter reaches its maximum value, the value is set to 0 on the next calculation.

Application conditions

Initialisation: at first ECU power up / on saved RAM lost (or reprogramming)
CTR_CDN_OBD_RBM = 0
at reset
CTR_CDN_OBD_RBM = restored from NVMY

Recurrence: –

Activation: *LV_DC_RBM 0→1 transition*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If CTR_CDN_OBD_RBM = 65535 (maximum value of CTR_CDN_OBD_RBM)
Then
CTR_CDN_OBD_RBM = 0
Else
General denominator calculation:
CTR_CDN_OBD_RBM = CTR_CDN_OBD_RBM + 1
Endif

B.83.3 Monitor individual numerator calculation

Description:

For all monitors requiring Rate-Based Monitoring (m = 0 to (NC_NR_DIAG_RBM - 1)) a numerator must be calculated. This numerator CTR_COMP_RBM[m] is incremented, if the conditions for the monitor were present for a sufficient time (bit 0 of STATE_RBM[m] = 1), but only one time within the driving cycle. This value is only initialized with 0 on saved RAM lost (or reprogramming)
If the counter CTR_CDN_RBM[m] is halved, because of maximum value limitation, the value CTR_COMP_RBM[m] is also divided by 2 (positive rounded).

Application conditions

Initialisation:
```
at first ECU power up /  on saved RAM lost (or reprogramming)
   CTR_COMP_RBM[m]  = 0
  at reset
   CTR_COMP_RBM[m]  = restored from NVMY
 at LV_DC 0 →1 transition or ECU reset
   STATE_CTR_RBM[m]  = 0
  with m = 0 to (NC_NR_DIAG_RBM – 1)
```
Recurrence: `10 s` **or** `LV_DC 1 → 0 transition`

Activation: `LV_INH_DC_RBM = 0` **and** `LV_DC = 1`

Formula section:

For m = 0 to (NC_NR_DIAG_RBM - 1)
all monitor requiring Rate-Based Monitoring
{ see specification "Rate-Based Monitoring (Appl. Inc.)" }
If bit 0 of STATE_CTR_RBM[m] = 0
(Incrementation of CTR_COMP_RBM[m] not yet done in this DC)
Then **If** bit 0 of STATE_RBM[m] = 1
(monitor is done for RBM)
and bit 1 of STATE_RBM[m] = 0
(monitor isn't inhibited because of a system fault)
Then CTR_COMP_RBM[m] = CTR_COMP_RBM[m] + 1
bit 0 of STATE_CTR_RBM[m] = 1
(Incrementation of CTR_COMP_RBM[m] done in DC)
Endif
Endif
Endfor

B.83.4 Monitor individual denominator calculation

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

In comparison to the counter CTR_IGK_CYC_RBM, counting the numbers of driving cycles (longer C_DLY_AST_RBM) since the first ECU power-up, the monitor individual denominator is counting the number of DC in which special vehicle/driving and ambient conditions are met individually for each monitor.
The counter CTR_CDN_RBM[m] is managed individually for each monitor (m = 0 to (NC_NR_DIAG_RBM - 1)), for which the monitoring of the real in-use performance is made. To increment the monitor denominator, some common conditions must be fulfilled (LV_DC_RBM = 1) but also monitor individual conditions. These monitor individual conditions are managed within the monitor function (bit 2 of STATE_RBM[m]). The value is only initialized with 0 on saved RAM lost (or reprogramming).
If the counter CTR_COMP_RBM[m] is halved, because of maximum value limitation, the value CTR_CDN_RBM[m] is also divided by 2 (positive rounded).

Application conditions

Initialisation:

```
at first ECU power up /  on saved RAM lost (or reprogramming)
      CTR_CDN_RBM[m]   = 0
   at reset
      CTR_CDN_RBM[m]   = restored from NVMY
   with m = 0 to (NC_NR_DIAG_RBM - 1)
```

Recurrence: *10 s **or** LV_DC 1 → 0 transition (before LV_DC_RBM initialisation performed at LV_DC 1 → 0)*

Activation: *LV_INH_DC_RBM = 0 **and** LV_DC_RBM = 1*

Formula section:

For m = 0 to (NC_NR_DIAG_RBM - 1)
all monitor requiring Rate-Based Monitoring
{ see specification "Rate-Based Monitoring (Appl. Inc.)" }
If bit 1 of STATE_CTR_RBM[m] = 0
(incrementation is not done yet)
Then **If** bit 1 of STATE_RBM[m] = 0
(monitor is not inhibit, because of a system fault)
and bit 2 of STATE_RBM[m] = 1
(monitor individual RBM conditions are met within this DC)
Then CTR_CDN_RBM[m] = CTR_CDN_RBM[m] +1
bit 1 of STATE_CTR_RBM[m] = 1
(incrementation is done within DC)
Endif
Endif
Endfor

B.83.5 Counter overflow treatment for monitor individual numerator and denominator

Description:

If either the numerator or denominator for a specific component reaches the maximum value (65535), both numbers shall be divided by two before either is incremented again to avoid overflow problems.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialisation: –

Recurrence: –

Activation: `LV_DC 0 → 1 transition`

Formula section:

For m = 0 to (NC_NR_DIAG_RBM - 1)
  all monitor requiring Rate-Based Monitoring
  { see specification “Rate-Based Monitoring (Appl. Inc.)” }
  If CTR_CDN_RBM[m] = 65535 (maximum value of CTR_CDN_RBM[m])
  or
  CTR_COMP_RBM[m] = 65535 (maximum value of CTR_COMP_RBM[m])
  Then CTR_CDN_RBM[m] = CTR_CDN_RBM[m] /2
  CTR_COMP_RBM[m] = CTR_COMP_RBM[m] /2
  Endif
Endfor

B.83.6 Standardized vehicle operation for Rate-Based Monitoring

FUNCTION DESCRIPTION:

General information:

For the calculation of the denominators for Rate-Based Monitoring, CARB standardized vehicle operations, which must be met to increment the denominator counter.

Description:

A special driving cycle (LV_DC_RBM) for Rate-Based Monitoring is defined, which is set, if the following standardized vehicle operations are fulfilled:

- Cumulated trip length (time since engine start) T_AST_RBM >= C_T_AST_RBM

(CARB : 600 s)

- Cumulative vehicle operation >= C_VS_THD_RBM for minimum of C_T_VS_RBM

(CARB : >= 40 km/h (25mph) for at least 300 s)

- Continuous vehicle operation in idle equal or longer than C_T_IS_RBM (accelerator pedal released and vehicle speed less or equal than 1 mph)

(CARB : 30 s)

with

- altitude such as ambient pressure AMP > C_AMP_MIN_RBM

(CARB : 8000 feet)

- ambient temperature (TAM_DSL_CMN) >= C_TAM_MIN_RBM

  (CARB : 20 °F)

Remark: to manage data type diversity between GS and DS divisions, TAM_DSL_CMN variable is updated with ambient temperature information every 100 ms.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.83.7 Cold start conditions detection

FUNCTION DESCRIPTION:

General information:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The individual monitor condition established for evaporative system denominator calculation (see §1968.2 - 4.3.2, section D) can be applied for other diagnoses (bit 2 calculation of STATE_RBM_xx) that require extended monitoring evaluation (e.g. coolant or intake air rationality).

Description:

Cold start conditions are set within the driving cycle when: (see §1968.2 - 4.3.2, section D)

- Cumulative time since engine start is greater than or equal to 600 seconds while at an ambient temperature of greater than or equal to 40 degrees Fahrenheit but less than or equal to 95 degrees Fahrenheit
- Engine cold start occurs with engine coolant temperature at engine start greater than or equal to 40 degrees Fahrenheit but less than or equal to 95 degrees Fahrenheit and less than or equal to 12 degrees Fahrenheit higher than ambient temperature at engine start.

Application conditions

Initialisation: at RST system event **or** at LV_DC 0 → 1 transition
LV_DC_CDN_CST_RBM = 0
T_AST_CST_RBM = 0 s
TAM_ST_DSL_CMN = TAM_DSL_CMN

Recurrence: *100ms*

B.84.1 Definition of diagnosis using RBM

FUNCTION DESCRIPTION:

Description:

Depending on the system configuration and the customer requirements, the diagnosis individual counters for Rate-Based Monitoring, the numerator and denominator, must be calculated for specific monitors.

Within this module the monitors using RBM statistics are defined.

Application conditions

Initialisation : at ECU reset and LV_DC 0 1 transition :

```
    For  i = 0 to NC_NR_DIAG_RBM do
    STATE_RBM[i] = 0
        Endfor
```

Recurrence: 10 s { always executed prior to Rate-Based Monitoring main module }

Activation: every engine operating state

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.84.2 Clear rate base monitoring statistics

Description:

For development conveniences, it is often useful to reinit the rate base monitoring statistics. This is possible by setting the calibration bit LC_RBM_CLR to 1.

Application conditions

Initialisation: –

Recurrence: –

Activation: `0 1 transition of LC_RBM_CLR`

Formula section:

If LC_RBM_CLR = 1
Then ACTION_ERRM_ClearRbmStatistics (OUT < ResultClrInfo>)
Endif

B.84.3 Inhibition of standardized vehicle operation calculation

FUNCTION DESCRIPTION:

General information:

The calculation of the standardized vehicle operation LV_DC_RBM, necessary for the calculation of the denominators for the Rate-Based Monitoring functionality, depends on different engine and ambient conditions.

Description:

With the value LV_INH_DC_RBM the inhibition of the standardized vehicle operation calculation is controlled. An inhibition is possible due to a system failure that influences the conditions necessary to set LV_DC_RBM.

Application conditions

Initialisation: `at ECU reset or LV_DC 0 1 transition : LV_INH_DC_RBM = 0`

Recurrence: `1 s`

Activation: `LV_DC = 1`
and `LV_INH_DC_RBM = 0`

Formula section:

At LV_DC 0 1 transition :

The pending status of the following failures has to be checked only once :

- LV_ERR_AMP
- LV_ERR_AMP_PLAUS

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- LV_ERR_VS
- LV_ERR_TAM_PLAUS
- LV_ERR_TAM_CAN

If(1) { CPU optimization at LV_DC 0 1 transition }
CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn t empty }
Then(1)
While LV_INH_DC_RBM = 0 **do**
with each XX failure of the above list : ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<CALL>)
If(2) XX has a pending status
Then(2)
LV_INH_DC_RBM = 1
Endif(2)
Endwhile
Else(1)
{ the dynamic failure memory is empty }
No action
Endif(1)

Every 1 s :

If LV_ERR_AMP = 1
or LV_ERR_AMP_PLAUS = 1
or LV_ERR_VS = 1
or LV_ERR_TAM_PLAUS = 1
or LV_ERR_TAM_CAN = 1
Then LV_INH_DC_RBM = 1
Endif

B.84.4 Calculation of cold start denominator

FUNCTION DESCRIPTION:

General information:

Calculation is done in generic part. LV_CDN_CST_RBM is still defined due to interface reasons.

Application conditions

Initialisation: *at LV_DC 0->1 transition or ECU reset set LV_CDN_CST_RBM = 0*

Recurrence: *1s*

Activation: *LV_DC = 1 and LV_CDN_CST_RBM = 0*

Formula section:

LV_CDN_CST_RBM = LV_DC_CDN_CST_RBM

B.84.5 Ambient air temperature adaptation to handle GS/DS data types differences

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

FUNCTION DESCRIPTION:

Description:

Some temperatures values can be delivered from Diesel or Gasoline system:
Ambient temperature TAM
As data types may be different, the following fomula section shall be used to allow adaptation to each environment.

Application conditions

Initialisation: `at ECU reset set TAM_DSL_CMN = TAM`

Recurrence: *100 ms*

Activation: *always*

Formula section:

TAM_DSL_CMN = TAM

B.84.6 Standardized vehicle operation adaptations

FUNCTION DESCRIPTION:

General information:

Due to new vehicles configurations encountered (Stop& Start, conventional combustio engine), CARB standardized vehicle operations (LV_DC_RBM) defined for conventional vehicles may be difficult to reach, mainly because some engine states are no more covered (idle mode).
CARB regulation:
"For hybrid vehicles, vehicles that employ alternate engine start hardware or strategies (e.g., integrated starter and generators), or alternate fuel vehicles (e.g., dedicated, bi-fuel, or dual-fuel applications), the manufacturer may request Executive Officer approval to use alternate criteria to that set forth in section (d)(4.3.2)(B) above for incrementing the denominator. In general, the Executive Officer shall not approve alternate criteria for vehicles that only employ engine shut off at or near idle/vehicle stop conditions. Executive Officer approval of the alternate criteria shall be based on the equivalence of the alternate criteria to determine the amount of vehicle operation relative to the measure of conventional vehicle operation in accordance with the criteria in section (d)(4.3.2)(B) above."

The purpose of the following formula section is to povide or re-build missing data so as to keep CARB standardized vehicle operation definition.

Application conditions

Initialisation: *at RST system event*

```
LV_IS_RBM = 1
LV_OBD_IS_RBM_CUS_ADJ = 1 (bit always to one)
```

Recurrence: *100 ms*

Activation: *all ECU states*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.85 Readiness codes

Data definition:

Action definition

ACTION_ERRM_InitReadiness ()	Mode: O

Import actions:

ACTION_ERRM_ReadReadinessCodCus (<INOUT>,<ReadinessCode>,<OUT>,<ResultReadinessCode>)
ACTION_ERRM_ReadReadinessCode (**INOUT**<PRM_READINESSCODE>,**OUT**<PRM_RESULTREADINESSCODE>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

Readiness flag allows to know if a full diagnostic check (not in EOL phase) has been done or not (minimum number of checks necessary for MIL illumination if failure is present).

A readiness flag is defined for each diagnosis (LV_READY_XX). Based on these flags, readiness code status (2 bytes STATE_READY_OBD_1 and STATE_READY_OBD_2) are generated in the Communication Interface (API) file for Carb mode.
Readiness flags are mainly used by after market service and inspections maintenance. When after market achieves a repair, the system should be controlled before to give back the car to its owner.
Because some failure need a long time (and may be 2 DC) to be diagnosed, the repair operator need an as quick as possible information meaning the repairs is OK.
The readiness flag indicates when it is set to 0 that :

- the diagnosis related to failure XX is done since the last clear DTC service received.

- and if a failure XX is present, MIL would be illuminated.

For after market time optimisation, in case of no failure at all, the readiness flag is set to 0.
The readiness flag indicates when it is set to 1 that :

- the diagnosis related to failure XX is not done since the last clear DTC service received.
- or if a failure XX is present, MIL is not still illuminated (may takes many driving cycle).

After failure erase, all bits associated to supported functions are set to 1.
When the system has executed enough driving cycles for determining if MIL should be switch On or not, all the readiness flags are in 0 state. At this occurrence, failures which may have switch on the MIL could be considered as repaired if MIL is Off.

B.85.1 Readiness flag set to 0

Description:

The readiness flag LV_READY_XX is set to 0 when enough driving cycle has been done without failure XX.

Application conditions

Initialization: On saved ram lost
LV_READY_XX = 1

Recurrence: at the recurrence of activation condition

Activation: *at transition LV_DC 0->1*
or *at transition LV_END_DIAG_XX 0->1*

Formula section:

```
If      LV_READY_XX = 1                          (diag XX not still ready)
        and LV_DC = 1                            (driving cycle valid)
          and LV_END_DIAG_XX = 1                 (diag done)
          and LV_EOL_OBD_DC = 0                  (not in EOL tests)
Then      If     LV_ERR_MEM_XX = 1               (failure in 2nd layer memory)
  Then      If LV_ERR_DC[IDX] = 0 (no failure present this DC)
              Then      LV_READY_XX = 0          (diag XX is ready)
                Else      If      LV_DC_MAX[IDX] = 1
                          Then    LV_READY_XX = 0     (diag XX is ready)
                Endif
          Endif
            Else      If      LV_ERR_XX = 0
                   Then       LV_READY_XX = 0          (diag XX is ready)
                   Endif
            Endif
Endif
```

B.85.2 Readiness flag reinitialisation (set to 1)

Description:

Syntax : ACTION_ERRM_InitReadiness ( )
Parameter(in) : No parameter
Parameter(out) : No parameter

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Short description :
The readiness flag LV_READY_XX is reinitialized (set to 1) upon communication tool request via the action ACTION_ERRM_InitReadiness ( ).
This reinitilisation is always done when all failure are erased from failure memory.

Application conditions

Initialization: –

Recurrence: –

Activation: *at action request*

Formula section:

For every failure : LV_READY_XX = 1

B.85.3 Readiness code information update

Description:

Purpose of this paragraph is to update readiness code completion status. This update shall be done :

- at end of driving cycle, for readiness status display,
- on action call, for customer tool and Scan Tool coherency with STATE_READY_OBD_X.

Important remark: each time ACTION_ERRM_ReadReadinessCode is called Readiness codes completion status (STATE_READY_OBD_1 and STATE_READY_OBD_2) are calculated.

Application conditions

Activation: at LV_DC 1 0 transition

Initialization: on non-volatil memory reset/ lost **or** on failure erase service received
STATE_READY_OBD_1 = FFh,
STATE_READY_OBD_2 = FFh
{FFh value indicates that readiness code is not yet computed}

Recurrence: none, executed single time on activation.

Formula section:

{ Action call to update STATE_READY_OBD_1 and STATE_READY_OBD_2 }

Call ACTION_ERRM_ReadReadinessCode(INOUT<STATE_READY_OBD_1, STATE_READY_OBD_2>, OUT<ResultReadinessCode>)

Application conditions

Activation : at LV_DC 1 0 transition

Initialization: on non-volatil memory reset/ lost
or
on failure erase service received
STATE_READY_OBD_3 = FFh

General information

STATE_SCDN[k] : Similar conditions status for diagnostic instance k

bit 0: 0: SCDN will be recorded (updated) at next failure occurrence
1: SCDN are recorded
bit 1: Recognition of similar conditions with failure detection this DC
bit 2: Recognition of similar condition without failure/exceedance detection this DC

Copyright (C) Continental AG,2007

It’s also set after C_CTR_SCDN_EQU_DC_MAX driving cycles without similar conditions without error

bit 3: Failure XX was present last DC

bit 4: Request to increment driving cycle counter of failure XX

bit 5: " exceedance" of specific limit was reported for failure XX

Similar Conditions

General Information:

The different states of a failure are managed regards their driving cycle and warm up cycle counters values (see Dynamic error management core for details).

For Misfire and Fuel system failures, some additional conditions should be fulfilled to increment and decrement their driving cycle counter. These additional conditions are related to engine conditions and are called similar conditions.

When similar conditions without failure are fulfilled for the failure XX already stored in the dynamic memory in a previous driving cycle, bit 2 of STATE_SCDN[k] is set to 1. That means, that the driving cycle counter of failure XX could be decremented at the end of the driving cycle if the failure XX will not get present till this treatment. If an exceedance is reported by the diagnostic function (bit 5 of STATE_SCDN[k] is set to 1), the driving cycle counter is not decremented at the end of the DC. Exception: Driving cycle counter decrementation linked with C_CTR_SCDN_EQU_DC_MAX DCs, see description below.

Also the incrementation of the driving cycle counter of a failure stored in dynamic memory is controlled by the similar conditions functionality. The incrementation done in the error management core is triggered by the ACTION_ERRM_IncrementDCctrScdn (XX) in the following cases:

- Similar conditions are recorded
  (bit 0 of STATE_SCDN[k] 0->1).

- A failure already stored in memory occurs again in the following driving cycle
  (bit 2 of STATE_SCDN[k] = 1).

- A temporary failure or a confirmed failure with MIL off (LV_DC_MAX[IDX] = 0) occurs again not in the following driving cycle but with similar conditions with failure
  (bit 1 of STATE_SCDN[k] = 1).

- A confirmed failure with MIL on (LV_DC_MAX[IDX] = 1) occurs again.

In all of these cases, the driving cycle counter is incremented (bit 4 of STATE_SCDN[k] 0→1).

For a temporary failure or confirmed failure with MIL off (LV_DC_MAX[IDX] = 0), even if similar conditions are not recognized during a C_CTR_CDN_EQU_DC_MAX number of driving cycles, the driving cycle counter of the failure can be decremented after C_CTR_CDN_EQU_DC_MAX driving cycles.

Similar conditions functionality is inhibited when LC_ENA_SCDN=0 or NLC_ENA_SCDN=0.

Remark:

To keep the link between the index of the failure using the similar condition and the index of the failure in static memory, a transfer function is defined: k = Scdn (XX). The link between the diagnosis instance and the similar conditions instance k is described in the application incidence of similar condition.

B.86.1 Ratio calculation to recognize the similar condition without failure

General information:

For the recognition of similar conditions the current engine speed /load conditions are compared with the recorded similar conditions window.
Based on two counters calculated with this algorithm the SCDN recognition at end of the diagnostic window is done. (see next chapter)

- CTR_SCDN_EQU[k]

  counting the number of times engine speed /load conditions are within the recorded similar conditions window (with LV_CDN_DIAG_XX = 1)
- CTR_SCDN_SUM[k]
  counting the number of times the diagnosis conditions are set (LV_CDN_DIAG_XX = 1)

The calculation of the counters is stopped, if an exceedance is reported from diagnostic function.

Syntax :	ACTION_ERRM_CdnDiagScdn (IN <XX>)	
Parameter (in) :	XX	failure XX using similar condition instance XX
Parameter (out) :	-	

Short description:

This action is called at each diagnosis condition. It is used to calculate a ratio to recognize the similar condition with or without failure.

Application conditions:

Initialisation:
```
at transition LV_DC 0 -> 1 or reset
bit 0, bit 3 of STATE_SCDN[k]            = restored from NVMY
bit 1, bit 2, bit 4, bit 5  of STATE_SCDN[k]     = 0

CTR_SCDN_EQU[k]                                  = 0
CTR_SCDN_SUM[k]                                  = 0
```

Activation:
```
At action request  and LV_DC = 1
and  LC_ENA_SCDN = 1 and NLC_ENA_SCDN = 1
(similar conditions enable)
```

Deactivation: –

Recurrence: –

Function description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

```
k = Scdn (XX)
If   bit 0 of STATE_SCDN[k]    = 1   (similar conditions are
                                          recorded for failure XX)
and  bit 5 of STATE_SCDN[k]    = 0   (no exceedance reported from
                                          diagnostic function)
Then        If    LV_CDN_DIAG_XX = 1
            Then  CTR_SCDN_SUM[k] ++
                  (check if current N, LOAD_SCDN point is within SCDN window)
                  If       N <=  N_SCDN_MAX_EQU[k]
                  and      N >=  N_SCDN_MIN_EQU[k]
                  and      LOAD_SCDN <=  LOAD_SCDN_MAX_EQU[k]
                  and      LOAD_SCDN >=  LOAD_SCDN_MIN_EQU[k]
                  Then       CTR_SCDN_EQU[k] ++
                  Endif
Endif
```

B.86.2 Record and recognition of similar conditions at end of diagnosis window

General information:

The similar conditions are stored for a failure XX (or updated) in the following cases:

- The similar conditions are frozen within the window N/LOAD_MAX/MIN_SCDN_EQU[k], if the corresponding failure is stored in the memory (failure gets present the first time)

- The similar conditions are stored again (updated) within the window N/LOAD_MAX/MIN_SCDN_EQU[k], if the corresponding failure occurs again and the driving cycle counter of this failure was 0 before.

In both cases bit 0 of STATE_SCDN[k] is 0 before the storage.

The recognition of similar conditions for detected failure is done by comparing, if the actual N/LOAD point is within the stored SCDN window. If also the same warmup status is reached at this time, similar conditions with failure are recognized. This calculation is done at the action call depending of the monitoring function, only in the following case:

- Similar conditions are stored in a previous driving cycle (bit 0 of STATE_SCDN[k] = 1)

- and the same failure XX was not present the last driving cycle. In case of same failure present last driving cycle, the driving cycle counter is incremented without asking for similar conditions.

- and failure is not illuminating the MIL. In case failure is illuminating the MIL at present the driving cycle counter is set to the maximum without asking for similar conditions.

- and driving cycle counter not already incremented in this driving cycle

If no error is present at the end of the diagnosis window, the ratio (CTR_SCDN_EQU[k] /CTR_SCDN_SUM[k]) is compared with the threshold C_CTR_SCDN_NOT_ERR_THD[k]. If the threshold and the same warmup status are reached at this time, similar conditions without failure are recognized.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

This calculation is done at the end of a diagnosis window, only if no failure XX is present in the following cases:

- Similar conditions are already recorded for failure XX (bit 0 of STATE_SCDN[k] = 1) in a previous driving cycle

- Similar conditions were not already encountered within this driving cycle with no failure

- no exceedance reported from diagnostic function (bit 5 of STATE_SCDN[k] = 0)

- Driving cycle counter was not incremented this driving cycle yet.

Syntax : ACTION_ERRM_EndWinScdn (IN <XX>, <EXC>)

Parameter (in) : XX failure XX using similar condition instance XX
EXC Exceedance reported from Diagnostic function

Parameter (out) : -

Short description:

This action is called at each end of diagnosis windows if there's no failure or when the failure gets present or when an exceedance is recognized by the diagnostic function. This usage of this function depends on the diagnostic function. It is used for recognition of similar condition with or without failure

Application conditions:

Initialisation: –

Activation: At action request **and** LV_DC = 1
and LC_ENA_SCDN = 1 **and** NLC_ENA_SCDN = 1
(similar conditions enable)

Deactivation: –

Then         CTR_SCDN_EQU[k] = 0
             CTR_SCDN_SUM[k] = 0
Endif
```

B.86.3 SCDN storage and recognition for detected failure performed last DC

General information:

According regulation the information, if a failure XX (using SCDN functionality) was present the last driving cycle, must be respected to increment the DC counter. In case of a new failure occurrence, if the same failure was present the last driving cycle, the driving cycle counter must be incremented (if not already incremented this driving cycle) independently of similar conditions.

Application conditions:

Initialisation: –

Activation: At LV_DC transition 1 -> 0 **and** LC_ENA_SCDN = 1 **and** NLC_ENA_SCDN = 1 (similar conditions enable)

Deactivation: –

Recurrence: –

Function description:

Formula section:

```
For k = 0 to NC_NR_WIN_SCDN - 1
    k = Scdn(XX); XX = F(IDX)
      If  LV_ERR_DC[IDX]    = 1       (failure present in this DC)
      Then     bit 3 of STATE_SCDN[k] = 1
          (failure present the last driving cycle)

          CTR_SCDN_EQU_DC[k] = C_CTR_SCDN_EQU_DC_MAX
          re-initialization of similar conditions counters)

      Else     bit 3 of STATE_SCDN[k] = 0
          (failure not present the last driving cycle)
      Endif
EndFor
```

B.86.4 SCDN usage to decrement driving cycle counter

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

Syntax : ACTION_ERRM_DecrementDCctrScdn (OUT <DCdec>, IN <XX>)

Parameter (in) : XX number of failure to store in dynamic memory
Parameter (out) : DCdec YES if decrementation of DC counter is possible

NO if decrementation of DC counter is not possible

Short description:

At the end of a driving cycle (LV_DC 1->0) the driving cycle counter for the failure XX can be decremented if similar conditions without failure are recognized and no exceedance reported from diagnostic function (bit 5 of STATE_SCDN[k] = 0) (used for misfire monitoring). For temporary failure or confirmed failure with MIL off, even if similar conditions are not recognized during a C_CTR_CDN_EQU_DC_MAX number of driving cycle, the driving cycle counter of the failure can be decremented after C_CTR_CDN_EQU_DC_MAX driving cycles.

Application conditions:

Initialisation: –
Activation: at action request
Deactivation: –
Recurrence: –

Function description:

Formula section:

```
k = Scdn(XX)
DCdec = NO     (decrementation of DC counter is not possible)
If   bit 2 of STATE_SCDN[k] = 1     (similar conditions encountered
                                              with no failure)
and  bit 5 of STATE_SCDN[k] = 0     (no exceedance reported)
Then      DCdec = YES               (decrementation of DC counter is possible)
Else      If   LV_DC_MAX[IDX] = 0  (failure is temporary or confirmed
                                     with MIL off)
          Then CTR_SCDN_EQU_DC[k] = CTR_SCDN_EQU_DC[k] - 1
               If   CTR_SCDN_EQU_DC[k] = 0
                    bit 2 of STATE_SCDN[k] = 1
                    DCdec = YES     (decrementation of DC counter is possible)
               Endif
          Endif
Endif

If      DCdec = YES
and     (LV_DC_MAX[IDX] = 0    (failure is temporary or confirmed with
                                MIL off and DC counter of failure will
                                be 0 after decrementation)

        or (LV_DC_MAX[IDX] = 1 and  CTR_DC[IDX] <= DC_DEC_XX))

                                     (failure is confirmed with MIL on and
                                     MIL will be switched off after
                                     decrementation)

Then    bit 0 of STATE_SCDN[k] = 0  (The SCDN window of failure XX will be
                                     updated  With new engine conditions (N /
                                     LOAD (min/ max))at next failure
                                     occurrence)
Endif
```

B.86.5 Similar conditions erase

General information:

Syntax : ACTION_ERRM_EraseScdn (IN <XX>)

Parameter (in) : XX number of failure to store in dynamic memory

Parameter (out) : -

Short description:

The similar conditions are erased by calling the action ACTION_ERRM_EraseScdn :
- when saved ram lost (at initialization)
- when corresponding failure is erased (see dynamic error management core module)

Application conditions:

Initialisation: –

Activation: at action request

Deactivation: –

Recurrence: –

Function description:

Formula section:

```
k = Scdn (XX)
STATE_SCDN[k]           = 0
N_MAX_SCDN_ EQU [k]     = 0 [rpm]
N_MIN_SCDN_EQU[k]       = 8160 [rpm]
LOAD_MAX_SCDN_EQU[k]    = 0 [%]
LOAD_MIN_SCDN_EQU[k]    = 99.60937 [%]
CTR_SCDN_EQU_DC[k]      = 0
LV_WUP_SCDN_EQU[k]      = 0
CTR_SCDN_EQU[k]   = 0
CTR_SCDN_SUM[k]   = 0
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.87 Similar conditions (Appl. Inc.)

Data definition:

Import actions:

ACTION_ERRM_CdnDiagScdn (**IN**<PRM_IDX_DIAG>)
ACTION_ERRM_EndWinScdn (**IN**<PRM_IDX_ERR>,**IN**<PRM_EXC>)

FUNCTION DESCRIPTION:

General information:

This file defines the usage of the similar conditions functionality.

B.87.1 Similar conditions window definition

B.87.1.1 Similar condition data definition

Description:

There is only some failure using the similar condition so this table allows to do the link between the index of the failure in static memory and the index of the failure using the similar condition:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Diagnosis instances XX using similar conditions functionality	NC_NR_WIN_SCDN = **8 (4 cyl or MSV)** NC_NR_WIN_SCDN = **10 (6 cyl)** NC_NR_WIN_SCDN = **12 (8 cyl)**

Diagnosis instance XX	**similar conditions instance (k)**
FSD_1	0
FSD_2	1
FSD_LAM_LIM_1	2 If NC_INJ_CONF = ! 0
FSD_LAM_LIM_2	3 If NC_INJ_CONF = ! 0
MIS_0	4
MIS_1	5
MIS_2	6
MIS_3	7
MIS_4	8 If NC_CYL_NR = 6 or 8
MIS_5	9 If NC_CYL_NR = 6 or 8
MIS_6	10 If NC_CYL_NR = 8
MIS_7	11 If NC_CYL_NR = 8
	(NC_NR_WIN_SCDN - 1)

One function is defined to do the link between the index of the failure in static memory and the index of the failure using the similar condition: k = Scdn(XX)

B.87.1.2 Load calculation for similar condition

Description:

The calculated load SAE1979 (LOAD_CLC) is used for similar condition.

Application conditions

Initialisation: `At reset: LOAD_SCDN = LOAD_CLC`

Recurrence: `100 ms`

Activation: –

Formula section:

LOAD_SCDN = LOAD_CLC

B.87.1.3 Treatment activated by the fuel system diagnosis for the similar condition

Description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

This treatement allows to call the two generic ACTION_ERRM_CdnDiagScdn (IN <XX>), ACTION_ERRM_EndWinScdn (IN <XX>, IN <EXC>) actions using for the similar condition.

Application conditions

Initialisation: –
Recurrence: *fuel system diagnosis recurrency*
Activation: –

Formula section:

For i = 0 to NC_CBK_EX_NR - 1
Adaptation to calculate a ratio used to recognize the similar condition with or without failure:
If LV_CDN_DIAG_FSD[i] = 1
Then ACTION_ERRM_CdnDiagScdn (FSD[i])
Endif
If LV_CDN_DIAG_FSD_LAM_LIM[i] = 1
Then ACTION_ERRM_CdnDiagScdn (FSD_LAM_LIM[i])
Endif

Adaptation for the record and recognition of similar conditions:
If LV_END_DIAG_WIN_FSD[i] 0 ->1
Then
Record and recognition of similar conditions at the end of diagnosis or when the failure is present:
ACTION_ERRM_EndWinScdn (FSD[i], 0)
Endif
If LV_END_DIAG_WIN_FSD_LAM_LIM[i] 0 ->1
Then
Record and recognition of similar conditions at the end of diagnosis or when the failure is present:
ACTION_ERRM_EndWinScdn (FSD_LAM_LIM[i], 0)
Endif
EndFor

B.87.2 SCDN usage for direct failure confirmation

Description:

Syntax : ACTION_ERRM_ConfirmErrScdn (OUT <DCconf>, IN <XX>)
Parameter (in) : XX number of failure to store in dynamic memory
Parameter (out) : DCconf 1 if failure must be confirmed directly
0 if failure should not be confirmed directly

Short description:
With the ACTION_ERRM_ConfirmErrScdn (OUT <DCconf>, IN <XX>) the value DCconf is transmitted to the driving cycle counter management to give the possibility to confirm a failure directly by incrementing the driving cycle counter for the failure XX to the maximum. This treatment must be done in the following situation:
A temporary failure XX caused by misfire B is in the memory and a failure XX caused by misfire A occures (not stored before). Then the misfire B depending failure can be erased and the misfire A failure can be confirmed directly.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialization: –

Recurrence: –

Activation: *at action request*

Formula section:

DCconf = 0 (direct confirmation of failure XX is not possible)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Import actions:

ACTION_ERRM_GetReadyClass (**IN**<PRM_IDX_ERR>,**OUT**<PRM_READY_CLAS>)	
ACTION_ERRM_MonitorEnableStatus (**INOUT**<PRM_MONITORENABLESTATUS>)	

FUNCTION DESCRIPTION:

General information:

EOBD/CARB official requirements include a list of statistical data related to Error Management. These statistical data are counters and timers related to Error Management events. You can find below, in the following chapters, a description of all these requirements.

B.88.1 Time since diagnostic trouble codes cleared

Description:

Purpose of this strategy is to compute the time accumulated by the vehicle since diagnostic trouble codes cleared (referenced in ISO15031 as Modes 01h & 02h PID4Eh). It is simply an indication for I/M (Inspection/Maintenance), of the last time an external test equipment was used to clear DTCs.

Application conditions

Initialization: on non-volatil memory reset or lost
or on failure erase service received
T_DTC_CLR = 0

Recurrence : 1 minute ±1 second, after event : on "failure erase" service received

Activation : –

Deactivation: –

Formula section :

{ T_DTC_CLR is updated at required recurrence }
{ T_DTC_CLR shall saturate to its maximal value 65535 }

If T_DTC_CLR < 65535
Then
T_DTC_CLR = T_DTC_CLR + 1
Endif

B.88.2 Distance counters since MIL activation and Minutes run by the engine with MIL activated

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Description:

According to ISO/DIS 15031-5.8 (Road vehicles — Communication between vehicle and external equipment for emissions-related diagnostics — Part 5: Emissions-related diagnostic services), ECU must be able to indicate :

- the distance travelled while the MIL is activated
- the number of minutes run by the engine while MIL is activated

Distance Travelled While MIL is Activated

The purpose is to compute the covered distance while the MIL is illuminated (MIL blinking is considered as a MIL illumination). This mileage (DIST_ACT_MIL) is a global distance :

- which is not linked with any failure and is independent from the Pre-drive check
- which is dependent from the global inhibition MIL boolean
- which is dependent of the MIL request
- which is readable with Scan-Tool with kilometer as unit

Conditions for “Distance travelled” counter :

- reset to 0 when MIL state changes from deactivated to activated by this ECU
- accumulate counts in km if MIL is activated (ON)
- do not change value while MIL is not activated (OFF)
- reset to 0 if diagnostic information is cleared either by service 04h or 40 warm-up cycles without MIL activated
- do not wrap to 0 if value is FFFFh

Minutes run by the engine while MIL activated

The purpose is to compute the time accumulated while MIL is activated (Modes 01h & 02h PID4Dh). This duration shall be cleared when failure memory is erased and after 40 warm-up cycles.

Conditions for “Minutes run by the engine while MIL activated” counter :

- reset to 0 when MIL state changes from deactivated to activated by this ECU
- accumulate counts in minutes if MIL is activated (ON)
- do not change value while MIL is not activated (OFF)
- reset to 0 if diagnostic information is cleared either by service 04h or 40 warm-up cycles without MIL activated
- do not wrap to 0000h if value is FFFFh

B.88.2.1 Initialisatation at Transtion MIL OFF to ON or FLL (external MIL request)

Description for actions:

ACTION_ERRM_*MilOffToOnTrans* ()
This action describes the initialisation at MIL transition from OFF to FLL; OFF to ON

FUNCTION DESCRIPTION:

This action is called from generic Lamp Management at MIL-transition from OFF2FFL and OFF2ON.

Formula section:

DIST_REL_ACT_MIL = DIST
DIST_ACT_MIL = 0
CTR_ACT_MIL = C_CTR_MAX_WUP_CYC
T_ACT_MIL = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

T_ACT_MIL_60 = 0

B.88.2.2 Calculation of DIST_ACT_MIL and T_ACT_MIL

Application conditions

Initialization:
```
On saved ram lost
  or      failure erase service received
        DIST_REL_ACT_MIL = DIST
        DIST_ACT_MIL = 0
        CTR_ACT_MIL = C_CTR_MAX_WUP_CYC
        T_ACT_MIL = 0
      T_ACT_MIL_60 = 0
```

Recurrence: *upon LV_DC 1→0 transition and 1 s*

Activation: LV_DC = 1 **and** LV_PWL = 0 **and** (LV_STALL = 0 **or** LV_ES = 0)

Formula section:

Each 1s:

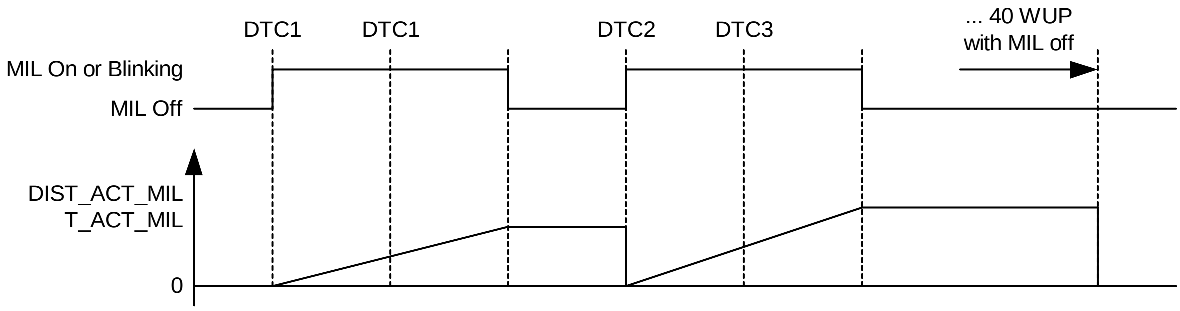
If(1) STATE_MIL = MIL_FLL **or** STATE_MIL = ON **or**
(NLC_MIL_ACT_REQ = 1 **and** LV_MIL_ACT_REQ = 1
and bit 1 of C_CONF_MIL = 1**)**
Then(1)
  If(2) (DIST - DIST_REL_ACT_MIL) < 65535
  Then(2)
    DIST_ACT_MIL = DIST - DIST_REL_ACT_MIL
  Else(2)
    DIST_ACT_MIL = 65535
  Endif(2)
  T_ACT_MIL_60 = T_ACT_MIL_60 + 1 s
  If(2) (T_ACT_MIL_60 = 60)
  Then(2)
    T_ACT_MIL_60 = 0
    If(3) T_ACT_MIL < 65535
    Then(3)
      T_ACT_MIL = T_ACT_MIL + 1 min
    Else(3)
      T_ACT_MIL = 65535
    Endif(3)
  Endif(2)
Endif(1)

At LV_DC 1→0 transition :

If(1) LV_WUP_CYC = 1
and
STATE_MIL was OFF during all the warm-up cycle
and
(LV_MIL_ACT_REQ_DC = 0 during driving cycle
or bit 1 of C_CONF_MIL = 0 **or** NLC_MIL_ACT_REQ = 0**)**

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

and
CTR_ACT_MIL > 0
Then(1)
CTR_ACT_MIL = CTR_ACT_MIL -1
If(2) CTR_ACT_MIL = 0
Then(2)
DIST_REL_ACT_MIL = DIST
DIST_ACT_MIL = 0
T_ACT_MIL = 0
T_ACT_MIL_60 = 0
Endif(2)
Endif(1)



B.88.3 Distance since diagnostic trouble codes cleared

Description :

Purpose of this strategy is to compute the distance accumulated by the vehicle since diagnostic trouble codes cleared (referenced in ISO15031 as mode01h& 02hPID31h). It is simply an indication for Inspection/Maintenance, of the last time an external test equipment was used to clear DTCs.

Application conditions

Initialization: `on non-volatil memory reset or lost`
`or`
`on failure erase service received`
`DIST_DTC_CLR = 0`
`DIST_REL_DTC_CLR = DIST`

Recurrence : `1 second`

Activation : –

Deactivation: –

Formula section :

{ DIST_DTC_CLR is updated regularly regarding DIST }
{ DIST_DTC_CLR shall saturate to its maximal value 65535 km}

If DIST - DIST_REL_DTC_CLR < 65535
Then
DIST_DTC_CLR = DIST - DIST_REL_DTC_CLR

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Else

DIST_DTC_CLR = 65535

Endif

B.88.4 Number of warm-ups since diagnostic trouble codes cleared

Description:

Purpose of this strategy is to compute number of warm-ups since diagnostic trouble codes cleared (referenced in ISO15031 as Modes 01h & 02h PID30h). It's just an indication for Inspection/Maintenance, to determine the last time an external test equipment was used to clear DTCs.

Application conditions

Activation : `On LV_WUP_CYC 0 → 1 transition`

Initialization: `On non-volatil memory reset or lost`
or `on failure erase service received`
`CTR_WUP_DTC_CLR=0`

Recurrence : `none, executed single time on activation.`

Formula section:

{ on detection of a warm-up cycle CTR_WUP_DTC_CLR is incremented }
{ CTR_WUP_DTC_CLR shall saturate to its maximal value 255 }

If CTR_WUP_DTC_CLR < 255
Then

CTR_WUP_DTC_CLR = CTR_WUP_DTC_CLR + 1

Endif

B.88.5 Monitor enable/completion status for the current driving cycle

General information:

Purpose of this strategy is to get the follwoing informations :

- if a diagnosis (a monitor) is disabled for rest of this monitoring cycle or not (referenced in ISO15031 as Modes 01h & 02h PID41h).
- if a diagnosis (a monitor) is completed for the current monitoring cycle or not (referenced in ISO15031 as Modes 01h & 02h PID41h).

Each concerned diagnosis is part of a generic list : Misfire, Fuel system, Comprehensive component, Catalyst, Heated catalyst, Evaporative system, Secondary air system, A/C system refrigerant, Oxygen sensor, Oxygen sensor heater, EGR system monitoring.

MonitorEnableStatus :
Each bit of STATE_ENA_OBD variable contains status for each predefined diagnosis as defined below :

Enable status of a diagnosis this monitoring cycle:

- NO (STATE_ENA_OBD[n]=0) means disabled for rest of this monitoring cycle

or not supported in C_STATE_READY_OBD_1 & C_STATE_READY_OBD_2

- YES (STATE_ENA_OBD[n]=1) means enabled for this monitoring cycle.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

MonitorCompletionStatus :

Each bit of STATE_CMPL_OBD variable contains status for each predefined diagnosis as defined below :

Completion status of a diagnosis this monitoring cycle:

- YES (STATE_CMPL_OBD[n]=0) means monitor complete this monitoring cycle, or not supported in C_STATE_READY_OBD_1 & C_STATE_READY_OBD_2
- NO (STATE_CMPL_OBD[n]=1) means monitor not complete this monitoring cycle.

Calibration data detailled description for C_STATE_SET_CMPL_OBD :

Completion status calculation for CARB_MIS, CARB_FSD, CARB_CC diagnosis :

0: Completion status of conserned group is calculated based on the end of diagnosis of each group of diagnostic

1: Completion status of conserned group always indicates "completed"

General information:

The function check filler cap during DC is part of the tank leakage detection package.
The function controls the conditions, which are responsible , to enable a check of open filler cap. Is such a condition available, a request LV_ENA_CHK_FUC_ROUGH_LEAK_MES can be set and a rough leak measurement shall be enabled.

Copyright (C) Continental AG,2007

The trigger for the check of open filler cap can be either a valid refueling or a given rough leak suspicion. Are the conditions available, which enable a check, that means low acceleration and low oscillation of the fuel tank level, then a check will be done, if a minimum speed of the vehicle is reached.
A test request is still present for a calibratable number of driving cycles. In case of a detected open filler cap, a calibratable number of tests can be done, after a indication lamp in the instrument cluster was set.

B.90.1 Rough leak request due to check filler cap during DC

General information:

Conditions to set the test request LV_ENA_CHK_FUC_ROUGH_LEAK_MES:

- A valid refueling is given. Setting of the nv-bit LV_ENA_CHK_FUC_REFU. The resetting of this logical value is done, if a CFC-test has finished.
- Availability of a suspected rough leak from the tank leakage detection function. The request is stored until a CFC-test has finished.
- Setting of the test request, if the vehicle speed is greater or equal than a threshold.

Conditions to reset the test request LV_ENA_CHK_FUC_ROUGH_LEAK_MES:

- Vehicle speed is lower than a threshold
- Powerful acceleration of the vehicle
- high ambient pressure deviation

FUNCTION DESCRIPTION:

Application conditions

Initialisation:
```
in case of reset or LV_IGK = 0  1:
    AMP_CHK_FUC = AMP_MES, all other variables to 0
    Restore out of the NV-memory:
 LV_ENA_CHK_FUC_REFU,      LV_ROUGH_LEAK_SUSP_CHK_FUC
       LV_CTR_DC_CHK_FUC
  In case of clear FMY:
    All variables to 0
    AMP_CHK_FUC = AMP_MES
```

Recurrence: *100 ms*

Activation: *LC_CONF_DMTL = 1, during all ECU states*

Formula section:

B.90.2 Decision of check filler cap open or closed

General information:

Conditions to set LV_CHK_FUC_END:

- Number of the maximum DC are reached. This condition is reached, if the engine stops C_CTR_DC_ENA_CHK_FUC_MAX times, indicated by T_AST. The number of the counted cycles is reseted, if the filler cap test has ended or in case of the error open filler cap .
- Cfc test successfully ended, to be recognized by the cycleflag of the rough leak test in common with no suspected rough leak
- End of the test with C_CTR_CHK_FUC_OPEN_MAX times open filler cap.

Conditions to reset LV_CHK_FUC_END:

- By initialisation of the ECU
- With recognition of a new valid refueling

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Conditions to set LV_CHK_FUC_OPEN

- Cycle flag of the rough leak measurement
- Suspected rough leak

Condition to reset LV_CHK_FUC_OPEN

- End of check filler cap test

B.90.3 Control of the check filler cap lamp in the instrument cluster

General information:

Forming of the lamp control by LV_CHK_FUC_OPEN and the stored value LV_CHK_FUC_OPEN_ACT. If an opened filler cap is recognized and the vehicle speed is higher than a threshold for a calibratable time, the indication lamp will be set for a calibratable time. To prevent a setting of the lamp after the lamp has burned once, this information is stored in LV_CHK_FUC_OPEN_ACT. This bit shall be reseted after the end of the check filler cap test.

FUNCTION DESCRIPTION:

FUNCTION DESCRIPTION:

General Information:

The diagnosis is used for the functional test of the CP solenoid. Therefore the CPS is diagnosed via its effects on the engine.
The functional check of the CPS consists of 3 steps:

- Step 1: based on the ACF load degree
- Step 2: based on
  - the engine speed change at IS,
  - the deviation of lambda-controller   and
  - the measured MAP before and during CPS-opening
- Step 3: based on the difference between the measured air mass flow before and during a CPS opening

If the CPS has been detected to be OK within a step or as not OK after step 3 then the function is exited irreversibly until the next engine start.
The steps 1, 2 and 3 are processed successively, i.e. the next step may only be performed if the preceeding one has not been detected as OK. The only exception is step 1. Step 1 may also be performed parallel to step 2 and 3, which means:
After step 1 has been processed once and CPS has not been detected as OK then (if enable conditions are fulfilled) it is proceeded with step 2 and at the same time calculation of step 1 is started again. Calculation of step 1 is done until CPS is detected as OK within one of the steps (1, 2 or 3) or until CPS is dectected as definitely not OK by the end of step 3.
If the CPS is detected to be not OK after all 3 steps have been passed (end of step 3), then the error is set.
The complete diagnosis “functional check CPS” is performed only once per driving cycle.
Exception:
Activation of functional check CPS via EOL-test (LV_EOL_CPS 0 - ->1):
Through the EOL-test the functional check CPS can be triggered several times per engine operation.
The diagnosis is addressed via the serial interface. Only STEP_2 will be performed.
For general enable conditions of the diagnosis see chapter "Appl. Inc. Functional Check CPS".

Error-symptoms are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Application conditions:

Initialisation: 1) on transition LV_IGK OFF→ ON or reset:
All variables from output-data-section have to be initialized with zero:
except: STATE_DIAGCPS_OLD = STEP_1
STATE_DIAGCPS = STEP_INIT
T_DIAGCPS_DLY = C_T_DIAGCPS_DLY
T_CL_MMV_DIAGCPS = C_T_CL_MMV_DIAGCPS
T_CL_MMV_DIAGCPS_2 = C_T_CL_MMV_DIAGCPS_2
CL_MMV_SAE = CL_MMV_SAE
CL_MMV_DIAGCPS_MIN_SAE = CL_MMV_DIAGCPS_MIN_SAE
CL_MMV_DIAGCPS_MAX_SAE = CL_MMV_DIAGCPS_MAX_SAE
SUM_DIAG_DIAGCPS_SAE = SUM_DIAG_DIAGCPS_SAE
SUM_DIAGCPS_MAX_SAE = SUM_DIAGCPS_MAX_SAE
MAF_DIAGCPS_SAE = MAF_DIAGCPS_SAE
MAF_DIAGCPS_THD_SAE = MAF_DIAGCPS_THD_SAE

2) on clearing failure memory
All variables from output-data-section have to be initialized with zero:
except: STATE_DIAGCPS_OLD = STEP_1
STATE_DIAGCPS = STEP_INIT
T_DIAGCPS_DLY = C_T_DIAGCPS_DLY
T_CL_MMV_DIAGCPS = C_T_CL_MMV_DIAGCPS
T_CL_MMV_DIAGCPS_2 = C_T_CL_MMV_DIAGCPS_2

Recurrence: 100 ms
Activation: LV_DC = 1
Deactivation: LV_DC = 0

Conditions for End-of-line (EOL) - Test:

Description:

This is to secure that any time the functional check CPS is activated via EOL-Test :

- the functional check starts right from the beginning again
- only those steps of the functional check CPS are performed regarding the EOL-Test
- the diagnosis results of the functional check (issued via serial interface) are the results from the EOL-Test only

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Detection of EOL-Request:
IF (LV_EOL_CPS(k-1) = 0 **AND** LV_EOL_CPS(k) = 1)

Copyright (C) Continental AG,2007

```
THEN        LV_EOL_CPS_INI = 1
            STATE_DIAGCPS = STEP_INIT
ELSE        LV_EOL_CPS_INI = 0
ENDIF
```

Detection of OPM-Change: *// OPM = operation mode*

```
IF      MAP_DIP_SP_MMV > C_MAP_DIP_SP_MMV_DIAGCPS
THEN  LV_OPM_AV_DIAGCPS_P_THR = 1     //GD, T-GD (gedrosselt); direct injection vehicles
ELSE  LV_OPM_AV_DIAGCPS_P_THR = 0     //UGD (ungedrosselt); VVT vehicles
    ENDIF

  IF      STATE_DIAGCPS = STEP_2         or
          STATE_DIAGCPS = STEP_3
  THEN
  IF    (LV_OPM_AV_DIAGCPS_P_THR k != // UGD ⇓ T- GD or GD
              LV_OPM_AV_DIAGCPS_P_THR k-1)
     THEN        LV_OPM_AV_CNG_DIAGCPS = 1
                 STATE_DIAGCPS = STEP_INIT
       ELSE        LV_OPM_AV_CNG_DIAGCPS = 0
       ENDIF
  ENDIF
```

The functionality in Step 1 which consists in counting the time during which the CL_MMV is above the threshold C_CL_MMV_DIAGCPS, needs to be reset in the following cases:

- transition between UGD/GD happens
- the system is in open loop (CL_MMV frozen)
- the canister load model is active (CL_MMV not reliable)

```
IF        (LV_OPM_AV_DIAGCPS_P_THR k ! =
          LV_OPM_AV_DIAGCPS_P_THR k-1)         OR

STEP 2: N-DIF-/LAM-/MAP-Diagnosis

Description:

In step 2, the CPS is evaluated based on the engine speed change (throttled mode), MAP change (unthrottled mode) and Lambda deviation at IS. To this effect, the CPS is opened for a short time and the engine speed monitored for a certain period.
After step 2 has been enabled for the first time, it is requested during each IS phase. This is repeated as long as a result has been reached in step 2. The function is not bound to one IS phase, but can be distributed to several IS phases.

STEP 3: MAF-DIF_Diagnosis

Description:

If the functional check is not recognized as OK via step 1 and via step 2, but as not OK via both steps, then step 3 is requested.
In step 3 the CPS is considered on the basis of the measured mass air flow before and during a CPS opening phase.

B.92.1 Diagnosis inhibition

FUNCTION DESCRIPTION:

General information:

The functional check is used for the functional test of the CP solenoid which means that the CPS is diagnosed via its effects on the engine.
There are many errors which make it necessary to stop the functional check CPS when they occure. Therefore a diagnosis has to be made whether the functional check can be enabled or not.
If LV_INH_DIAGCPS = 0 and LV_DI_DIAGCPS = 0 then the functional check is enabled.
If the bit LV_INH_DIAGCPS = 1 is set through one of the errors listed below, then the functional check is exited irreversibly until the next engine start.
If the bit LV_INH_DIAGCPS=0 and LV_DI_DIAGCPS=1 then the functional check is exited reversibly until LV_DI_DIAGCPS = 0 (recurrence 100 ms).
If one of the OBD errors ocurs as mentioned in the formula section the RBM of the functional check CPS diagnosis is inhibited by LV_INH_DIAG_RBM_DIAGCPS = 1.

Application conditions

Initialisation: *at every LV_IGK = 0→1 and reset all variables are initialized with 0*

Recurrence: *100 ms*

Activation: *LV_DC = 1*

Deactivation: LV_DC = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. B.92.2 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the DIAGCPS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_DIAGCPS data.
Within STATE_RBM_DIAGCPS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for DIAGCPS diagnosis)

Application conditions

Initialisation : at LV_DC 0 → 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_DIAGCPS = 0
on failure memory reset :
bit 1 of STATE_RBM_DIAGCPS = 0

Recurrence: 1 s

Activation: LV_DC 0 → 1 transition **and** LV_DC = 1

Formula section:

At LV_DC 0 → 1 transition
The pending status of the following failures has to be checked only once :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. How maximum error DMTL is built up

General information:

In the scope of the legal requirements for On-Board Diagnosis (OBD II) it must be possible to detect a rough leak with a diameter of > 1.0 mm as well as a miniature leak with a diameter of > 0.5 mm within the tank system.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The leakage diagnostic unit DMTL is installed to the fresh air connector of the CP. To measure a leakage within the tank system, an excess pressure is built up in the tank system after closing the canister purge valve and changing over a valve in the diagnostic module. An excess pressure of approx. 25 hPa is built up by means of the electrical pump in the diagnostic module. The pump's power consumption is used as a measure for the tank tightness. The power consumption in a defined reference leakage serves as a reference for stating the size of a leakage.

Function description

The function is basically enabled via the variant bit LV_CONF_DMTL which is set to 1 via the data record if the DMTL module is installed.
The diagnostic sequence is controlled via the state machine of the central sequencing control system. It receives from the function enabling module the enable LV_ENA_SMALL_LEAK_MES for measuring the miniature leak, and the enable LV_ENA_ROUGH_LEAK_MES for measuring the rough leak. Subsequently, the state machine starts a reference leakage measurement. After the time C_T_REF_LEAK_MES_MAX has elapsed, a transition to the rough leak diagnosis is performed, except in case the current monitoring detects a module error or the diagnosis is interrupted due to a detected diagnosis.
The system detects a rough leak suspect if the pump current does not exceed the threshold CUR_DMTL_THD_ROUGH_LEAK within the time T_DMTL_ROUGH_LEAK and if the pump current does not reach the threshold CUR_DMTL_THD_ROUGH_LEAK_LEN after the extension time T_DMTL_ROUGH_LEAK. In case of a rough leak suspect a second reference measurement is performed on the basis of which the final decision on a rough leck suspect is made. Subsequently, a transition to the miniature leak diagnosis is performed. The tank system is detected to be tight if the pump current exceeds the reference current CUR_DMTL_REF_LEAK.
If the pump current is detected to have reached steady state twice after the time T_DMTL_SMALL_LEAK, a second reference measurement is performed. If a current increase is detected, a miniature leakage is diagnosed. In case of a current reduction, the tank system is detected to be tight .
At the end of the diagnosis, the pump motor is switched off and the change-over valve is reset to its regeneration position.
The errors are indicated with the logic variable LV_ERR_DMTLM for a DMTL module error, LV_ERR_ROUGH_LEAK in case a rough leak is present, or LV_ERR_SMALL_LEAK if a miniature leak has been detected.

A current diagnosis is indicated with the bit LV_DMTL_ACT; interruption of diagnosis is requested via the bit LV_DMTL_STOP. The diagnosis is interrupted if tank cover open has been detected, at the beginning of refueling, in case of an excessive battery voltage fluctuation during diagnosis, in case of decreasing pump current during the measuring phase or if a short-circuit of the pump output stage has been detected.
During the reference stage the function is finished without results if humidity has been detected.
The pump current CUR_DMTL is filtered after conversion to a standard voltage of 12 V in the function block of the pump current filtering. At the beginning of the reference measurement and at the beginning of the rough leak measurement, a smaller time constant is used to enable short transient period of the filter.
Moreover, the filtered battery voltage is sampled at the end of the reference measurement, and the change is monitored in the following rough/miniature leak measurement for the threshold C_VB_DMTL_DIF. The result LV_VB_DIF_MAX = 1 results in interruption of the diagnosis.
During the reference leakage measurement it is taken care of current fluctuations which can lead to an interruption of the diagnosis.
The function block "Fuel cap and refueling check" differentiates the corrected pump current and checks for exceeding a positive threshold C_THD_CUR_DMTL_DIF_REFU, i.e. for increasing pump current to detect "refueling", as the tank pressure and the pump current rise on refueling. When the tank cap is opened, the tank pressure collapses; thus the pump current is reduced. When the negative threshold C_THD_CUR_DMTL_DIF_FUC is no longer reached, the logic variable LV_DET_FUC_OPEN is set to indicate that the fuel cap is open.

A slow decrease of C_THD_CUR_DMTL_DIF_MES of the pump current leads to an interruption of the diagnosis.
The error and cycle flags are generated in the error block.
Enabling of the minimum leakage diagnosis is essentially initiated while the control unit is closed during off delay, below a certain level, while the vehicle does not run, if the CP is not excessively loaded, at ambient temperatures within a certain band width, the battery voltage within a certain band width and while the CPS is closed.
Moreover, the system checks whether a minimum time since engine start C_T_AST_DMTL_MIN has elapsed, a cold start was given and whether the engine is running.
When the bit LV_REQ_PWL_DMTL is set, the extension of the post-operating phase is enforced up to the end of diagnosis. The diagnosis is started with the delay C_T_DLY_ES_PWL after engine start.
In the function block Demand rough leak check due to Check Filler Cap a rough leak check is activated after refuelling has been detected. With this check a tank cover check is performed. The error entry can be prevented while this check. If a rough leak has been detected a info in the instrument board will be activated in the combi instrument.

Application conditions

B.93.2 Pump current of DMTL module

General information:
The most important analog input of the "tank leakage diagnostic function" represents the pump current of the DMTL module. The current to be evaluated is recorded and calculated by voltage measurement at the corresponding shunts. Subsequently, the calculated current is corrected and filtered before it is included in calculation of the function as an input variable.

B.93.2.1 Pump current DMTL

General information:

The current of the pump motor by means of which an excess pressure is built up in the tank system serves as measure for the detection of a leakage in the tank system.
To detect the equivalent current from the measured voltage V_DMTL which is generated in the control unit using the measurement shunt, this requirement is taken into consideration via the calibratable constant C_R_DMTL.
The module is calculated with a time base of 10 ms.

Application conditions

Initialisation: *CUR_DMTL = 0*

Recurrence: *100 ms*

Activation: *LV_CONF_DMTL = 1*

Formula section:

CUR_DMTL = V_DMTL /C_R_DMTL

B.93.2.2 Filtering of pump current

General information:

The pump current is filtered after conversion to the referenced battery voltage. At the beginning and at the end of the reference measurement, a greater time constant is used to ensure a short filter settling time.
A correction factor for the pump current is taken as a function of the calculated value VB_DMTL_FIL via a characteristic IP_FAC_CUR_DMTL. Thus, the pump current CUR_DMTL is corrected depending on the battery voltage, and results in relation to CUR_DMTL_COR.

Application conditions

Initialisation: *CUR_DMTL_COR = 0*
CUR_DMTL_COR_FIL = 0

Recurrence: *100 ms*

Activation: *LV_CONF_DMTL = 1*

B.93.2.3 VB depending pump current correction

General information:

At the end of the reference measurement, the filtered battery voltage VB_DMTL_REF is measured and monitored for a higher deviation in the following rough or miniature leak measurement. If a high battery voltage deviation is detected, LV_VB_DIF_MAX is set and the diagnosis is aborted.

Application conditions

Initialisation: *LV_VB_DIF_MAX is restored from the NVMY*
VB_DMTL_REF = VB_DMTL_FIL = 12V

Recurrence: *100 ms*

Activation: *LV_CONF_DMTL = 1*

B.93.6 Tank level sensor

General information:

The function enabling of the tank leakage diagnostic function depends, amongst other things, on the tank being filled to between 15 % and 85 % of its capacity. The tank level information is transferred to the control unit via CAN in the INSTR2 message. If a level error is transmitted by CAN or if the CAN message is not issued, then the bit is set for a validated tank level LV_FTL_DMTL_VAL = 0.

Application conditions

Initialisation: *LV_FTL_DMTL_VAL = 0*
LV_FTL_DMTL_MAX = 0
LV_FTL_DMTL_MIN = 0

Recurrence: *1 s*

B.93.7 Tank level plausibility check

For the tank diagnostic function, it is necessary to detect a refueling process, to obtain certain tank level bits and to perform a plausibility check of the tank level signal.

B.93.7.1 Initialization of diagnostic quantities

Application conditions

Initialisation: *FCO_AV_DMTL is restored out of NVMY*
FCO_DMTL_INI = 0 - FCO_AV_DMTL

Recurrence: *1 s*

Activation: *LV_IGK = 1*

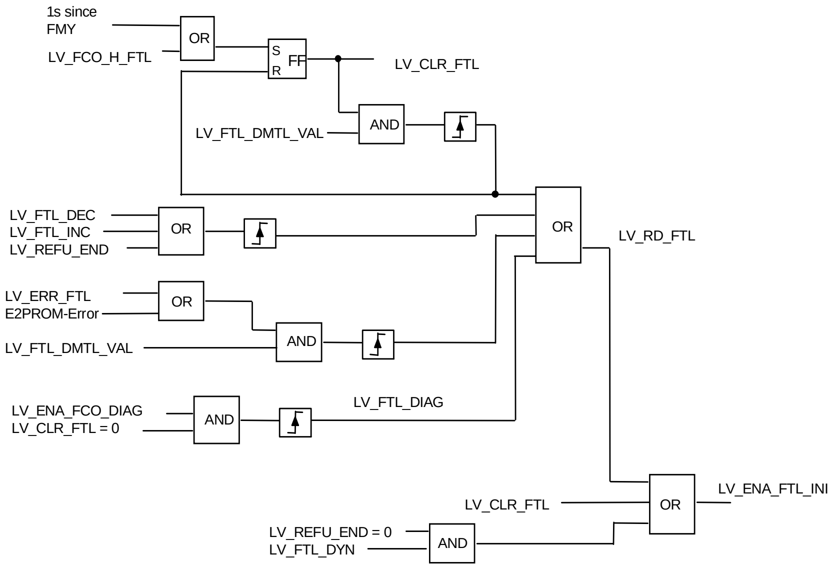
Deactivation: LV_IGK = 1 (0

General information:

To perform a plausibility check of the level signal, a fuel consumption resulting from the difference between two fuel level values is compared with the fuel consumption resulting from the injection calculation.

Signal flow diagram:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



In case of the initial initialization or an EEPROM error, FCO_AV_DMTL = FCO_DMTL_INI = FTL_INI = 0 is set.
In case the failure memory is deleted, FTL_INI = 0.

Formula section:

If FCO_AV_DMTL $>$ C_FTL_DIAG_MAX
Then LV_FCO_H_FTL = 1
Endif

If FMY is cleared **OR**
LV_FCO_H_FTL = 1

Endif

If LV_FTL_DIF_IGN_OFF = 1
Then FTL_ST = FTL
DIF_FTL_AST = FTL_ST - FTL_OLD
Endif

If LV_FTL_DIF_IGN_OFF = 1
then **If** LV_ENA_FTL_DIAG = 1 **AND**
DIF_FTL_AST > C_FTL_DIAG_MIN
Then LV_FTL_INC = 1
Else LV_FTL_INC = 0
Endif
If LV_ENA_FTL_DIAG = 1 **AND**
DIF_FTL_AST < C_FTL_DEC_FTL_DIAG_MIN
Then LV_FTL_DEC = 1
Else LV_FTL_DEC = 0
Endif
Endif

If LV_REFU_RLS_DIAG = 0 → 1
Then LV_FTL_DEC = 0
LV_FTL_INC = 0
DIF_FTL_AST = 0
Endif

In case of the initial initialization or an EEPROM error, FTL_OLD = 0 is initialized.

In case of "delete failure memory", the following occurs:

LV_FTL_IN = FTL_OLD = LV_FTL_DEC = LV_FTL_INC = FTL_ST = DIF_FTL_AST = 0

B.93.7.4 Refueling flag output

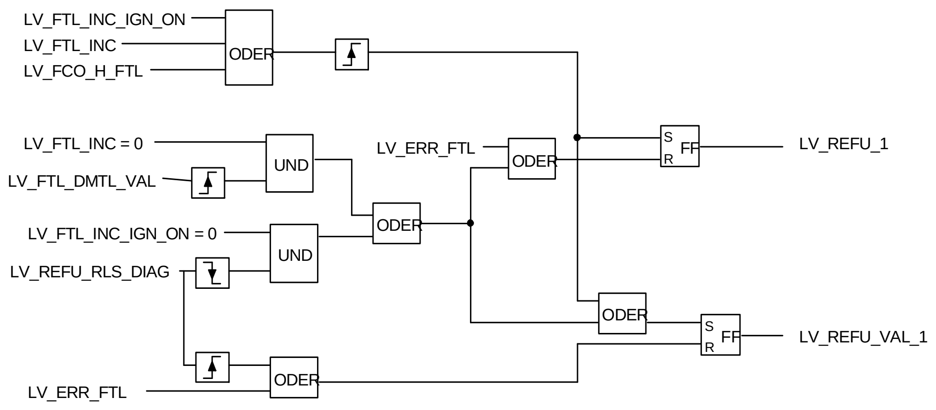
Application conditions

Recurrence: *1 s*

Activation: *LV_IGK = 1*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Signal flow diagram:



The output of the refueling bits LV_REFU and LV_REFU_VAL depends on the level diagnosis enable state.

The following logic is derived therefrom:

If LV_ENA_FTL_DIAG = 1 **AND** LV_REFU_1 = 1
Then LV_REFU = 1
Else LV_REFU = 0
Endif

If LV_ENA_FTL_DIAG = 1 **AND** LV_REFU_VAL_1 = 1
Then LV_REFU_VAL = 1
Else LV_REFU_VAL = 0
Endif

If no diagnosis has been enabled LV_ENA_FTL_DIAG = 0, then the refueling bits LV_REFU = 0 and LV_REFU_VAL = 0 are issued.

In case of "delete failure memory", the following occurs:
LV_REFU_1 = LV_REFU_VAL_1 = 0

In case of ERU to PWL:
LV_REFU_VAL_1 = 0

In case of igkOff2on:
LV_REFU_VAL = 0

B.93.7.5 Fuel level diagnosis

Application conditions

Recurrence: *1 s*

Activation: *LV_IGK = 1*

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Consumption diagnosis enable:

```
If      LV_FTL_DMTL_VAL = 1                         AND
        [LV_FTL_DYN = 0                OR
        LV_REFU_END = 1]                            AND
        FCO_AV_DMTL > C_ENA_FCO_DIAG                AND
        LV_ENA_FTL_DIAG =1
  Then  LV_ENA_FCO_DIAG = 1
  Else  LV_ENA_FCO_DIAG = 0
Endif
```

Upper and lower threshold of the consumption diagnosis:

```
If      LV_FTL_DIAG = 1              AND      LV_ENA_FTL_DIAG = 1
  Then  If    DIF_FCO_FTL = FCO_AV_DMTL - (FTL_INI - FTL) > C_FCO_DIAG_MAX
              Then    LV_FCO_DIAG_MAX = 1
              Else    LV_FCO_DIAG_MAX = 0
        Endif
        If    DIF_FCO_FTL = FCO_AV_DMTL - (FTL_INI - FTL) < C_FCO_DIAG_MIN
              Then    LV_FCO_DIAG_MIN = 1
              Else    LV_FCO_DIAG_MIN = 0
  Else  LV_FCO_DIAG_MAX = 0       AND       LV_FCO_DIAG_MIN = 0
Endif
```

In case of "delete failure memory", the following occurs:

LV_FCO_DIAG_MAX = LV_FCO_DIAG_MIN = LV_ENA_FCO_DIAG = DIF_FCO_FTL = 0

B.93.7.6 Fuel level diagnosis enable

B.93.19 End of line test and factory test of DMTL function

Application conditions

Recurrence: *100 ms*

Activation: *LV_CONF_DMTL = 1*

Initialisation: LV_DMTL_ASA = 0

FUNCTION DESCRIPTION:

The end of line test and the factory test must permit execution of the tank leak diagnostic function via test unit.
The fundamental difference is the fact that at the end of line, the timeout monitoring of the test unit signal is deleted and that a change-over of "ignition key" into both directions does not interrupt the function. Another particularity of the end of line function is the fact that the function is started anew without any further test unit intervention if it has been aborted due to "engine speed detected, but START not exited", provided that all enable conditions are present.
On the other hand, activation in the factory is only admissible with the test unit connected and ignition key ON.

Formula section:

If (STATE_EOL_KWP_DMTL = 0 (Start Command from Tester received))

or LV_ERR_DMTLH = 1
Then LV_INH_DIAG_RBM_DMTL = 1
(DMTL diagnosis inhibited due to OBD error)
Else LV_INH_DIAG_RBM_DMTL = 0
(DMTL diagnosis not inhibited)
Endif

B.94.2 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the tank leakage detection monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_DMTLM, STATE_RBM_ROUGH_LEAK and STATE_RBM_SMALL_LEAK data.
Within STATE_RBM_xxx, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for DMTL function)

Application conditions:

Initialisation :

at LV_DC 0 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_DMTLM = 0
bit 0, bit 1 and bit 2 of STATE_RBM_ROUGH_LEAK = 0

B.95 Fuel system pressure diagnosis for low pressure (Appl. Inc.)

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_EFPPWM_PLAUS	V	0... FFH	0... 255	1	-
Increment of the plausibility check of EFPPWM anti-bounce counter					
C_ABC_INC_FUP_EFP_NOT_PLAUS	V	0... FFH	0... 255	1	-
Increment of the loose contact check of FUP EFP anti-bounce counter					
C_ABC_INC_L_PRS_SYS	V	0... FFH	0... 255	1	-
Increment of low pressure system monitoring anti-bounce counter					
C_ABC_MAX_EFPPWM_PLAUS	V	1... FFH	1... 255	1	-
Threshold to be reached, before plausibility check error of EFPPWM					
C_ABC_MAX_FUP_EFP_NOT_PLAUS	V	1... FFH	1... 255	1	-
Threshold to be reached, before FUP_EFP loose contact					
C_ABC_MAX_L_PRS_SYS	V	1... FFH	1... 255	1	-
Threshold to be reached, before permanently activating low pressure system monitoring error					

General Information

The low pressure system diagnosis is not inhibited.

Error treatment:
Error debounce:
Debounce counter increment: C_ABC_INC_L_PRS_SYS
Debounce counter maximum value: C_ABC_MAX_L_PRS_SYS

Debounce counter increment: C_ABC_INC_EFPPWM_PLAUS
Debounce counter maximum value: C_ABC_MAX_EFPPWM_PLAUS

- Debounce counter increment: C_ABC_INC_FUP_EFP_NOT_PLAUS
- Debounce counter maximum value: C_ABC_MAX_FUP_EFP_NOT_PLAUS

Logical constant for enabling of the minimum EFPPWM					

General information

The purpose of this module is to diagnose mechanical errors in the low pressure system.

Specific diagnostic information for the project is defined in chapters ‘Diagnosis information’ (freeze frame, DTC, error code number, symptom number, data for MIL management, ...).

After debounce, the correponding error bit LV_ERR... is set to 1, and the corresponding symptom is active.
Only if the driving cycle is finished, the error bit LV_ERR... and the debounced counter are set to 0, and the corresponding symptom is not active.

B.96.1 Fuel system pressure diagnosis for low pressure

General information:

If the software works in a master/slave ECU environment, the compiler switch NC_STATE_ECU_MST_SLA has a value $>$ 0.
In this case, the module will not be activated on the slave ECU, and all outputs will remain 0.

Application conditions:

Initialisation:

```
All values are initialized at ECU Reset, according Filter-type
STD_INI

T_PUC_END   =  C_T_PUC_END_EFPPWM_PLAUS
```

Activation:

```
If ( NC_STATE_ECU_MST_SLA = 0 // no master/ slave system
   or LV_ECU_SLA = 0 )         // master ECU
   and ( LV_IGK = 1 and N_32 > C_N_32_FUP_EFP_DIAG )
```

Deactivation: *activation condition not fullfilled*

```
at deactivation: LV_CDN_DIAG_EFPPWM_PLAUS = 0
                 LV_CDN_DIAG_L_PRS_SYS = 0
                 LV_CDN_DIAG_FUP_EFP_NOT_PLAUS = 0
                 T_EFPPWM_PLAUS_0 = 0
```

Recurrence: 20ms

Formula section:

B.96.2 Plausibility check EFPPWM

General information:

The plausibility check for the EFPPWM consists out of three parts:
1) A check of the I-part of the controller is done, which indicates mainly rapid changes in the performance of the pump or other low pressure system related topics.
2) The adaptive integral part can be used as an indicator for life time topics of the fuel pump.
3) The adaptive minimum EFPPWM gives the functionality of the fuel pump at ‘zero delivery’ to the high pressure system.

Application conditions:

Initialisation: –

Activation: –

Deactivation: –

Recurrence: –

Function description:

Formula section:

The calculation of the plausibility check is only done, if the function is activated, otherwise the plausibiltiy check is stopped and all values are stored until reactivation.

B.96.3 LP system monitoring

General information:

Certain pressure thresholds are monitored, in order to detect mechanical faults of the components of the fuel circuit.
There are two pressure limits to detect overpressure, and there is one to detect that pressure is too low:
1) FUP_EFP > Tol2 : Indicates an overpressure with an error in the LP pump pressure relief valve. The pressure is higher than the pressure at which the relief valve should open.
2) Tol1 < FUP_EFP < Tol2 : Indicates a pressure which is below the critical value of the LP pump pressure relief valve. This could happen when there is a mechanical fault, but the overpressure relief valve is still ok.
3) FUP < Bol1 : Indicates an excessive loss of pressure. Mechanical failure in the pump or regulator, or fuel leakage, can be detected this way.

LC_INH_FUP_DIAG_ON_CH	V	0... 1H	0 ...1	1	-
High pressure system diagnoses (FUP_MFP_PLAUS and H_PRS_SYS) are inhibited during catalyst heating, if set to 1					
LC_MOD_ERR_H_PRS_SYS	V	0... 1H	0 ...1	1	-
Defines behaviour of LV_ERR_H_PRS_SYS (0 = H_PRS_SYS_PRE, 1 = H_PRS_SYS_PRE or FUP_CH)					

Import actions:

ACTION_ERRM_FilterSymptom (**IN**<PRM_IDX_DIAG>,**IN**<PRM_LV_CDN_DIAG>,**IN**<PRM_ERR_SYM>,**IN**<PRM_C_ABC_INC>, **IN**<PRM_C_ABC_DEC>,**IN**<PRM_C_ABC_MAX>,**OUT**<PRM_LV_ERR>)
ACTION_ERRM_GetLvErr (**IN**<IDX_DIAG>,**OUT**<LV_ERR>)

General information:

The purpose is to diagnose mechanical errors.
Specific diagnosis information to the project are defined in chapters Diagnosis information (Freeze frame, DTC, error code number, symptom number, data for MIL management ...).
General information:
After debounce the corresponding error bit LV_ERR... is set to 1 and the corresponding symptom is active. Only if the driving cycle is finished the error bit LV_ERR... and the debounced counter are set to 0 and the corresponding symptom is not active.
The fuel system pressure diagnosis will be executed in dependency on the status of the fuel pressure sensor.
If the diagnosis is not prohibited the MFP plausibility check, the FUP sensor plausibility check and the HP system monitoring can be executed. The MFP plausibility check will be calculated only in state MFP_CTL.

The high-pressure system check indicates mainly an abnormal fuel pressure value in fuel system.

If a plausibility check error or the high-pressure system check error is detected a request for Lambda=1 mode is set to identify the origin of the non-plausibility.

The flags LV_CDN_DIAG_XXX exept the flag for FUP_STOP are ==0 if the function is not active. LV_CDN_DIAG_FUP_STOP == 1 if the function is not active.

Copyright (C) Continental AG,2007

FUNCTION DESCRIPTION:

General information:

To inhibit the monitoring of fuel system pressure diagnosis, several
Diagnostic errors examined.

Application conditions

Initialisation: on transition LV_IGK OFF → ON **OR** reset **OR** Failure memory cleared
All output variables initialized to 0h excepted:
ACTION_ERRM_GetLvErr(NC_IDX_DIAG_FUP_CH, LV_ERR_FUP_CH)
T_END_DIAG_RBM_FUP_CH initialised with C_T_END_DIAG_RBM_FUP_CH

Recurrence: *100 ms*

Activation: LV_DC = 1

Deactivation: LV_DC = 0

Formula section:

IF LV_CDN_DIAG_FUP_CH= 1 **AND** LV_END_DIAG_RBM_FUP_CH= 0
THEN decrement the timer T_END_DIAG_RBM_FUP_CH
ENDIF
IF LV_CDN_DIAG_FUP_CH= 0 **AND** LV_END_DIAG_RBM_FUP_CH= 0
THEN T_END_DIAG_RBM_FUP_CH= C_T_END_DIAG_RBM_FUP_CH
ENDIF
IF T_END_DIAG_RBM_FUP_CH = 0
THEN LV_END_DIAG_RBM_FUP_CH = 1
ENDIF

if LV_ERR_FUP = 1 **or**
LV_ERR_H_PRS_SYS_PRE = 1 **or**
LV_ERR_FUP_MFP_PLAUS = 1 **or**
LV_ERR_FUP_ORNG = 1 **or**
LV_ERR_VCV = 1
then LV_INH_DIAG_RBM_FUP_CH = 1
else LV_INH_DIAG_RBM_FUP_CH = 0
endif

B.99.1.2 Calculation of STATE_RBM_XX

FUNCTION DESCRIPTION:

General information:

With this module the interface between the monitor XX and the Rate-Based Monitoring statistics is defined with STATE_RBM_XX data.
Within STATE_RBM_XX three different information are defined:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Information about bit 0 of STATE_RBM_XX:
Conditions for monitoring are met long enough to detect malfunction (no intrusive operation, no short trip)

Information about bit 1 of STATE_RBM_XX:
Monitor disabled because of system malfunction (depending on failure status: pending)

Information about bit 2 of STATE_RBM_XX:
Monitor individual RBM conditions encountered within this DC

Only calculation of STATE_RBM_FUP_CH[0] supported. If NC_CBK_HPP_NR=2, than STATE_RBM_FUP_CH[1] =0.

Application conditions

Initialisation:

```
 at ECU reset :
bit 0, bit 1 and bit 2 of  STATE_RBM_FUP_CH[0] = 0

at LV_DC 0 -> 1 transition :

bit 0, bit 1, bit 2 of  STATE_RBM_FUP_CH[0] = 0
 On failure memory reset :

bit 1 of  STATE_RBM_FUP_CH[0] = 0

 if      NC_CBK_HPP_NR >1
then   STATE_RBM_FUP_CH[1]=0
endif
```

Recurrence: *1 s (excepted parts where the recurrence is given explicitly)*

Activation: *LV_DC = 1*

Deactivation: LV_DC = 0

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUP_CH

At LV_DC 0 → 1 transition

The pending status of the following failures has to be checked only once:

LV_ERR_H_PRS_SYS_PRE	LV_ERR_FUP	LV_ERR_VCV	LV_ERR_FUP_ORNG
LV_ERR_FUP_MFP_PLAUS			

If(1) { CPU optimization at LV_DC 0 → 1 transition }
CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn't empty }

Then(1)

While bit 1 of STATE_RBM_FUP_CH[0] = 0 **do**

with each failure of the above list :

Copyright (C) Continental AG,2007

ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<C

If(2) XX has a pending status
Then(2)
bit 1 of STATE_RBM_FUP_CH[0] = 1
Endif(2)
Endwhile
Else(1)
{ the dynamic failure memory is empty }
No action
Endif(1)

Every 1 s :
If bit 0 of STATE_RBM_FUP_CH[0] = 0
Then
If LV_END_DIAG_RBM_FUP_CH = 1
Then bit 0 of STATE_RBM_FUP_CH[0] = 1
Endif
Endif
If bit 1 of STATE_RBM_FUP_CH[0] = 0
Then
If LV_INH_DIAG_RBM_FUP_CH = 1
Then bit 1 of STATE_RBM_FUP_CH[0] = 1
Endif
Endif

Every 100 ms:
If bit 2 of STATE_RBM_ FUP_CH[0] = 0
Then
If LV_CH = 1 **And**
T_AST > C_T_AST_RBM_FUP_CH
Then bit 2 of STATE_RBM_FUP_CH[0] = 1
Endif
Endif

B.99.2 FUP diagnosis during catalyst heating (LV_ERR_FUP_CH)

General information:

During catalyst heating a deviation in FUP_SP to FUP (FUP_DIF) is observed. If the deviation is smaller or greater than a threshold for a defined time the corresponding symptom and error will be set after debounce.

Application conditions:

Initialisation: STD_INI, all other at reset with 0
Recurrence: 20ms
Activation: (LV_IGK = 1) **and** (N_32 > C_N_32_FUP_DIAG)
Deactivation: **If** (LV_IGK = 0) **or** (N_32 <= C_N_32_FUP_DIAG)
Then LV_CDN_DIAG_FUP_CH = 0
T_FUP_CH_DIAG_MIN = 0 ms
T_FUP_CH_DIAG_MAX = 0 ms

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
            Endif
```

Formula section:

```
If          LV_INH_DIAG_RBM_FUP_CH = 0     and
            LV_ERR_FUP_CH = 0              and
            LV_CH = 1                      and
            TCO > C_TCO_MIN_FUP_CH         and
            T_AST > C_T_AST_MIN_FUP_CH

Then        // check if FUP is too low:
            If      FUP_DIF > C_FUP_DIF_DIAG_MAX

B.100 Cold start emission reduction strategy diagnosis for injection

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
ANG_INJ_CSERS_MAX [NC_NR_IV_PLS] [NC_CYL_NR]	V	0... 780H	0... 720	0.375	°CRK
Maximum possible angle setpoint for a CSERS angle evaluation cycle					
ANG_INJ_CSERS_MIN [NC_NR_IV_PLS] [NC_CYL_NR]	V	0... 780H	0... 720	0.375	°CRK
Minimum possible angle setpoint for a CSERS angle evaluation cycle					
ANG_MEM [NC_NR_IV_PLS]	V	0... 780H	0... 720	0.375	°CRK
Memorized angle set point used for two consecutive evaluation cycles.					
CTR_CSERS_INJ_ERR	V	0... FFFFH	0... 65535	1	-
Error counter, increments one time per segment if error of CSERS multiple injection in phasing or timing or pulse number occurs					
CTR_SEG_CH	V	0... FFFFH	0... 65535	1	-
Segment counter, increments if catalyst heating segment with valid CSERS multiple injection diagnosis occurs					
LV_SYM_CSERS_INJ_DIAG	O/V	0... 1H	0 ...1	1	-
Symptom of CSERS multiple injection diagnosis					
LV_T_CH_ACT	O/V	0... 1H	0 ...1	1	-
CSERS multiple injection diagnosis was long enough valid. CSERS multiple injection diagnosis returns valid symptom					
RATIO_CSERS_INJ_ERR	V	0... FFFFH	0 ...1	15.259e-6	-
Error ratio of detected errors to evaluated catalyst heating segments					
TI_4_CSERS_MAX [NC_NR_IV_PLS] [NC_CYL_NR]	V	0... FFFFH	0... 262.14	0.004	ms
Maximum possible timing setpoint for a CSERS timing evaluation cycle					
TI_4_CSERS_MIN [NC_NR_IV_PLS] [NC_CYL_NR]	V	0... FFFFH	0... 262.14	0.004	ms
Minimum possible timing setpoint for a CSERS timing evaluation cycle					
TI_4_MEM [NC_NR_IV_PLS]	V	0... FFFFH	0... 262.14	0.004	ms
Memorized timing set point used for two consecutive evaluation cycles.					

Input data:

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ANG_INJ_CSERS_DELTA_THD	V	0... 780H	0... 720	0.375	°CRK
Error in phasing is detected for CSEERS multiple injection if measured angle of pulse exceeds threshold					
C_CTR_CH_ACT_THD	V	0... FFFFH	0... 65535	1	-
Threshold indicating that CSERS multiple injection diagnosis was long enough valid. CSERS multiple injection diagnosis returns valid symptom if threshold is exceeded.					
C_RATIO_CSERS_INJ_ERR_THD	V	0... FFFFH	0 ...1	15.259e-6	-
An error symptom is set for CSERS multiple injection diagnosis if threshold is excceded					
C_SEG_DELTA_INJ_BAS	V	0... FH	0... 15	1	-
Calibrated constant assigning the packege of set points which will be used for CSERS multiple injection diagnosis					
C_T_INJ_PLS_NOT_RUN	V	0... FFFFH	0... 262.14	0.004	ms
TI_MES equates to TI = 0ms if threshold is not exceeded					
C_TI_4_CSERS_DELTA_THD	V	0... FFFFH	0... 262.14	0.004	ms
Error in timing is detected for CSEERS multiple injection if measured duration of pulse exceeds threshold					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_MAX_SEG_CSERS_INJ	-	0... FFH	0... 255	1	-
Number of segments which have to be waited until first CSERS multiple injection diagnosis run can be made					

Action definition

ACTION_INJR_ChkInjSp (IN<PRM_CYL>)	Mode: -
Diagnosis action comparing ASW set points to BSW measurement values, returning error symptom if CSERS conditions for INJR are not met	

Parameter	Type	Hex.Limits	Phys.Limits	Resol.	Unit
PRM_CYL	in	0... FFH	0... 255	1	-
This action relates to cylinder Cyl.					

ACTION_INJR_IniInjSpMem (IN<PRM_CYL>)	Mode: -
Action stores last possible set points in cycle to be used as first possible set points in following cycle for CSERS diagnosis.	

Parameter	Type	Hex.Limits	Phys.Limits	Resol.	Unit
PRM_CYL	in	0... FFH	0... 255	1	-
This action relates to cylinder Cyl.					

ACTION_INJR_SetIniInjSP (IN<PRM_CYL>)	Mode: -
Copy memorised injection set points to min/max calculation of new cycle.	

Parameter	Type	Hex.Limits	Phys.Limits	Resol.	Unit
PRM_CYL	in	0... FFH	0... 255	1	-
This action relates to cylinder Cyl.					

ACTION_INJR_UpInjSpMinMax (IN<PRM_CYL>)	Mode: -
Update of min and max set points	

Parameter	Type	Hex.Limits	Phys.Limits	Resol.	Unit
PRM_CYL	in	0... FFH	0... 255	1	-
This action relates to cylinder Cyl.					

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information

For a comparison of set point values to the actual value, the set point values have to be prepared. Reason for this is that the set point values are calculated for each segment, but used only once each motor cycle. It is not known in ASW which set point value is taken in BSW. Therefore, all calculated set points have to be taken into account.
This is done by storing min and max values of each possible used set point for each single motor cycle. The acquisition separates set points for cylinders and pulses.

Application conditions:

Initialisation: `at reset, clear FMY, IGK on to off:`
```
CTR_SEG_CH = 0
CTR_CSERS_INJ_ERR = 0
RATIO_CSERS_INJ_ERR = 0
LV_SYM_CSERS_INJ_DIAG = 0
LV_T_CH_ACT = 0
```

Activation: `always`

Deactivation: `never`

Recurrence: `segment`

Function description:

Signal flow diagram:

For a robust diagnosis, we have to take account segment jitter, jitter of injbas-event (interrupt or task at 180° after TDC of each cylinder where BSW passes measured values of last injection cycle to ASW), wide ranges of phasing set points and injection times.
Furthermore, regarding set point variation, different update behaviour is configured for different injection modes. So, the actually executed injection times and phasing of the different pulses usually not match the respective set points calculated at a certain segment, but depend on the set point variation over several segments of an injection.

For example:
1) Supposed is SOI = 500°CEK and TI = 3ms and BSW has started the pulse. During execution of the pulse we get a new set point SOI = 480°CRK, TI = 4ms.
BSW maybe configured in such a way that 4ms are applied but SOI = 500°CRK since the pulses had already started. So we have a mixture of two set points. If the pulse is configured as an EOI-pulse, than the EOI would not correspond to any of the two set points.
2) Supposed is an update between two pulses. The first pulse might be executed according to the first set point, the second pulse according to the second set point. In update mode "update" the TI difference of the first pulse might be applied to the second pulse. So the second pulse might not correspond to any set point.
3) Supposed is an EOI_TI pulse with EOI = 400°CRK and TI = 5ms. Further, an angular frequency of 10°CRK/1ms (N=1667/min) is supposed. As result, the set point SOI = 450°CRK. At 430° another set point is requested with EOI = 420° and TI = 7ms.
BSW will prolong the actually performed pulse to 7ms, so the performed pulse is SOI = 450°CRK, EOI = 380°CRK. This is 20° less than the minimum of both EOI set points and will lead with high probability to an increment of the error counter.
4) There are lots of cases in terms of pulse collisions, collisions with SOI_LIM, EOI_LIM, maximum injection range violations in current or past cycles, application of TI_T or T_TI pulses, special update mode configurations where a wrong failure symptom may be detected. So an adequate calibration of the error ratio threshold C_RATIO_CSERS_INJ_ERR_THD has to be considered

So, the following algorithm is applied for the diagnosis:
LV_CDN_PRE_CSERS_INJ_DIAG must be 1 for at least NC_CYL_NR + 1 segments (no inhibits, same mode for all cylinders, no electrical defects, . . . , see Appl. Inc.). Set points for injection angles and times are sampled over NC_NR_CL + 1 segments and the respective minimum and maximum values are calculated for each cylinder. For the error evaluation it is checked if the measured values of injection angles and times are in between [min - threshold; max + threshold]. If this is not the case, an error counter is incremented.

The figure below shows where the sampled set points take place referring to the segment where the evaluation is done (typical scenario for a 4-cylinder engine).

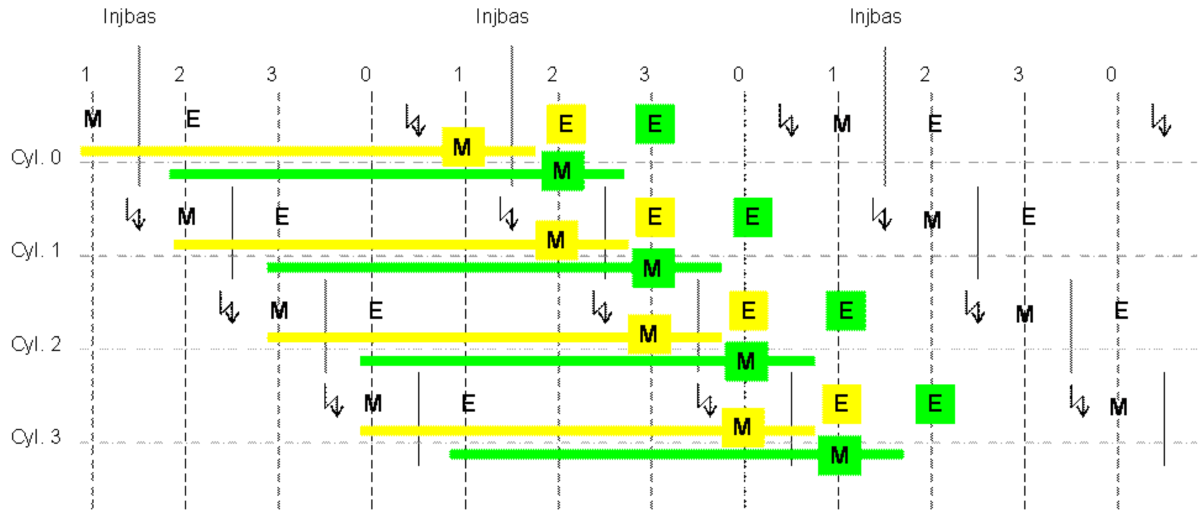

Figure B.100.1:

The injbas-event of a certain cylinder is 180°CRK after TDC. Here, the BSW passes the measured values of the last injection cycle to the ASW.
For cylinder 0: SEG_NR = s is the first segment after injbas_0 (figure above: s = 2).
a) If s is more than 30°CRKafter injbas_0, evaluation is done at segment s = 2 (calibratable via C_SEG_DELTA_INJ_BAS = 2, yellow line in figure above) and set point sampling is done every segment, from 1 up to NC_CYL_NR + 1 segments before.
b) If s is less than 30°CRK after injbas_0, evaluation is done at segment s + 1 (= 3 in figure above, calibratable via C_SEG_DELTA_INJ_BAS = 3, green line). Set point sampling is done from 1 up to NC_CYL_NR + 1 segments before.
So it is guaranteed that the measured values are up-to-date for evaluation (E in figure) and that all relevant set points have been sampled.
As NC_CYL_NR + 1 samples of set points are necessary for the diagnosis evaluation, the injection parameter of the last segment have to be memorized and used for the next consecutive evaluation cycle again (marked with M in figure above).

Calibration hint for C_SEG_DELTA_INJ_BAS:
For low engine speed, measure CRK_PSN_INJ_BAS_0 and SEG_NR (update rate every segment) in the application system. If the biggest value of CRK_PSN_INJ_BAS_0 is smaller than 690°CRK (note that 0°CRK is considered as 720°CRK), than set C_SEG_DELTA_INJ_BAS to the respective SEG_NR of the biggest value (= 2 in the example above).
Otherwise set C_SEG_DELTA_INJ_BAS to the next SEG_NR (= 3 in the example above).

B.100.4 ACTION_INJR_ChkInjSp

An error counter should be incremented exactly one time, if at least one of the following parameters is wrong:
- injection angle
- injection timing

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- number of pulses

Wrong injection angle is detected, if the minimum difference between min and max injection phase set point and BSW injection phase measurement value for an engine cycle exceeds a calibratable threshold.
Wrong injection timing is detected, if the minimum difference between min and max injection time set point and BSW injection time measurement value for an engine cycle exceeds a calibratable threshold.
Wrong number of pulses is detected via previous checks if an enabled pulse is not executed and via a check that BSW injection time measurement does not exceed a threshold for a disabled pulse.

For error evaluation, the error counter is compared relative to the number of combustions which were driven since the diagnosis started. If the error ratio exceeds a calibratable threshold, the error symptom for CSERS for multiple injection is set.
The error symptom must not be set before catalyst heating was active for a minimum time.

Diagnostic Description						
CSERS_INJ	CSERS thresholds for INJR are exceeded	0			NO_FIL	CC
CSERS diagnosis for multiple injection		1				
		2				
		3				

General information

In this specification following functions are handled:

- calculation of project specific diagnosis condition
- mapping of project specific set points and measurement variables to generic CSERS diagnosis variables
- project specific error handling

B.101.1 Variable mapping

General information:

Variable mapping has to be done for "old" INJR pulse concept. In this function, the names of the old set point variables are mapped to the names which are also used in the CSERS for multiple injection diagnosis core specification.

Application conditions:

Initialisation: `-`

Activation: `always`

Deactivation: `never`

Recurrence: `every segment;`
`before calculation of CSERS core spec and after calculation of iftrans0`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.101.2 Condition calculation of CSERS diagnosis for INJR

General information:

Condition for CSERS multiple injection diagnosis is given if:
- start ended . . . AND
- engine state is catalyst heating or if test mode is activated . . . AND
- no injection inhibition is active . . . AND
- more than one injection pulses are active . . . AND
- injection modes are equal for all cylinders . . . AND
- catalyst heating was not deactivated yet in driving cycle . . . AND
- no injection valve failure symptom or debounced error is present . . . AND
- no injection power stage bank failure symptom or debounced error is present

Due to hardware constraints on some power stages (e.g. ATIC21) STATE_DIAG_IV != 0 or STATE_DIAG_PBK_IV != 0 would cause false failure recognition. Accordingly the diagnosis is faded out then.

Application conditions:

Initialisation: `at reset, clear FMY, IGK off to on:`
`LV_CDN_PRE_CSERS_INJ_DIAG = 0`
`LV_CH_FIRST_DEAC = 0`

Activation: `always`

Deactivation: `never`

B.101.3 CSERS_INJ demo test mode activation

General information:

Here, the condition for enabling the CSERS multiple injection diagnosis demo test mode is calculated.

Condition for enabling the CSERS multiple injection diagnosis demo test mode is:
- multiple injection is active
- catalyst heating is active
- demo test mode is activated by calibration

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.101.5 Rate based monitoring

General information:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

With this module the interface between the XX monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_XX data.
Within STATE_RBM_XX, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)
  (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions:

Initialisation:
```
reset:  bit 0, bit 1 and bit 2 of STATE_RBM_CSERS_INJ = 0
LV_DC 0 -> 1 transition:  bit 0, bit 1 and bit 2 of STATE_
RBM_CSERS_INJ = 0
CLR_FMY: bit 1 of STATE_RBM_CSERS_INJ = 0

reset, LV_DC 0 ->1, CLR_FMY: T_STATE_CSERS_INJ_RBM = 0
```

Activation: `LV_DC 0 ->  1 transition and LV_DC = 1`

Deactivation: `never`

Recurrence: `1s`

Function description:

Formula section:

LDP_VS_IP_CLRC_AMP_PLAUS	4	0... FFH	0... 255	1	km/h
Filter constant for mean moving calculation of AMP_MES					

FUNCTION DESCRIPTION:

General information:

Due to CARB requirements the diagnosis detects unplausible ambient pressures which cannot be detected by electrical diagnosis.

The diagnosis is based gradient monitoring of AMP_MES.

Description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

AMP_MMV_PLAUS is the mean-moving value of AMP_MES and represents the maximum possible change of AMP if the car is driving uphill or downhill.

If AMP_MES is below or upper AMP_MMV_PLAUS -/+ calibratable offset C_AMP_PLAUS_DIF_ERR the sensor is detected as not plausible and ERR_SYM_AMP_PLAUS is set.

Application conditions

Initialisation: according ABC - type **"MEM"** *(all 0 at LV_IGK 0->1, error is set irreversible)*
AMP_MMV_PLAUS = AMP_MES at LV_IGK 0->1 **or** Reset

Recurrence: 1s

Activation: *LV_IGK = 1* ***and*** *LV_INH_DIAG_AMP_PLAUS = 0*

Deactivation: LV_IGK = 0 **or** LV_INH_DIAG_AMP_PLAUS = 1
(set LV_CDN_DIAG_AMP_PLAUS = 0 at deactivation)

Formula section:

Continuous gradient monitoring:
LV_CDN_DIAG_AMP_PLAUS = 1
AMP_MMV_PLAUS(n) = AMP_MMV_PLAUS(n-1)
+ IP_CLRC_AMP_PLAUS * (AMP_MES - AMP_MMV_PLAUS(n-1))
If AMP_MES > AMP_MMV_PLAUS + C_AMP_PLAUS_DIF_ERR
Then ERR_SYM_AMP_PLAUS = SYM_0
Elseif AMP_MES < AMP_MMV_PLAUS - C_AMP_PLAUS_DIF_ERR
Then ERR_SYM_AMP_PLAUS = SYM_1
Else ERR_SYM_AMP_PLAUS = NO_SYM
Endif

LV_ERR_AMP_PLAUS, LV_END_DIAG_AMP_PLAUS is calculated by error management.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Time delay for decreasing the debounce counter for oil dilution detection in fuel system diagnosis					

General information

This function checks all necessary activation conditions in order to activate fuel system diagnosis. High rate of evaporated fuel during rich warmup phase under cold start conditions could lead to wrong failure detection and therefore a special inhibition flag for that case is generated.

NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements the variable extension _i is used in the model instead of [i] as found in the textual description.

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.104.3: LACO_FCTDGFSDA0/INI/RST

Initialize NVMY data

CTR_STOP_FSD is set to 0 in case of failure in the nonvolatile memory data storage.

Read NVMY data

CTR_STOP_FSD is restored from the nonvolatile memory data storage after reset.

Store NVMY data

CTR_STOP_FSD is saved in the nonvolatile memory data storage during PWL phase.

B.104.2 Formula section for 20ms task

Exhaust bank specific functionality

Activation of fuel system diagnosis

Calculation of LV_FSD_ACT[i]

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

In order to activate fuel system diagnosis no inhibition must be present, lambda controller must be active and ambient pressure, air mass flow, engine speed, coolant temperature and intake air temperature must be above their thresholds.

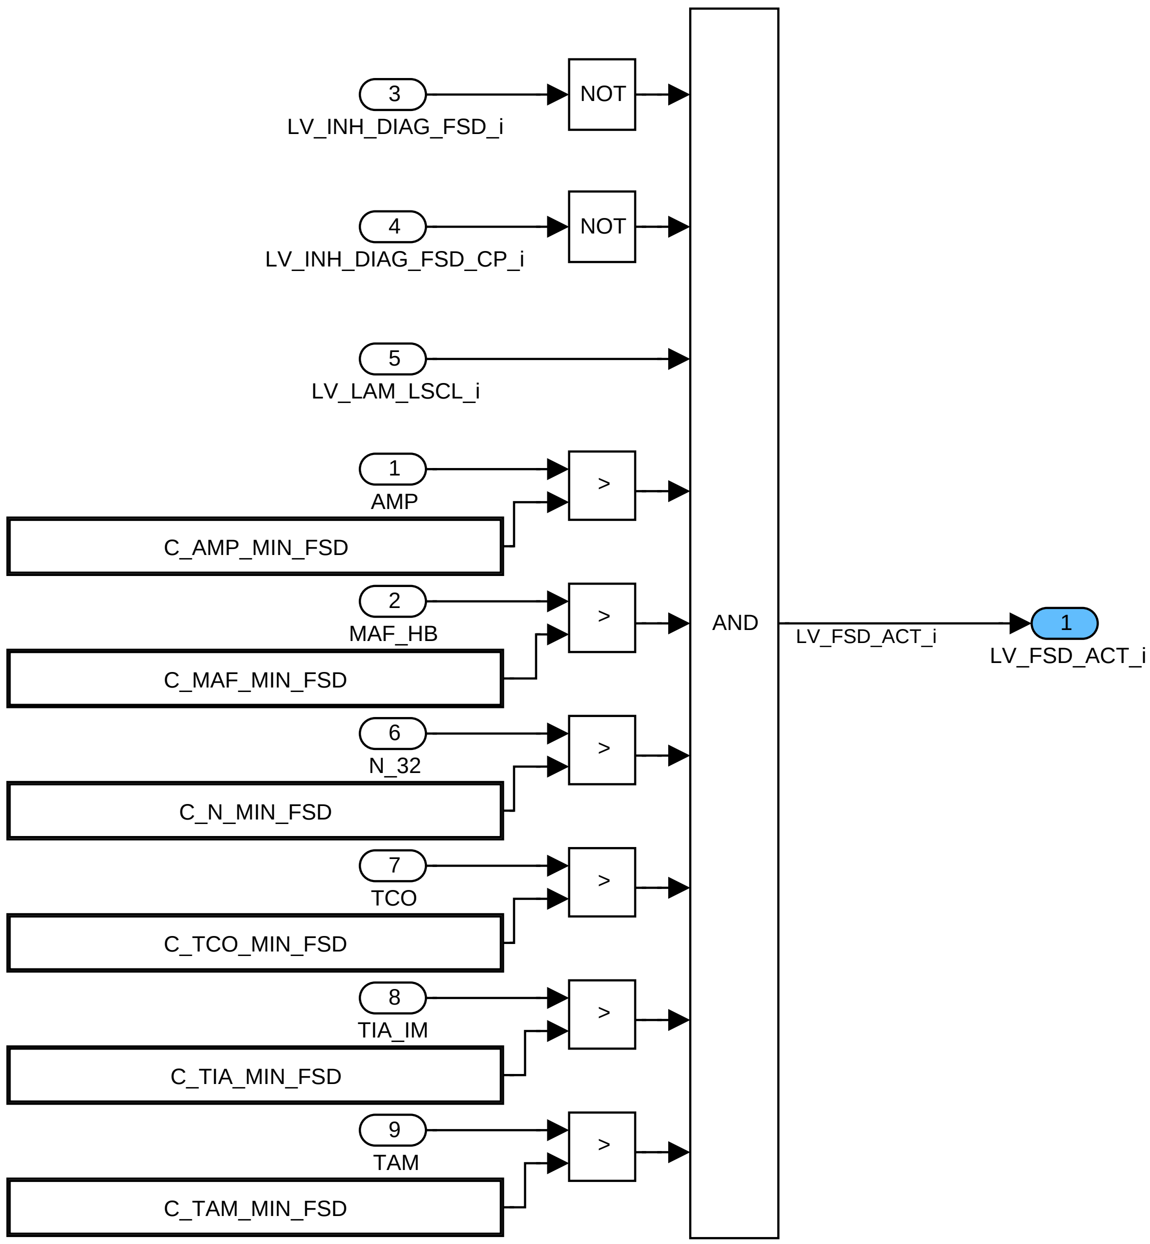

Figure B.104.4: LACO_FCTDGFSDA0/OPM_20MS/OPM/FSD_ACT/FSD_ACT

B.104.3 Formula section for 1s task

For high rate of evaporated fuel (diluted in the engine oil) during rich warmup phase under cold start conditions lambda controller and adaptation may reach the negative limits relevant for FSD (MIN limits). In order to prevent an error detection in that case the flag LV_INH_FSD_STOP_OIL used by FSD is set. The counter CTR_STOP_FSD is a measure for the amount of diluted fuel in the engine oil.

Increment of CTR_STOP_FSD

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

At each transition from engine stop to engine run (LV_ES switches from 1 to 0) the counter CTR_CTOP_FSD is incremented by the TCO_ST depending map value ID_CTR_INC_FSD_STOP_OIL.

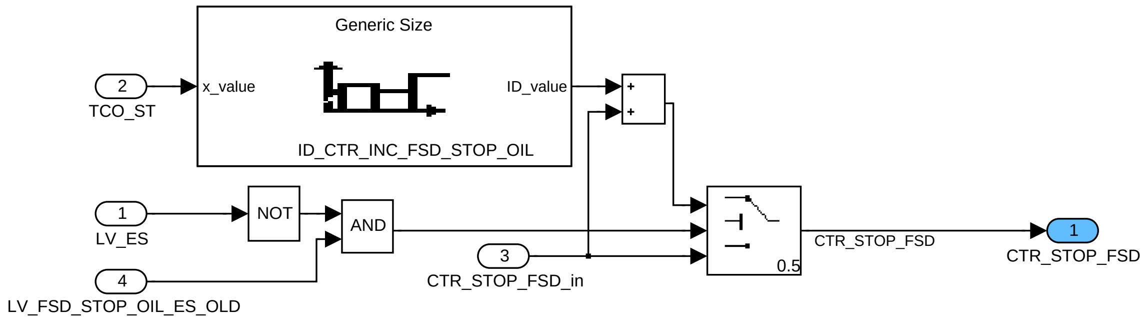

Figure B.104.5: LACO_FCTDGFSDA0/OPM_1S/INC_CTR

Decrement CTR_STOP_FSD

ID_DLY_DEC_FSD_STOP_OIL defines the time to elapse at a certain TOIL range for decrementing CTR_STOP_FSD by 1. The TOIL range is defined by 2 adjacent map break points. At engine stop and as long as the oil temperature is below a threshold this timer is set to 0 in order to not run the increment functionality. The timer is reset to 0 as soon the threshold is reached.

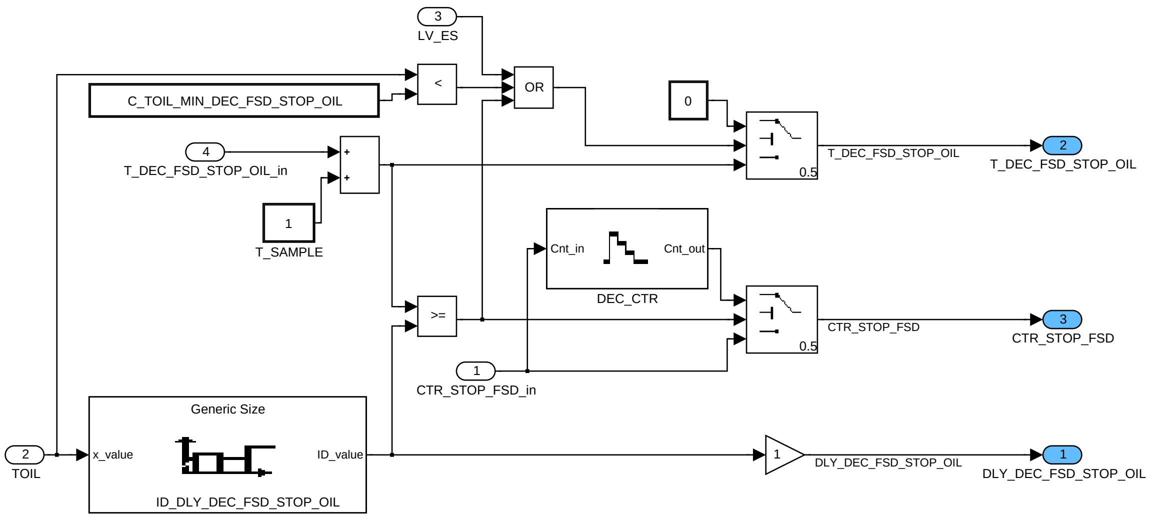

Figure B.104.6: LACO_FCTDGFSDA0/OPM_1S/DEC_CTR

Inhibition of fuel system diagnosis

The flag LV_INH_FSD_STOP_OIL is set if the counter CTR_STOP_FSD reaches a calibration threshold.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. General information

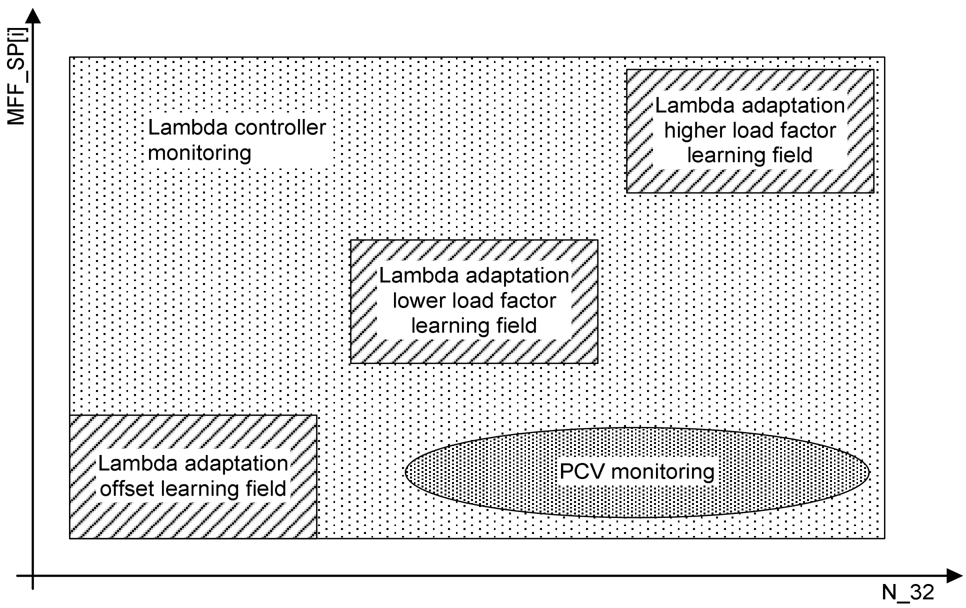
The objective of the fuel system diagnosis is to monitor the lambda control output and the lambda adaptation values in various areas. It should also cover the PCV monitoring where the lambda control output is considered in the idle range.



Monitoring area of fuel system diagnosis

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Breaking the adaptation and lambda controller limits for a long time, which may have been caused by failures in the fuel or intake system will involve emission rise and therefore shall be diagnosed by fuel system diagnosis.
FSD errors are located in three failure memories with two and four symptoms each:

ERR_SYM_FSD[i]:
NO_SYM: no symptom
SYM_0: maximum limit of additive adaptation value reached
SYM_1: minimum limit of additive adaptation value reached
SYM_2: maximum limit of multiplicative adaptation value (lower area) reached
SYM_3: minimum limit of multiplicative adaptation value (lower area) reached

ERR_SYM_FSD_H_RNG[i]:
NO_SYM: no symptom
SYM_0: maximum limit of multiplicative adaptation value (upper area) reached
SYM_1: minimum limit of multiplicative adaptation value (upper area) reached

ERR_SYM_FSD_LAM_LIM[i]:
NO_SYM: no symptom
SYM_0: lambda control in dead stop (upper limit)
SYM_1: lambda control in dead stop (lower limit)

NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements the variable extension _i is used in the model instead of [i] as found in the textual description.

Exhaust bank specific functionality

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

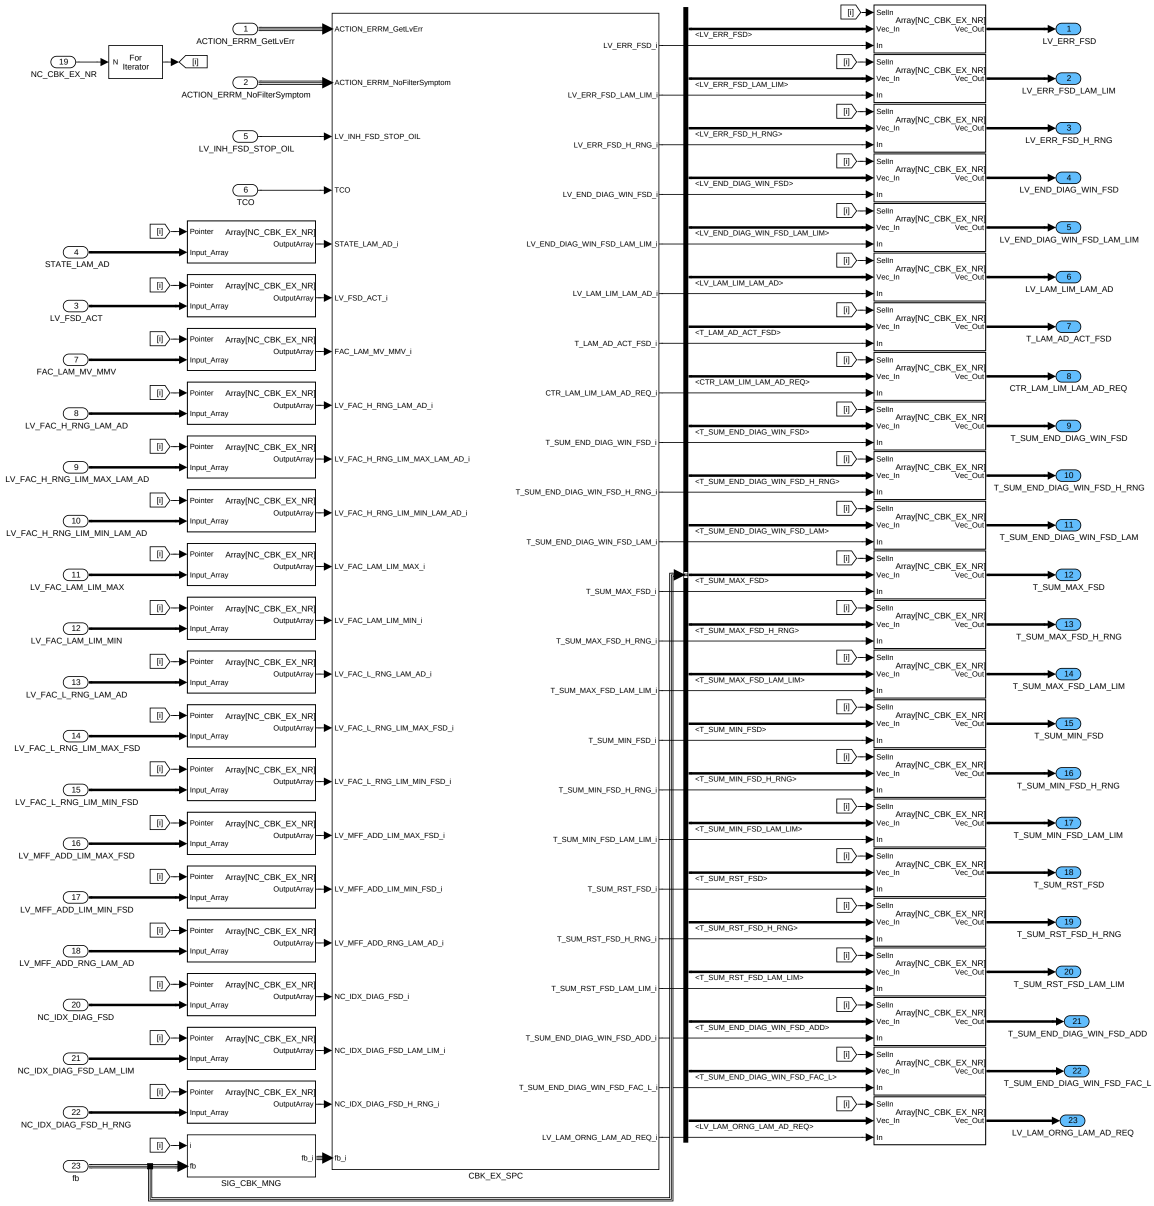

Figure B.105.6: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG

Overview about the diagnostics

The diagnosis function is split into 4 blocks.
1. By means of an interface functionality to the lambda adaptation the forced lambda adaptation can be requested by the FSD. This functionality runs independent of the rest.
2. The diagnosis conditions for all failure location are evaluated separately from each other.
3. The main block is the evaluation of the error symptom and the management of the end of diagnosis information. The decision about present errors is also part of this block.
4. The interface to the error management ERRM is handled in this block. My means of ACTION calls the relevant information is transmitted to the ERRM.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

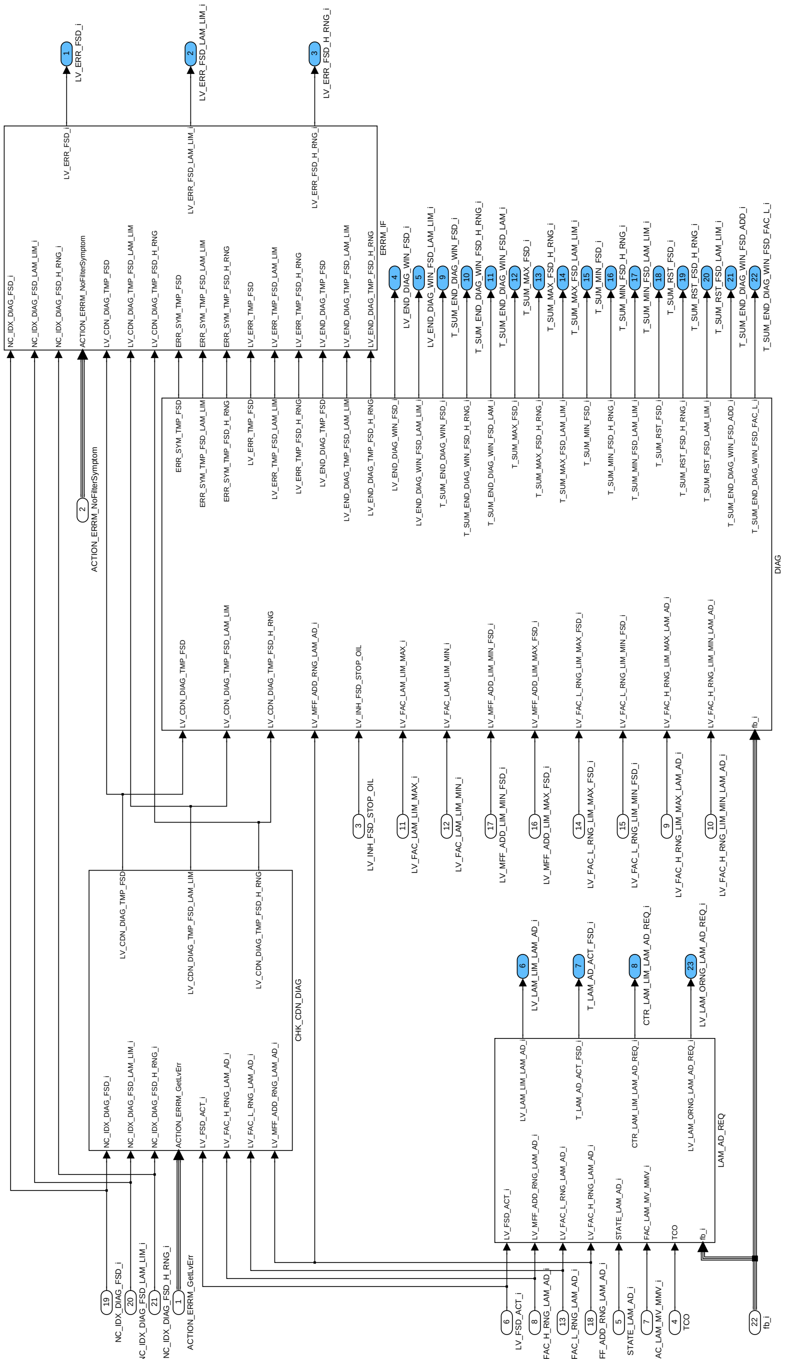

Figure B.105.7: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC

Interface to lambda adaptation

When the lowpass filtered lambda controller output exceeds a minimum or maximum calibration threshold the lambda adaptation shall be forced by the FSD to get active and adapt the lambda controller deviation in order to confirm to lambda excursion. The request for this forced lambda adaptation is controlled by an antibounce mechanism.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

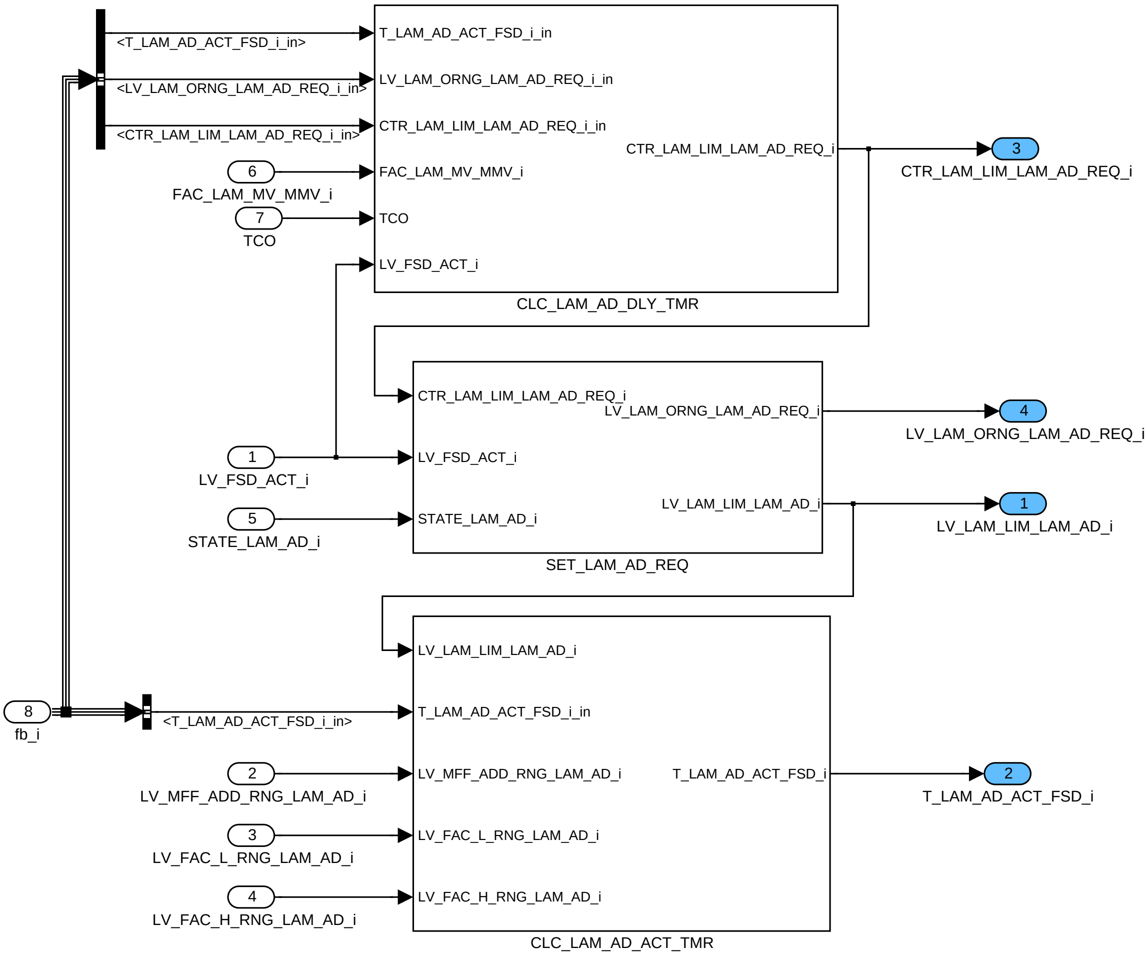

Figure B.105.8: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/LAM_AD_REQ

Request counter

The request counter CTR_LAM_LIM_LAM_AD_REQ[i] is reset to 0 as soon as the activation timer T_ LAM_AD_ACT_FSD[i] expires.

As long as
the request counter is not yet expired
(indicated by the flag LV_LAM_ORNG_LAM_AD_REQ[i]),
fuel system diagnosis is active (LV_FSD_ACT[i] = 1) and
lambda controller output is not zero
the counter is either incremented or decremented depending on whether lambda controller output is inside or outside the permitted range. The incrementation /decrementation speed is tunable.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure B.105.9: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/LAM_AD_REQ/
CLC_LAM_AD_DLY_TMR

Request flag /Lamda controller out of range flag

If the request counter is expired, fuel system diagnosis is active and the lambda adaptation is inside one of its learning fields (either state CDN_FAC_L, CDN_FAC_H, CDN_ADD, ADAPT_FAC_L, ADAPT_FAC_H or ADAPT_ADD indicated by STATE_LAM_AD[i] >= CDN_FAC_L), the flag LV_LAM_LIM_LAM_AD[i] that requests the forced lambda adaptation is set to 1.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

As soon as request counter reaches the calibration threshold the flag LV_LAM_ORNG_LAM_AD_REQ[i] indicating that the request timer expired is set.

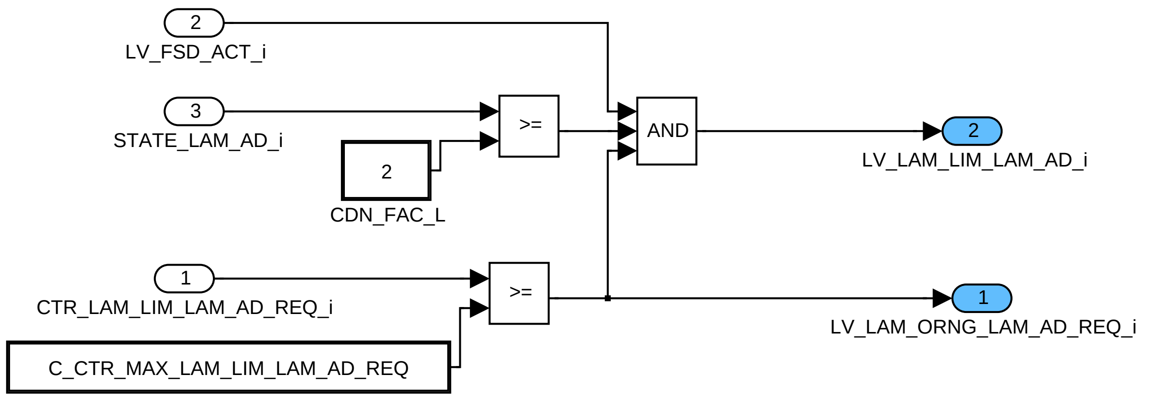

Figure B.105.10: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/LAM_AD_REQ/SET_LAM_AD_REQ

Activation timer

The activation timer T_LAM_AD_ACT_FSD[i] is incremented as long as the request flag for forced lambda adaptation is set and lambda adaptation is active. As soon as the activation timer expires it is reset to 0.

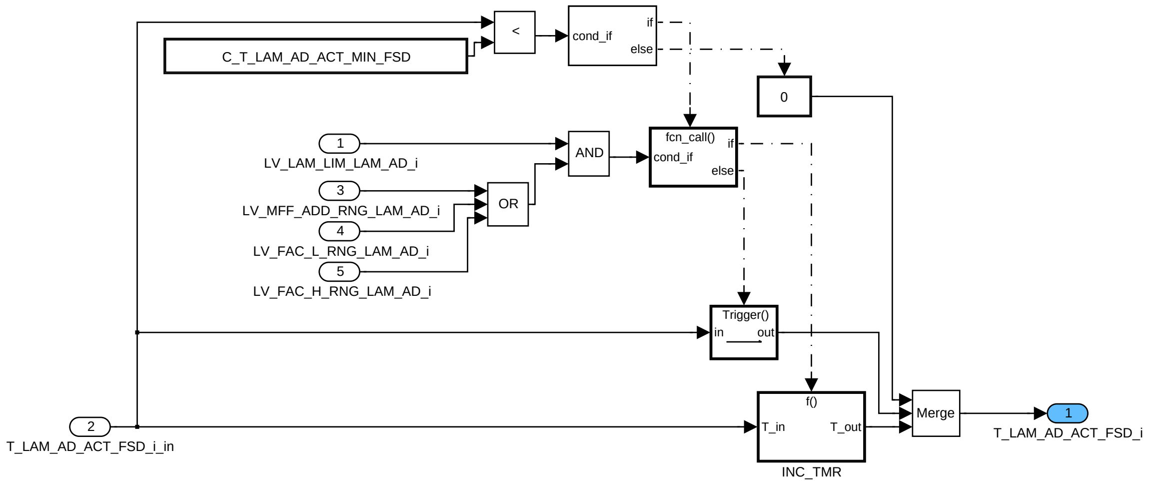

Figure B.105.11: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/LAM_AD_REQ/CLC_LAM_AD_ACT_TMR

Increment timer

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

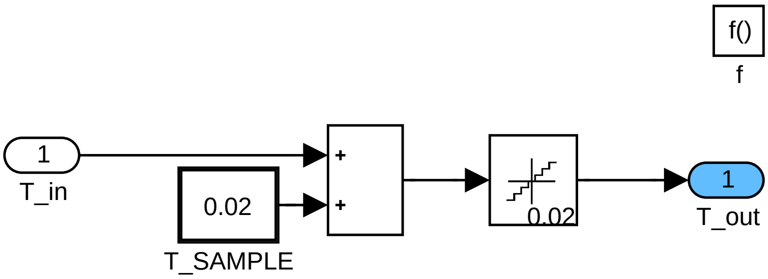

Figure B.105.12: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/LAM_AD_REQ/CLC_LAM_AD_ACT_TMR/INC_TMR

Check diagnostic conditions

For each failure location the diagnostic condition is evaluated separately.

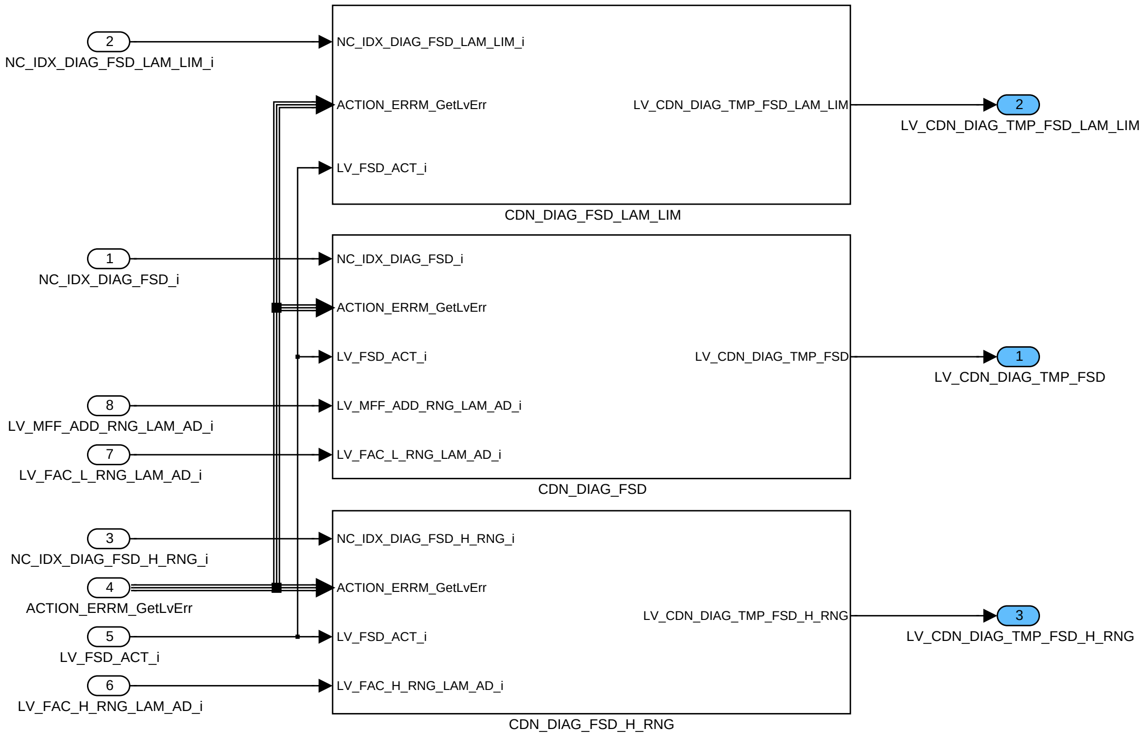

Figure B.105.13: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/CHK_CDN_DIAG

Check conditions for lambda adaptation monitoring

Conditions are fulfilled when no error is present, the global activation conditions are fulfilled and the lambda adaptation is either in the offset or lower load factor learning field.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error detection and end of diagnosis management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

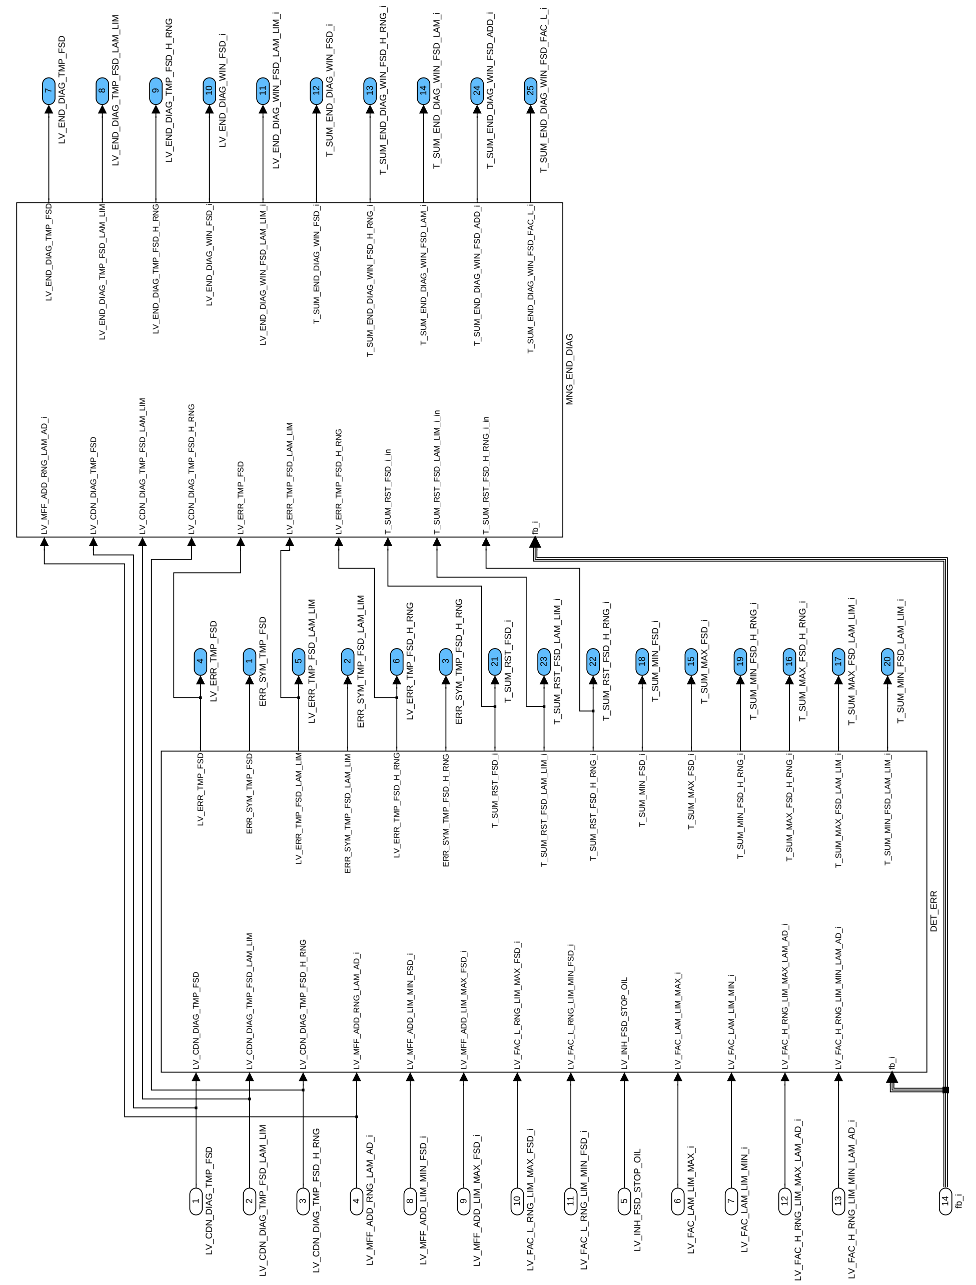

Figure B.105.17: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/DIAG

Error symptom detection

For each failure location the symptom detection is executed separately.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

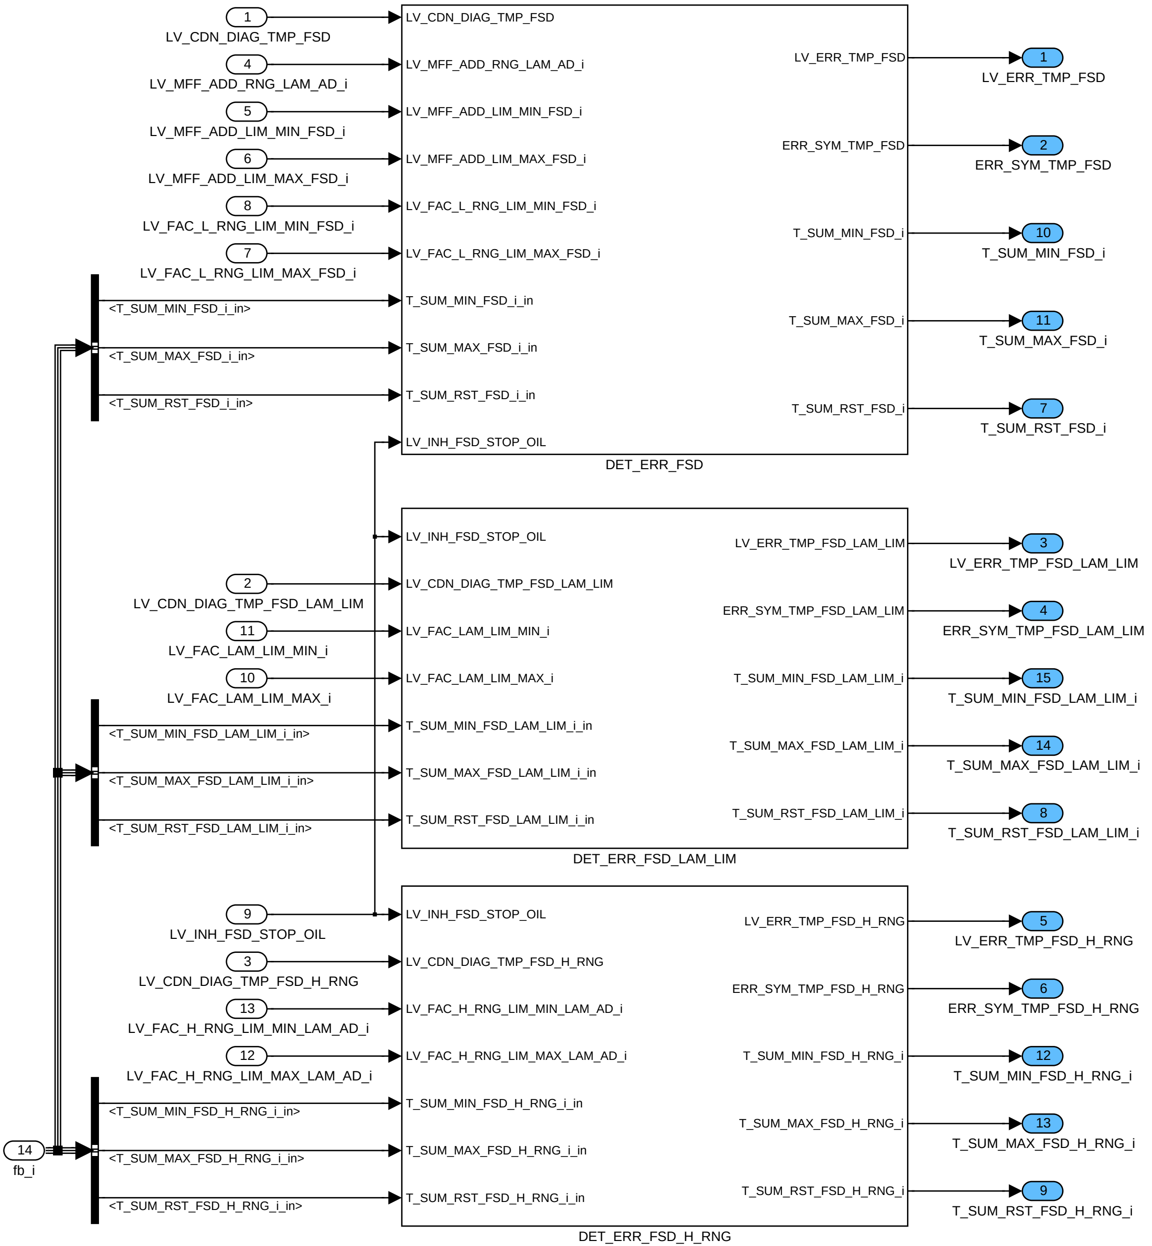

Figure B.105.18: LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/DIAG/DET_ERR

Error symptom detection for lambda adaptation monitoring

In case the conditions are not fulfilled all timers remain unchanged and the temporary error flag and symptom have no relevance.
Depending on whether lambda adaptation is in the offset or lower load factor learning field different but similar functionalities are executed.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

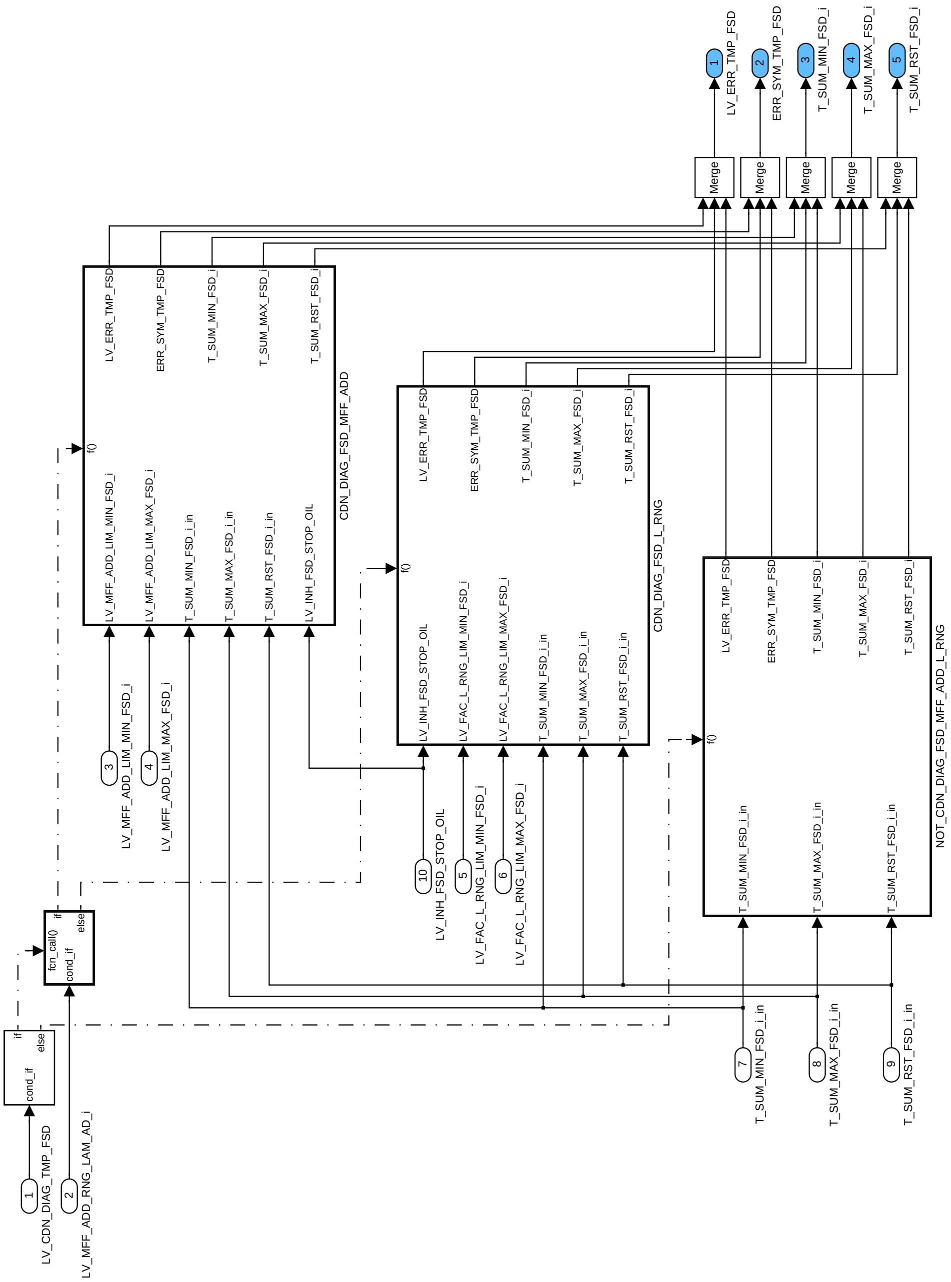

Figure B.105.19:
LACO_FCTDGFSD0/operate_20MS/CBK_EX_MNG/CBK_EX_SPC/DIAG/DET_ERR/DET_ERR_FSD

Conditions for lambda adaptation offset monitoring fulfilled

Between 3 different cases must be distinguished:

1. Lambda adaptation factor for lower load is at its minimum threshold (indicated by the flag LV_ MFF_ ADD _LIM_MIN_LAM_AD[i]) and no inhibition due to oil dilution under cold start conditions.
2. Lambda adaptation factor for lower load is at its maximum threshold (indicated by the flag LV_MFF_ ADD_LIM_MAX_LAM_AD[i]).
3. No limitation of the lambda adaptation factor for lower load.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Independent of these cases the antibounce timers used to finally set the error are evaluated afterwards.

Set end of diagnosis for lambda adaptation monitoring

The condition to set the temporary end flag LV_END_DIAG_TMP_FSD are: Diagnostic condition must be fulfilled and either an error was detected (temporary end flag LV_ERR_TMP_FSD is 1) or the timer T_SUM_END_DIAG_WIN_FSD[i] has reached the calibration threshold.
If LV_END_DIAG_TMP_FSD is set once, the corresponding error flag of the error management remain set for the rest of the driving cycle.
In order to set the end flag for similar conditions LV_END_DIAG_WIN_FSD[i] the diagnostic conditions must be fulfilled too and either the temporary error flag was set or the timer T_SUM_END_DIAG_WIN_FSD[i] has reached the calibration threshold and both timers T_SUM_END_DIAG_WIN_FSD_ADD[i] and T_SUM_END_DIAG_WIN_FAC_L[i] were above the threshold defined by C_T_SUM_RST_FSD and C_CRLC_T_SUM_WIN_FSD_RST.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This function manages the inhibition of the fuel system diagnosis (FSD) due to system errors and canister purge states.

NC_CBK_EX_NR defines the number of exhaust banks.
For vector elements the variable extension _i is used in the model instead of [i] as found in the textual description.
Configuration for diagnostic symptoms:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

NLC_USE_CRK_OSC_MIS	-	0... 1H	0 ...1	1	-
Crankshaft oscillation detection module used (=1) or stub version (=0)					

General information

The misfire detection based on engine roughness index (ER) may be disturbed by crankshaft oscillations when single misfire (random) occurs, especially for front drive vehicles crankshaft in the low engine speed /high engine load area (in combination with a 3rd, 4th or 5th gear ratio). A single misfire acts as a drivetrain /crankshaft oscillations trigger, in this case the ER index is distrubed by these oscillations, in some conditions it is practically not possible to distinguish on ER index, real misfire towards speed drop caused through crankshaft speed oscillations.
The trigger for such oscillations can be a single misfire, an obstacle, a big torque change or others instantaneous conditions.
The principle of this crankshaft /drivetrain oscillation detection is to detect such an oscillation and then to fade-out the misfire detection for a short period to avoid over-detection.
Initialisation: *on ECU reset, on LC_MIS_INH 0 to 1 transition*
SEG_SUM_FRQ_CRK_OSC = 0

EndIf
Update rate: Segment

B.107.1 Detection description

The final decision about crankshaft oscillation consists of two parts:

- The detection of a critical engine roughness oscillation frequency.
- The detection of a critical engine roughness oscillation amplitude.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007
A4: 2007-11

If both parts fulfilled at the same time their own detection criterion, a crankshaft oscillation is detected. The reason therefore is, that even at constant speed due to normal little speed variations a high frequency or at a normal acceleration phase a big amplitude is possible.

B.107.1.1 Determination of a critical engine roughness frequency

Application conditions

Activation: *LV_CRK_OSC_DET_ACT = 1*

Deactivation: *LV_CRK_OSC_DET_ACT = 0*

Formula section:

If Bit sign between DRV0_ER$_{(n-1)}$and DRV0_ER$_{(n)}$changes
Then SEG_SUM_FRQ_CRK_OSC = IP_SEG_MIN_FRQ_CRK_OSC(N_32)
ElseIf SEG_SUM_FRQ_CRK_OSC 0
Then SEG_SUM_FRQ_CRK_OSC = SEG_SUM_FRQ_CRK_OSC - 1
EndIf
If SEG_SUM_FRQ_CRK_OSC 0
Then LV_FRQ_CRIT_CRK_OSC = 1 *// Critical crankshaft frequency status is active*
Else LV_FRQ_CRIT_CRK_OSC = 0
EndIf

B.107.1.2 Determination of a critical engine roughness oscillation amplitude

Application conditions

Activation: *LV_CRK_OSC_DET_ACT = 1*

Deactivation: *LV_CRK_OSC_DET_ACT = 0*

Formula section:

If Bit sign between DRV0_ER$_{(n-1)}$and DRV0_ER$_{(n)}$changes
Then DRV0_ER_SUM_OSC$_{(n)}$ = DRV0_ER$_{(n)}$
Else DRV0_ER_SUM_OSC$_{(n)}$ = DRV0_ER_SUM_OSC$_{(n-1)}$ + DRV0_ER$_{(n)}$
// with saturation
EndIf
DRV0_ER_SUM_THD_OSC = IP_DRV0_ER_THD_OSC(N_32, LOAD_MIS)
If DRV0_ER_SUM_OSC DRV0_ER_SUM_THD_OSC
Then LV_AMPL_CRIT_CRK_OSC = 1 *// Critical crankshaft amplitude status is active*
Else LV_AMPL_CRIT_CRK_OSC = 0
EndIf

B.107.1.3 Determination of crankshaft oscillation final status

Application conditions

Activation: *LV_CRK_OSC_DET_ACT = 1*

Deactivation: *LV_CRK_OSC_DET_ACT = 0*

Maximum torque value to determine engine load ratio scale for misfire detection					

B.108.1 Misfire detection engine parameters

FUNCTION DESCRIPTION:

In order to cover all the combustion states of an engine (Hom. AFS, AFL & Strat.) in torque based engine control, a general variable LOAD_MIS that represents the ratio of engine load - whatever should be the load definition depending on engine combustion state (*eg. MAF in Hom. and TQI_AV in Strat.*) - is defined for the purpose of the Misfire function and the calculation of the ER-misfire detection thresholds.
Depending on the project choice configuration (*with C_CONF_LOAD_MIS*), in Homogenous combustion mode this Misfire load variable should be either MAF, MAP or TQI_AV. In the other hand this Misfire load variable is always TQI_AV in Stratified combustion mode.
Legally, the presence of engine misfire in the engine operating region is bounded by the positive torque line (i.e. engine load with the transmission in neutral) and an engine speed value.
The zero load line is a function of the engine speed and depends on the engine combustion mode (for GDI application), coolant temperature and atmospheric pressure.

Application conditions

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation: All variables are initialised to 0 at reset, at engine stop **Or** at LC_MIS_INH 0 to 1 transition
LOAD_GRD_MIS is first time calculated when LOAD_MIS stack have been fill in (4 segments).

Recurrence: *every segment task*

Activation: LV_ENA_SEG_T_MES = 1
And LC_MIS_INH = 0

Deactivation: LV_ENA_SEG_T_MES = 0
Or LC_MIS_INH = 1

Formula section:

Normalised engine load dedicated to misfire detection
For each misfire segment, the following stack is serviced:
LOAD_MIS_3 =LOAD_MIS_2
LOAD_MIS_2 =LOAD_MIS_1
LOAD_MIS_1 = LOAD_MIS
If C_CONF_LOAD_MIS = 0
Or LV_S_ACT = 1
Then *LOAD_MIS_Temp* = TQI_AV /IP_TQI_AV_MAX_MIS(N_32) *// TQI_AV based*
ElseIf C_CONF_LOAD_MIS = 1
Then *LOAD_MIS_Temp* = MAF /IP_MAF_MAX_MIS(N32) *// MAF based*
Else *LOAD_MIS_Temp* = MAP /C_MAP_MAX_MIS *// MAP based*
EndIf
LOAD_MIS = FAC_GAIN_LOAD_MIS * *LOAD_Temp* *// Application incidence correction*
LOAD_GRD_MIS = | LOAD_MIS - LOAD_MIS_3 |
Note : LOAD_MIS calculation steps are checked against division by zero
LOAD_MIS_Temp is a non visible, temporary value

B.108.2 Generic fade out conditions for misfire detection

General information:

Generic fade out (LV_REQ_APP_INH_MIS) is based on all conditions who could create unreliable conditions for misfire detection :

- Engine gradients (engine load, throttle, combustion mode & ignition angle transients).
- Crankshaft jolt effects who can distrub detection process (rough road, drivetrain oscillations, air conditionner & accessoiries activation/deactivation).
- OBDI errors on one of the sensors used by the misfire monitoring process.

All these different conditions are merge into a carrier (MIS_DET_CDN_APP_INH).

Application conditions

Initialisation: at ECU reset, at Engine Stop **Or** at LC_MIS_INH 0 to 1 transition
LV_REQ_APP_INH_MIS = 1
MIS_DET_CDN_APP_INH = 2047
MIS_DET_CDN_APP_INH_NR = 11
MAP_DIF_MIS = 0
IGA_DIF_MIS = 0
IGA_BAS_DIF_MIS = 0
IGA_MIS_2 = 0
IGA_MIS_1 = 0
IGA_MIS = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Recurrence: segment task for data process
10 ms for free running timers

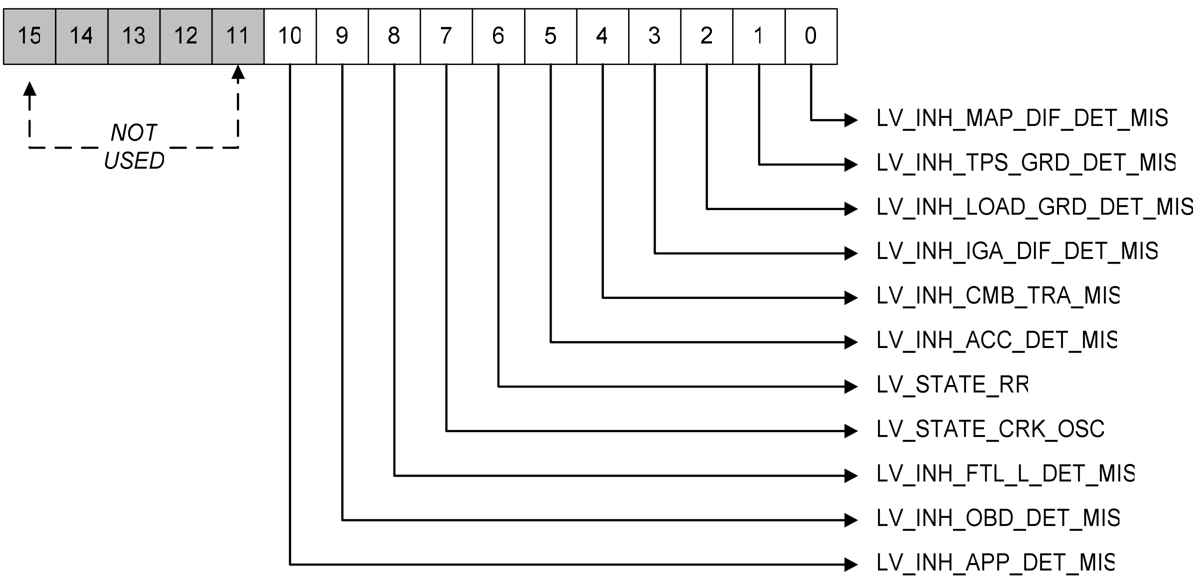
Activation: LV_ENA_ER = 1
And LC_MIS_INH = 0

Deactivation: LV_ENA_ER = 0
Or LC_MIS_INH = 1

Remark : Timers used for delay are 10 ms free running decounters, they are not linked to activation/ deactivation conditions described above.

B.108.2.1 Generic fade out condition carrier definition

MIS_DET_CDN_APP_INH



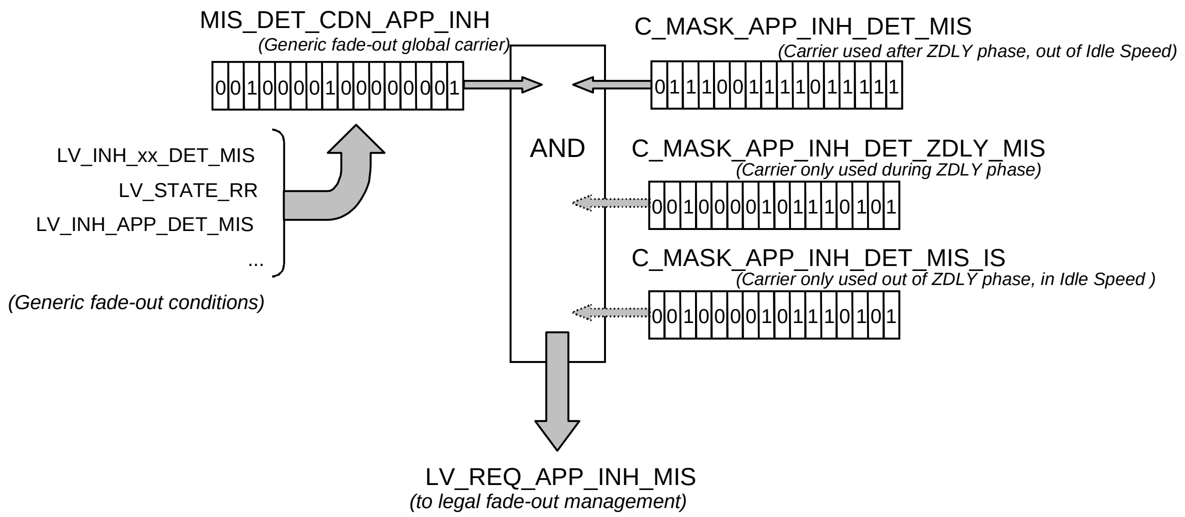
remark : MIS_DET_CDN_APP_INH is updated at current misfire task

B.108.2.2 Configurable generic fade-out management

Generic fade out management during zero delay phase, nominal phase & idle speed engine state can be configurated via 3 bitfield masks that allow to take in account or not some conditions in a phase and not in the other.
If the corresponding bit in the MIS_DET_CDN_APP_INH carrier structure is set to 0 in C_MASK_APP_INH_DET_ZDLY_MIS, C_MASK_APP_INH_DET_MIS or C_MASK_APP_INH_DET_MIS_IS calibration, then the corresponding condition will not fade-out misfire detection.
For the definition of C_MASK_APP_INH_DET_ZDLY_MIS, C_MASK_APP_INH_DET_MIS & C_MASK_APP_INH_DET_MIS_IS masks please refer to the legal requirements & customer recommendations.

Overview:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Formula section:

If(1) CTR_T_ZDLY_MIS != 0
Then(1) *// ZDLY phase*
MIS_DET_CDN_APP_INH_NR =
sum(MIS_DET_CDN_APP_INH & C_MASK_APP_INH_DET_ZDLY_MIS)
(bitfield operations)
Else(1)
If(2) LV_IS = 1
Then(2) *// Idle Speed engine state*
MIS_DET_CDN_APP_INH_NR =
sum(MIS_DET_CDN_APP_INH & C_MASK_APP_INH_DET_MIS_IS)
(bitfield operations)
Else(2) *// Out of idle speed engine state*
MIS_DET_CDN_APP_INH_NR =
sum(MIS_DET_CDN_APP_INH & C_MASK_APP_INH_DET_MIS)
(bitfield operations)
EndIf(2)
EndIf(1)

If MIS_DET_CDN_APP_INH_NR != 0
Then LV_REQ_APP_INH_MIS = 1
Else LV_REQ_APP_INH_MIS = 0
EndIf

B.108.2.3 Maximum manifold air-pressure gradient

Due to trailing throttle /acceleration transition problems, it could be necessary to disable misfire detection for a short period when the manifold air-pressure gradient exceeds an applicable value.

Application conditions:

In all homogeneous combustion mode, Misfire detection is disabled when the amount of the MAP gradient exceeds IP_MAP_DIF_MAX_MIS(MAP)

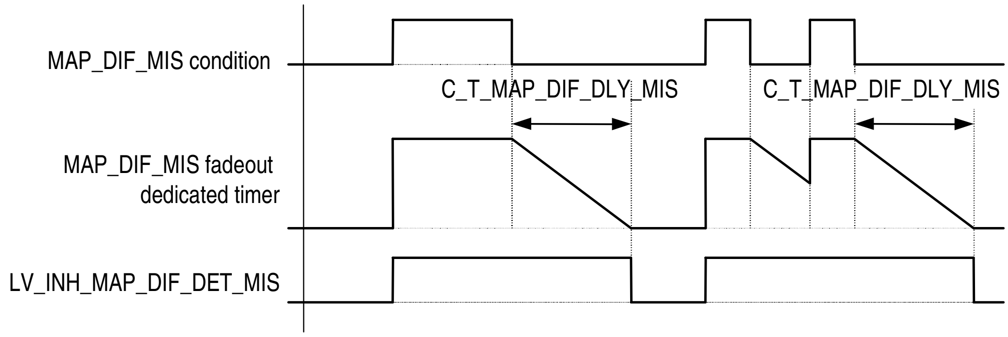
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at LC_MIS_INH 0 to 1 transition*
LV_INH_MAP_DIF_DET_MIS = 1

Formula section:

MAP_DIF_MIS = | MAP$_{(n)}$ - MAP$_{(n-2)}$ |
If LV_S_ACT = 0
And MAP_DIF_MIS $>$ IP_MAP_DIF_MAX_MIS(MAP)
Then
After condition rising edge triggering, LV_INH_MAP_DIF_DET_MIS flag is set to 1 as long as condition is true.
After condition falling edge triggering, LV_INH_MAP_DIF_DET_MIS flag is hold to 1 for a period of C_T_MAP_DIF_DLY_MIS.
EndIf

Fade out behaviour summary:



B.108.2.4 Maximum throttle gradient

Due to trailing throttle /acceleration transient problems at low load, it is necessary to disable misfire detection for a short period when the throttle gradient exceeds an applicable value.

Application conditions:

Misfire detection can be disabled when the amount of the throttle gradient exceeds the applicable value hereunder mentioned. But during the 0-delay activation of the misfire monitoring, driver-induced fade-out is allowed:

Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at LC_MIS_INH 0 to 1 transition*
LV_INH_TPS_GRD_DET_MIS = 1

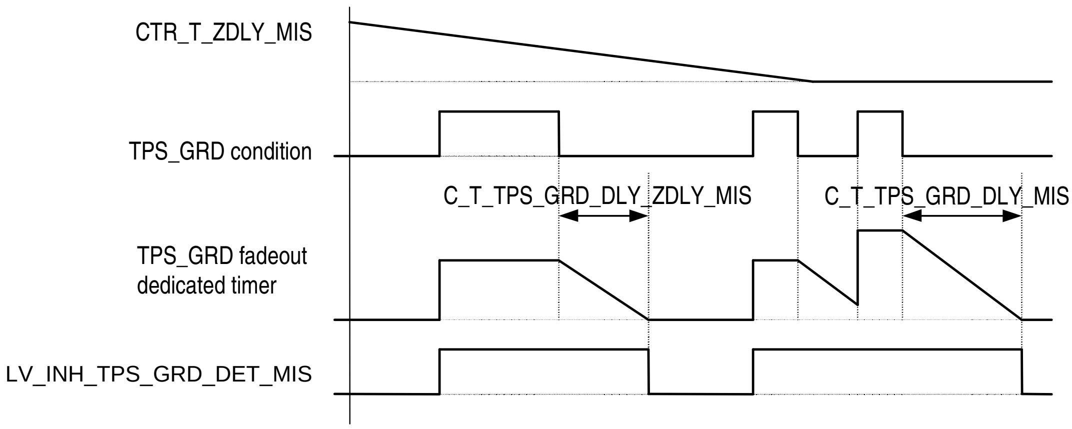
Formula section:

If(1) CTR_T_ZDLY_MIS = 0
Then(1)
If(2) TPS_GRD $>$ IP_TPS_GRD_MAX_MIS(TPS_AV)
Then(2)
After condition rising edge triggering, LV_INH_TPS_GRD_DET_MIS flag is set to 1 as long as condition is true.
After condition falling edge triggering, LV_INH_TPS_GRD_DET_MIS flag is hold to 1 for a period of C_T_TPS_GRD_DLY_MIS.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

EndIf(2)
Else(1)
If(2) TPS_GRD > IP_TPS_GRD_ZDLY_MIS(TPS_AV)
Then(2)
After condition rising edge triggering, LV_INH_TPS_GRD_DET_MIS flag is set to 1 as long as condition is true.
After condition falling edge triggering, LV_INH_TPS_GRD_DET_MIS flag is hold to 1 for a period of C_T_TPS_GRD_DLY_ZDLY_MIS.
EndIf(2)
EndIf(1)

Fade out behaviour summary:



B.108.2.5 Maximum engine load gradient

Due to trailing throttle /acceleration transient problems at low load, it could be necessary to disable misfire detection for a short period when the engine load exceeds an applicable value.

Application conditions:

Misfire detection can be disabled when the amount of engine load gradient exceeds a calibration value, this value is switched according combustion mode. Fade out delay is also specific to combustion mode.

Initialisation: *at ECU reset, at Engine Stop **Or** at LC_MIS_INH 0 to 1 transition*
LV_INH_LOAD_GRD_DET_MIS = 1

Formula section:

If(1) LV_S_ACT = 0
Then(1)
If(2) LOAD_GRD_MIS > IP_LOAD_GRD_MIS(LOAD_MIS)
Then(2)
After condition rising edge triggering, LV_INH_LOAD_GRD_DET_MIS flag is set to 1 as long as condition is true.
After condition falling edge triggering, LV_INH_LOAD_GRD_DET_MIS flag is hold to 1 for a period of C_T_LOAD_GRD_HOM_DLY_MIS.
EndIf(2)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

EndIf(1)
#If NC_CMB_CONF = AFS_S Or AFS_AFL_S

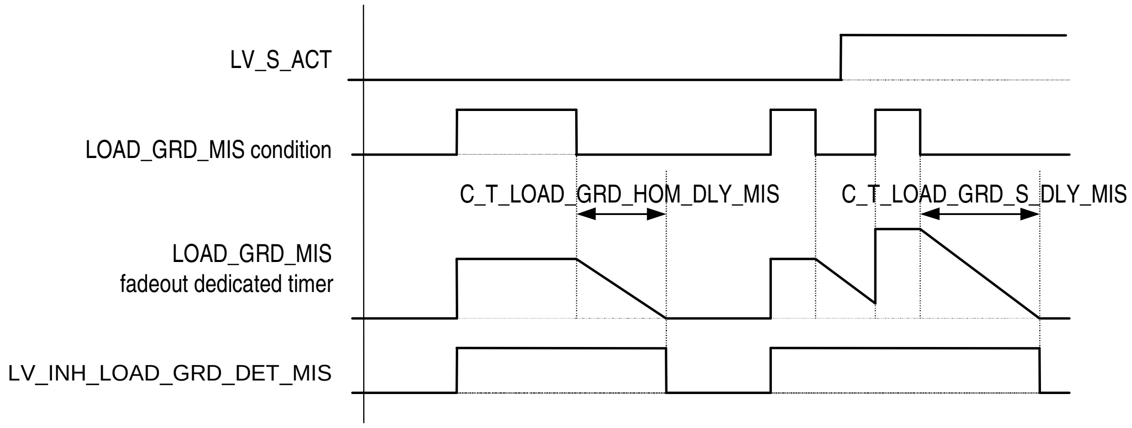
Then(1)
If(2) LOAD_GRD_MIS > IP_LOAD_GRD_S_MIS(LOAD_MIS)
Then(2)
After condition rising edge triggering, LV_INH_LOAD_GRD_DET_MIS flag is set to 1 as long as condition is true.
After condition falling edge triggering, LV_INH_LOAD_GRD_DET_MIS flag is hold to 1 for a period of C_T_LOAD_GRD_S_DLY_MIS.
EndIf(2)
EndIf(1)
#EndIf

Fade out behaviour summary:



B.108.2.6 Ignition retardation without change limitation

Various functions or CAN requests (e.g.. gear-shift signal. torque reduction. etc...) cause an ignition - timing retardation, without change limitation. Misfire detection can be disabled when the amount of the ignition timing retardation is too important.
Several criterion are available to disable the misfire monitoring according the ignition angle behaviour. Two relative criterions dedicated to focus on IGA transients, one in idle speed and one in part load, plus one absolute criterion dedicated to focus on too important IGA values compared to the
Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at LC_MIS_INH 0 to 1 transition*
LV_INH_IGA_DIF_DET_MIS = 1

Formula section:

For each TDC, the following stacks are serviced after having calculated IGA_AV_x.
IGA_DIF_MIS = | IGA_MIS_2 - IGA_MIS |
IGA_BAS_DIF_MIS = IGA_BAS_COR_MV - IGA_MIS
IGA_MIS_2 = IGA_MIS_1
IGA_MIS_1 = IGA_MIS
IGA_MIS = IGA_AV[SEG_NR]

B.108.2.7 Combustion mode transients

Application conditions:

While the combustion manager is in transient state, the misfire detection can be disabled to have a proper base for evaluation of the ER-misfire detection thresholds, which are defined for the stationary modes (AFS, AFL & S). See definiton in Application Incidences file. (LV_INH_CMB_TRA_MIS = 1).

B.108.2.8 Air - conditioning compressor activation

When the air - conditioning compressor is switched on, an additional load is briefly applied to the engine.
This load jump can cause a segment period jump and crankshaft vibration, depending on the engine operating state and load request.

Application conditions:

Misfire detection can be suppressed for the applicable constant period C_T_ACCOUT_DLY_MIS, starting if the air - conditioning compressor is switched on or off (LV_ACCOUT_RLY changes from 0 to 1 or from 1 to 0), during this period LV_INH_ACC_DET_MIS is set to 1.

Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at LC_MIS_INH 0 to 1 transition*
LV_INH_ACC_DET_MIS = 1

Formula section:

If LV_ACCOUT_RLY = 0 -> 1
Or LV_ACCOUT_RLY = 1 -> 0
Then LV_INH_ACC_DET_MIS is set to 1 during C_T_ACCOUT_DLY_MIS
EndIf

B.108.2.9 Rough road detection

Application conditions:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Misfire detection can be suppressed when the status of the *rough road detection* is active (LV_STATE_RR = 1).

B.108.2.10 Crankshaft oscillation detection

Application conditions:

Misfire detection can be suppressed when the status of the *crankshaft oscillation detection* is active (LV_STATE_CRK_OSC = 1).

B.108.2.11 Low fuel level

Application conditions:

Misfire detection can be suppressed when the low fuel level is detected (LV_INH_FTL_L_DET_MIS=1).

B.108.2.12 OBDI diagnosis fade-out

Application conditions:

LV_INH_OBD_DET_MIS combines all OBD project specific error bits to generate an input for the generic misfire detection fade-out conditions. *See definition in Misfire detection - Application Incidences file.* Misfiring detection can be suppressed if LV_INH_OBD_DET_MIS = 1

B.108.2.13 Application incidences fade-out

Application conditions:

LV_INH_APP_DET_MIS combines all project specific special conditions to generate an input for the generic misfire detection fade-out conditions. *See definition in Misfire detection - Application Incidences file*. Misfiring detection can be suppressed if LV_INH_APP_DET_MIS = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation of CARB-required 0-delay monitoring					

General information

This chapter is relative to misfire detection fade out management as defined by legal texts linked to functionnal OBD diagnosis (OBDII, EOBD...).
Continuous misfire monitoring from engine starting instant:

- ***Engine start instant*** *: the point when the engine reaches a speed 150 rpm below the normal, warmed-up idle speed (as determined in the drive position for vehicles equipped with an automatic transmission) (CARB definition).*
- *One engine cycle (2 crankshaft revolutions) is allowed to initialise misfire detection process (see CTR_TDC_ZDLY_MIS using).*

Fade out conditions may disable misfire monitoring with the following conditions:

- **Minimum engine speed** : N_IS_SP - 150 rpm *(US)*
- **Maximum engine speed** : Redline engine speed *(US)* or -00 rpm *(EC)*
- **Minimum engine load** :

Zero load line (engine positive torque line)

A line joining the point (3000 rpm, zero load) and a point (6000 rpm, 135 hPa *(or 4 inches Hg)* above the zero load line)

- **Minimum coolant or ambiant temperature**

Below 20°F (US) or -7°C (EC) *(equivalent),*

Or If Engine start coolant temperature is below 20°F, until current temperature reaches warm up engine temperature 70°F.

- **Minimum atmospheric pressure**

Elevations above 8000 feet above sea level (US) or 2 500 meters (EC)

- **Time after start**

A 5s time after start fade-out can be allowed for EC market

Such kind of fade out is prohibited for US market (see CARB requirement for zero delay misfire monitoring activation)

- **Cylinder shut-off**

During fuel cut-off phase, on a specific cylinder shut-off or the number of cylinder in shut-off is too important, misfire diagnosis may be fade out *(no injection/combustion occurs)*

B.109.1 Misfire detection fade out management

FUNCTION DESCRIPTION:

CARB requests an activation of the misfire monitoring and diagnosis as off engine start. Particular fade-out conditions are required during the first 5 seconds since engine running. In this section the flag representing the request is defined, and is used in several other modules that are concerned with this requirement *(LC_REQ_ZDLY_MIS = 1).*
For non-CARB applications, this special monitoring is not required and has to be de-activated *(LC_ REQ_ZDLY_MIS = 0).*
A state-based approach is taken for the activation of the misfire detection algorithms, distinguishing the separate monitoring during the first 5 seconds and the ’nominal’ monitoring afterwards, and preparatory phases. During the monitoring phases, the normal fade-out mechanisms are used, corrected for some fade-outs that are not allowed during the first 5 seconds.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Application conditions:

Activation:
Engine Start LV_RUN_ENG = 1
Deactivation:
Engine Stop LV_RUN_ENG = 0 **Or** ECU reset
Remark: At deactivation, ALL internal and external variables related to the legal fade out misfire detection conditions must be reset to 0.

In nominal mode (after engine start and zero delay period), the state machine executes no operations.

Formula section:

At engine start-up (LV_RUN_ENG switches from 0 to 1) the system starts in STATE_DIAG_MIS = 0 (initialisation phase).
In the case of a CARB-application, special monitoring takes placed during C_T_ZDLY_MIS seconds. The timer is started at detection of engine running:

If LC_REQ_ZDLY_MIS = 1
And STATE_DIAG_MIS = 0
Then CTR_T_ZDLY_MIS = C_T_ZDLY_MIS
EndIf

Transition initialisation state to preparation states for 0-delay OR to nominal monitoring

If LC_REQ_ZDLY_MIS = 1
And STATE_DIAG_MIS = 0
And N > C_N_MIN_ZDLY_MIS
Then ***Zero-Delay Activation of Misfire Detection***
STATE_DIAG_MIS = 1
CTR_TDC_ZDLY_MIS = C_NR_TDC_ZDLY_MIS
ElseIf LC_REQ_ZDLY_MIS = 0
And STATE_DIAG_MIS = 0
And N > C_N_MIN_ZDLY_MIS
Then ***Standard Activation of Misfire Detection***
STATE_DIAG_MIS = 3
CTR_TDC_ZDLY_MIS = C_NR_TDC_ZDLY_MIS
Else ***Initialisation Phase***
LV_DIAG_MIS = 0
LV_ZDLY_DIAG_MIS = 0
EndIf

Transition back to the initialisation phase

If LV_ES = 1
And STATE_DIAG_MIS <> 0
Then ***In case of engine stop, return to initialisation phase***
STATE_DIAG_MIS = 0
EndIf

Transition preparation state 0-delay monitoring to 0-delay monitoring state

If LC_REQ_ZDLY_MIS = 1 CARB application
And STATE_DIAG_MIS = 1 0-delay preparation state
And N > C_N_MIN_ZDLY_MIS engine speed over threshold
And CTR_TDC_ZDLY_MIS = 0 1 engine cycle passed
Then STATE_DIAG_MIS = 2
LV_ZDLY_DIAG_MIS = 1
EndIf

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Transition preparation nominal state to nominal monitoring state

If LC_REQ_ZDLY_MIS = 0 standard application
And STATE_DIAG_MIS = 3 preparation monitoring state
And N > C_N_MIN_ZDLY_MIS engine speed over threshold
And CTR_TDC_ZDLY_MIS = 0 1 engine cycle passed
Then STATE_DIAG_MIS = 4
LV_DIAG_MIS = 1
EndIf

Transition 0-delay monitoring state to nominal monitoring state

If LC_REQ_ZDLY_MIS = 1 *CARB application*
And STATE_DIAG_MIS = 2 *0-delay monitoring state*
And N > C_N_MIN_ZDLY_MIS *engine speed over threshold*
And CTR_TDC_ZDLY_MIS = 0 *1 engine cycle passed*
And CTR_T_ZDLY_MIS = 0 *timer finished (typically 5 seconds)*
Then STATE_DIAG_MIS = 4
LV_DIAG_MIS = 1
LV_ZDLY_DIAG_MIS = 0
EndIf

The counter CTR_T_ZDLY_MIS is decremented at every time instance of 10 ms when STATE_DIAG_MIS != 0.
The counter CTR_TDC_ZDLY_MIS is decremented with 1 at every TDC.
(both counters are saturated to 0)
Rermark: During the 0-delay misfire detection, no fade-outs are allowed for crankshaft oscillation, rough road detection and zero-load line conditions (see appropriate sections). However, it is allowed to have so-called driver-induced fade-outs (e.g. gradient on pedal value). This latter section has been added.

At hot resets, the system starts again in the initialisation phase.

B.109.2 Misfire detection legal fade out conditions

FUNCTION DESCRIPTION:

General information:

Legal fade out (LV_REQ_INH_MIS) is based on all fade out conditions allowed by the legal texts for continuous misfire monitoring.
All these different fade-out conditions are merge into a global carrier (MIS_DET_CDN_INH).
Timers used for fade-out conditions delays are free running timers who are not deactivated according following conditions.

Application conditions: *(global to Misfire detection legal fade out conditions chapter)*
Initialisation: at Reset, Engine Stop, **Or** on Deactivation event
LV_PUC_DET_MIS = 0
LV_IV_OFF_DET_MIS = 1
LV_REQ_INH_MIS = 1
MIS_DET_CDN_INH = 127
MIS_DET_CDN_INH_NR = 7
Recurrence: every segment task
Activation: *LC_MIS_INH = 0*
Deactivation: *LC_MIS_INH = 1*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

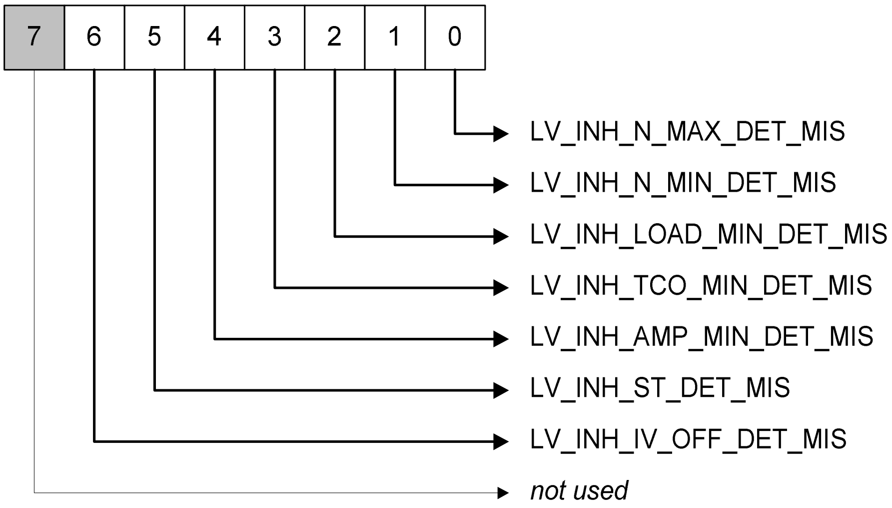
Copyright (C) Continental AG,2007

B.109.2.1 Fade out carrier definition

Misfire fade out conditions carrier:

MIS_DET_CDN_INH

Carrier used for fade-out conditions merge
(legal fade-out overview)



B.109.2.2 Configurable Fade-out Management

Application conditions:

Fade out management during zero delay phase & nominal phase can be configurated via 2 bitfield masks that allow to take in account or not some conditions in a phase and not in the other.
If the corresponding bit in the MIS_DET_CDN_INH carrier structure is set to 0 in C_MASK_INH_DET_ZDLY_MIS or C_MASK_INH_DET_MIS calibration, then the corresponding condition will not fade-out misfire detection.
For the definition of C_MASK_INH_DET_ZDLY_MIS & C_MASK_INH_DET_MIS masks please refer to the legal requirements & customer recommendations.

Formula section:

If CTR_T_ZDLY_MIS ? 0
Then
MIS_DET_CDN_INH_NR = sum(MIS_DET_CDN_INH & C_MASK_INH_DET_ZDLY_MIS)
(bitfield operations)
Else
MIS_DET_CDN_INH_NR = sum(MIS_DET_CDN_INH & C_MASK_INH_DET_MIS)
(bitfield operations)
EndIf
If MIS_DET_CDN_INH_NR 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Or LV_REQ_APP_INH_MIS = 1 *// Fade out request linked to misfire detection method*
Then LV_REQ_INH_MIS = 1 *// General fade out request*
Else LV_REQ_INH_MIS = 0
EndIf

B.109.2.3 Maximum engine speed fade-out

Application conditions:

The misfire monitoring can be inhibated when the engine speed reachs the maximum engine speed imposed by the market target : Redline engine speed for US applications or -00 rpm for EC applications. Moreover this information is use to stop misfire monitoring process for high speed if not required (limitation of cpu load especially for european application).

Formula section:

If (LV_AT = 1 **And** N > C_N_MAX_MIS_AT)
Or (LV_AT = 0 **And** N > C_N_MAX_MIS_MT)
Then LV_INH_N_MAX_DET_MIS = 1
Else LV_INH_N_MAX_DET_MIS = 0
EndIf

B.109.2.4 Minimum engine speed fade-out

The irregular engine operation test is performed as soon as the above-mentioned condition is disabled.

Important:

- C_N_MIN_MIS is defined by the current configuration of the index used for misfire detection in the current application. C_N_MIN_MIS should be lower than C_N_MIN_ZDLY_MIS.
- C_N_MIN_ZDLY_MIS is defined as the engine speed set-point for a warm engine minus 150 rpm. After passing below the C_N_MIN_ZDLY_MIS threshold, one is allowed one engine cycle (meaning for example for a 4-cylinder engine 4 tdc's) before reactivating the output of the misfire detection algorithm. Misfire detection is suppressed for a period of C_NR_TDC_INH_MIS tdc's.
- It should be checked in each application that within the allowed number of TDC's proper misfire detection index values have been re-obtained. Typically, it should be possible to restart misfire detection earlier.

Application conditions:

N < C_N_MIN_ZDLY_MIS

Engine speed below CARB requirements *(used for US applications)*.

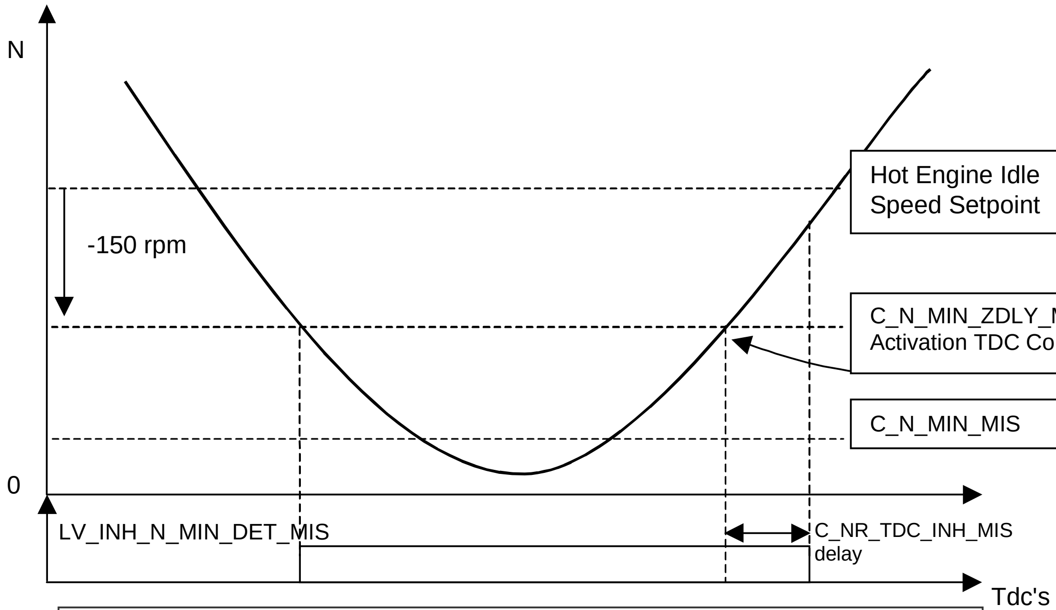
Typically, once N < C_N_MIN_ZDLY_MIS, the output of the misfire detection is inhibited, allthough the calculation is still valid. C_NR_TDC_ZDLY_MIS tdc's decounter is started at passing engine speed C_N_MIN_ZDLY_MIS again. Once the decounter is at 0, misfire detection index output is allowed.

N < C_N_MIN_MIS

Engine speed below misfire detection index resolution *(used for CE applications)*. If the engine speed falls below C_N_MIN_MIS.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007



Explanation on the mechanism to re-activate the misfire detection after an engine speed drop

As the misfiring test is not mandatory and risky over a certain engine speed threshold, a fade out condition is tested on engine rpm (not allowed for US market).
Activation: *LV_INH_N_MAX_DET_MIS = 0*
Deactivation: *LV_INH_N_MAX_DET_MIS = 1*
Action on deactivation event: *LV_INH_N_MIN_DET_MIS = 1*

Formula section:

If N < C_N_MIN_ZDLY_MIS
Or N < C_N_MIN_MIS
Then LV_INH_N_MIN_DET_MIS = 1
Else LV_INH_N_MIN_DET_MIS = 0
caution : see specific reactivation conditions above when N > C_N_MIN_ZDLY_MIS, C_NR_TDC_INH_MIS delay used
EndIf

B.109.2.5 Minimum engine load

Application conditions:

Below a specific load (zero load), fluctuations in engine speed cannot be detected, even in the event of misfire. In this case, the misfire detection is disabled.
Activation: *LV_INH_N_MAX_DET_MIS = 0*
Deactivation: *LV_INH_N_MAX_DET_MIS = 1*
Action on deactivation event: *LV_INH_LOAD_MIN_DET_MIS = 1*

Formula section:

If LOAD_MIS < LOAD_MIN_MIS
Then LV_INH_LOAD_MIN_DET_MIS = 1
Else LV_INH_LOAD_MIN_DET_MIS = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

EndIf

B.109.2.6 Minimum coolant temperature

Application conditions:

Misfire detection can be disabled when the coolant temperature is below a threshold (20°F /-7°C). Additionally when the coolant temperature at engine start is below this threshold, the misfire monitoring can be disable on that driving cycle until the current engine temperature reaches a warm up temperature threshold (70°F /21°C):
Activation: *LV_INH_N_MAX_DET_MIS = 0*
Deactivation: *LV_INH_N_MAX_DET_MIS = 1*
Action on deactivation event: *LV_INH_TCO_MIN_DET_MIS = 1*

Formula section:

LV_TEMP : temporary bit used to check only one occurence per engine start
Initialisation : *LV_TEMP = 0 at ECU reset* ***Or*** *LV_DC 0 -> 1*
If TCO < C_TCO_MIN_MIS
Or (TCO_ST < C_TCO_MIN_MIS
And TCO < C_TCO_WUP_MIN_MIS
And *LV_TEMP = 0*)
Then LV_INH_TCO_MIN_DET_MIS = 1
Else LV_INH_TCO_MIN_DET_MIS = 0
LV_TEMP = 1
EndIf

B.109.2.7 Minimum atmospheric pressure

Application conditions:

Misfire detection can be disabled when the atmospheric pressure is below a threshold:
Activation: *LV_INH_N_MAX_DET_MIS = 0*
Deactivation: *LV_INH_N_MAX_DET_MIS = 1*
Action on deactivation event: *LV_INH_AMP_MIN_DET_MIS = 1*

Formula section:

If AMP < C_AMP_MIN_MIS
Then LV_INH_AMP_MIN_DET_MIS = 1
Else LV_INH_AMP_MIN_DET_MIS = 0
EndIf

B.109.2.8 After start

Application conditions

Activation: `LV_INH_N_MAX_DET_MIS = 0`

Deactivation: `LV_INH_N_MAX_DET_MIS = 1`

Action on deactivation event: `LV_INH_ST_DET_MIS = 1`

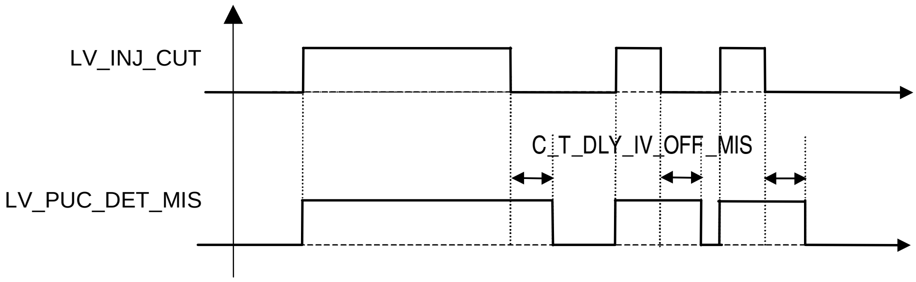
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Misfire detection can be suppressed (see legal requirements - forbidden for CARB zero delay requirements) for a C_T_DLY_ST_MIS duration after the engine exits the operating state start (LV_ST), during this period LV_INH_ST_DET_MIS is set to 1, even if C_T_DLY_ST_MIS = 0.

B.109.2.9 Injection shut-off

Application conditions:

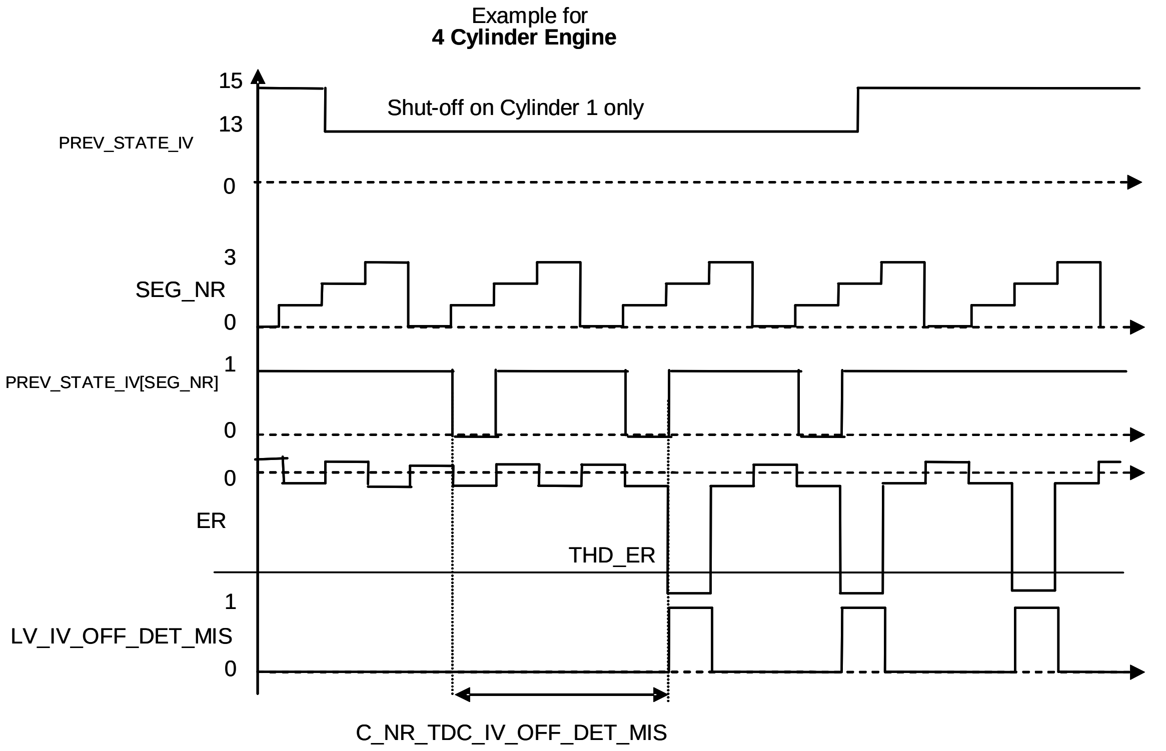
Misfire detection can be suppressed for the cylinder(s), for which injection has been shut-off.
General fuel shut-off:
LV_INJ_CUT indicates a general fuel shut-off. LV_PUC_DET_MIS bit includes a calibration delay time (C_T_DLY_IV_OFF_MIS) triggered at fuel cut-off condition falling edge, in a way to start the misfire detection only after crankshaft oscillations due to fuel reactivation.



Cylinder specific shut-off:
If the current cylinder checked by misfire detection is shut-off by any EMS function even MISF limp home functionnality), a fade-out can be apply for the misfire detection of this cylinder.
Due to the delay between the misfire index and the injection current informations, a calibration delay (C_NR_TDC_IV_OFF_DET_MIS) has been introduced on LV_IV_OFF_DET_MIS.
This delay synchronises MISF & INJR informations in a way to apply correctly the fade-out on the proper cylinder during individual cylinder shut-off operations, and to be able the perform the misfire monitoring on the other cylinders who are not in shut-off mode.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007



Limit number of cylinders shut-off:

If the number of shut-off cylinders reaches a calibration data (C_SUM_INH_IV_MAX_DET_MIS), reliable misfire detection is impossible. In such case is preferable to inhibate misfire detection.

Formula section:

General fuel shut-off:

If LV_INJ_CUT = 1 *// All cylinders are shut off*
Then LV_PUC_DET_MIS = 1
Else LV_PUC_DET_MIS = 0 after C_T_DLY_IV_OFF_MIS delay time
EndIf

Cylinder fuel shut-off:

If PREV_STATE_IV[(SEG_NR+C_SEG_NR_OFS_PREV_STATE_IV)%NC_CYL_NR] = 0 *// indexed by cylinder bit position*
Then LV_IV_OFF_DET_MIS = 1 after a C_NR_TDC_IV_OFF_DET_MIS delay
Else LV_IV_OFF_DET_MIS = 0 after a C_NR_TDC_IV_OFF_DET_MIS delay
EndIf

Activation: *LV_INH_N_MAX_DET_MIS = 0*
Deactivation: *LV_INH_N_MAX_DET_MIS = 1*
Action on deactivation event: *LV_INH_IV_OFF_DET_MIS = 1*

Formula section:

General definition:

If LV_PUC_DET_MIS = 1

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

The misfire rate determination and misfire specific error management are applied to the following CARB misfire legal definitions:

Copyright (C) Continental AG,2007

- **CARB A misfire failure criterion** *(LV_MIS_STATE_A)*:

Risk of catalyst damage, monitoring interval over 200 crankshaft revolutions (= 200 * NC_CYL_NR /2 TDCs) during the driving cycle.

- **CARB B1 misfire failure criterion** *(LV_MIS_STATE_B1):*

Emission increase, monitoring interval over the first 1000 crankshaft revolutions (= 1000 * NC_CYL_NR /2 TDCs) of the driving cycle.

- **CARB B4 misfire failure criterion** *(LV_MIS_STATE_B4):*

Emission increase, monitoring interval over 1000 crankshaft revolutions (= 1000 * NC_CYL_NR /2 TDCs). For criterion confirmation, misfire must be take place for 4 monitoring intervals (consecutive or not).

MIS_A, MIS_B1 & MIS_B4 Handling Flowchart diagram:

B.110.1 Combination of different diagnosis reliability levels (misfire detection, ignition, injection)

FUNCTION DESCRIPTION:

General information:

Due to their physical principle, the individual diagnostic functions have a different diagnostic relevance depending on the operating point.
To achieve the best possible detection of misfires, the individual diagnostic methods are combined. Here with an assumed misfire of a part function, an operating point dependent weighting factor, which reflects the reliability of this part function in the current operating point, is taken from a map. If the sum of these three values now exceeds a threshold for one combustion, then misfire is detected.
The value which is not debounced is used as input value of the IV and IGCFB diagnoses. The injection for a cylinder is cut off exclusively by the CARB error mechanism and not by the IV and IGCFB diagnostic functions.

Application conditions:

Misfire segment after detection, before CARB diagnosis

Application conditions

Update rate: `every segment`

Activation:
LC_MIS_INH = 0
Deactivation:
LC_MIS_INH = 1
Initialisation on ECU reset, on LV_DC 0 to 1 transition and on LC_MIS_INH 0 to 1 transition:
SUM_FAC_DIAG_MIS = 0
FAC_IGC_DIAG_MIS = 0
FAC_IV_DIAG_MIS = 0
LV_DET_CFM_MIS = 0

Formula section:

The output from the misfire detection, injection and ignition diagnosis functions is influenced by weighting interpolated table, giving the reliability of the individual functions.
- A weighting value of **0** means that detection is not possible for this engine operating point.
- A value equal to or greater than **1** indicates reliable detection.
- The values in between represent the corresponding levels of reliability.

- Irregular engine operation weighting (LV_DET_MIS = 1):
If misfiring is suspected by the irregular engine operation test, a weighting factor for the corresponding engine operating point is applied. This factor is derived from tables according combustion mode and determine in application incidence. The corresponding result is in FAC_ER_DIAG_MIS data.

- Ignition diagnosis weighting (IGC_DIAG_MIS):
IGC_DIAG_MIS is the not debounced carrier from Ignition diagnosis, which has to be delayed due to misfire detection *(according segment reference SEG_NR_ER-1, cylinder x compression phase)*. If misfiring is suspected by the ignition diagnosis function, a weighting factor for the corresponding engine operating point is applied.
This factor is derived from IP_FAC_IGC_DIAG_MIS table.
For the time the number of cylinders shut off due to misfire detection limp home reaches or exceeds the applicable number of C_MIS_NR_OFF_IV_IGCFB, FAC_IGC_DIAG factor is forced to 1 *(test based on INH_IV_MIS carrier)*.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

If(1) IGC_DIAG_MIS[SEG_NR_ER] = 1
And LV_INH_IGC_DIAG_MIS = 0
Then(1)
If(2) number of bits set to "1" in INH_IV_MIS carrier structure >= C_MIS_NR_OFF_IV_IGCFB

Then(2) FAC_IGC_DIAG_MIS = 1
Else(2) FAC_IGC_DIAG_MIS = IP_FAC_IGC_DIAG_MIS(N_32, LOAD_MIS)
EndIf(2)
Else(1) FAC_IGC_DIAG_MIS = 0
EndIf(1)

- Injection diagnosis weighting (STATE_DIAG_IV) :

STATE_DIAG_IV is a not debounced carrier from Injection valves diagnosis.
Injection valve in default is identifed according segment reference SEG_NR_ER within the bitfield structure STATE_DIAG_IV.
If misfiring is suspected by the injection valve diagnosis function, a weighting factor for the corresponding engine combustion mode is applied.

If STATE_DIAG_IV[SEG_NR_ER] = 1
And LV_INH_IV_DIAG_MIS = 0
Then FAC_IV_DIAG_MIS = IP_FAC_IV_DIAG_MIS(N_32, LOAD_MIS)
Else FAC_IV_DIAG_MIS = 0
EndIf

- Formation of a cylinder - specific diagnosis weighting sum :

The sum of the three weighting values SUM_FAC_DIAG_MIS is performed for the individual cylinder. as soon as one of the three diagnosis function suspects misfiring.

SUM_FAC_DIAG_MIS = FAC_ER_DIAG_MIS
+ FAC_IGC_DIAG_MIS
+ FAC_IV_DIAG_FAC

If SUM_FAC_DIAG_MIS >= 1
Then LV_DET_CFM_MIS = 1 *misfire status is confirmed*
Else LV_DET_CFM_MIS = 0 *no misfire*
EndIf

B.110.2 Misfire detection counters (ISO 15031 Data)

FUNCTION DESCRIPTION:

General information:

These counters are incremented at each misfire detection based on misfire index evaluation *(after crossed diagnosis with IGC & IV OBDI diags evaluation)*. Thus, it s possible to determine the total number of misfire detected during engine lifetime and during current driving cycle.
Moreover, cylinder misfire counters have been introduced for Mode 6 communication service, as described in last ISO specification available (ISO/DIS 15031-5.8).
The calculation of CTR_MIS_DC_MMV_CYL (resolution=1) is rounded to 1 and that leads to a loss of information, since only when CTR_MIS_DC_CYL reaches 10 the MMV value will count up one time.
To avoid this, the calculation must be done, like the described in the CARB requirement, with a intermediate variable with higher resolution to keep the information.
Note: CTR_MIS_TOT_DC & CTR_MIS_DC_CYL[NC_CYL_NR] are initialised only at engine running to keep the information after engine stop.

B.110.2.1 NVMY Data Formating

On non volatile memory formatting or on NV memory corruption detection:
CTR_MIS_TOT_NVMY = 0
CTR_MIS_TOT_DC = 0
For(1) x = 0 : NC_CYL_NR-1
CTR_MIS_DC_CYL[x] = 0
CTR_MIS_DC_MMV_CYL_IT[x] = 0
CTR_MIS_DC_MMV_CYL[x] = CTR_MIS_DC_MMV_CYL_IT[x]
EndFor(1)

B.110.2.2 Initialisation of former /current driving cycle counters

Initialisations:

- NVMY data loading loading at NVMY_READ event
  Read all the counters from NVMY
  Write NVMY high resolution counter to non-NVMY low resolution counter
  For(1) x = 0 : NC_CYL_NR-1
  // round-off to nearest integer (ceil or floor the value to integer value)
  CTR_MIS_DC_MMV_CYL[x] = CTR_MIS_DC_MMV_CYL_IT[x]
  EndFor(1)
- NVMY data store at NVMY_STO event
  Store all the counters to NVMY
- at LV_DC 0 -> 1 transition event
  CTR_MIS_TOT_DC = 0
  For(1) x = 0 : NC_CYL_NR-1
  CTR_MIS_DC_CYL[x] = 0
  EndFor(1)

B.110.2.3 Increment of misfire counters during current driving cycle

Application conditions

Activation: *LV_ENA_ER = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_ER = 0*
Or *LC_MIS_INH = 1*

Update rate: Segment task

Formula section:

If LV_DET_CFM_MIS = 1
Then CTR_MIS_TOT_DC = CTR_MIS_TOT_DC + 1 *// with saturation*
CTR_MIS_TOT_NVMY = CTR_MIS_TOT_NVMY + 1 *// with saturation*
CTR_MIS_DC_CYL[SEG_NR_ER] = CTR_MIS_DC_CYL[SEG_NR_ER] + 1
// with saturation
EndIf

B.110.2.4 Update of the EWMA misfire counters

Exponential weighted moving average (EWMA) misfire counters are updated at the beginning of the driving cycle based on former driving cycle values.

Update rate: at LV_DC 0 -> 1 transition event*before CTR_MIS_DC_CYL[x] reset (section "Initializations" above)*

For x = 0 : NC_CYL_NR-1
CTR_MIS_DC_MMV_CYL_IT[x] =
0.9 * CTR_MIS_DC_MMV_CYL_IT[x]+ 0.1 * CTR_MIS_DC_CYL[x]
//Write high resolution counter to low resolution counter
// round-off to nearest integer (ceil or floor the value to integer value)
CTR_MIS_DC_MMV_CYL[x] = CTR_MIS_DC_MMV_CYL_IT[x]
EndFor

B.110.3 Exhaust cylinder bank reference for misfire detection

FUNCTION DESCRIPTION:

For catalyst damage and/or emission criterion, misfire diagnosis functions can be set via calibration data in a way to be able to detect criterions according exhaust cylinder bank phasing instead of a global criterion detection.
Exhaust cylinder bank reference for misfire detection allows to increase these criterions on the dedicated cylinder bank weighting factor if the misfire detected has effect on the impacted cylinder bank and not on the other (if multiple exhaust cylinder bank design).

Description:

The exhaust cylinder bank reference SEG_NR_CBK_ER is determinate according the segment reference SEG_NR_ER. It already includes the delay introduced by the misfire index chosen.

Application conditions

Update rate: *Segment task*

Activation: LV_SYN_ENG = 1

Deactivation: LV_SYN_ENG = 0

Initialisation on Deactivation condition:
SEG_NR_CBK_ER = 0
Initialisation: at ECU reset, at DCON, at LC_MIS_INH 0->1, clearing failure memory
SEG_NR_CBK_ER = 0

Formula section:

SEG_NR_CBK_ER = NC_CBK_EX_NR_MISF[SEG_NR_ER]

B.110.4 Determination of CARB A misfire criterion, causing catalyst damage

Description:

With a CARB A misfire rate criterion, the emissions are increased and there is a risk of catalyst damage if the cylinder causing the failure criterion can not be shut off.
Detection:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

The check for misfire rate violation **CARB A** comprises 200 crankshaft revolutions *(100 * NC_CYL_NR tdc's)* for statistic misfiring and cyclewise monitoring for best possible catalyst protection.
If a confirmed misfiring is detected on ER current TDC (LV_DET_CFM_MIS=1), a weighting factor (MIS_A_FAC) is added to the cylinder-specific counter MIS_CTR_A[SEG_NR_ER], extracted from an interpolated table *(see APP. INC.)* who depends on engine combustion mode and current operating point. The increment represents the severity of catalyst damage.
Statistic:
The monitoring for Misfire **CARB A** is performed continuously in intervals of 200 crankshaft revolutions.
Monitoring during CARB A window:
Toguaranteebest possible catalyst protection, the cylinder-specific counters are monitored each cycle. For that purpose, MIS_CTR_A[SEG_NR_ER] is compared to the applicable value C_MIS_A_IND_THD representing the critical threshold for single cylinder misfiring.
If the threshold is reached outside of the FTP cycle, the concerning cylinder is shut off immediately. CARB A misfire criterion is confirmed, else the criterion will be evaluated at the end of the 200 crankshaft revolution window.
Monitoring at the end of 200 crankshaft revolutions:
At the end of each monitoring interval the cylinder-specific sums MIS_CTR_A[NC_CYL_NR] and the global sum (MIS_SUM_A) are available.
If the sum MIS_SUM_A is greater than the threshold C_MIS_SUM_A_THD, the cylinder with the highest misfire rate is determined (by comparing the different MIS_CTR_A[NC_CYL_NR] values).
Then operation inside/outside of the FTP-area is checked by comparison of the counter CTR_FTP_CDN_MIS_A /MIS_NR_TDC_A with the threshold C_RATIO_FTP_CDN_MIS_A. If the FTP tdc's ratio is lower than the threshold, not enough operating points have been inside the FTP-window and therefore operation outside FTP-area is detected (LV_FTP_MIS_A=0). This is done in order to fulfil the CARB-regulations, which require MIL-illumination at first threshold exceeding outside the FTP-area and at third exceeding inside the FTP-area.
Therefore the counter CTR_DET_MIS_A is incremented inside the FTP-area at each threshold exceeding. That means it reaches the maximum of C_NR_DET_MAX_MIS_A = 3 only if the threshold is exceeded in 3 succeeding monitoring intervals.
Outside the FTP-area the failure CARB A is validated immediately. The counter is reset only after an ECU-reset.
Even if we are inside the FTP-area, a specific application request (according catalyst temperature or else) LV_REQ_APP_CTR_MIS_A can force to validate immediately the failure CARB A *(see legal requirements & customer wishes).* This request is defined in associated Application Incidences file.
Note: cylinder and Exhaut cylinder bank specific counters are respectively indexed with SEG_NR_ER and SEG_NR_CBK_ER phase reference counters to take in account ERND delay in misfire monitoring process

Application conditions

Initialisation: *at ECU reset, at LV_DC 0 - > 1 transition, at LC_MIS_INH 0 to 1 transition & at MIS_A or MIS_[NC_CYL_NR] errors clearing*

```
SYM_CYL_MIS_A    = 0
INH_IV_MIS     = 0
MIS_NR_TDC_A    = 0
MIS_SUM_A     = 0
CTR_FTP_CDN_MIS_A  = 0
CTR_DET_MIS_A    = 0
CTR_CHK_MIS_A    = 0
LV_END_WIN_MIS_A = 0
 LV_END_MIS_A    = 0
 LV_FTP_MIS_A    = 0
LV_MIS_STATE_A    = 0
LV_INH_IV_MIS_A   = 0

```
 LV_ERR_IN_WIN_MIS_A     = 0
For x = 0 :  NC_CYL_NR-1
 MIS_CTR_A[x] = 0   // All cylinder specific counters
 CTR_MIS_A_LIH_CYL[x] = 0 // All cylinder specific counters
EndFor
For i = 0 :  NC_CBK_EX_NR-1
 MIS_SUM_A_CBK[i] = 0 // All Exhaut cylinder bank specific
counters
EndFor
```

Update rate: *segment task*

Activation:
LV_DC = 1
And LC_MIS_INH = 0
Deactivation:
LV_DC = 0
Or LC_MIS_INH = 1

B.110.4.1 Determination of catalyst damage weighting factor

Catalyst damage weighting factor is determinated according engine combustion mode & buffered to take in account admission phase (SEG_NR_ER - 2).
MIS_A_FAC_BUF is managed as a rotary buffer, MIS_A_FAC_BUF[0] is the weighting factor for the actual segment value.
At each ER segment recurrence:
FAC_MIS_A_APP depends on the combustion mode and determine in application incidence (must be calculated first)
MIS_A_FAC_BUF is managed as a rotary buffer

MIS_A_FAC_BUF[current_position] = FAC_MIS_A_APP
MIS_A_FAC = MIS_A_FAC_BUF [oldest_position] *// points on the oldest value of the buffer*

B.110.4.2 CARB A window management (main process)

```

B.110.4.10 Conditions for Cylinder switch back on

Update rate: *every 100ms, independently of MIS_A window process & conditions*
Cylinder(s) x can be switched on according two different methods:

1. Cylinder(s) x can be switched back on at the end of the driving cycle

   LC_CONF_INH_IV_MIS = 0

1. Cylinder(s) x can be switched back on after a defined number of fuel cut-off phases **and** at the end of the driving cycle

   LC_CONF_INH_IV_MIS = 1

   For this purpose, the system performs a test for the applicable number C_MIS_MIN_NR_PUC of trailing throttle fuel cut-off LV_PUC cycles, since the last cylinder(s) shutoff.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Therefore, the trailing throttle fuel cut-off LV_PUC flag must have been active for the applicable minimum period C_T_MIS_MIN_PUC.

If the condition concerning the minimum number of trailing throttle fuel cut-off events is met. Cylinder shut-off is cancelled at the end of the last trailing throttle fuel cut-off phase only for cylinders who answer to the conditions CTR_MIS_A_LIH_CYL[x] < C_NR_MAX_MIS_A_LIH_CYL *(check for all cylinders),* all other cylinders stay in fuel cut-off up to end of the driving cycle.

Cylinder shut-off is also cancelled after engine stopped LV_ES.

B.110.4.11 Process on cylinder shut-off cancellation

Update rate: every TDC, independently of MIS_A window process & conditions

If Any 1 -> 0 cylinder bit(s) transition within INH_IV_MIS
And LC_CONF_MIS_A_LIH = 1
Then Corresponding bit(s) within SYM_CYL_MIS_A is set to 0
If LC_CONF_MPL_DET_MIS_A = 1
And Number of remaining cylinder bit(s) set to 1 in SYM_CYL_MIS_A is less than C_NR_CYL_MPL_MIS_A cylinders
Then Set MPL bit *(multiple)* to 0 in SYM_CYL_MIS_A carrier
EndIf
If No more cylinder bit(s) or RNDbit are set to 1 whitin SYM_CYL_MIS_A structure

Else LV_INH_IV_MIS_A = 0
EndIf

B.110.5 Determination of CARB B1 & B4 misfire criterions, causing increased emissions

Description:

The purpose is to detect a misfire rate causing an emission increase. The failure criterion entry is performed by direct statistical evaluation.

Detection:

The check for misfire rate violation CARB comprises 1.000 crankshaft revolutions (500*NC_CYL_NR tdc's).

Each combustion during these 1.000 crankshaft revolutions is monitored for misfiring.

If a confirmed misfiring is detected on ER current TDC (LV_DET_CFM_MIS=1), the cylinder-specific misfire counter MIS_CTR_B[SEG_NR_ER] is incremented by one.

In every driving cycle a distinction is made between misfires detected during the first 1000 crankshaft revs after engine start (**CARB B1**) and misfires detected in later observing intervals. In the second case, a misfire rate violation must take place during four monitoring intervals to recognise misfire (**CARB B4**).

Statistic:

At the end of the first 1.000 crankshaft revolutions, the added cylinder-specific sums are evaluated. If the sum exceeds the applicable value C_THD_MIS_B1_AT/MT, **CARB B1** misfire criterion is detected.

At the end of each following 1.000 crankshaft revolutions interval, the added cylinder-specific sums are evaluated. If the sum exceeds the applicable value C_THD_MIS_B1_AT/MT the anti-bounce counter

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

CTR_DET_MIS_B4 will be incremented till its maximum C_NR_DET_MAX_MIS_B4 (typical = 3) is reached. If the sum does not exceed C_THD_MIS_B1_AT/MT, CTR_DET_MIS_B4 remains unchanged.
To filter out those cylinders with low misfire rates, the cylinder-specific counters MIS_CTR_B[NC_CYL_NR] shall be compared to the applicable value C_THD_MIS_B_MIN before storage takes place.
If none of the cylinder-specific counters is higher than C_THD_MIS_B_MIN, a maximum choice is done and the cylinder with the highest misfire rate is entered into failure memory.

Application conditions

Initialisation: *at ECU reset, at LV_DC 0 -> 1 transition, at LC_MIS_INH 0 to 1 transition & at MIS_B1/ B4 or MIS_[NC_CYL_NR] errors clearing*

```
LV_MIS_STATE_B1    = 0

B.111.1 Application Incidences data for diagnosis

Description:

LV_REQ_APP_CTR_MIS_A is used for Misfire A calculation considering the load for the catalyst due to exhaust temperature.

Application conditions

Initialisation: *0 at reset*

Recurrence: ENRD segment synchronous,
After misfire detection, Before misfire diagnosis

Activation: *LC_MIS_INH = 0* ***and*** *LV_DC = 1*

Deactivation: *LC_MIS_INH = 1* ***or*** *LV_DC = 0*

Formula section:

LV_INH_IV_DIAG_MIS = LV_INH_DET_MIS
LV_INH_IGC_DIAG_MIS = LV_INH_DET_MIS
Calculation of LV_REQ_APP_CTR_MIS_A
If TEG_CAT_UP_MDL_MAX > C_TEG_CAT_UP_MIS_A_MAX
Then LV_REQ_APP_CTR_MIS_A = 1
Else LV_REQ_APP_CTR_MIS_A = 0
EndIf
Request to evaluate CARB A criterion with project specific calibration set
LV_MIS_A_DIAG_REQ_APP = 0
FAC_MIS_A_THD_IND_APP = 0
FAC_MIS_SUM_A_THD_APP = 0

Request to evaluate CARB B1 & B4 criterions with project specific calibration set
LV_MIS_B_DIAG_REQ_APP = 0
FAC_MIS_SUM_B1_THD_APP = 0
FAC_MIS_SUM_B4_THD_APP = 0

B.111.2 Combustion mode influence on the catalyst damage weigthing factor

At each ER segment recurrence:
FAC_MIS_A_APP must be calculated before "Determination of catalyst damage weighting factor" in the generic specification named **Misfire rate and error management**

Convention for combustion mode determination:
#If **NC_CMB_CONF = AFS_AFL Or AFS_AFL_S**
If OPM_AV = 3 (homogeneous-stratified)
Then xx = "HOM_S"
EndIf
#EndIf

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

#If **NC_CMB_CONF = AFS_S Or AFS_AFL_S**
If OPM_AV = 1 (stratified)
Then xx = "S"
EndIf
#EndIf
If OPM_AV <> 1 and OPM_AV <> 3 (homogeneous)
Then xx = "AFS"
EndIf

FAC_MIS_A_APP= IP_MIS_A_FAC_xx(N, LOAD_MIS)

B.111.3 Combustion mode gestion for combination of different diagnosis reliability level

FUNCTION DESCRIPTION:

General information:

FAC_ER_DIAG_MIS must be calculated before the determination of SUM_FAC_DIAG_MIS (in the generic specification named Misfire rate determination and error mamagement)

Application conditions:

Misfire segment after detection, before CARB diagnosis
Update rate: every segment
Activation:
LC_MIS_INH = 0
Deactivation:
LC_MIS_INH = 1

Formula section:

Initialisation on ECU reset, on LV_DC 0 to 1 transition and on LC_MIS_INH 0 to 1 transition:
FAC_ER_DIAG_MIS = 0
Irregular engine operation weighting (LV_DET_MIS = 1):
If misfiring is suspected by the irregular engine operation test, a weighting factor for the corresponding engine operating point is applied. This factor is derived from tables according combustion mode.

Convention for combustion mode determination:
#If **NC_CMB_CONF = AFS_AFL Or AFS_AFL_S**
If OPM_AV = 3 (homogeneous-stratified)
Then xx = "HOM_S"
EndIf
#EndIf
#If **NC_CMB_CONF = AFS_S Or AFS_AFL_S**
If OPM_AV = 1 (stratified)
Then xx = "S"
EndIf
#EndIf
If OPM_AV <> 1 and OPM_AV <> 3 (homogeneous)
Then xx = "AFS"

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

EndIf

If LV_DET_MIS = 1
Then FAC_ER_DIAG_MIS = IP_FAC_ER_xx_DIAG_MIS(N_32, LOAD_MIS)
Else FAC_ER_DIAG_MIS = 0
EndIf

B.111.4 Determination of CARB misfire criterion monitoring conditions (ER algorithm integration, NC_MISF_VERS = 1)

Description:

Depending on customers & legal requirements reached, two Tdc's counting modes are available :

- counting each Tdc's even if some aren't diagnosed *(LC_CTR_CONF_DIAG_MIS* = *0)*
- counting only diagnosed Tdc's *(LC_CTR_CONF_DIAG_MIS* = *1)*

LV_DC	LC_CTR_CONF_DIAG_MIS	LV_INH_DET_MIS	LC_CTR_CONF_OSC_MIS	LV_STATE_CRK_OSC	LV_CDN_MIS_A LV_CDN_MIS_B1 LV_CDN_MIS_B4	MIS_A, MIS_B1 & MIS_B4 Monitoring Modes
0	x	x	x	x	0	Out of Driving Cycle
1	0	x	x	x	1	All TDC's Counting Mode
1	1	1	x	x	0	Diagnosed TDC's Counting Mode / Classical Fade Out
1	1	0	0	0	1	Diagnosed TDC's Counting Mode / No Fade Out
1	1	0	0	1	0	Classical Fade Out **with** CRK_OSC / Diagnosed TDC's Counting Mode
1	1	0	1	0	1	Diagnosed TDC's Counting Mode / No Fade Out
1	1	0	1	1	1	Classical Fade Out **without** CRK_OSC / Diagnosed TDC's Counting Mode

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. EndIf(1)

B.111.5 Specific cylinder misfire errors

FUNCTION DESCRIPTION:

General information:

There is one LV_ERR_MIS[x] for each cyllinder (x = 0, 1, 2, 3, 4, 5), thus a seperate calibration of P-codes for each symptom is possible.

Description:

If Misfire criterion is detected on one cylinder with at least one of the CARB_A, CARB_B1 or CARB4 default criterions, the corresponding cylinder error is set (error is set directly without debounce). The symptom is always corresponding to the last error occurence, and the error is reseted only when all misfire criterions on this cylinder have disappeared.
Error-symptoms are defined to this diagnosis function as following :

```
[ | | | ]
 | | | └> - Cylinder in misfire, Criterion default : MIS_A     (= SYM_0)
 | | └───> - Cylinder in misfire, Criterion default : MIS_B1    (= SYM_1)
 | └─────> - Cylinder in misfire, Criterion default : MIS_B4    (= SYM_2)
 └───────> -                                                   (= SYM_3)
```

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation: at ECU reset **or** LV_DC 0 -> 1 **or** LC_MIS_INH 0 -> 1 for all cylinders

LV_CDN_DIAG_MIS[x] = 0
LV_END_DIAG_MIS[x] = 0
LV_ERR_MIS[x] = 0
ERR_SYM_MIS[x] = 0

Recurrence: The application recurrence is **ENRD segment**
After misfire detection, after misfire diagnosis !

Activation:

If(1) LV_DC = 1
And LC_MIS_INH = 0
And **(** LV_CDN_MIS_A = 1
Or LV_CDN_MIS_B4 = 1
Or LV_CDN_MIS_B1 = 1 **)**
Then(1) **For**(2)x = 0 ... NC_CYL_NR-1

B.111.8 Misfire event counters

Description:

The counters should be used for reading out diagnosis data in the workshop. All Data are stored in NVMY. The DC - related counters (CTR_SEG_MIS_ACT and CTR_MIS_DET) are initialized if engine is started or if NVMY is cleared.

Application conditions

Initialisation:	CTR_SEG_MIS_ACT and CTR_MIS_DET are initialized from MVMY and set to 0 at LV_RUN_ENG 0->1 **or** at clearing misfire NVMY variables. CTR_MIS_DET_CYL[i] are initialized from MVMY and only set to 0 at clearing misfire NVMY variables	
Recurrence:	*ER segment task, after ER determination process & Misfire detection*	
Activation:	*LV_REQ_INH_MIS = 0*	*increment counters*
Deactivation:	*LV_REQ_INH_MIS = 1*	*counters are unchanged*

Formula section:

Calculation of CTR_SEG_MIS_ACT
CTR_SEG_MIS_ACT n = CTR_SEG_MIS_ACT n-1 +1
//counting every segment if MSF detetion is active

Calculation of CTR_MIS_DET
If LV_DET_MIS = 1
Then CTR_MIS_DET n = CTR_MIS_DET n-1 +1
CTR_MIS_DET_CYL[SEG_NR_ER] n =
CTR_MIS_DET_CYL[SEG_NR_ER] n-1 +1

Endif
Remark for all counters:
If the counters reaches the end of Hex-limit, then the inrementing process is stopped and value remain on max value.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.112 Misfire detection

Data definition:

B.112.1 Global fade out switch for misfire detection and monitoring

Description:

There is one global switch which can be used for inhibiting all the MISF aggregate modules:

- Generic misfire parameters & fade-out conditions : Aggr MISF, chapter OBDII
- Legal misfire detection fade-out conditions : Aggr MISF, chapter OBDII
- Rough road detection : Aggr MISF, chapter OBDII
- Crankshaft oscillation detection : Aggr MISF, chapter OBDII
- Misfire detection : Aggr MISF, chapter OBDII
- Appl. Inc. for misfire detection : Aggr MISF, chapter OBDII
- Misfire rate and criterions determination : Aggr MISF, chapter OBDII
- Appl. Inc. for Misfire rate and criterions determination : Aggr MISF, chapter OBDII

B.112.2 Misfire detection thresholds determination for engine roughness index

Function description:

ER strategy misfire detection is based on a comparison between a cylinder specific ER value (nominal or normalised) and a threshold who is relative to the engine parameters when this same cylinder was in intake phase (threshold relative to combustion conditions image).
The engine roughness value ER depends strongly on the current operating point, both in its spread during undisturbed engine operation, and in the signal amplitude in case of an actual misfire.
ER misfire detection thresholds are defined according basic threshold maps and threshold corrections:

- *A basic threshold map:*

This map is function of engine load and speed which are calibrated for engine at operating temperature as well as for adapted transmitter gear. One map is assigned through the vehicle transmission type, idle speed condition & the combustion mode.

- *A threshold temperature correction:*

A temperature correction is applied to compensate larger signal amplitudes arise of ER values at lower engine temperatures. This correction is relative to TCO value.

- *A threshold correction during active injection valve cut-off:*

If one or several injection valves are cut off selectively by the engine management system (IV diagnoses ...), then the cylinder or cylinders are excluded from the misfire check. Due to the system, the signal amplitude of the ER value is reduced with a misfire at another cylinder. To improve the detection for this period, the absolute amount of the threshold can be reduced multiplicatively with the factor IP_

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FAC_THD_IV_ER(N_32) or IP_FAC_THD_IV_S_ER(N_32) *(in stratifed mode)*. *FAC_THD_IV_ER is a temporary data.*

- *A threshold correction defined in application incidences:*

FAC_THD_APP_ER is a threshold multiplicative correction who is defined in the misfire detection application incidences file.

B.112.2.1 Multiplicative correction for misfire thresholds

Application conditions

Initialisation: FAC_THD_IV_ER = 1

Recurrence: *every ENRD segment task*

Activation: *LV_ENA_SEG_T_MES = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_SEG_T_MES = 0*
Or *LC_MIS_INH = 1*

Formula section:

#IF NC_CMB_CONF = AFS_S Or AFS_AFL_S
If INH_INJ = 0
Then FAC_THD_IV_ER = 1
ElseIf LV_S_ACT = 1
Then FAC_THD_IV_ER = IP_FAC_THD_IV_S_ER(N_32)
Else FAC_THD_IV_ER = IP_FAC_THD_IV_ER(N_32)
EndIf
#ELSE
If INH_INJ = 0
Then FAC_THD_IV_ER = 1
Else FAC_THD_IV_ER = IP_FAC_THD_IV_ER(N_32)
EndIf
#ENDIF
FAC_THD_ER = IP_FAC_THD_TCO_ER(TCO) * FAC_THD_IV_ER * FAC_THD_APP_ER

B.112.2.2 Misfire detection threshold buffers management

To manage the delay between cylinder intake phase and cylinder ER values, buffers are used to store threshold values before using for detection.
THD_ER_BUF[NC_SIZE_THD_ER_BUF] buffer is managed as a FIFO stack.
THD_ER_BUF[0] threshold value is the one obtained at current segment.
THD_ER is threshold value delayed and who will be used for detection with current segment ER value. This delay between ER value and cylinder corresponding threshold depends on engine cylinder number (NC_CYL_NR).

B.112.2.3 Misfire detection threshold based on engine roughness value (THD_ER)

By using the ER value for misfire detection, the engine speed has the greatest influence on basic thresholds definition. On the other hand, by using the ER_STND values for misfire detection, the engine load has the greatest influence on basic thresholds definition.
The influence of the engine load on the detection thresholds can change rapidly during instationary operation, it is urgently necessary to determine and to temporarily store the threshold values already at the time of the actual combustion before the calculatory check.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

note: at each ER segment occurence, THD_ER_BUF is shifted with one memory unit (FIFO management) before determination process.

Application conditions

Initialisation:

```
at ECU reset Or  engine stop
 THD_ER = -32768
//  ER Threshold buffer init on ER buffer reinitialisation
For  k = 0 :  NC_SIZE_THD_ER_BUF-1
THD_ER_BUF[k] = -32768 // For all buffer cells
 EndFor
For  x = 0 :  NC_CYL_NR-1
 THD_ER_CYL[x] = -32768 // For all cylinders
 EndFor
```

Recurrence: *every ENRD segment task*

Activation: *LV_ENA_SEG_T_MES = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_SEG_T_MES = 0*
Or *LC_MIS_INH = 1*

Actions on Deactivation event:

THD_ER = -32768
// ER Threshold buffer init on ER buffer reinitialisation
For k = 0 : NC_SIZE_THD_ER_BUF-1
THD_ER_BUF[k] = -32768 *// For all buffer cells*
EndFor
For x = 0 : NC_CYL_NR-1
THD_ER_CYL[x] = -32768 *// For all cylinders*
EndFor

Formula section:

THD_ER_BUF[0] = THD_ER_CLC * FAC_THD_ER
THD_ER = THD_ER_BUF[NC_SIZE_THD_ER_BUF-1] *// Last cell of THD_ER buffer*
THD_ER_CYL[SEG_NR_ER] = THD_ER

B.112.3 Misfire detection based on engine roughness evaluation

General information:

The system identifies misfiring by monitoring engine roughness index. Misfiring causes the angular velocity of the crankshaft to drop in an angular range specific to the cylinder in question.
Misfire detection is based on nominal engine roughness (ER) by using THD_ER detection threshold.
The identification of the cylinder(s) detected in misfire is realised according SEG_NR_ER segment reference (see definition and scheme in ENRD aggregate) *(Chapter system variables)*.
THD_ER is already phased according ER delay *(see detection thresholds management)*.

Application conditions

Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at Deactivation Event*
LV_DET_MIS = 0
LV_DET_THD_MIS = 0
LV_INH_DET_MIS = 1
MIS_STATE_ER = 0
MIS_DET_CYL_INH = $2^{NC\_CYL\_NR} - 1$

Recurrence: *every segment task*

Activation: *LV_ENA_ER = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_ER = 0*
Or *LC_MIS_INH = 1*

Update rate:

ENRD segment task

B.113.1 Global fade out condition (N_32 threshold)

FUNCTION DESCRIPTION:

General information:

There is one global condition N_32 > C_N_THD_MIS_INH which can be used for inhibition (deactivation) of the following modules:

- Appl. Inc. for engine roughness calc. : chapter System variables
- Engine roughness calculation : chapter System variables
- Appl. Inc. for misfire detection : chapter OBDII
- Misfire detection : chapter OBDII
- Misfire rate detection and error handling : chapter OBDII

Formula section:

If N_32 > C_N_THD_MIS_INH
Then Engine roughness/Misfire detection is inhibited
Else no inhibition due to this condition
Endif

B.113.2 Misfire detection threshold correction gain specific to application

Description:

To ensure misfire detection during active catalyst heating in IS (in homogenous mode only), the threshold is multiplied with a factor depending on the torque reserve at catalyst heating TQ_ADD_CH.

Application conditions

Initialization: all 1 at reset and at each activation and deactivation
Recurrency: segment

Activation: *LV_ENA_SEG_T_MES = 1* ***and*** *LC_MIS_INH = 0*

Deactivation: *LV_ENA_SEG_T_MES = 0* ***or*** *LC_MIS_INH = 1*

Formula section:

If LV_IS = 1 **and**
LV_S_ACT = 0
Then FAC_THD_APP_ER = IP_FAC_THD_ER_CH(TQ_ADD_CH)
Else FAC_THD_APP_ER = 1
EndIf

B.113.3 Misfire detection inhibition related to OBDI diagnosis

Description:

Misfire detection process is inhibited when one of the following OBD I errors occurs.
Depending on calibration, IVVT diagnosis is considered for inhibition or not.

Application conditions

Initialization: all 0 at reset and at each activation and deactivation
Recurrency: updated every segment before misfire detection function

Activation: *LV_ENA_ER = 1* ***and*** *LC_MIS_INH = 0*

Deactivation: *LV_ENA_ER = 0* ***or*** *LC_MIS_ INH = 1*

Formula section:

If LV_ERR_TPS = 1 *// throttle error*
OR **[** LV_ERR_IVVT = 1 **and** LC_USE_IVVT_INH_MIS = 1**]** *// VANOS error*
OR LV_ERR_SEG_AD_ER = 1 *// Segment adaptation error*
OR LV_ERR_CRK_PLAUS = 1

OR LV_ERR_CRK_SYN = 1
OR LV_ERR_CRK_TOOTH = 1
OR LV_ERR_CRK_TOOTH_PER = 1
OR LV_ERR_TPS_1 = 1
OR LV_ERR_TPS_2 =1
OR LV_ERR_TPS_AD = 1
OR LV_ERR_TPS_MAF_1 = 1
OR LV_ERR_TPS_MAF_2 = 1
OR LV_ERR_TPS_MON_1 = 1
OR LV_ERR_TPS_RATIO = 1
OR LV_ERR_TPS_ST_CHK_2 = 1
OR LV_ERR_T_SEG_ER = 1
OR LV_ERR_MTC_CTL_2 = 1
OR LV_ERR_MTC_CTL_3 = 1
OR LV_ERR_MTC_DR = 1
OR LV_ERR_TPS_AD_BOL = 1
Then LV_INH_OBD_DET_MIS = 1
Else LV_INH_OBD_DET_MIS = 0
EndIf

B.113.4 Misfire detection inhibition related to AMT gearshift intervention

FUNCTION DESCRIPTION:

General information:

LV_INH_APP_DET_MIS is used for project-specific inhibition of Misfire detection, e.g.:

- AMT gearshift intervention

Description:

When AMT gearshift intervention is detected (LV_GS = 1) misfire detection can be suppresed because this load jump can cause a segment period jump and crankshaft vibration, depending on the engine operating state and load request.

If AMT gearshift intervention has been detected (LV_GS changes from 1 to 0 or 0 to 1), Misfire detection can be suppressed for the applicable constant period C_T_AMT_GS_DLY_MIS starting at transition LV_GS 1->0.

Application conditions

Initialization:	all 0 at reset and at each activation and deactivation
Recurrence:	*updated every segment before misfire detection function*
Activation:	*LV_ENA_ER = 1* **and** *LC_MIS_INH = 0*
Deactivation:	*LV_ENA_ER = 0* **or** *LC_MIS_ INH = 1*

Formula section:

Cylinder fuel shut-off:

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

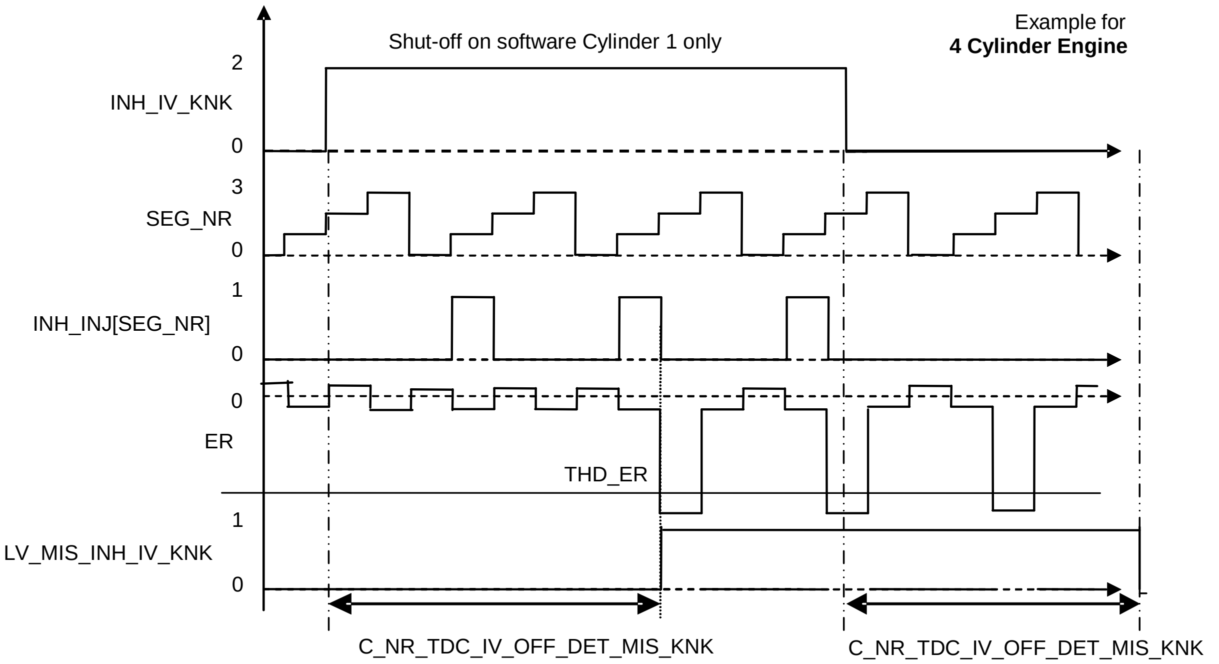
// Initial appliation value for C_NR_TDC_IV_OFF_DET_MIS_KNK, should be taken from C_NR_TDC_IV_OFF_DET_MIS + *NC_CYL_NR-2*
There is a delay of 2 segments for calculation of INH_IV_KNK, hence delay of NC_CYL_NR-2 segments to shut off the injector. Injection switch off only in the next segment calculation.
Further there is a delay of C_NR_TDC_IV_OFF_DET_MIS TDC,s for ER calculation. Hence total delay is C_NR_TDC_IV_OFF_DET_MIS + *NC_CYL_NR-2*



B.113.5 Rough road detection fade out condition

Description:

Rough road detection is inhibited if no VS signal is available (LV_ERR_VS = 1).

Application conditions

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Initialisation: *all 0 at reset and at each activation and deactivation*

Recurrence: *same as rough road detection update rate*

Activation: *LC_MIS_INH = 0*

Deactivation: *LC_MIS_ INH = 1*

Formula section:

If LV_ERR_VS = 1
Then LV_INH_APP_RR = 1
Else LV_INH_APP_RR = 0
Endif

B.113.6 Misfire low fuel tank level informations

Description:

- Misfire detection can be supressed if low fuel is detected (LV_INH_FTL_L_DET_MIS).
- Low fuel signal can be used to calculate P-Code Misfire with low fuel P313.

Application conditions

Initialisation: *all 0 at reset and at each activation and deactivation*

Recurrence: *200ms //same as fuel tank level information*

Activation: *LC_MIS_INH = 0*

Deactivation: *LC_MIS_INH = 1*

Formula section:

Low fuel tank level information for misfire detection inhibition
If LV_FTL_OBD_INH_L = 1
And LC_FTL_L_DET_MIS = 1
Then LV_INH_FTL_L_DET_MIS = 1
Else LV_INH_FTL_L_DET_MIS = 0
EndIf

Low fuel tank level information for error management of symptom "misfire with low fuel tank level".
If LV_FTL_OBD_INH_L = 1
And LC_FTL_L_DIAG_MIS = 1
Then LV_FTL_L_DIAG_MIS = 1
Else LV_FTL_L_DIAG_MIS = 0
EndIf

B.113.7 Total counter misfire detection

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This counter is incremented at each misfire detection based on misfire index evaluation *(before crossed diagnosis with IGC & IV OBDI diags evaluation)*. Thus, it s possible to determine the total number of misfire detected during engine lifetime.

Application conditions

Initialisation: *restored from NVMY*

Recurrence: *updated every segment after LV_DET_MIS calculation*

Activation: *LC_MIS_INH = 0*

Deactivation: *LC_MIS_INH = 1*

Formula section:

On NV memory formatting or on NV memory corruption detection :
CTR_TOT_MIS = 0

Processing :
at each transition LV_DET_MIS 0 -> 1
CTR_TOT_MIS = CTR_TOT_MIS + 1

B.113.8 Crankshaft oscillation detection fade-out

FUNCTION DESCRIPTION:

Crankshaft oscillation detection process can be inhibited when one function and/or error requires an inhibition.
Note : This bit is necessary only if the crankshaft oscillation detection module is used in the project (NLC_USE_CRK_OSC_MIS = 1)

Application conditions

Initialisation: *all 0 at reset and at each activation and deactivation*

Recurrence: *Segment, before Crankshaft oscillation detection*

Activation: *LC_MIS_INH = 0*

Deactivation: *LC_MIS_ INH = 1*

Formula section:

If LV_ERR_VS = 1
Then LV_INH_CRK_OSC_DET = 1
Else LV_INH_CRK_OSC_DET = 0
EndIf

B.113.9 Mean value of the corrected basic ignition angles

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialisation: *IGA_BAS_COR_MV = 0 at reset*

Recurrence: *10 ms*

Activation: *LV_IGK = 1*

Formula section:

IGA_BAS_COR_MV = IGA_BAS_COR

B.113.10 Correction gain for engine load specific to application

Description:

Here can be defined a gain who can change the normalised engine load dedicated to misfire monitoring according specific load corrections.

This correction can be applied during torque reduction sequences specific to project.

Application conditions

Activation: *LV_ENA_SEG_T_MES = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_SEG_T_MES= 0*
Or *LC_MIS_INH = 1*

Initialisation: FAC_GAIN_LOAD_MIS = 1
Recurrency: –

B.113.11 Current Misfire Detection Threshold

General information:

THD_ER_CLC represents the current value used for determination of the misfire detection threshold. This data must be calculated before THD_ER calculation and after LOAD_MIS calculation.

Description:

Keyword configuration table:

NC_CMB_CONF	OPM_AV	xx
AFS	2	AFS
AFS_AFL	2	AFS
AFS_AFL	3	HOM_S
AFS_S	1	S
AFS_S	2	AFS
AFS_AFL_S	1	S
AFS_AFL_S	2	AFS
AFS_AFL_S	3	HOM_S

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Application conditions

Initialisation: at ECU reset **Or** engine stop
THD_ER_CLC = -32768
THD_ER_CLC_PREV = -32768
LV_ER_CLC_PREV_INI = 1

Recurrence: *every ENRD segment task*

Activation: *LV_ENA_SEG_T_MES = 1*
And *LC_MIS_INH = 0*

Deactivation: *LV_ENA_SEG_T_MES = 0*
Or *LC_MIS_INH = 1*

Actions on Deactivation event:
THD_ER_CLC = -32768
LV_ER_CLC_PREV_INI = 1

Formula section:

Convention for combustion mode determination:
#If **NC_CMB_CONF = AFS_AFL Or AFS_AFL_S**
If OPM_AV = 3 (homogeneous-stratified)
Then xx = "HOM_S"
EndIf
#EndIf
#If **NC_CMB_CONF = AFS_S Or AFS_AFL_S**
If OPM_AV = 1 (stratified)

Copyright (C) Continental AG,2007

Endif(2)
Endif(1)

Calculation of THD_ER_CLC:
If LV_IS = 1
Then THD_ER_CLC = IP_THD_xx_ER_IS_yy(N,LOAD_MIS)
Else THD_ER_CLC = IP_THD_xx_ER_yy(N,LOAD_MIS)
End
Initialisation of THD_ER_CLC_PREV:
If LV_ER_CLC_PREV_INI = 1
then THD_ER_CLC_PREV = THD_ER_CLC
LV_ER_CLC_PREV_INI = 0
endif
Positive gradient limitation of THD_ER_CLC:
If THD_ER_CLC - THD_ER_CLC_PREV > C_THD_ER_CLC_GRD
then THD_ER_CLC = THD_ER_CLC_PREV + C_THD_ER_CLC_GRD
else **if** THD_ER_CLC > THD_ER_CLC_PREV + C_THD_ER_CLC_GRD
then THD_ER_CLC = THD_ER_CLC_PREV + C_THD_ER_CLC_GRD
else THD_ER_CLC = THD_ER_CLC // no change!
endif
endif
Store previous value of THD_ER_CLC:
THD_ER_CLC_PREV = THD_ER_CLC

B.113.12 Zero Load Line for Misfire detection

FUNCTION DESCRIPTION:

The zero load line is a function of the engine speed and depends on the engine combustion mode (for GDI application), coolant temperature and atmospheric pressure.

Application conditions

Initialisation: Variable is initialised to 0 at reset, at engine stop **Or** at LC_MIS_INH 0 to 1 transition

Recurrence: every segment task

Activation: LV_ENA_SEG_T_MES = 1
And LC_MIS_INH = 0

Deactivation: LV_ENA_SEG_T_MES = 0
Or LC_MIS_INH = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Minimum engine load and zero load lines
Convention for combustion mode determination:
#If **NC_CMB_CONF = AFS_AFL Or AFS_AFL_S**
If OPM_AV = 3 (homogeneous-stratified)
Then xx = "HOM_S"
EndIf

#EndIf
#If NC_CMB_CONF = AFS_S Or AFS_AFL_S
If OPM_AV = 1 (stratified)
Then xx = "S"
EndIf
#EndIf

If OPM_AV <> 1 and OPM_AV <> 3 (homogeneous)
Then xx = "AFS"
EndIf

Then(1)
yy= AT
ElseIf(2) LV_VAR_TCT = 1
Then(2)
yy= TCT
Else(2)
yy= MT
Endif(2)
Endif(1)

LOAD_MIN_MIS = IP_LOAD_MIN_MIS_xx_yy(N, TCO)

B.113.13 Misfire Combustion mode transients informations

Application conditions:

While the combustion manager is in transient state, the misfire detection can be disabled to have a proper base for evaluation of the ER-misfire detection thresholds, which are defined for the stationary modes (AFS, AFL & S).
This function must be called before the generic specification named "Generic fade out conditions for misfire detection"

Initialisation: *at ECU reset, at Engine Stop* ***Or*** *at LC_MIS_INH 0 to 1 transition*
LV_INH_CMB_TRA_MIS = 1

Formula section:

#If NC_CMB_CONF = AFS_S Or AFS_AFL_S
If OPM_AV = x -> 1 (x is different of 1)
Then LV_INH_CMB_TRA_MIS is set to 1 during C_NR_TDC_CMB_TRA_S_MIS tdc's
EndIf
#EndIf

#If NC_CMB_CONF = AFS_AFL Or AFS_AFL_S

Fields information (For more information refers to Error Management file “Table of Failure”) :

- ABC Type : STD_INI, STD, MEM, MEM_INI, DEC_CAL, STC, NO, MPL_STD_INI
- CARB Class : MIS, FSD, CC, CAT, HC, EVAP, SA, AC, LS, LSH, EGR, OTHER, NO.

The above imported action is defined in the VHMD - IRS (Infrastructure Requirement Specification)

FUNCTION DESCRIPTION:

General information:

Rough road conditions must be detected to prevent erroneous misfire detection because of the influence jolty tracks have on the crankshaft as a result of transmission via the drive train. The speed disturbance of one wheel can be used to calculate the road conditions. Therefore, the control unit uses the signal from the driven wheel on the right side (ABS sensor or an additive sensor for the version without ABS) because the probability of the presence of a jolty track is greater than left.
However, transmission from the left to the right side has also been observed depending on the chassis and other circumstances, so that a limited detection of unilateral rough-road conditions on the left side is also possible.
The minimum number of integrated teeth for one segment depends on the number of teeth per revolution of the wheel speed. An angle of about 30 ° is preferable (e.g. an integration of 4 teeth is used for a wheel with 48 teeth). This number is determined by the non calibrateable constant NC_SEG_TOOTH_RR.
At higher speed ranges the number of integrated teeth for one segment is determined by the recurrence time of 10 ms.

B.114.1 Rough road detection

Application conditions

Initialisation:
SUM_RR = 0 at ECU-reset
LV_RR_PREV_INI = 1 at ECU-reset and at function deactivation
all other outputs = 0 at ECU-reset and at function deactivation

Recurrence: *10 ms*

Activation:
LV_ERR_VS_PLAUS = 0 **and**
VS C_VS_MIN_RR **and**
VS $\leq$ C_VS_MAX_RR **and**
LV_ST_END = 1

Deactivation:
LV_ERR_VS_PLAUS = 1 **or**
VS $<$ C_VS_MIN_RR **or**
VS $>$ C_VS_MAX_RR **or**
LV_ST_END = 0

Remark: to avoid unnecessary burden of the micro controler it is recommended to calibrate C_VS_MAX_RR according the needs. At vehicle speeds above approximately 100 km/h there is no more feed back from wheels to crankshaft.

Formula section:

IF(1) LC_SWI_RR_CAN = 0
THEN(1)

ACTION_INFR_GetVsRrPulsStamp(VS_RR_EDGE_CTR_AV, VS_RR_EDGE_T_AV, VS_RR_EDGE_T_AV_MAX)

Initialisation of VS_RR_EDGE_T_AV/CTR(n-1) and new_rr_clc:
If LV_RR_PREV_INI = 1
then VS_RR_EDGE_T_AV(n-1) = VS_RR_EDGE_T_AV(n)
VS_RR_EDGE_CTR_AV(n-1) = VS_RR_EDGE_CTR_AV(n)
new_rr_clc = 2
LV_RR_PREV_INI = 0
endif

a) Segment period acquisition

The function uses consecutive segment times for calculation of a wheel speed gradient. The segments are built with a minimum number of NC_SEG_TOOTH_RR edges and afterwards normalized to a length of 8 teeth.

If VS_RR_EDGE_CTR_AV$_n$ - VS_RR_EDGE_CTR_AV$_{n-1}$ >= NC_SEG_TOOTH_RR

then

$$SEG\_T\_MES\_0\_RR = \left| \frac{(VS\_RR\_EDGE\_T\_AV_n - VS\_RR\_EDGE\_T\_AV_{n-1}) * 8}{VS\_RR\_EDGE\_CTR\_AV_n - VS\_RR\_EDGE\_CTR\_AV_{n-1}} \right|$$

SEG_T_MES_1_RR is the segment period preceding SEG_T_MES_0_RR.

endif

b) Calculation of rough road value

$$WHEEL\_GRD = \left| \frac{SEG\_T\_MES\_1\_RR - SEG\_T\_MES\_0\_RR}{SEG\_T\_MES\_1\_RR} \right| * 1000[‰]$$

The raw values WHEEL_GRD are used in a floating averaging, to restrict suppression to actual rough road conditions.

ELSE(1) *//calculation of rough road values with CAN signals in 20ms*
because WHEEL_CAN_XX_XX signals will be updated every 20ms
(that's the reason for the internal CTR_CALC)

CTR_CALC**++**

Copyright (C) Continental AG,2007

The start value of the timer DLY_ER_RR is C_DLY_ER_RR.
//LV_STATE_RR is calc. in 10ms so DLY_ER_RR must also calc. in 10ms

B.114.2 Wheel Gradient diagnosis for rough road detection

General information:

Wheel Gradient monitoring for rough road detection:
With the rough road detection function it is possible to calculate a wheel gradient which indicates rough road. If this gradient exceeds a THD, then rough road is detected and MISF monitoring is disabled. To confirm CARB requirements it is necessary to monitor the calculated wheel gradient value to avoid wrong MISF inhibition.

Application conditions:

Initialisation:	`all = 0, except RATIO_XX_XX = 1`
	`at RESET`
	`at LV_IGK = 0 -> 1`
	`at` *`CLRFMY`*
	`at function deactivation`	

Recurrence:	`100 ms`	
Activation:	`LV_IGK == 1`	**and**
	`LV_ERR_CAN_BOFF == 0`	**and**
	`LC_ENA_WHEEL_GRD_DIAG == 1`	
Deactivation:	`if activation condition not true`	

Function description:

Formula section:

General Information

This is evaluation of NOx sensor software version. In case of too less version, an error shall be generated.

Meaning of states:

PAS passive state, no actions are executed
REQ request for NOx sensor software version
CHK check of the NOx sensor software version and calculation of diagnosis values
END diagnosis finished

Application Conditions

Initialization: RST, CLRFMY, NVMINI, NVMRES, NVMSTO
Recurrence: 100MS
Activation: LV_DC==1
Deactivation: LV_DC==0

Function description

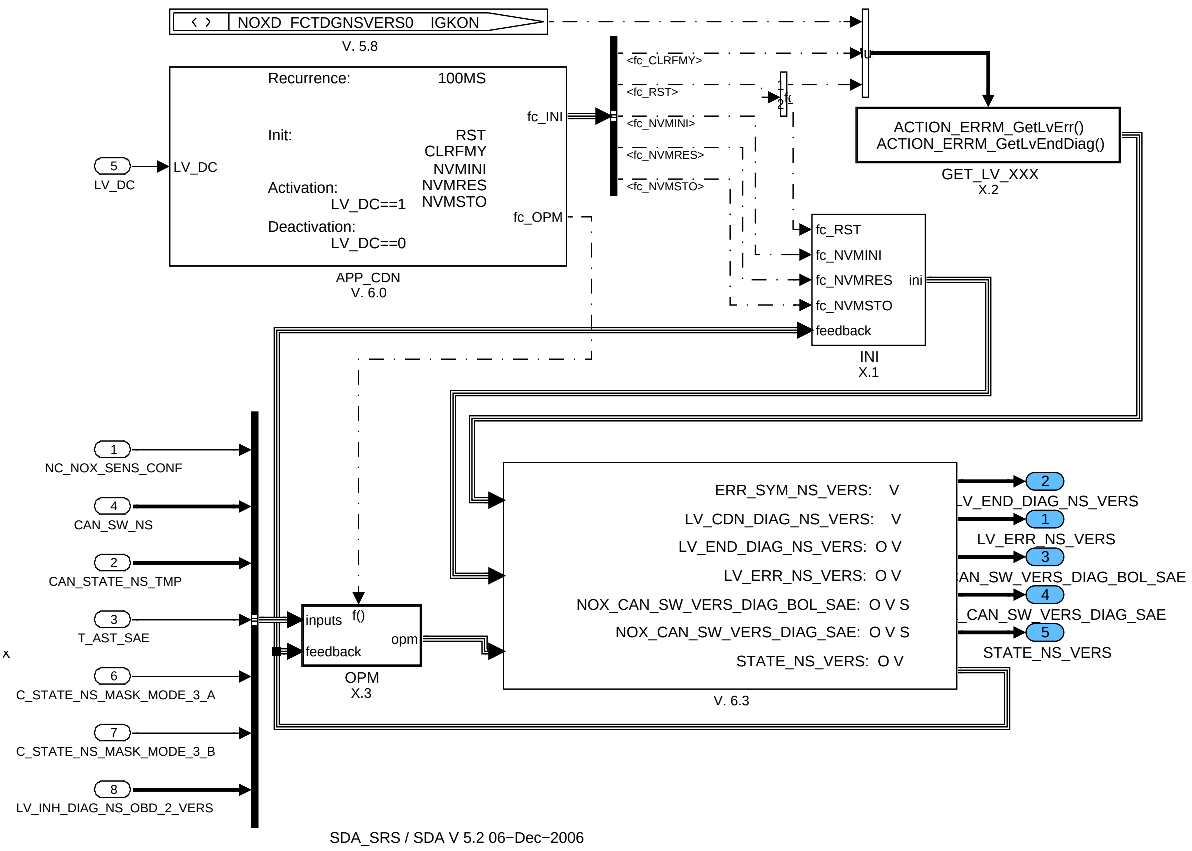

Figure B.115.1: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.115.1 Initialization and Management of nonvolatile memory

B.115.1.1 Initialization at Reset

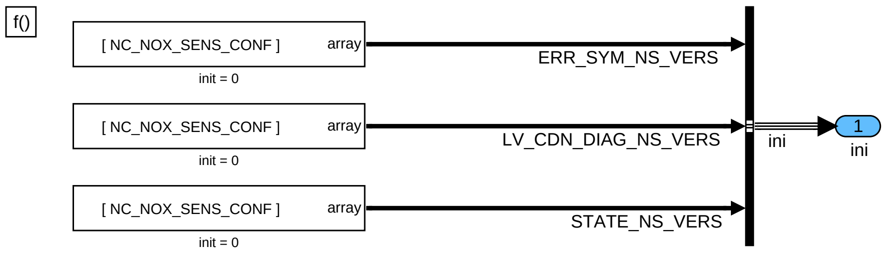

Figure B.115.2: :

B.115.1.2 Initialization of NVMY data

All Mode 6 values will be stored in the nonvolatile memory. The values will be reset to zero, if failure memory will be cleared.

B.115.2 Synchronization of the LV_ERR_NS_VERS and LV_END_DIAG_NS_VERS

Synchronisation between LV_ERR_NS_VERS and its result from ERRM is done using action ACTION_ERRM_GetLvErr() similarly synchronisation between LV_END_DIAG_NS_ VERS and its result from ERRM is done using action ACTION_ERRM_GetLvEndDiag()at RESET ,IGKON and CLRFMY events.

B.115.3 Operation at 100ms

B.115.3.1 Introduction of multiple sensor system

B.115.3.1.1 Calculation of the diagnosis results

B.115.3.1.1.1 Determination of diagnostic condition

General information

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

This module consists a limited dynamics evaluation for the NOx sensor and the global NOx sensor OBD II error flag.

The reset strategy of this error bit LV_ERR_NS_OBD_2_i can be selected by C_ERR_RST_NS_OBD_2_i. It can be chosen between following possibilities for error bit reset:
- reset only at clear of error memory
- reset at every start of new driving cycle
- manual reset, permanent reset.

Application Condition

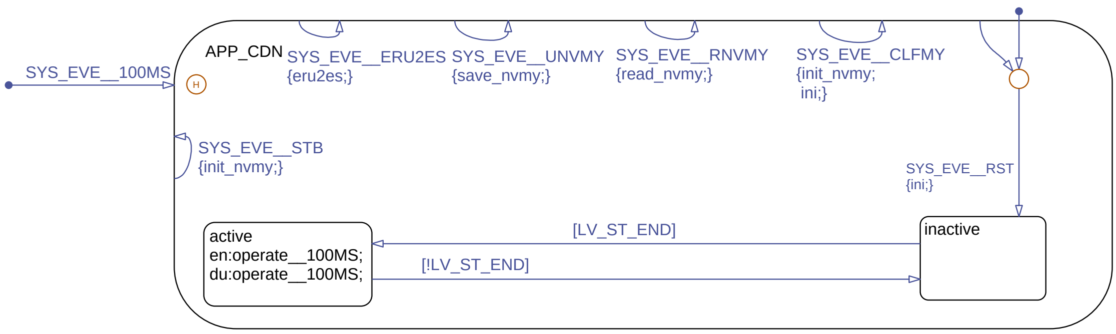

Figure B.116.1: NOXD_MODULB07G/APP_CDN/Chart

Function Description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

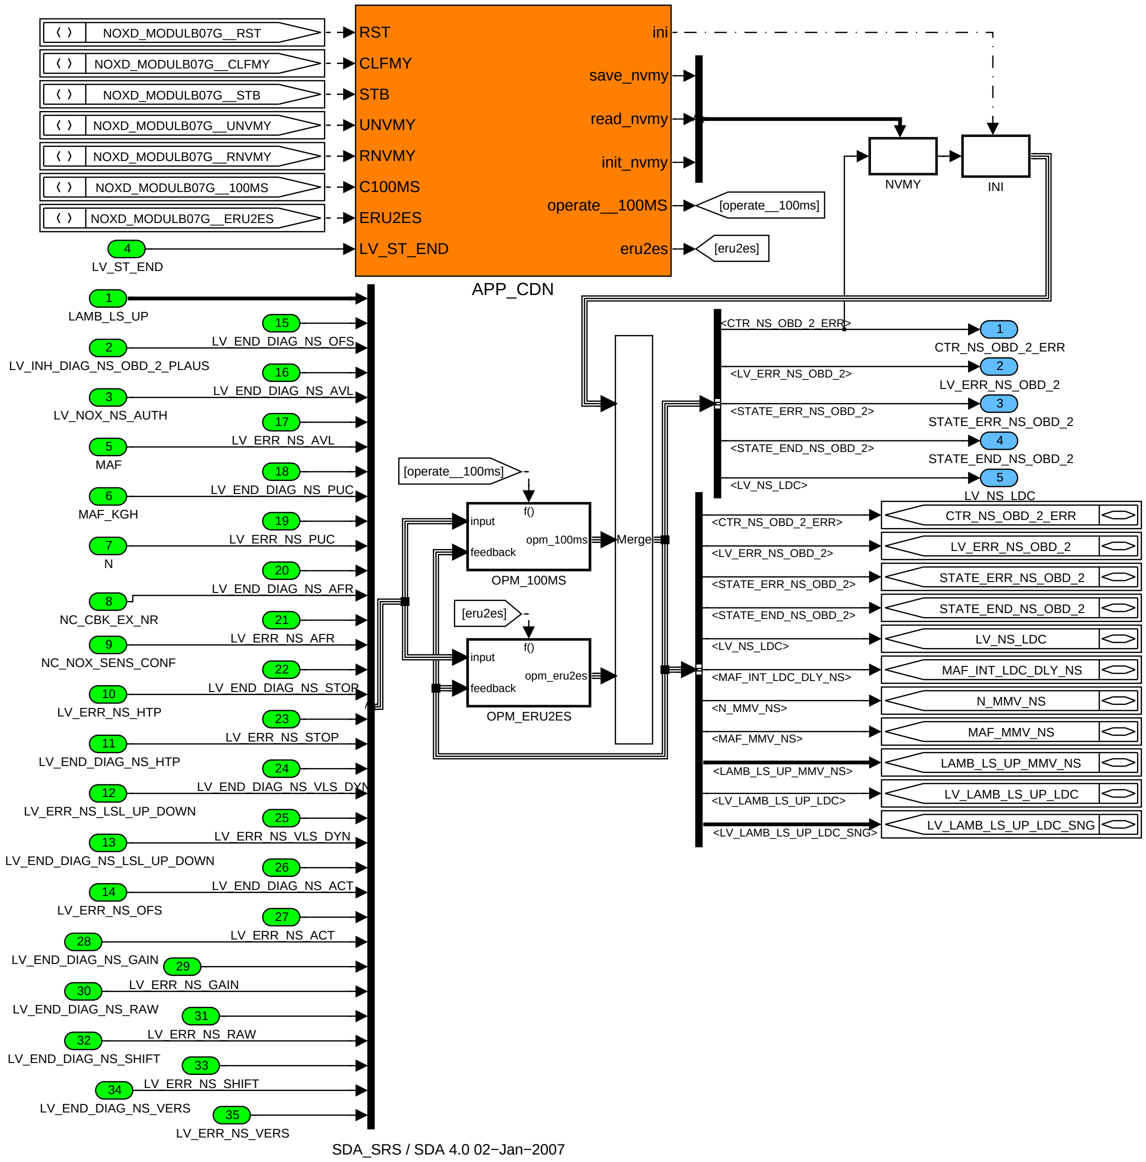

Figure B.116.2: NOXD_MODULB07G

B.116.1 Initialization at reset or at clear failure memory

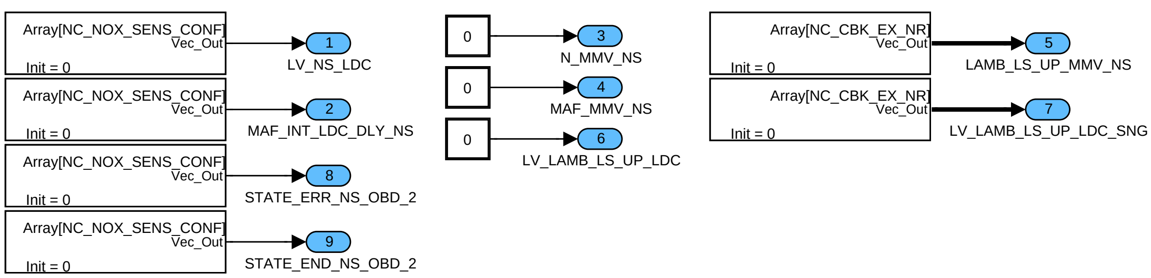

Figure B.116.3: NOXD_MODULB07G/INI/CLC1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.116.2 Management of non-volatile memory

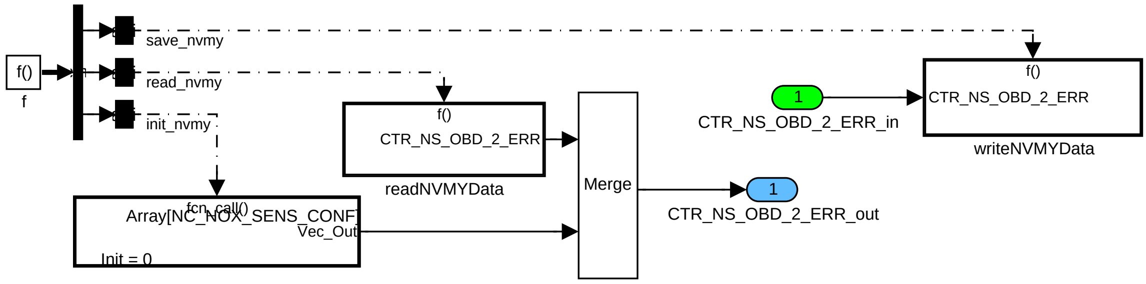

Figure B.116.5: NOXD_MODULB07G/NVMY

B.116.3 Loop control 100 ms

The calculation inside FOR_LOOP_LS have to be done for each upstream lambda sensor, controlled by configuration data NC_CBK_EX_NR.
If NC_CBK_EX_NR = 1, then calculation for i = 1.
If NC_CBK_EX_NR = 2, then calculation for i = 1 and 2.

The calculation inside NO_LOOP have to be done only once.

The calculation inside FOR_LOOP_NS have to be done for each NOx sensor, controlled by configuration data NC_NOX_SENS_CONF.
If NC_NOX_SENS_CONF = 1, then calculation for i = 1.
If NC_NOX_SENS_CONF = 2, then calculation for i = 1 and 2.

NC_NOX_SENS_CONF cannot be greater than NC_CBK_EX_NR.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Calculation for each NOx sensor

Evaluation of limited dynamics

The dynamic is limited if several conditions are valid for a longer time, controlled by the MAF integral.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

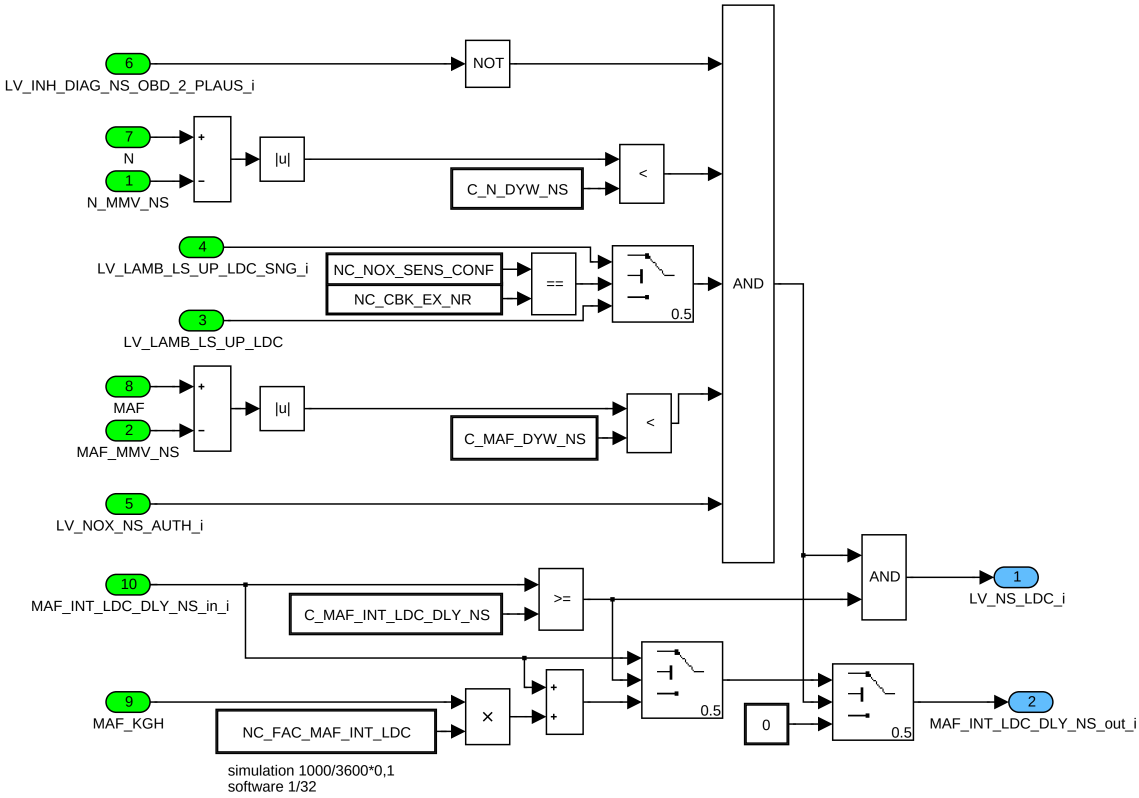

Figure B.116.12: NOXD_MODULB07G/OPM_100MS/FOR_LOOP_NS/CLC1

Collection of error information of all OBD II diagnosis types

The results of all diagnosis types will be collected in two status variables.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

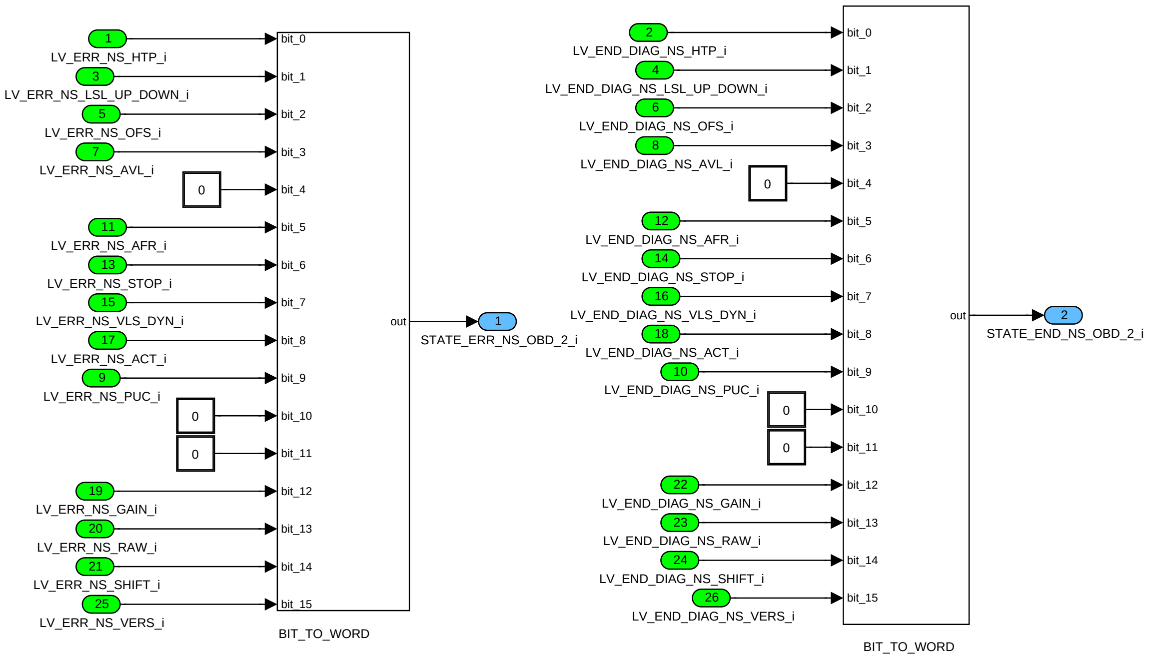

Figure B.116.13: NOXD_MODULB07G/OPM_100MS/FOR_LOOP_NS/CLC2

Global OBD II error bit

If any diagnosis detects an error, then the global error bit will be set.

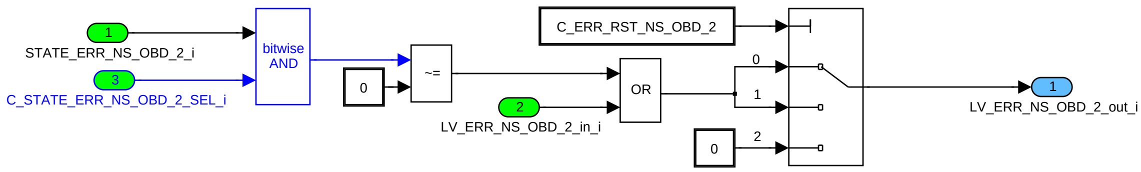

Figure B.116.14: NOXD_MODULB07G/OPM_100MS/FOR_LOOP_NS/CLC3

B.116.4 Loop control at engine run to engine stop

The calculation inside FOR_LOOP_NS have to be done for each NOx sensor, controlled by configuration data NC_NOX_SENS_CONF.
If NC_NOX_SENS_CONF = 1, then calculation for i = 1.
If NC_NOX_SENS_CONF = 2, then calculation for i = 1 and 2.

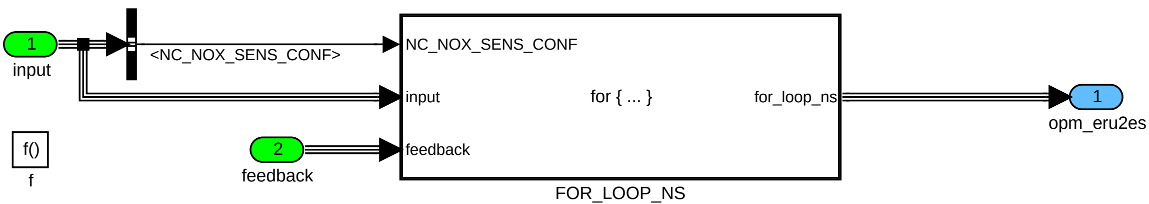

Figure B.116.15: NOXD_MODULB07G/OPM_ERU2ES

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error counter

For each NOx sensor a counter will be incremented if any OBD II error was detected or decremented if all selected end of OBD II diagnosis signals are valid. This is only done once at the end of the driving cycle. This selection will be done with the bit mask C_ERR_NS_OBD_2_BIT_SEL_i.

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.117.2 Calculation for each NOx sensor

The calculation have to be done for each NOx sensor, controlled by configuration data NC_NOX_SENS_CONF.
If NC_NOX_SENS_CONF = 1, then calculation for i = 1.
If NC_NOX_SENS_CONF = 2, then calculation for i = 1 and 2.

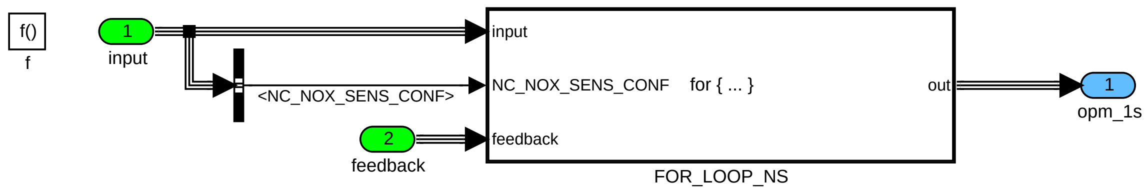

Figure B.117.4: NOXD_MODULB07A/OPM_1S

Main calculation

If the diagnosis is inhibited, then all values will be set to zero, else the diagnosis will be calculated. LV_ERR_NS_HTP will be get by ACTION_ERRM_GetLvErr and LV_END_DIAG_NS_HTP will be get by ACTION_ERRM_GetLvEndDiag.

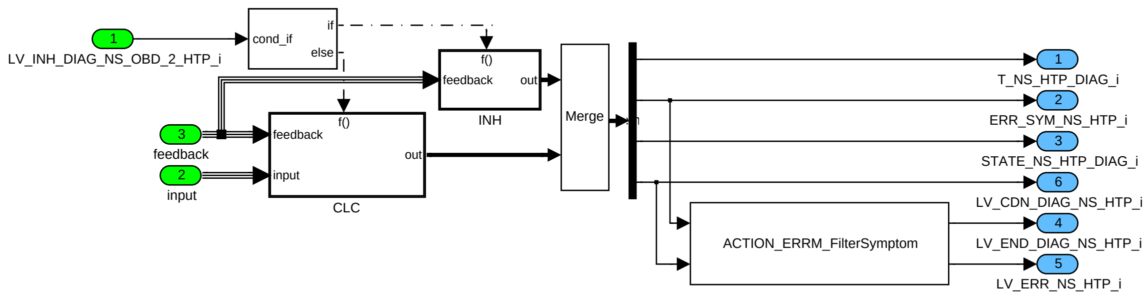

Figure B.117.5: NOXD_MODULB07A/OPM_1S/FOR_LOOP_NS/MAIN

Diagnosis inhibited

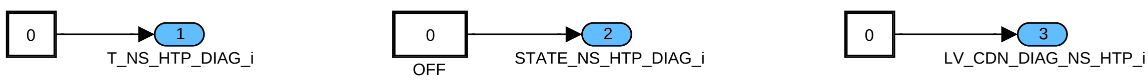

Figure B.117.6: NOXD_MODULB07A/OPM_1S/FOR_LOOP_NS/MAIN/INH/CLC

State machine

The default case is case 0 (OFF).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. B.118 NOx sensor OBDII diagnosis - Lambda signal dynamic

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
ERR_SYM_NS_VLS_DYN [NC_NOX_SENS_CONF]	V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	-	-
Error symptom for the NOx sensor dynamic diagnosis of binary signal					
LV_CDN_DIAG_NS_VLS_DYN [NC_NOX_SENS_CONF]	V	0... 1H	0 ...1	1	-
Diagnosis condition of NOx sensor dynamic diagnosis of binary signal					
LV_END_DIAG_NS_VLS_DYN [NC_NOX_SENS_CONF]	O/V	0... 1H	0 ...1	1	-
End of NOx sensor dynamic diagnosis of binary signal					
LV_ERR_NS_VLS_DYN [NC_NOX_SENS_CONF]	O/V	0... 1H	0 ...1	1	-
Error flag of NOx sensor dynamic diagnosis of binary signal					
LV_NT_RGN_REQ_OLD	-	0... 1H	0 ...1	1	-
Old value of LV_NT_RGN_REQ for edge detection					
STATE_VLS_RGN_NT_DIAG [NC_NOX_SENS_CONF]	V	0H 1H 2H	WAIT INIT DIAG	-	-
State of dynamic diagnosis for binary signal					
T_VLS_NS_SWI [NC_NOX_SENS_CONF]	V	0... FFH	0... 5.1	0.02	s
Timer for signal switch time measurement					
T_WAIT_VLS_DYN [NC_NOX_SENS_CONF]	V	0... FFH	0... 5.1	0.02	s
Timer for waiting of stratified mode activation					
VLS_NS_RGN_NT_END [NC_NOX_SENS_CONF]	V	0... 578H	-200 ...1200	1	mV
NOx sensor binary O2 signal voltage at the time of leaving NOx catalyst regeneration phase
