Name	Mode	Hex. limits	Phys. limits	Resol.	Unit

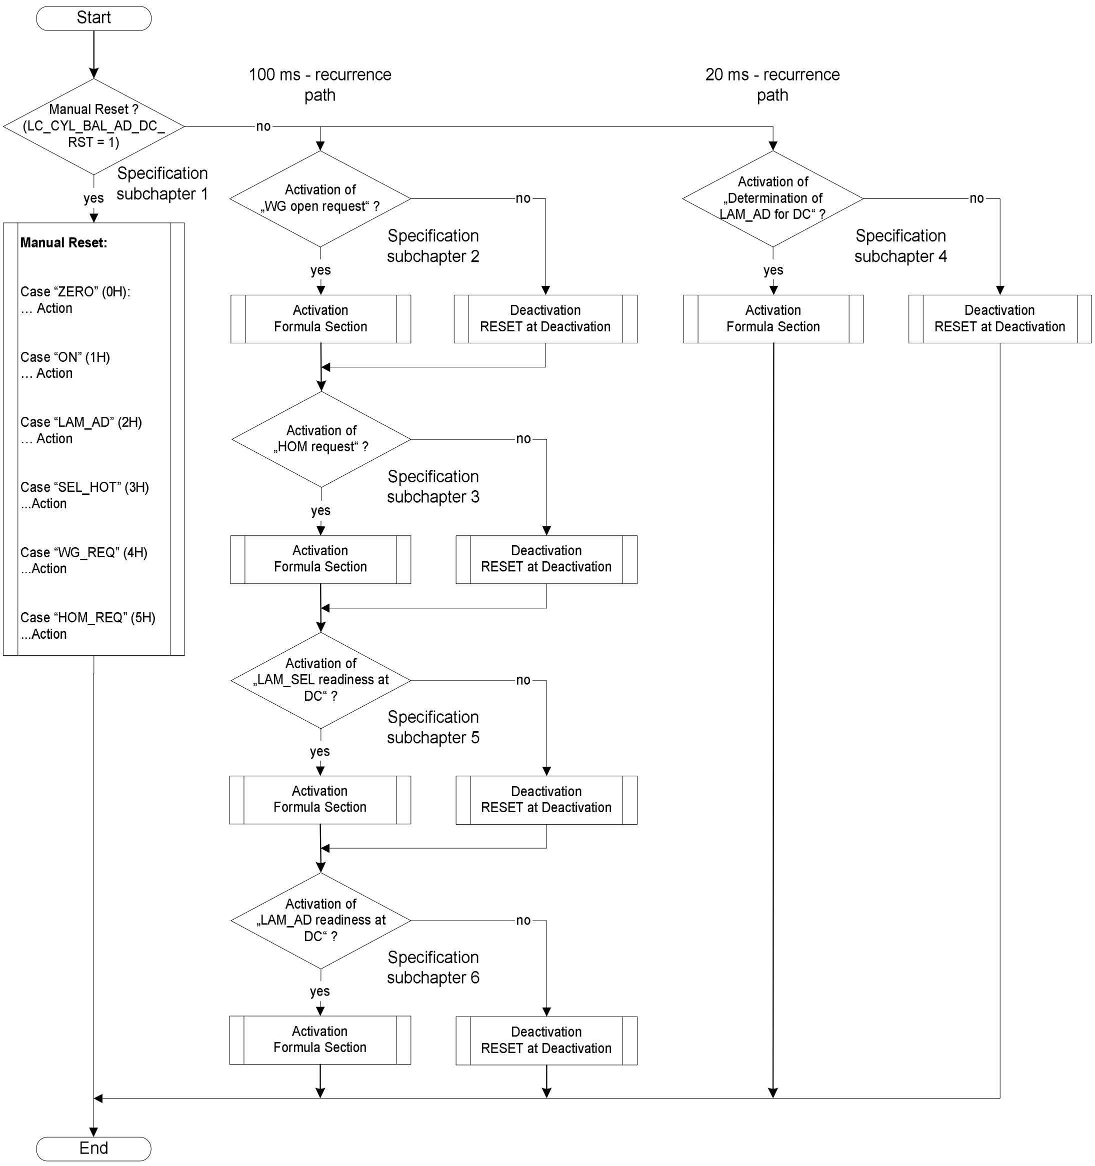
FUNCTION DESCRIPTION:

Task of the cylinder balancing coordination at DC is to control the adaptation functions during the current driving cycle.

Signal flow diagram:



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialisation: See separate chapters

Recurrence: *See separate chapters*

Activation: *See separate chapters*

Deactivation: *See separate chapters*

9.47.1 Manual reset of cylinder balancing readiness at active drving cycle (DC):

FUNCTION DESCRIPTION:

General information:

In case of a manual reset it is possible to adjust the exported output data to a wanted value to make the function test and handling more easier. While the manual function reset is activated, all following subchapters within the module "cylinder balancing coordination at DC" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during this period.

Application conditions

Recurrence: *100 ms*

Activation: *LC_CYL_BAL_AD_DC_RST = 1*

Deactivation: *LC_CYL_BAL_AD_DC_RST = 0*

Formula section:

```
IF        C_CYL_BAL_AD_DC_RST =  ZERO  (0H)
THEN      LV_CYL_BAL_LAM_AD_DC = 0
            LV_CYL_BAL_LAM_SEL_AD_HOT_DC = 0

9.47.2 Waste gate open request for cylinder balancing adaptation:

FUNCTION DESCRIPTION:

General information:

For a turbo engine, the cylinder individual lambda control is only possible while the waste gate is sufficient opened to identify the exhaust package for each cylinder. In case of a planned adaptation, a request to open the waste gate is carried out for each turbine before.

Application conditions:

Initialization at Reset ***or*** *Deactivation:*
FOR m = 0 to NC_CBK_EX_NR - 1
LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 0
END FOR

Recurrence: 100 ms

9.47.3 Homogenous combustion mode request for cylinder balancing adaptation:

FUNCTION DESCRIPTION:

General information:

For a stratified combustion engine, the cylinder individual lambda control as well as the global lambda adaptation are only possible while the engine is running in homogenous combustion mode with activated lambda control. In case of a planned adaptation, a request to switch to homogenous combustion is carried out before.

Application conditions:

Initialization at Reset ***or*** *Deactivation:*
LV_CYL_BAL_AD_HOM_REQ_DC = 0

Recurrence: 100 ms

Activation:
LC_CYL_BAL_AD_DC_RST = 0 **and**

9.47.4 Determination of lambda adaptation cycle for cylinder balancing at DC

FUNCTION DESCRIPTION:

General information:

Because the lambda adaptation function is running with a higher recurrence in comparison to cylinder balancing coordination at DC, the determination of a finished lambda adaptation cycle has to be carried out faster to avoid signal under-sampling.

Initialization at Reset ***or*** *Deactivation:*
FOR m = 0 to NC_CBK_EX_NR - 1
LV_CYL_BAL_LAM_AD_END[m] = 0

Copyright (C) Continental AG,2007

END FOR

9.47.5 Calculation of cylinder balancing selective lambda adaptation readiness (DC):

FUNCTION DESCRIPTION:

General information:

A periodic request for homogenous combustion mode is carried out in defined time intervals to allow the start of the cylinder selective adaptation functions, which are only activated in homogenous combustion mode. In case of a turbo engine, a periodic request to open the waste gate is carried out.

Application conditions:

Initialization at first Engine run or NVMY-error:
T_CYL_BAL_LAM_SEL_DC = 0.0[s] *(first initialization)*
LV_CYL_BAL_LAM_SEL_AD_HOT_DC = 0 *(first initialization)*

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

A periodic request for homogenous combustion mode is carried out in defined time intervals to allow the start of the lambda adaptation functions, which are only activated in homogenous combustion mode.

Application conditions:

Initialization at first Engine run or NVMY-error:
T_CYL_BAL_LAM_AD_DC = 0.0[s] *(first initialization)*
LV_CYL_BAL_LAM_AD_DC = 0 *(first initialization)*
FOR m = 0 to NC_CBK_EX_NR - 1
LV_CYL_BAL_LAM_AD_ADD_DC[m] = 0 *(first initialization)*
LV_CYL_BAL_LAM_AD_FAC_L_DC[m] = 0 *(first initialization)*
LV_CYL_BAL_LAM_AD_FAC_H_DC[m] = 0 *(first initialization)*
END FOR

Initialization at Reset:

9.48.1 BSD-Drivers

9.48.1.1 Device-detection algorithm

FUNCTION DESCRIPTION:

General information:

There is an algorithm installed to detect the single component devices connected to the ECU via BSD. At every ECU reset the learning algorithm is started and for each possible device it is checked whether the device is available or not. In case the consecutive positive acknowledges of the device reach the calibratabel threshold C_CTR_BSD_CPT_DET the corresponding device has been learnt. Once a device has been detected it is assumed that it is installed for ever and for this specific device the learning algorithm is deactivated. To realise this the flag indicating whether a device is learnt or not is stored in the NVMY. The learnt devices can solely be deleted via tester tool. They can be read via KWP job. Alternator, QLT and electronically controlled water pump are assumed to be there in every case, resulting in a fulltime activation of the corresponding device drivers. In addition each device can be set by a SW constant as to be available (C_STATE_BSD_CPT_AVL) and if the available devices should be leart or not (C_STATE_BSD_CPT_DET) (set as loc. True!)

Description:

The following bit-coding is applied to the calibration constants C_STATE_BSD_CPT_AVL, C_STATE_BSD_CPT_DET and the status byte LF_BSD_CPT_AVL (set as loc. True!)
The logical data field LF_BSD_CPT_AVL displays the configured and learnt BSD components. In case there is a mismatch between C_STATE_BSD_CPT_AVL and LF_BSD_CPT_AVL obviously a problem occurred in the BSD components learning session. The by the constant C_STATE_BSD_CPT_DET configured BSD components are directly set in the logical data field LF_BSD_CPT_AVL. The BSD components which have to be learnt are set after the learning process has been finished. In case the BSD component has been successfully learnt the corresponding bit is set to 1 in the logical data field LF_BSD_CPT_AVL. Otherwise the corresponding device bit stays 0.
.

Bit position	BSD device
0	SENS_BAT_SMT -- Intelligent battery sensor (IBS)
1	-- O3 Sensor
2	-- el. waterpump electronics
3	CWP -- electrical coolant water pump
4	QOIL - oil quality sensor (QLT)
5	-- alternator 2
6	ALTER - alternator
7	-- glow plug control unit

9.48.1.2 BSD-Timing coordinaton and BSD timing table

Description for actions:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_COMS_*SetBsdGlobalCom* (<CTR_BSD_CPT_COM_OK>)					
Action which delivers at the end of the BSD timing table the status of the communication of all BSD devices of the list; number of successful communications for one scheduling timing list cycle					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
CTR_BSD_CPT_COM_OK	IN	0...FFH	0...255	1	-
Number of the 'ok' communications per total scheduling timing list cycle of the BSD devices					
ACTION_COMS_*SetBsdSingleCom* (<STATE_BSD_CPT>,<STATE_BSD_COM>)					
Action which delivers at the end of the BSD timing slot the status of the communication of the actual BSD device of the scheduling list					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
STATE_BSD_CPT	IN	0...FFH	0...255	1	-
BSD device, which communicates actually with the ECU via BSD					
STATE_BSD_COM	IN	0...FFH	0...255	1	-
Status of the communication to the BSD devices (faulty /o.k.)					

FUNCTION DESCRIPTION:

General information:

The BSD timing coordinator handles the scheduling of the device drivers. The 8 possible component devices (bit 0...3) can be configured in the table ID_STATE_BSD_SDL_TBL. In addition the configuration can be configered for 3 different states (Engine running (bit 4), power latch (bit 5), wake up (bit3)). The table configures the scheduling of the BSD devices. The end of the scheduling table is marked by FFH.

For each BSD device the status of the communication is checked. In case of no acknowledge of the device the flags LV_CWP_COM_ACT, LV_ALTER_COM_ACT, LV_QOIL_COM_ACT, LV_SENS_BAT_SMT_COM_ACT are set at the end of the timing slot and the action ACTION_COMS_*SetBsdSingleCom (*IN <STATE_BSD_CPT>, IN <STATE_BSD_COM>) is called.

The action feeds the diagnosis of the individual BSD devices in term of the detection of a communication error.

After the detection of faulty communication in a certain timing slot the next corresponding timing slot is served with a 22 synchronisation pulse phase followed by a none acknoledge!

Unter certain circumstances the communication to a device can be stopped (LV_MSG_xxx_COM_STOP) although the time slot is still reserved for this device. The staus byte STATE_BSD_MSG_COM_STOP communicates the information via to the BSD timing coordinator to which BSD component a timout is applied. Background: it is assumed that after a disturbed communication to a device has been detected a break in the communication could cure the problem.

Before the BSD device scheduling timing table is started again (IDX_BSD_SDL_TBL =0) the flags LV_xxx_COM_ACT have to be reset to 0. In case no acknowledge is set through the whole BSD timing table, the flags LV_xxx_COM_ACT are still =0 at the end of the timing table, so therefore the global BSD error can be fed with this information. For each positive acknowledge per timing slot the counter CTR_BSD_CPT_COM_OK is incremented by 1. CTR_BSD_CPT_COM_OK equal to 0 indicates a global BSD communication error. At the end of the list IDX_BSD_SDL_TBL(ID_STATE_BSD_SDL_TBL = FFH) the action ACTION_COMS_*SetBsdGlobalCom*(<CTR_BSD_CPT_COM_OK>) is called and the global BSD error can be debounced by the ERRM.

The communication to the devices is monitored by the BSW.

The error symptom detection is made out of basic software information BIOS_BSD_xx.

If a problem is detected the corresponding malfunction of the communication between the ECU and the BSD device is indicated by the corresponding flag LV_xxx_COM_ACT.

With xxx: ALTER - alternator
CWP - electrical coolant water pump
QOIL - oil quality sensor (QLT)
SENS_BAT_SMT - intelligent battery sensor (IBS)

Description:

The driver of a certain device is only called if the device has been learnt. Some BSD device drivers are not called (writing only!) if the message to be written has not changed. So if it is not necessary for the device driver to send (e.g. if the values did not change), this is reported to the timing coordinator. The timing coordinator can then pass on this time slot to the next BSD device in the scheduling timing table.

Design of the scheduling timing table of the BSD devices:

ID_STATE_BSD_SDL_TBL

IDX_BSD_SDL_TBL	Bit 7 not used	Bit 6 not used	Bit 5 'wake up' ECU_STATE = 6H	Bit 4 'engine running' ECU_STATE = 0H v	Bit 3 'power latch' ECU_STATE = 4H	Bit 2	Bit 1	Bit 0	
0	0	0	0	1	0	1	1	0	e.g. Alternator ***SetBsdSingleCom***
1	0	0	1	1	0	0	0	0	e.g. Battery sensor ***SetBsdSingleCom***
2	0	0	1	1	1	0	1	1	e.g. Coolant water pump ***SetBsdSingleCom***
. . .	. . .	. . .	. . .	. . .	. . .	. . .	. . .	. . .	
17	1	1	1	1	1	1	1	1	FFH - End of table; goto begin of table ***SetBsdGlobalCom***
. . .	. . .	. . .	. . .	. . .	. . .	. . .	. . .	. . .	
30	0	0	0	0	0	0	0	0	
31	0	0	0	0	0	0	0	0	

The BSD device   is coded in Bit 0...2.

Application conditions

Initialisation: `0at WakeUp`
Recurrence: `20ms (optional 25ms in MS-)`

Activation: `WakeUp`

Deactivation: `Sleeping`

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Handling of the single /global BSD com error /counter CTR_BSD_CPT_COM_OK:

If IDX_BSD_SDL_TBL < IDX_BSD_SDL_TBL(ID_STATE_BSD_SDL_TBL = FFH)
//Pointer of the BSD timing coordinator is between the starting point of the scheduling timing table
and the end of the Scheduling timing table//

Then
If LV_MSG_xxx_COM_STOP = 0 (STATE_BSD_MSG_COM_STOP)
Then **If** ECU receives no positive acknowledge from slave device
Then LV_xxx_COM_ACT = 0 **and**
Send a 22 sychronisation pulse phase
in next corresponding time slot followed by
LV_xxx_COM_ACT == 0
Else LV_xxx_COM_ACT = 1
Endif
If LV_xxx_COM_ACT = 1
With: xxx - corresponding to the actual time slot device
Then CTR_BSD_CPT_COM_OK ++
Endif
// the end of the timing table is not reached-transmit single message error status//
Call ACTION_COMS_*SetBsdSingleCom* (IN <STATE_BSD_CPT>, IN <STATE_BSD_COM>)
IDX_BSD_SDL_TBL++
Else stop communication to device xxx in the corresponding time slot
STATE_BSD_COM = FFH
Call ACTION_COMS_*SetBsdSingleCom* (IN <STATE_BSD_CPT>, IN <STATE_BSD_COM>)
IDX_BSD_SDL_TBL++

Endif

//Counter is reset to 0 at the end of the Scheduling timing table after the action has been called//
// the end of the timing table is reached-transmit global BSD error status//
Else Call ACTION_COMS_*SetBsdGlobalCom*(IN <CTR_BSD_CPT_COM_ACT>) CTR_BSD_CPT_COM_OK = 0 // reset communication counter//*
IDX_BSD_SDL_TBL = 0 // re-started BSD timing table//*
LV_CWP_COM_ACT = 0 // Table is re-started ; reset communication flags//*
LV_ALTER_COM_ACT = 0
LV_QOIL_COM_ACT = 0
LV_SENS_BAT_SMT_COM_ACT = 0
Endif

Control of the communication after an communication error has been detected:

If C_CTR_MAX_xxx_COM_STOP <> FFFFH **and**
LV_ERR_xxx_COM = 1
Then stop communication with this device for this DC (LV_IGK 1- ->0)
Else communication with the corresponding device to be continued

With:
STATE_BSD_CPT = STATE_BSD_SDL_TBL(bit0...2)
STATE_BSD_COM = LV_xxx_COM_ACT

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

6H -- ALTER - alternator	40H = LV_MSG_ALTER_COM_STOP = 1

9.48.1.3 Component driver

FUNCTION DESCRIPTION:

General information:

Basics that should be implemented in a device driver:

Description:

To be translated:

Wenn Werte geschrieben werden sollen, soll abgeprüft werden ob der Wert gleich dem zuletzt gesendeten Wert ist. Ist dieses der Fall, kann die Funktion für diesen Buszyklus wieder verlassen werden.
Diese Funktionalität dient dazu, die Busbelastung niedrig zu halten.
Der nächste Teilnehmer laut Timing-Liste kann dann diesen Zeitslot nutzen.

Nach dem Lernprozess wird das angeschlossene Gerät vom BSD-Timing-Koordinator als vorhanden markiert. Jetzt wird die eigentliche BSD-Kommunikation mit dem ausgewähltem Gerät gestartet. Dabei läuft innerhalb des Komponententreibers wiederum ein Schreib-Lese-Koordinator, welcher in seiner Abfolge frei definiert werden kann. Getaktet wird dieser Vorgang durch den Aufruf des BSD-Timing-Koordinators.

Application conditions

Recurrence: `wird durch BSD-Timingcoordinator generiert`

Activation: `WakeUp`

Deactivation: `Sleeping`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

9.48.2 Component Driver for BSD-alternator

9.48.2.1 Identification of the controller type

FUNCTION DESCRIPTION:

This function allows to identify the controller type of the alternator that is installed and to choose the communication protocol via code word. Possible controller types:

General information:

BSD-controller II measures and limits the exciting current. Additional a detection of the chip temperature. It provides information about the actual alternator torque for a torque model. The communication of the BSD-controller type I is different to the BSD-controller type II. In the first phase BSD-controller type I or type II can be installed. At init., register 7 provides information about controller- and chip version and the nominal voltage. Address 6 communicates with type I and type II. Later on a mix of type I and type II assembly is impossible.

Description:

Detection of the controller type (Register 7, Bit 6/7):

Type	ALTER_COD_2
BSD-controller I	00
BSD-controller II	01

Choosing the communication protocol via code word:

Type	LC_ALTER_BSD_PROT_2
BSD-controller I	0
BSD-controller II	1

Combinations and possible BSD protocol:

ALTER_COD_2	LC_ALTER_BSD_PROT_2	LV_ALTER_BSD_PROT_2
00	0	0
00	1	0
01	0	0
01	1	1

Conditions to be choose by software switch:

sw-switch / codeword	condition	meaning	BMW naming
LC_ALTER_BSD_PROT_2	LV_ALTER_BSD_PTOT_2	BSD-prot 1 or 2	CW_GENPROT

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

9.48.2.2 BSD controller I

Id. for address 0x06 (BSD component driver controller typ I)

Copyright (C) Continental AG,2007

Part: electr. alternator, electronic: address: 6

Remark: address 6 must communicate with type I and type II (depending of the detection what type is installed).

Specification only for BSD-controller type I !!

Endif
If LV_ALTER_EVE_WR Or
LV_ALTER_EVE_RD = 1
Then T_FIL_CUR_EXCT_ALTER = C_T_FIL_CUR_EXCT_ALTER * 2
Endif

FUNCTION DESCRIPTION:

General information:

V_ALTER_SP will be limited to the upper threshold 16.0 V. After that it will be provided to the BSW for the BSD interface.
T_LOAD_RESP_ALTER will be converted to 3 s resolution, limited between 0 and 9 seconds and provided to the BSW for the BSD interface as well.
ALTER_COD_1 delivers the type of alternator
ALTER_COD_0 delivers the manufactory of alternator
This both information is necessary to identify the alternator. Depending on this information the power management is able to switch different calibrations.

Application conditions:
Activation: at every engine operating state
Deactivation: -
Initialization: all outputs 0 (LV_GEN_xx = FALSE)
ALTER_COD_1 = 1F H /*initalisation to max value*/
ALTER_COD_0 = 7 H /*initalisation to max value*/

Update-Rate: 50 ms

Formula section:

if no valid message was received during a timeout : T_LOAD_RESP_ALTER = 3 s
V_ALTER = 14.3 V
else : POW_REL_ALTER_CLC, T_LOAD_RESP_ALTER and V_ALTER are received via BSD interface.

The failure-bits LV_GEN_xxare received via BSD interface.

I

FUNCTION DESCRIPTION:

General information:

LF_ALTER_EVE_WR is a status flag, which is generated by comparison of the variables CUR_ALTER_EXCT_LIM, T_LOAD_RESP_ALTER, V_ALTER and the corresponding setpoints.
NR_ALTER_EVE_WR is the output of the map **ID_NR_ALTER_EVE_WR** and describes the number of the eo-write event. In case of equality of LF_ALTER_EVE_WR and the datapoint of ID_NR_ALTER_EVE_WR one of 8 possible write events is selected, otherwise the output of ID_NR_ALTER_EVE_WR is 0.
CTR_ALTER_EVE_WR is the counter for the eo-write event process.
STATE_ALTER_VALUE_WR is the output of the map **ID_STATE_ALTER_VALUE_WR** and selects dependant on CTR_ALTER_EVE_WR and NR_ALTER_EVE_WR the next value to write on the bus.

9.48.2.3.1 Additional information for the BSD controller II protocol.

Writing only after a value has changed (after events) therefore comparison of value and reference value (for example Tlrgen -> Tlrfgen).

register 1:
Tlrgen (LR-value) should be round down to the next value of tn. For more details see 1.2.3.5 table writing reg 1. When writing the LR-value then the bit B_lrreg1ak = 1.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Writing of the set points to the alternator register 0 only in a defined time schedule (depending on C_T_WR_PER_ALTER_TBL_0)

register 2:

Reading of the values only in a defined time schedule (depending on C_T_RD_PER_ALTER_TBL_2).

register 3:

Read of register 3 as often as possible without eo-communication (defined in the flow chart 1.2.3.2). Minimum every second time slot = read register 3. At successfully communication the variable lerrfgrenz is written.

register 5:

Reading of the values only in a defined time schedule (depending on C_T_RD_PER_ALTER_TBL_5)

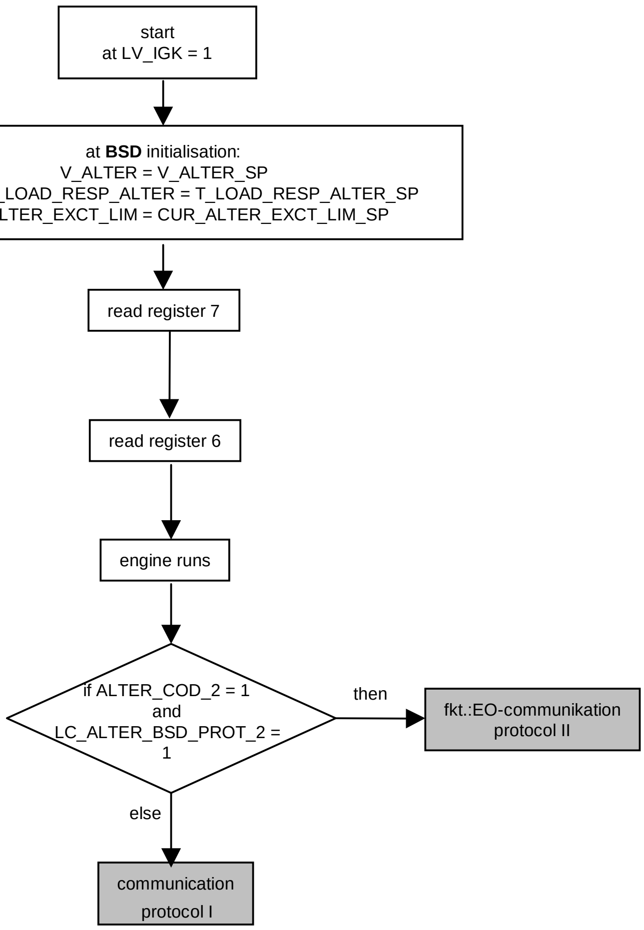
register 6:

Reading once at start communication BSD

register 7:

Reading once at start communication BSD

General flowchart KT_Gen BSD controller II



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. 9.48.2.3.2 Flow chart for function EO-communication BSD controller II

Superior function KT_Sched (time scheduler)

only for example, content of time slots not describe the software !!!

20 ms	20 ms	20 ms	20 ms	20 ms	20 ms	20 ms	20 ms	20 ms	20 ms	20 ms
alter- nator	battery sensor	electr. cwp	QLT	alter- nator	battery sensor	electr. cwp	QLT	alter- nator	battery sensor	....

By a time scheduler every 20 ms a new communication is triggered. During this time one register can be in progress (sending a protocol and call a driver). If KT_Gen is triggered, then the progress shown below is started.

Subordinated function EO communication KT_GEN

Application conditions

Initialisation: *only if LV_ALTER_BSD_PROT_2 = 1*

Recurrence: *40 ms*

Activation: *at every engine state*

Deactivation: –

Following flow charts are only a functional description of EO-communication BSD controller II.
Due to the fact, that it is not possible to do action on BSD immediately for the requested device (for e.g. Generator), the requested jobs has to be stored in circular buffer (FIFO).

In case of GEN slot is carry out the jobs in the buffer will be executed according the FIFO principle.

In case of "V_ALTER_SP (U_gen)" goes to 10,6V, immediately write of REG 0 and delete all other Jobs in the queue.

In case of "wrablauf > 0", immediately execute function "ablaufwr" and delete all other Jobs in the queue. New entries can be done after the last requested job from "ablaufwr" was executed.

Was a deleting of the queue performed and there are still jobs for reading Reg. 2 or Reg. 5 in the buffer, the jobs are lost.
Due to the fact, there is no positive response for reading Reg.2 or Reg.5, therefore set the timers for Reg.2 and Reg.5 again.

The recurrence of calculation "Generator BSD Controller II function" (40ms) could be higher than the BSD-Driver execute the Generator components (best case 20ms, worst case more than 40ms).
To avoid multiple entries for the same job in the buffer (because there was no update yet), the job entry in the buffer is locked till this job was performed by the BSD Driver.

The locking of the Register will be indicated with following flags:

- LV_REQ_GEN_WR_REG0
- LV_REQ_GEN_WR_REG 1
- LV_REQ_GEN_WR_REG 3
- LV_REQ_GEN_RD_REG 2

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- LV_REQ_GEN_RD_REG 5
- LV_STEP_BSD_ALTER

the corresponding flags will be set to "0" after job has been perfomed.

Following locks in the buffer could be possible:

wrablauf = 0
Lock requested writing Reg. 0, 1, 3 till this job is done.
wrablauf > 0
Immediately execute function "ablaufwr", writing all jobs that are defined in ID_STATE_ALTER_VALUE_WR and lock new entry in the queue.

Lock reading Reg. 2 or Reg. 5 till reading was successfully executed.

In case of C_T_WR_PER_ALTER_TBL_0 /1 are set to "0" not time triggert write to REG 0 /1 will be executed, only event triggert action can be perfomed.

9.48.2.4 State machine Component Driver for BSD-alternator Type I

FUNCTION DESCRIPTION:

General information:

Der Komponententreiber wird durch einen Zustandsautomaten der im Aufrufraster des BSD-Timing-Koordinator läuft dargestellt. Wie der **Abbildung 1-1** zu entnehmen ist besteht der KT aus mehreren Zuständen die im folgenden näher beschrieben werden.

Signal flow diagram:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

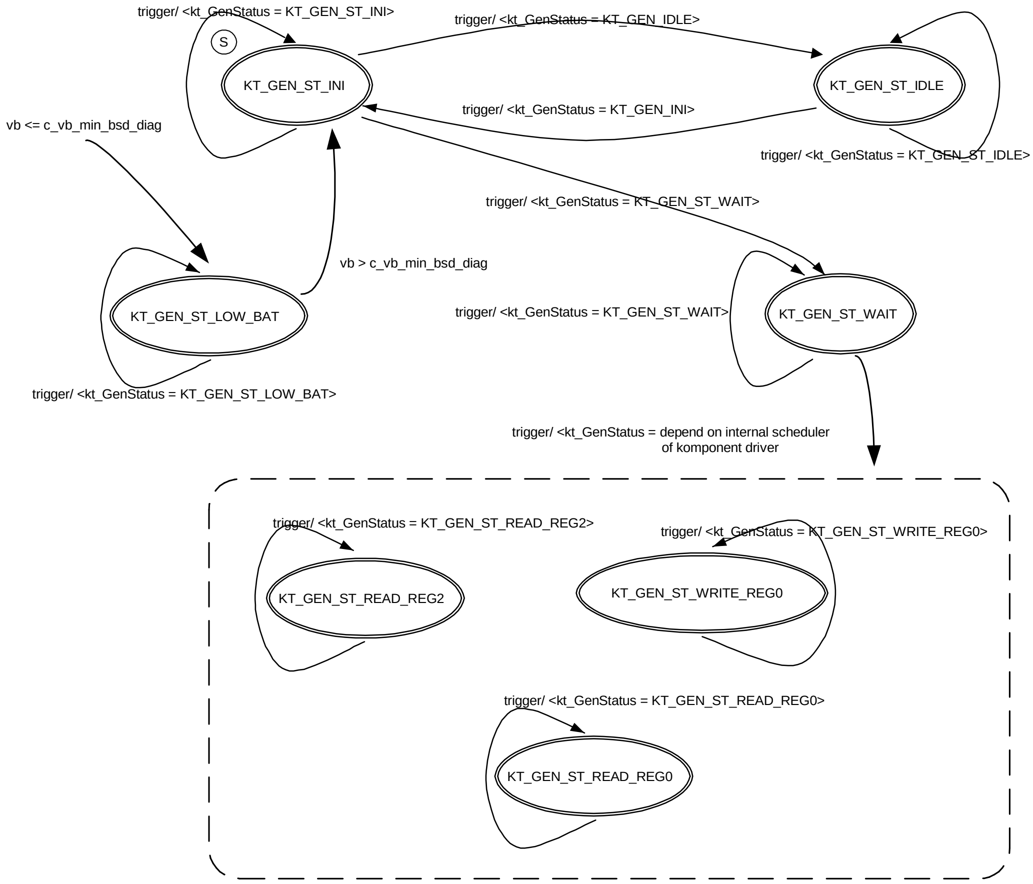

Abbildung 1-1: Statemachine KT-Treiber Generator

Description:

A) Allgemeiner Zustand:

In jedem Zustand des KT werden folgende Fehler geprüft:

Überschreitet der ***timeout counter for valid message*** die Schwelle **KT_GEN_VALID_MESSAGE_ TIMEOUT** so wird die Größe **V_ALTER** auf den Applikationswert **UGENTYP** (13.8V entspricht den Notlaufwert des Generators) bzw. die Größe **T_LOAD_RESP_ALTER** auf den Applikatonswert **TL-RDEFAULT** (0x1E entspricht den Notlaufwert des Generators) gesetzt ansonsten wird der ***timeout counter for valid message*** inkrementiert (bei gültigen Daten wird dieser durch die Call_Back-Function zurückgesetzt).

Anschließend wird geprüft ob das Generatorinterface aktiv ist d.h. Bedingung ***B_genactiv*** = True, wenn ja wird der ***timeout send counter*** und der ***timeout read counter*** inkrementiert (bei gültigen Daten wird dieser durch die jeweilige Call_Back-Function zurückgesetzt).

Desweiteren wird im jedem Zustand geprüft ob der ***timeout send counter*** die Schwelle **KT_GEN_ SEND_TIMEOUT** bzw. der ***timeout read counter*** die Schwelle **KT_GEN_SEND_TIMEOUT** überschritten hat. Wurde einer dieser Schwellen überschritten geht der KT in den Zustand *kt_GenStatus = KT_GEN_ST_INI* über .

B) Zustand KT_GEN_ST_INI:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Zu Beginn wird der KT initialisiert d.h.
V_ALTER = 0;
T_LOAD_RESP_ALTER = 0;
LV_GEN_ERR_EL = FALSE;
LV_GEN_ERR_TEMP = FALSE;
LV_GEN_ERR_MEC = FALSE;
LV_GEN_IF_OFF = FALSE;
POW_REL_ALTER_CLC = 0;

und andere diverse Größen wie Fehlerzähler usw..

Nach der Initialisierung befindet sich der KT im Zustand *kt_GenStatus = KT_GEN_ST_INI*. In diesem Zustand wird zyklisch ein ***initialization timeout counter*** hochgezählt und dem Hardwaretreiber (HWT) Initialisierungsdaten übergeben und anschließend der HWT gestartet. Als Initialisierungsdaten werden dem HWT folgende Größen übergeben:

period length
low_time Sync pulse
low_time of sended LOW Bit
low_time of sended HIGH Bit
pointer to callback function for read register when result is ready
pointer to callback function for send register when quit from peripherie is OK
pointer to error handler

Wie oben zu sehen ist, werden dem HWT unter anderem zwei Pointer für die Call-Back-Funktion übergeben genaueres hierzu folgt etwas später.

Nun wird der ***initialization timeout counter*** inkrementiert. Anschließend wird geprüft ob der ***initialization timeout counter*** die Initialisierungsschwelle **KT_GEN_INI_TIMEOUT** überschritten hat, wenn ja geht der KT in dem Zustand *kt_GenStatus = KT_GEN_ST_IDLE* über und der ***initialization timeout counter*** wird zurückgesetzt.

Nachdem der HWT gestartet worden ist, geht der KT in dem Zustand *kt_GenStatus = KT_GEN_ST_WAIT* über.

C) Zustand KT_GEN_ST_WAIT:

In diesem Zustand wird gewartet bis der HWT den Status work mitteilt. Hier muß durch den BSD-Timing-Koordinator angezeigt werden ob sich der Treiber noch im Lernmodus befindet . Ist dieser Lernprozess abgeschlossen wird der ***initialization timeout counter*** , ***timeout counter send message*** und der ***timeout counter read message*** zurückgesetzt und die Bedingung ***B_genactiv*** auf True gesetzt (generator interface is active). Anschließend geht der KT in den Status über welcher vom internen Schreib-Lese-Koordinator vorgegeben wird.

D) Zustand KT_GEN_ST_IDLE:

Befindet sich der KT im Zustand *kt_GenStatus = KT_GEN_ST_IDLE* wird dem HWT ein ausschalten des generator interface mitgeteilt, d.h. die Kommunikation auf der BSD-Schnittstelle bzgl. Generator wird eingestellt. Anschließend wird gewartet bis der HWT ein generator interface off mitteilt.
Nachdem vom HWT ein generator interface off mitgeteilt wurde wird die Bedingung ***B_genactiv*** auf False gesetzt, die Bedingung ***LV_GEN_IF_OFF*** auf True gesetzt und in diesem Zustand verharrt. Die Bedingung ***LV_GEN_IF_OFF*** wird nur oberhalb einer Batterie Spannungsschwelle VB >=C_VB_MIN_POW_DIAG aktiviert.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

E) Zustand KT_GEN_ST_WRITE_REG0:
Die Generatorsollspannung ***V_ALTER_SP*** zwischen den beiden Applikationswerten **UGMN** und **UGMX** begrenzt. Ist ***V_ALTER_SP*** kleiner gleich **UGMN** wird als Generatorsollspannung der Applikationswert **OUINIGEN** verwendet.

Nach einer Umquantisierung des Sollwerts Load- Response- Zeit Generator ***T_LOAD_RESP_ALTER_SP*** wird diese zwischen den beiden Applikationswerten **TLRMN** und **TLRMX** begrenzt.

Anschließend wird dem HWT über einen Funktionsaufruf die Generatorsollspannung ***V_ALTER_SP*** und der Sollwert der Load-Response-Zeit ***T_LOAD_RESP_ALTER_SP*** mitgeteilt. Wurden diese Werte vom HWT über die BSD-Schnittstelle gesendet, wird die Call-Back-Funktion *KT_gen_sendErgHandler* über einen Pointer aufgerufen.

Nachdem die Werte dem HWT übergeben worden sind, geht der KT in den nächsten angeforderten Zustand *kt_GenStatus* über.

F) Zustand KT_GEN_ST_READ_REG0:
Es werden HWT Daten von der BSD-Schnittstelle bzw. vom Generator durch einen Funktionsaufruf des HWT mit gültiger Generatoradressse angefordert.

Liegen Daten vom BSD-Generator dem HWT vor, so ruft der HWT durch einen Pointer die Call-Back-Funktion *KT_gen_readErgHandler* auf.
Nachdem die Werte durch den HWT übernommen worden sind, geht der KT in den nächsten angeforderten Zustand *kt_GenStatus* über.

G) Zustand KT_GEN_ST_READ_REG2:
Es werden HWT Daten von der BSD-Schnittstelle bzw. vom Generator durch einen Funktionsaufruf des HWT mit gültiger Generatoradressse angefordert.

Liegen Daten vom BSD-Generator dem HWT vor, so ruft der HWT durch einen Pointer die Call-Back-Funktion *KT_gen_readErgHandler* auf.

Nachdem die Werte durch den HWT übernommen worden sind, geht der KT in den nächsten angeforderten Zustand *kt_GenStatus* über.

H) Call-Back-Funktion KT_gen_sendErgHandler:
Wie bereits im Kapitel erwähnt, wird bei einer erfolgreichen Übertragung der Generatorsollspannung ***V_ALTER_SP*** bzw. des Sollwerts Load- Response- Zeit ***T_LOAD_RESP_ALTER_SP*** durch den HWT die Call-Back-Funktion *KT_gen_sendErgHandler* über einen Pointer durch den HWT aufgerufen.

In dieser Call-Back-Funktion wird der ***timeout counter for valid message*** sowie der ***timeout send counter*** zurückgesetzt.
I) Call-Back-Funktion KT_gen_readErgHandler:
Liegen Daten vom BSD-Generator dem HWT vor, so ruft der HWT durch einen Pointer die Call-Back-Funktion *KT_gen_readErgHandler* and the flag LV_ALTER_ERR_IF is reset.

In dieser Call-Back-Funktion wird zunächst der ***timeout counter for valid message*** sowie der ***timeout read counter*** zurückgesetzt. Anschließend werden die vom HWT übergebenen Daten ausgewertet bzw. nach einer entsprechenden Umquantisierung abgespeichert.

J) Fehler-Handler-Funktion KT_gen_errHandler:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Erkennt der HWT Fehler auf der BSD-Schnitstelle, geht der KT in den Zustand *kt_GenStatus = KT_GEN_ST_INI* über and the flag LV_ALTER_ERR_IF is set.

9.48.3 Component Driver (Interface) for Intelligent Battery Sensor IBS - %ZWK-TIBS 1.20

FUNCTION DESCRIPTION:

Beschreibung der Schnittstelle HW-Treiber - Komponententreiber für die Verbindung IBS - DME

General information:

Der intelligente Batteriesensor bietet eine Reihe unterschiedlicher Einsatzmöglichkeiten und wird darum auf längere Sicht Gegenstand der Entwicklung sein. Dabei ist abzusehen, dass bei den unterschiedlichen Nutzungen auch wechselnde Variablen, Parameter und sonstige Datenstrukturen von und zum Sensor übertragen werden müssen. Es ist daher sinnvoll, in der Kommunikation zwischen Host und Sensor eine invariante Schnittstelle zu definieren, die die variablen Schichten des Komponententreibers und der Anwendersoftware vom Hardwaretreiber trennt, der nur einmal implementiert wird.

Description:

A) Realisierung Schnittstelle

Zum Datenaustausch in beiden Richtungen werden 3 Variable vom Typ unsigned char verwendet.: BSD_SENS_BAT_SMT_INFO, BSD_SENS_BAT_SMT_ADR und LF_BSD_SENS_BAT_SMT_CTL. Sie sind im Modul des Hardwaretreibers global vereinbart.

BSD_SENS_BAT_SMT_INFO überträgt den Inhalt eines der acht BSD Register.

BSD_SENS_BAT_SMT_ADR (0 .. 7) adressiert das gewünschte Register.

LF_BSD_SENS_BAT_SMT_CTL enthält 7 Flags, die als Anforderung, Quittung, Fehlermeldung etc. die Kommunikation zwischen Komponententreiber (KT) und Hardwaretreiber (HT) koordinieren.

Um eine möglichst schnelle Übertragung zu erreichen, müssen der KT und der HT nacheinander in dieser Reihenfolge von der gleichen zyklischen Task aufgerufen werden.

B) Flags zur Kommunikation Hardware-/Komponententreiber, in LF_BSD_SENS_BAT_SMT_CTL

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Name	*Bit*	*gesetzt durch*	*gelöscht durch*	*Bedeutung*
BSDHTOK LV_SENS_BAT_SMT_BSD_DR_OK	0	HT	HT	Hardware Treiber ist bereit zur Übertragung; Flag bleibt an solange kein Fehlerzustand
BSDWRITE LV_SENS_BAT_SMT_BSD_WR	1	KT	KT	Richtung, hi: Register im Sensor schreiben
BSDDO LV_SENS_BAT_SMT_BSD_RUN	2	KT	HT	Anforderung von Komponenten- an Hardwaretreiber zum Start einer Übertragung
BSDBSY LV_SENS_BAT_SMT_BSD_WORK	3	HT	HT	Übertragung aktiv, Hardwaretreiber busy; Flag wird z.Zt. vom KT nicht benutzt
BSDRXRDY LV_SENS_BAT_SMT_BSD_TRM_END_AVL	4	HT	KT	Übertragung beendet, eingelesenes Byte ist verfügbar; Flag von Handler () im HT gesetzt
BSDTXOK LV_SENS_BAT_SMT_BSD_TRM_END_OK	5	HT	KT	Übertragung beendet, Byte wurde erfolgreich gesendet; Flag von Handler () im HT gesetzt
BSDERR LV_SENS_BAT_SMT_BSD_ERR_IT	7	HT	HT	BSD Fehler

Nur die fett gedruckten Flags werden für die laufende Kommunikation zwischen Komponenten- und Hardwaretreiber benötigt.

C) Ablauf der Übertragung eines BSD Telegramms

1. Nach KL15 an löscht die Hardwaretreiber- Initialisierung alle Flags in LF_BSD_SENS_BAT_SMT_CTL.
2. Der Hardwaretreiber baut die Verbindung zur Schnittstellen- Hardware auf. Nach erfolgreicher Verbindung und bei Funktionsbereitschaft setzt der HT das Flag LV_SENS_BAT_SMT_BSD_DR_OK.
3. Ist ausschließlich das Bit LV_SENS_BAT_SMT_BSD_DR_OK in LF_BSD_SENS_BAT_SMT_CTL gesetzt, interpretiert der KT dies als Startbedingung und setzt seine zyklische Kommunikation zum Sensor auf.
4. Der Komponententreiber prüft LV_SENS_BAT_SMT_BSD_DR_OK vor jeder Aktion. Ist der HT bereit, wird das gewünschte Register in BsdReg adressiert. Bei Schreiboperationen wird das Bit LV_SENS_BAT_SMT_BSD_WR und das Datenbyte BSD_SENS_BAT_SMT_INFO belegt. Der KT setzt das Bit LV_SENS_BAT_SMT_BSD_RUN.
5. Der Hardwaretreiber erkennt an LV_SENS_BAT_SMT_BSD_RUN die Anforderung zur Übertragung. Soll gesendet werden, übermittelt er das Datenbyte an die Hardware und startet die Sendung zum gewünschten Register, andernfalls veranlasst er den Empfang eines Bytes aus dem Sensor. Der HT löscht dann die Anforderung LV_SENS_BAT_SMT_BSD_RUN und setzt statt dessen das Flag LV_SENS_BAT_SMT_BSD_WORK.
6. Das Ende einer Übertragung wird je nach Implementierung durch schnelles Polling oder per Interrupt festgestellt, der HT enthält eine entsprechende Handler Routine. Diese löscht LV_SENS_BAT_SMT_BSD_WORK, kopiert nach einem Lesevorgang das eingelesene Byte nach BSD_SENS_BAT_SMT_INFO und setzt das Flag LV_SENS_BAT_SMT_BSD_TRM_END_AVL

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

zum Zeichen, dass der Komponententreiber ein empfangenes Byte auslesen kann. Nach einem erfolgreichen Schreibvorgang wird nur das Flag LV_SENS_BAT_SMT_BSD_TRM_END_OK gesetzt.

7. Der Komponententreiber liest LV_SENS_BAT_SMT_BSD_TRM_END_AVL bzw. LV_SENS_BAT_SMT_BSD_TRM_END_OK und löscht diese Flags, nachdem er ggf. das eingelesene Byte übernommen hat. Nach einem erneuten Test auf LV_SENS_BAT_SMT_BSD_DR_OK kann die nächste Übertragung durch Setzen von LV_SENS_BAT_SMT_BSD_RUN gestartet werden, s. 4).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Bemerkungen:
Das Flag LV_SENS_BAT_SMT_BSD_WORK wird z.Zt. nur HT- intern verwendet, der KT greift nicht darauf zurück.
Bei interruptgesteuerten Handler Routinen muss die Möglichkeit einer Unterbrechung von HT oder KT durch den Interrupt berücksichtigt werden. Im Komponententreiber wird darum eine lokale Kopie von LF_BSD_SENS_BAT_SMT_CTL verwendet.

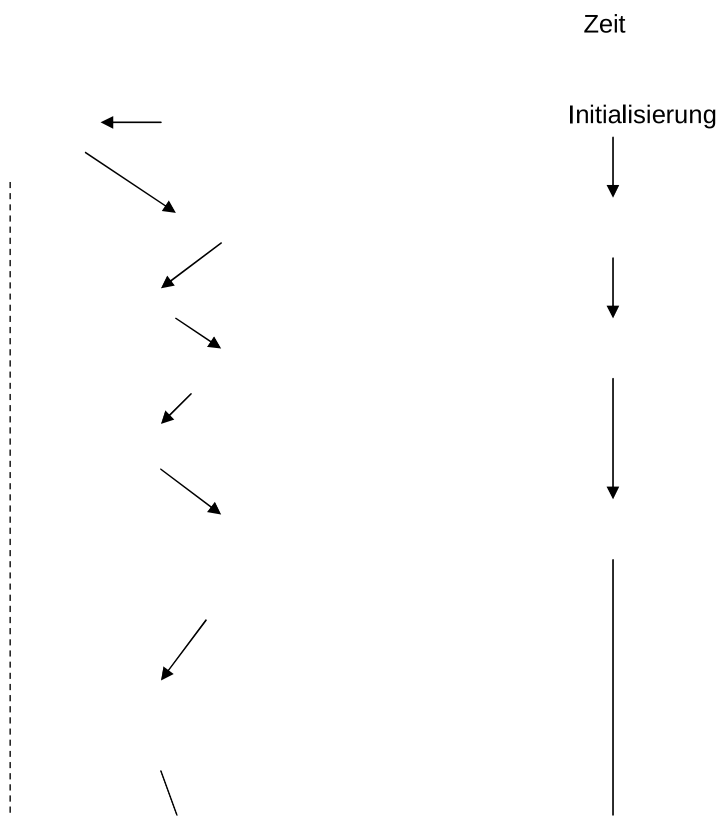
D) Fehlerbehandlung durch den HT

Wenn der Hardwaretreiber initial die Verbindung nicht herstellen kann oder wenn zwischenzeitlich die Verbindung abreisst, wird das Flag LV_SENS_BAT_SMT_BSD_DR_OK nicht gesetzt bzw. gelöscht.
In der Folge werden laufend neue Versuche zur Verbindung unternommen. Ist nach Ablauf einer entsprechenden Wartezeit Ibs_Ht_TimeOut keine Verbindung zustande gekommen, wird das Flag LV_SENS_BAT_SMT_BSD_ERR_IT gesetzt und alle anderen Flags gelöscht.
Der HT nimmt anschliessend einen Idle- Zustand ein, aus dem er nach der Zeit Ibs_Ht_IdleTime erwacht und wieder für Ibs_Ht_TimeOut weitere Initialisierungen versucht. Bei Erfolg kann wieder LV_SENS_BAT_SMT_BSD_DR_OK gesetzt und alle anderen Flags gelöscht werden, andernfalls bleibt die Fehlermeldung stehen.

Ibs_Ht_TimeOut: 20 Lese/ Schreibversuche

Ibs_Ht_IdleTime: applizierbar, vorbelegt 100s

E) Schema Flagaustausch zwischen Komponenten- und Hardwaretreiber



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Control of error interface across the BMW Layer for the PWSL OBJ file
As soon as a certain number of communications between the IBS and the ECU were not succesful the bit LV_SENS_BAT_SMT_ERR_IT is set. This bit is part of the logical field LF_BSD_SENS_BAT_SMT_CTL (bit 7). This logical field is then copied across the BMW Layer and used in the PWSL functionality. In case of a global BSD error the bit is set as well. Due to the fact that the single BSD error is de-bounced with a anti bounce counter and the counter CTR_MSG_SENS_BAT_SMT_COM_DIAG is reset to 0 after each increment of the anti bounce counter the anti bounce counter has to be taken into account as well.

IF LV_SENS_BAT_SMT_DET = 1 **and**
[CTR_MSG_SENS_BAT_SMT_COM_DIAG $\geq$ 1 **or**
CTR_ABC_SENS_BAT_SMT_COM $\geq$ 1 **or**
LV_ERR_BSD = 1]
THEN LV_SENS_BAT_SMT_BSD_ERR_IT = 1
EISE LV_SENS_BAT_SMT_BSD_ERR_IT = 0

9.48.4 Component Driver for electrical water pump

FUNCTION DESCRIPTION:

General information:

Register 0 and 6 is continuously updated although the LH requires a demand oriented writing of the messages (e.g. N_REL_CWP_SP). This is due to the fact that the CWP SW expectes at least all 2,5secs an updated information otherwise LIH mode is activated by the CWP SW.

Description:

Please find in the following section the **r/w** operations for the registers of the CWP.

1.	Time slot for CWP	KT_WE_ST_**WRITE**_REG0	Speed Setpoint
2.	Time slot for CWP	KT_WE_ST_*READ*_REG5	Variant
3.	Time slot for CWP	KT_WE_ST_*READ*_REG2	Supply Voltage

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. 9.48.5 Aquisition values for QLT - sensor

FUNCTION DESCRIPTION:

General information:

The oil sensor (QLT = Quality Level Temperature) delivers information about the oil temperature, the oil level and the oil quality. This sensor is located in oil pan. The communication between this oil sensor and the engine management systen (ECU) is done via BSD-interface.

Description:

A) Describtion of communication of the BSD-Interface

On the SW-side in the ECU the recieved BSD-messages are treated with a "component driver".
5 Registers are relevant:
0 Oiltemperatur
1 Oilniveau
2,3 Permittivity
6 Status /Variant
this values are updated every 200ms

In case of a BSD-communication error the bit B_ozfbsd is set

B) Describtion of the registers

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

This function delivers a alternator use profile over alternator load, alterantor chip temperatur and alterantor speed.
During a driving cycle (LV_ES = 0 and LV_ST_END = 1) the absolute temporary use profile STATE_TBL_ALTER_DC is calculated. It is a accumulated time of the related alternator operating points. Additional an timer is incremented (T_STATE_TBL_ALTER_DC) during calculation of STATE_TBL_ALTER_DC.
After a driving cycle (LV_ES 0->1) the relative use profile STATE_TBL_ALTER is calculated out of STATE_TBL_ALTER_DC, the old profile STATE_TBL_ALTER and the timer T_STATE_TBL_ALTER /_DC. This profile is saved in non volatile memory. The timer is calculated out of it's old value and the new timer T_STATE_TBL_ALTER_DC and is saved in non volatile memory. The timer T_STATE_TBL_ALTER and the profile STATE_TBL_ALTER show the behaviour of the alternator during the lifetime of the vehicle.
T_STATE_TBL_ALTER and STATE_TBL_ALTER are saved in NVMY during power latch phase.

Application conditions

Initialisation: `STATE_TBL_ALTER and T_STATE_TBL_ALTER from NVMY, all other = 0 at reset, at LC_AD_CLR 0->1` **or** `LC_AD_CLR_ALTER 0->1, T_STATE_TBL_ALTER = 0 and STATE_TBL_ALTER = 0`

Recurrence: *1s*

Activation: *at every engine state*

Formula section:

```
// Calculation of alternator profile during driving cycle:
If      LV_ES = 0   and   LV_ST_END = 1   and   LV_STATE_TBL_ALTER_INH = 0
Then        // calculation of STATE_TBL_ALTER_DC with x = ID_STATE_TEMP_ALTER,        // y =
ID_STATE_LOAD_ALTER, z = ID_STATE_N_ALTER:
            STATE_TBL_ALTER_DC[x][y][z] = STATE_TBL_ALTER_DC[x][y][z] + 1
            // increment timer:
            T_STATE_TBL_ALTER_DC ++
            // stop calculation if limit reached:
            If       T_STATE_TBL_ALTER_DC = 65335s
            Then   LV_STATE_TBL_ALTER_INH = 1
            Endif
Else        do nothing - calculation of STATE_TBL_ALTER_DC stopped
Endif

// Calculation of alterantor profile for NVMY:
If              LV_ES 0 ->1
Then        //write STATE_TBL_ALTER_DC in STATE_TBL_ALTER:
             For x=1:7
             {         For y=1:5
                       {         For z=1:5
                              {    STATE_TBL_ALTER[x][y][z] =
                                   ( STATE_TBL_ALTER[x][y][z] * T_STATE_TBL_ALTER
                                        + STATE_TBL_ALTER_DC[x][y][z] )
                                   /( T_STATE_TBL_ALTER + T_STATE_TBL_ALTER_DC )
                              }
                       }
             }
             //calculate new time since starting to write STATE_TBL_ALTER:
             T_STATE_TBL_ALTER = T_STATE_TBL_ALTER + T_STATE_TBL_ALTER_DC
             //reset of temporary values:
             T_STATE_TBL_ALTER_DC = 0
             STATE_TBL_ALTER_DC[ ][ ][ ] = 0                    // complete map = 0
             LV_STATE_TBL_ALTER_INH = 0
Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. TIA threshold for EBOX cooling fan ON					

General information:

The function should prevent a overheating of the ECUs in the EBOX. For that, a cooling fan is controlled in dependency of the ECU temperature and the intake air temperature.

Application conditions

Initialisation:
```
LV_EBOX_CFA = 0 ,
 T_MAX_EBOX_CFA_ACT = 0  at transition LV_IGK 0 - ->1
 LV_EBOX_CFA_ACT_TEST_END = 0 at transition LV_IGK 0 - ->1
```

Recurrence: *1000 ms*

Activation:
```
at every engine operating states and
       LV_VAR_EBOX_CFA = 1
```

Description:

There are two operating states for the activation of the Ebox-cooling-fan:
1) for power stage diagnosis:
the Ebox-cooling-fan has to be briefly activated at every transition LV_IGK 0 - -> 1 in order to be able to perform a complete diagnosis cycle. After LV_IGK 0 - -> 1 and the exceeding of a calibratable N-threshold the Ebox-CFA is activated either until LV_END_DIAG_EBOX_CFA is set to 1 (diagnosis completed) or the maximum time C_T_MAX_EBOX_CFA_ACT has been reached.
2) normal operation:
activation via external adjustment or due to cooling request because of high TIA or TECU

Formula section:

```
// Activation of Ebox-cooling-fan - for diagnosis (at every transition LV_IGK 0 - -> 1):
If (1)        LV_IGK = 1     and
           N > C_N_THD_EBOX_CFA_ACT     and
              LV_EBOX_CFA_EXT_ADJ = 0       and
           LV_EBOX_CFA_ACT_TEST_END = 0
then (1)    if (2)          (T_MAX_EBOX_CFA_ACT < C_T_MAX_EBOX_CFA_ACT)   and
                            LV_END_DIAG_EBOX_CFA <> 1
             then (2)       T_MAX_EBOX_CFA_ACT = ++
                         LV_EBOX_CFA = 1
           else (2)        LV_EBOX_CFA = 0
                              LV_EBOX_CFA_ACT_TEST_END = 1
             endif (2)
else (1)

9.51.1 MISC_M905G

The functionality active engine bracket supports the controllable engine suspension. To improve the driveability of the vehicle and to decrease the transmission of engine vibrations, it is possible to switch the engine bracket from the state stiff to the state soft .

Copyright (C) Continental AG,2007

To compensate the more rough combustion in stratified mode the engine brackets are switched into a soft characteristic.

Application Condition

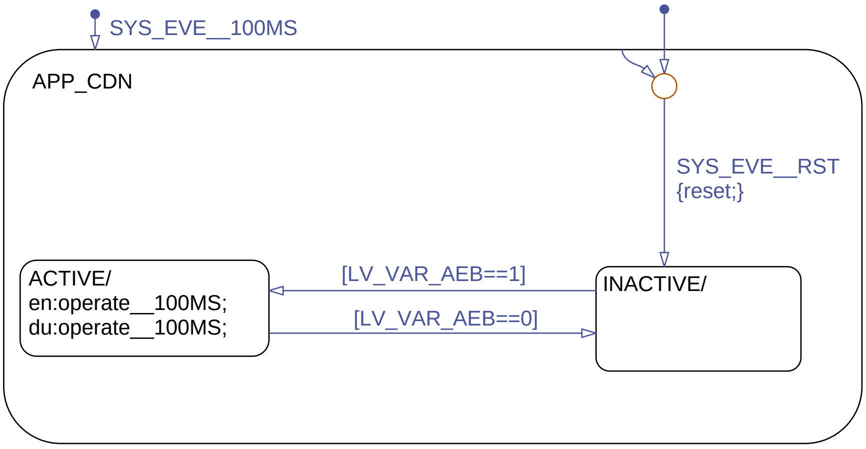

Figure 9.51.1: MISC_M905G/APP_CDN/Chart1

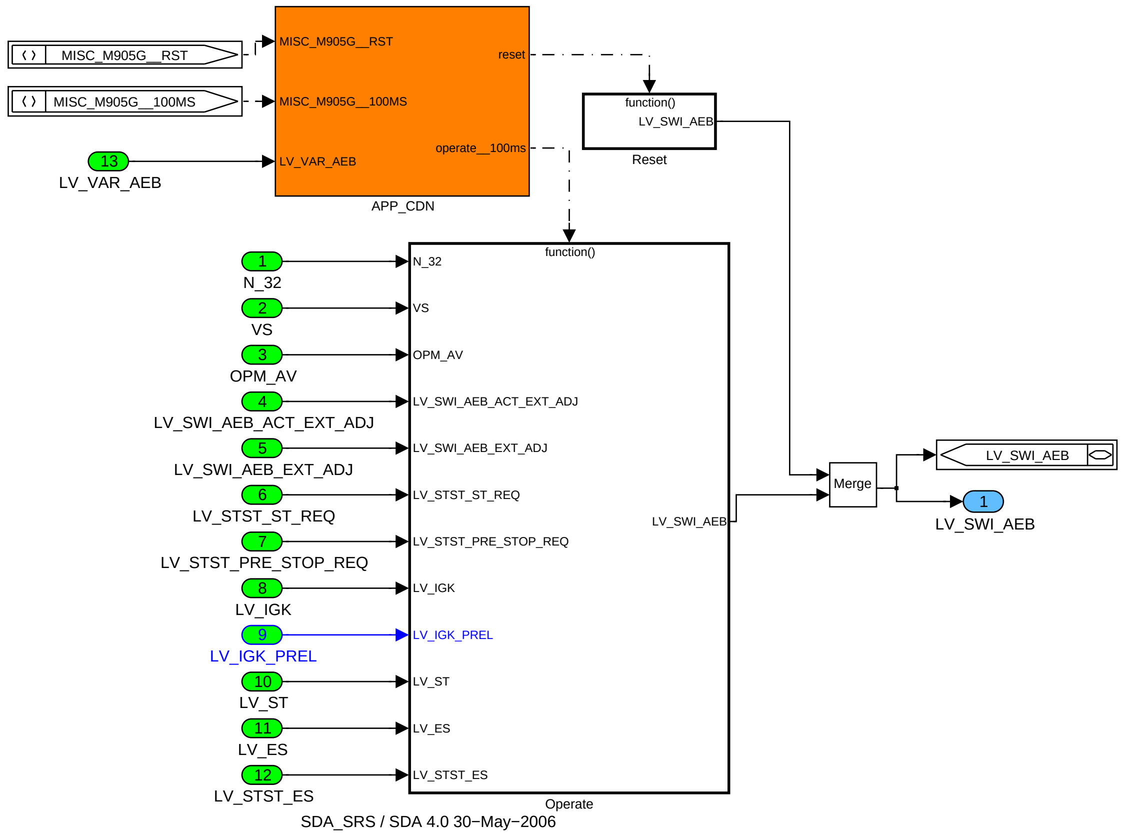

Figure 9.51.2: MISC_M905G

9.51.1.1 MISC_M905G/OPERATE

Dependent on engine speed and vehicle speed in each combustion mode, the logical variable LV_SWI_AEB is set to 1 and the corresponding ECUPin is set under current. In this case the engine bracket is switched to the state soft . Otherwise the "stiff" mode of the engine brackets is active. There is a hysteresis for engine speed and vehicle speed (common for all combustion modes) to avoid toggling of LV_SWI_AEB. The logical constant LC_SWI_AEB_TYP is introduced to take the different engine bracket types into account, which are provided from different suppliers.

intake air temperature hysteresis between activation and deactivation of CRCV_HEAT (default: 3°C)					
C_TIA_MAX_RLY_CRCV_HEAT	-	0... FEH	-48... 142.5	0.75	°C
Maximal intake air temperature for CRCV_HEAT activation (default: 0°C)					

9.52.1 Import Actions

ACTION_INFR_SetCRCVHEAT(IN <lv_rly_crcv_heat>**)**
This action sets the output pin for the "CRCV_HEAT Switch"

Note: The imported actions are defined in the HVAC - IRS (infrastructure requirement specification).

General information:

To prevent crankcase ventilation from fouling under cold conditions it is necessary to heat the ventilation rail. For the power stage of this heating an external relay plus heating foil is introduced. The control stage is realised by the engine management system using the below statemachine.

Application conditions

Initialisation: *at reset and deactivation all var. are initialised with 0*

Recurrence: *1000ms*

Activation: see signal flow diagram

Deactivation: see signal flow diagram

Signal flow diagram:

General information

9.53.1 Calculation of statistical data

Copyright (C) Continental AG,2007

General information:

This functionality provides a statistical quantification of the fuel quality, or RON, used in the vehicle over a long period of time. In addition, the fuel quality and the covered distance at the last five refuels is captured. This information can be accessed via a workshop tester and it provides the engineer/mechanic with information that could assist in analysing customer complaints hinting towards poor driveability etc. This functionality requires the detection of a refuel (LV_REFU = 1) which is provided by the DMTL module, hence the functionality is only operable in vehicles with DMTL.
The parameter used for the statistical analysis is, depending on system architecture, either IGA_MV_ADJ_KNK_RON or FAC_RON (= DZW_ANNM or F_OCTAN respectively, obtained from BMW layer). The parameter to be used is configurable via the switch LC_IGA_MV_ADJ_KNK_RON_SEL. A low-, medium- and high RON-range is configurable via calibratable constants. Each time a vehicle refuelling is detected, IGA_MV_ADJ_KNK_RON or FAC_RON is allocated to the applicable range and the corresponding statistical counter is incremented. At the same time the covered distance is captured. The three RON-range statistical counters together with the last five captured RON-ranges with corresponding covered distance are provided to the workshop tester via diagnostic communication.

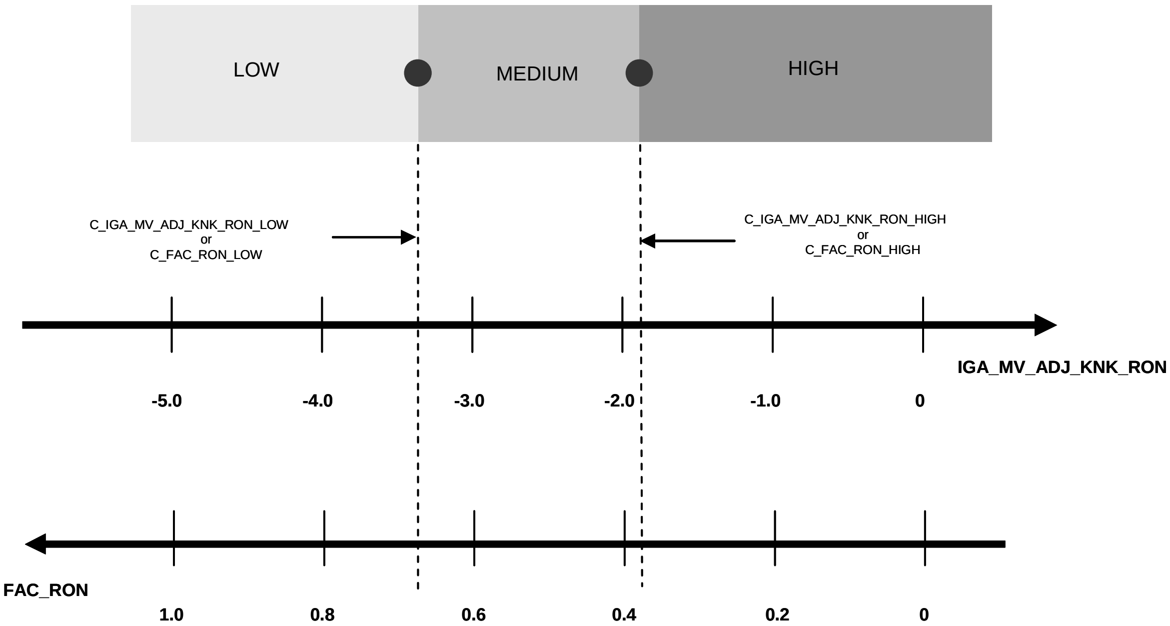

Figure 9.53.1:

Application conditions:

Initialisation:

```
All 0 at ECU reset, except:
CTR_STC_RON_xx                  from NVMY.
STATE_RON[NC_NR_RON_KWP]        from NVMY.
DIST_RON_STC[NC_NR_RON_KWP]     from NVMY.
Non-volatile data are initialized with 0 at first run of new
ECU or in case of NVRAM error.  Otherwise they are reprogramming-proo
```

Activation: `LC_RON_STC_ENA = 1` **and** `// at end-of-refuelling detection.`
`LV_REFU = 1`

Deactivation: `LV_RON_STC_DEACT = 1`

Recurrence: `1000ms`

9.53.2 Reset of statistical data

Copyright (C) Continental AG,2007

General information:

All non-volatile-data are **reprogramming proof,** i.e. they are NOT reset when the ECU is reprogrammed. However, they can be reset by application tool or workshop tester, via LC_AD_CLR_STC_RON or LV_RON_STC_CLR_KWP respectively.

Application conditions:

Initialisation: -

Activation: LC_RON_STC_ENA = 1 **and** LV_IGK = 1

Deactivation: -

Recurrence: 1000ms

Function description:

Formula section:

```
If      LC_AD_CLR_STC_RON = 1                   or
        LV_RON_STC_CLR_KWP = 1
Then    CTR_STC_RON_xx                                    =  0
        STATE_RON[NC_NR_RON_KWP] (Whole array)            = 0
        DIST_RON_STC[NC_NR_RON_KWP] (Whole array)         = 0
Endif
```

ACTION_SWT_SwidToCallid(IN<32bit SWID>, OUT<16bit CALL ID>)
Converts a 32bit SWID representation to a 16 bit CALL ID representation
ACTION_SWT_CallidToSwid(IN<16bit CALL ID>, OUT<32bit SWID>)
Converts a 16bit SWID representation to a 32 bit CALL ID representation
ACTION_SWT_SetFscLen(IN<32bit SWID>, IN<FSC_LEN>, OUT<SWT Returncode>)
Used by KWP to Set the complete length of the message Input Parameter: SWID: Software ID of the FSC which will be delivered FSC_LEN: Total Length of the FSC wihich will be delivered Output Parameter: SWT Returncode: **0x00:** Processing successfully; *) **0xFF:** Unknown failure; **0xFE:** SWID not in ECU/Invalid SWID; *) **0xD9:** No L3 authentication; **0xD6:** Wrong Parameter; *) **0xD3:** No free space for storing FSC *) used at Immobilizer FSC, too
ACTION_SWT_RcvFsc(IN<32bit SWID>, IN<u8ptr FSC>, IN<FRAME_LEN>, OUT<SWT Returncode>)
Used by KWP and UDS to overgive the FSC to the SWT Interface. Contains the complete FSC by calling from UDS. By calling from KWP the Action is called for every delivered segment. The Immobilizer FSC will be saved here temporary only in RAM. After successfully check "ACTION_SWT_ChkFsc", this informations will be stored in EEPROM and Flash. All other FSC will be stored here immediately into EEPROM without "Signature Check". The FSC-Status will be set to: **0x00**:nicht vorhanden; **0x01**:eingespielt; Input Parameter: SWID: Software ID of the FSC which will be delivered FSC: u8 Pointer to the beginning of the FSC segment FRAME_LEN: Total Length of the FSC Segment Output Parameter: SWT Returncode: **0x00:** Processing successfully; *) **0xFF:** Unknown failure; **0xFE:** SWID not in ECU/Invalid SWID; *) (KWP must send back 0xD6) **0xF8:** Invalid FSC Date; **0xE0:** Flash write error; **0xD9:** No L3 authentication; **0xD6:** Wrong Parameter; *) **0xD3:** No free space for storing FSC; **0xD1:** parser structure wrong / (IMOB FSC: Wrong); *) used at Immobilizer FSC, too
ACTION_SWT_ChkFsc(IN<32bit SWID>, OUT<SWT Returncode>)

Checks an overgiven FSC.Immobilizer FSC: After successfully check, this information will be stored in EEPROM and Flash. All other FSC are already stored in EEPROM and will be checked here. The information about this check will be stored in EEPROM: **0x02**:akzeptiert; **0x03**:abgelehnt;0x00:nicht vorhanden; 0x01:eingespielt; 0x04:storniert; Input Parameter: SWID: Software ID of the FSC was delivered by ACTION_SWT_StrFSc and needs to be checked Output Parameter: SWT Returncode: **0x00:** Processing successfully; *) **0xFF:** Unknown failure; **0xFE:** SWID not in ECU/Invalid SWID; *) **0xFC:** wrong SWID inside FSC; **0xF9:** Signature invalid;*) **0xF8:** Invalid FSC Date; **) **0xF6:** FSC is not available; **0xF5:** FSC is rejected; **0xF4:** FSC is cancelled; **0xDF:** Flash read error; *) **0xDE:** VIN check failed **0xD9:** No L3 authentication; **0xD2:** VIN can not be found in ECU; (VIN is 0x00...) **0xD1:** IMOB FSC: Wrong; **) *) used at Immobilizer FSC, too **) used at Immobilizer FSC only
ACTION_SWT_GetSodtwareIdFunc(OUT<u8ptr NUMBER_OF_SWID>, OUT<SWID>, OUT<SWT Returncode>)
Returns all SWID's which are available in this SW (without IMOB-SWID) Input: Parameter: none Output Parameter: NumberOfSwids: SWID: Software ID's of the FSC which are available SWT Returncode: **0x00:** Processing successfully; **0xFF:** Unknown failure; **0xD6:** Wrong Parameter
ACTION_SWT_GetStatus(IN<32bit SWID>, OUT<u8ptr STATUS>, OUT<SWT Returncode>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Returns the status of the FSC which is selected by the SWID (without IMOB-SWID)
<u>Input: Parameter:</u>
SWID: Software ID of the FSC which status should be checked
<u>Output Parameter:</u>
Status: Status of the stored FSC:
0x00:nicht vorhanden; **0x01**:eingespielt; **0x02**:akzeptiert; **0x03**:abgelehnt; **0x04**:storniert
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure; (also used by Flash read error)
0xFE: SWID not in ECU/Invalid SWID; (KWP must send back 0xFF only if all requests are invalid)

ACTION_SWT_DisableFsc(IN<32bit SWID>, OUT<SWT Returncode>)

Reverse an valid FSC (without IMOB-FSC)
The information about the disabled FSC will be stored in EEPROM: **0x04**:storniert;
<u>Input: Parameter:</u>
SWID: Software ID of the FSC which status should be checked
<u>Output Parameter:</u>
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure; (also used by Flash read/write error)
0xFE: SWID not in ECU/Invalid SWID;
0xF6: FSC is not available;
0xF4: FSC is already disabled;
0xD9: No L3 authentication;

ACTION_SWT_GetFscLen(IN<32bit SWID>, OUT<u8ptr LENGTH>, OUT<SWT Returncode>)

Returns the length of the FSC which is selected by the SWID (without IMOB-SWID)
<u>Input: Parameter:</u>
SWID: Software ID of the FSC which length should be checked
<u>Output Parameter:</u>
<u>Length:</u> Length of the selected FSC
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure;
0xFE: SWID not in ECU/Invalid SWID;
0xF6: FSC is not available;
0xDF: Flash read error;

ACTION_SWT_GetFsc(IN<32bit SWID>, OUT<u8ptr FSC>, OUT<SWT Returncode>)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Returns the complete FSC which is selected by the SWID (without IMOB-SWID)
Input: Parameter:
SWID: Software ID of the FSC which should be read
Output Parameter:
FSC: Freischaltcode (Header + Signature)
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure;
0xFE: SWID not in ECU/Invalid SWID; (KWP must send back **0xD6:** Wrong Parameter)
0xD6: Wrong Parameter; (also used for "FSC is not available")

ACTION_SWT_GetVin(OUT<u8ptr VIN>, OUT<SWT Returncode>)

Returns the Vehical Identification Number (Fahrgestellnummer)
Input: Parameter:
none
Output Parameter:
VIN: Vehical Identification Number (7 Byte)
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure;

ACTION_SWT_SetVin(IN<u8ptr VIN>, OUT<SWT Returncode>)

This action is simulating the storage of a new "VIN" into the ECU
Input: Parameter:
VIN: Vehical Identification Number (7 Byte)
Output Parameter:
SWT Returncode:
0x00: Processing successfully;
0xFF: Unknown failure;
0xE0: Flash write error; (VIN in ECU is not the received VIN)
0xD9: No L3 authentication;
0xD6: Wrong Parameter

ACTION_IMOB_ WrNvmyFscEws4A( )
Stores a IMOB FSC in EEPROM
ACTION_IMOB_ChkSigFsc( )
Checks if a IMOB FSC Signature is valid
ACTION_INTC_NO_VECH_REQ( )
Trigger CAS to send new VIN over CAN (VIN_CAN)

Definition of SWID and CALLID

General information:

The Software ID (SWID) is a 32 bit data type which contains 4 8bit fields. The CALL ID is a 16 bit short format used by KWP which is generated by 2 of the 4 SWID 8bit fields.

Endif

ACTION_SWT_SetFscLen(IN <32bit SWID>, <FSC_LEN>,OUT <SWT Returncode>)

General Information:

This action sets the expeted FSC length at the SWT_Interface. It needs to be called only if the FSC is transmitted via KWP Frames (L4) because the FSC is delivered in segments. This function stores the expected message length and its SWID to the SWT Interface.

Returnvalues are defined in the action tables.

Formula section:

LOC_FSC_BYTES_RCV=0

If FSC_LEN> NC_SIZE_FSC_BUFFER (296 bytes)

ACTION_SWT_ChkFsc (IN <32bit SWID>,OUT <SWT Returncode>)

General Information:

IMOB SWT:

This action checks the delivered FSC by valid serial_number, FSC creation date, SWID and enables the storage of the FSC into EEPROM and Flash.
General SWT:
This action checks the delivered FSC by valid VIN and SWID.
The Vatiable "LV_FSC_XMAX_RD_OK" is defined in "anvmswt.c" which doesn't need a specification.

Formula section:

General Information:

This Function is checking the FSC signature
Base for CR_A_NewAaMExp is the signature from the FSC (last 128byte of FSC)
The result is compared with the MD5-hashed FSC, excluded signature.
Attention: The Cryptofunction "CR_A_NewAaMExp" is used over a long time (ms), during this time it is not allowed to called this function a second time (e.g. for DH-KF-Calculation). At the moment there is no locking mechanism implemented, because projects with DH-KF-Calculation are not using VMAX, PMAX).

Formula section:

Function Description

General information:
The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The input signal is analog from a NTC located at the Mass air flow meter.
Description:
Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Short circuit to Vbatt or open load        (= SYM_0)
 │ │ └───> Short circuit to GND                  (= SYM_1)
 │ └─────> -                                     (= SYM_2)
 └───────> -                                     (= SYM_3)
```

General Information

General information:
The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The input signal is analog from a NTC.
Description:
Error symptoms are defined for this diagnosis function as:

> Short circuit to Vbatt or open load (= SYM_0)
> Short circuit to GND (= SYM_1)
> - (= SYM_2)
> - (= SYM_3)

Application Conditions

Initialization: RST, IGKON
Recurrence: 100MS
Activation: always
Deactivation: never

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Function description

Short circuit to ground, short circuit to battery or open load can be detected

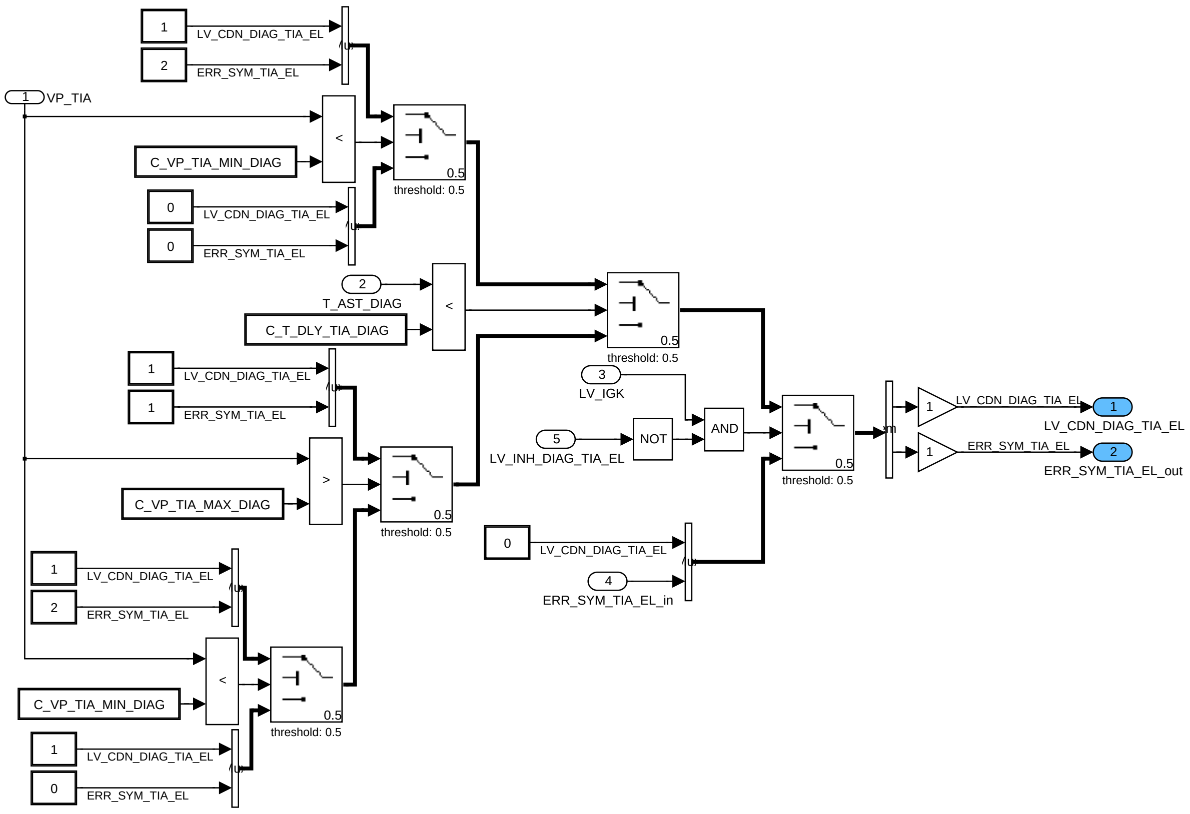

Figure A.2.3: :

A.2.2.1.2 Intake air temperature signal gradient diagnosis

The purpose of the signal gradient diagnosis is to detect a not plausible gradient on the intake air temperature signal. The monitoring is based on a comparison between the actual and the last intake air temperature value. The symptom of the error code is handled by anti-bouncing.
Error-symptoms are defined to this diagnosis function as following:

> (= SYM_0)
> (= SYM_1)
> -Intake air temperature range check error (= SYM_2)
> -Intake air temperature signal gradient error (= SYM_3)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Name	Mode	Hex. limits	Phys. limits	Resol.	Unit

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults in the recirculation flap.
The input signal is a modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.
The diagnosis condition calculation is done according **“Open range”** duty cycle, thus a definition of the PWM diagnosis windows is neccessary (see calibration data).

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
 │ │ │ └─> Short circuit to VBatt        (= SYM_0)
 │ │ └───> Short circuit to GND          (= SYM_1)
 │ └─────> Open load                     (= SYM_2)
 └───────> -                             (= SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 100ms

Activation: *LV_VAR_TCHA = 1*

Deactivation:
```
If    LV_VAR_TCHA = 0
 Then  LV_END_DIAG_RFP_DR = 1
  Endif
```

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_RFP_DR = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_RFP_DR.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RFP_DR.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_RFP_DR and ERR_DIAG_RFP_DR.

This algorithm determines:
ERR_SYM_RFP_DR (detected error symptom)
LV_ERR_RFP_DR (Error flag for debounced error)
LV_CDN_DIAG_RFP_DR (Diagnosis condition information)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LV_END_DIAG_RFP_DR (End of diagnosis information)

Diagnosis inhibition:

IF LV_IGK = 1 **AND**
LV_CDN_VB_OBD1 = 1 **AND**
LV_ERR_SPI_MPS = 0
THEN LV_INH_DIAG_RFP_DR = 0
ELSE LV_INH_DIAG_RFP_DR = 1
ENDIF

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

C_WG_DR_PWM_DIAG_MIN_SCB	-	0... FFFFH	0... 99.99847	1.5259e-3	%
Minimum threshold for SCB diagnosis window					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults in the waste gate. There are one for each exhaust bank (x = 1 or 2). All calibration data will be copyed into SW internal CBK spezific calibration data. Example:
C_ABC_INC_WG_DR = C_ABC_INC_WG_1_DR = C_ABC_INC_WG_2_DR
The input signal is a modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.
The diagnosis condition calculation is done according **“Open range”** duty cycle, thus a definition of the PWM diagnosis windows is neccessary (see calibration data).

Error-symptoms are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

In principle both brake light switch and brake test switch must be active at each braking. An edge mismatch between the brake light switch and brake test switch signal of +/- 20 µs can occur. A defective BTS is therefore detected by means of the following function.

Description:

The following errors can be detected:

- BLS implausible

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘

Switch to enable brake pressure monitoring for plausibility check					

FUNCTION DESCRIPTION:

General information:

The following diagnosis are performed:

- Diagnosis of sensor-supply voltage VCC_PVS_i
- PVS-synchronization control (RATIO-Check)
- Signal range check low and high (SRCL, SRCH)
- PVS double error
- Plausibility between brake /PVS

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.7.1 Global PVS system error LV_ERR_PVS

Description:

The global error LV_ERR_PVS is set if at least one PVS error is set.

Application conditions

Initialisation: *0 at LV_IGK 0->1* ***or*** *reset*

Recurrence: *10ms*

Activation: *LV_IGK = 1*

Formula section:

If LV_ERR_V_REF_x = 1 *// 1 or 2*
or LV_ERR_PVS_x = 1
or LV_ERR_PVS_RATIO = 1
Then LV_ERR_PVS = 1
Else LV_ERR_PVS = 0
Endif

A.7.2 Diagnosis of sensor-supply voltage VCC_PVS_i

General information:

The PVS sensor supply voltage 5V [Range 0...9.9902 V] is compared with the measured actual supply voltage every 10 ms (forming differences).
x = 1 and 2

Description:

If diagnosis condition is reached and error symptom is detected ERR_SYM_V_REF_i is set. After the debounce LV_ERR_V_REF_1 (at error channel 1), LV_ERR_V_REF_2 (at error channel 2) are set. The faulty channel is not evaluated during this driving cycle.
Remark:
During the debounce time (ERR_SYM_V_REF_x = SYM_3) the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
│ │ │ └─> -                                  (= SYM_0)
│ │ └───> -                                  (= SYM_1)
│ └─────> -                                  (= SYM_2)
└───────> PVS - Voltage controller faulty    (= SYM_3)
```

Application conditions

Initialisation: *all 0 at LV_IGK 0->1* ***or*** *reset*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Recurrence: *10ms*

Activation:
```
If        LV_IGK = 1                and
    LV_ERR_V_REF_x = 0
   Then        LV_CDN_DIAG_V_REF_x = 1
Else       LV_CDN_DIAG_V_REF_x = 0
Endif
```

Formula section:

Error detection PVS-Channel:
If(1) | 5V - VCC_PVS_x | > C_VCC_DIF_PVS
Then(1) ERR_SYM_V_REF_x = SYM_3
Set ofLV_ERR_V_REF_1 (or 2) and LV_ERR_PVS:
If(2) ABC counter reaches max
// CTR_ABC_V_REF_x >= C_ABC_MAX_V_REF_x
Then(2) LV_ERR_V_REF_x = 1 *// set for this DC*
Endif(2)
Else(1) ERR_SYM_V_REF_x = NO_SYM
Endif(2)

Calculation end of diagnosis
LV_END_DIAG_V_REF_x is calculated by error management

A.7.3 PVS-synchronization control (RATIO-Check)

Description:

In order to have an error free system the pedal value sensor voltages V_PVS_x may not deviate more than IP_PVS_RATIO_HYS (V_PVS_2 must be doubled!) from each other. The smaller PVS-voltage serves as a break point for the characteristic curve.
The RATIO-Check is then only carried out if both channels are error - free.
ERR_SYM_PVS_RATIO is set when the error conditions are present; after debounce the error bit LV_ ERR_PVS_RATIO is set.
During the debounce time (ERR_SYM_PVS_RATIO = SYM_3) the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").
Error-symptoms are defined to this diagnosis function as following :

```
 ┌─┬─┬─┬─┐
 └─┴─┴─┴─┘
 │  │  │  └─> -                              (= SYM_0)
 │  │  └────> -                              (= SYM_1)
 │  └───────> -                              (= SYM_2)
 └──────────> PVS voltages not plausible     (= SYM_3)
```

Application conditions

Initialisation: *all 0 at LV_IGK 0->1* ***or*** *reset*

Recurrence: *10ms*

Activation:
```
If        LV_IGK = 1                and
    LV_ERR_PVS = 0              and
   Then        LV_CDN_DIAG_PVS_RATIO = 1
Else       LV_CDN_DIAG_PVS_RATIO = 0
Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Error detection:

```
V_PVS_MIN  =  Min(V_PVS_1, 2 * V_PVS_2)
If(1)                    | V_PVS_1 - (2 * V_PVS_2) |  >  IP_PVS_RATIO_HYS__V_PVS_MIN
Then(1)          ERR_SYM_PVS_RATIO = SYM_3
Set ofLV_ERR_PVS_RATIO and LV_ERR_PVS:
   If(2)                    ABC counter reaches max
                                  // CTR_ABC_PVS_RATIO   >=  C_ABC_MAX_PVS_RATIO
   Then(2)          LV_ERR_PVS_RATIO =            1          // set for this DC
   Endif(2)
Else(1)          ERR_SYM_PVS_RATIO = NO_SYM
Endif(1)
```

Calculation end of diagnosis

LV_END_DIAG_PVS_RATIO is calculated by error management

A.7.4 Signal-Range-Check (High: SRCH /Low: SRCL)

General information:

Both diagnosis are only performed if the channel is not debounced as faulty (x = 1 and 2).

- The **SRCH** diagnosis is to detect a short to Vbatt error.
- The **SRCL** diagnosis is to detect a short to Ground /open load error.

Description:

SRCH diagnosis:

The sensor voltage must lie below the permissible voltage limits (C_V_PVS_MAX_DIAG_x) for an error-free system. ERR_SYM_PVS_x is set while the error symptom is present, the bits LV_ERR_PVS_X are set after debounce. The channel x is no longer evaluated during this driving cycle.

SRCL diagnosis:

The sensor voltage must lie upper the permissible voltage limits (C_V_PVS_MIN_DIAG_x) for an error-free system. ERR_SYM_PVS_x is set while the error symptom is present, the bits LV_ERR_PVS_X are set after debounce. The channel x is no longer evaluated during this driving cycle.

Remark:

During the debounce time (ERR_SYM_PVS_x = SYM_0 or SYM_1) and while error conditions are true the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").

Error-symptoms are defined to this diagnosis function as following :

```
 |_|_|_|_|
 | | | └─> Short circuit to Vbatt             (= SYM_0)
 | | └───> Short circuit to GND or open load (= SYM_1)
 | └─────> -                                 (= SYM_2)
 └───────> -                                 (= SYM_3)
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialisation: *all 0 at LV_IGK 0->1* ***or*** *reset*

Recurrence: *10ms*

Activation:

```
If        LV_IGK = 1                          and
    LV_ERR_PVS_x = 0                      and
    LV_ERR_V_REF_x = 0
   Then           LV_CDN_DIAG_PVS_x = 1
Else        LV_CDN_DIAG_PVS_x = 0
Endif
```

Formula section:

Short circuit to Vbatt:
If(1) V_PVS_x > C_V_PVS_MAX_DIAG_x (X = 1,2)
Then(1) ERR_SYM_PVS_x = SYM_0
Short circuit to GND or open load
Else(1)If(2) V_PVS_x < C_V_PVS_MIN_DIAG_x
Then(2) ERR_SYM_PVS_x = SYM_1
PVS voltage is in valid range
Else(2) ERR_SYM_PVS_x = NO_SYM
Endif(2)
Endif(1)

Calculation end of diagnosis and present failure
LV_ERR_PVS_x and LV_END_DIAG_PVS_x are calculated by error management

A.7.5 PVS - Double error

Description:

In order to illuminate the MIL if both PVS channels are detected as faulty there is a seperate error flag LV_ERR_PVS_DOUBLE (all other PVS errors shall be calibrated as non - MIL relevant).
If a channel is already detected as faulty (through sensor supply, SRCH, SRCL) and afterwards another sensor error appears, then the system goes into the PVS limp home for this driving cycle (see limited dynamic 2).
Error-symptoms are defined to this diagnosis function as following :

```
 _______________
|___|___|___|___|
 |   |   |   └──> -                            (= SYM_0)
 |   |   └──────> -                            (= SYM_1)
 |   └──────────> -                            (= SYM_2)
 └──────────────> PVS - Double error           (= SYM_3)
```

Application conditions

Initialisation: *all 0 at LV_IGK 0->1* ***or*** *reset*

Recurrence: *10ms*

Activation:

```
If        LV_IGK = 1                          and
    LV_ERR_PVS_DOUBLE = 0
   Then          LV_CDN_DIAG_PVS_DOUBLE = 1
        LV_END_DIAG_PVS_DOUBLE = 1
Else        LV_CDN_DIAG_PVS_DOUBLE = 0
Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

```
If      [ LV_ERR_V_REF_1 = 1        or
        LV_ERR_PVS_1 = 1      ]     and
        [ LV_ERR_V_REF_2 = 1        or
        LV_ERR_PVS_2 = 1 ]
Then    ERR_SYM_PVS_DOUBLE = SYM_3
        LV_ERR_PVS_DOUBLE = 1              //set direct
Endif
```

A.7.6 Plausibility between PVS signal and brake detection

General information:

This function is to detect a mechanical stucking PVS sensor or a break actuation while the gas pedal is already activated.
The diagnosis algorithm can be configured with C_PVS_BLS_BTS_PLAUS_CONF:

1. Function is disabled
2. Function is enabled but no error entry
3. Function is enabled with error entry

Description:

Error detection is based on a plausibility check brake/pedal value.
LV_PVS_BLS_NOT_PLAUS_ACT is using the same debounce calibration data like LV_ERR_PVS_BLS_NOT_PLAUS but without error entry.
If the configuration is switched within the active engine run after an active error was present then the error is not reseted until the error memory is cleared.

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │  │  │  └> -                          (= SYM_0)
 │  │  └───> -                          (= SYM_1)
 │  └──────> -                          (= SYM_2)
 └─────────> PVS to Brake not plausible (= SYM_3)
```

Application conditions

Initialisation: *at LV_IGK 0->1* ***or*** *reset* ***or*** *at clearing error memory:PV_AV_MAX_BRAKE_DET = 100%, all other output 0*

Recurrence: 10 ms

Activation:

```
If        C_PVS_BLS_BTS_PLAUS_CONF = 0      or
    LV_IGK = 0
 Then         Function is disabled      and
         PV_AV_MAX_BRAKE_DET = 100%     and
         LV_CDN_DIAG_PVS_BLS_NOT_PLAUS  =  0
 Else         function is active
Endif
```

Calculation end of diagnosis
LV_END_DIAG_PVS_BLS_NOT_PLAUS is calculated by error management

A.7.7 Pedal value sensor limp home

General information:

Depending if there is a ratio or single or double PVS error, different limp homes are applied.

PVS_LIH_PRED: Is active during debounce - time is active. The pedal value is frozen in rising direction.

PVS_LIH_x_PRED: Is active if only one channel is detected as faulty and the remaining channel was not in idle detection range for a calibratable time. Pedal value is 0.

PV_LIH_x: Is active if only one channel is detected as faulty and the remaining channel was in idle detection range for a calibratable time. Limited dynamic 1 is applied (= Lower engine speed limitation and if brake or brake error is active then pedal value is 0).

PVS_LIH_MIN: Is active if ratio error is present. Pedal value is selected as a MIN-selection.

PVS_DBL_ERROR: Is active if both channels are detected as faulty or with a present ratio error and a high range error of the observed (=MIN) channel. Limited dynamic 2 is applied (= pedal value is 0,

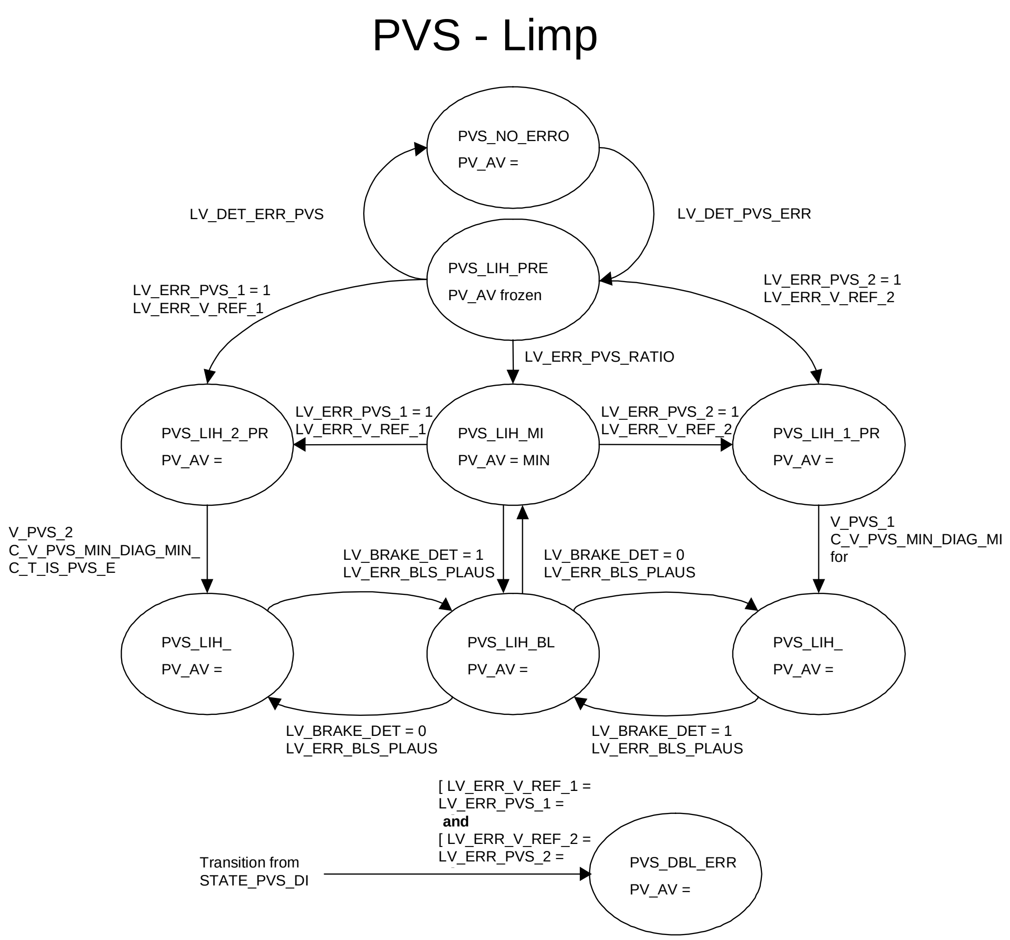
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Idle speed with a higher idle speed setpoint. If brake or brake error is active then the normal idle speed setpoint is applied).

PVS_LIH_BLS: Is active if limited dynamic 1 or 2 is active and brake is detected or brake failure is present. Then pedal value is 0

Signal flow diagram:



A.7.7.1 PVS limp-home limited dynamic 1

Description:

The dynamic of the vehicle is limited in order secure controlled vehicle reactions and adequately longer reaction times for the driver when **one** of the both PVS-channels are detected as faulty.
When brake activity or an brake error is detected a lower engine speed limitation is active.
If the error memory is cleared the limp home LV_DYN_LIM_1_ACT is set to 0 as well.

Formula section:

If(1) STATE_PVS_DIAG = PVS_LIH_1 **or**
PVS_LIH_2 **or**
PVS_LIH_MIN **or**

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. PVS_LIH_1_PRED **or**
PVS_LIH_2_PRED **or**
PVS_LIH_BLS

Then(1) LV_DYN_LIM_1_ACT = 1
If (2) STATE_PVS_DIAG = PVS_LIH_BLS
Then (2) LV_MTC_LIH_ACT = 1 *//Limp home engine speed limit*

Else (2) LV_MTC_LIH_ACT = 0
Endif (2)
Else(1) LV_DYN_LIM_1_ACT = 0
Endif (1)

A.7.7.2 PVS limp-home limited dynamic 2

Description:

The dynamic of the vehicle is limited in order secure controlled vehicle reactions and adequately longer reaction times for the driver when **both** channels are detected as faulty.
If an error free pedal value sensor signal is no longer present Limited dynamic 2 is set.
With the Limited dynamic 2 the vehicle is more handicaped than with Limited dynamic 1, the vehicle is driven by two idle speed setpoints.
If the error memory is cleared the limp home LV_DYN_LIM_2_ACT is set to 0 as well.

Formula section:

If(1) STATE_PVS_DIAG = PVS_DOUBLE_ERROR
Then(1) LV_DYN_LIM_2_ACT = 1
LV_MTC_LIH_ACT = 1 (see Engine speed limit coordination)

A.8 ECU reset service

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LIH_ACT	V	0... FFFFH	0... 65535	1	-
0H = kein E-GAS-Notlauf /AF50H = E-Gas-Notlauf aktiv (gespeichert im resetfesten Bereich)					
LV_N_LIM_REQ_RST_CHK	O/V	0... 1H	0 ...1	1	-
Logical variable to set engine speed limitation after ECU reset					

Input data:

LV_ERR_TQI_N_MAX_ MON {p. 6917}	LV_IGK {p. 906}	LV_MTC_LIH_ACT {p. 4216}	LV_N_LIM_REQ_MON {p. 6877}
LV_TPS_MTC_N_LIM {p. 4982}			

FUNCTION DESCRIPTION:

General information:

If ETC-Limp home is active, performance is limited for the driver. After a reset of the ECU this limitation of performance is lost from one second to another. To prevent this dangerous situation the word LIH_ ACT is saved to reset independant memory every 100 ms. This special part of memory is not deleted in case of warm reset (LV_WARM_RST = 1). In case of cold reset (LV_WARM_RST = 0) even information in this reset resistant memory is lost.
While initializing the ECU the word LIH_ACT is been read out of the reset resistant memory. If it is set, LV_N_LIM_REQ_RST_CHK is set to 1 for the current driving cycle. At transition LV_IGK = 1 0 or if the failure memory is been deleted, LV_N_LIM_REQ_RST_CHK and LIH_ACT are reset to 0.

Application Conditions:
Recurrence: 100ms

Initialisation:
at reset (but not in case of warm-reset LV_WARM_RST = 1) **OR**
at transition LV_IGK = 1 0 **OR**
after clearing failure memory

LV_N_LIM_REQ_RST_CHK = 0
LIH_ACT = 0

The following initialization is only used after warm-reset (LV_WARM_RST = 1):
IF after warm-reset LIH_ACT = AF50 hex (44880 dec)
(read after warm-reset from reset resistant memory)

THEN LV_N_LIM_REQ_RST_CHK = 1
(to be written only once while initializing ECU)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ELSE LV_N_LIM_REQ_RST_CHK = 0
(to be written only once while initializing ECU)

ENDIF.

Activation:
LV_IGK = 1

Deactivation:
LV_IGK = 0

Formula section:

IF LV_TPS_MTC_N_LIM = 1 **OR** *// ETC-LIH request*
LV_MTC_LIH_ACT = 1 **OR** *// PVS-LIH request*
LV_N_LIM_REQ_MON = 1 **OR** *// MON-LIH request*
LV_ERR_TQI_N_MAX_MON = 1 **OR**
LV_N_LIM_REQ_RST_CHK = 1

THEN LIH_ACT = AF50 hex (44880 dec)
(to be written to reset resistant memory every 100ms)

ELSE LIH_ACT = 0 (to be written to reset resistant memory every 100ms)

ENDIF.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit

Input data:

C_VB_MIN_OBD1 {p. 1186}	ECU_STATE {p. 1091}	LV_WARM_RST {p. 560}	PWL_LOCK_CDN {p. 3776}
V_IGK {p. 1185}			

FUNCTION DESCRIPTION:

General information:

The purpose of the test is the check of differents memories (RAM, Flash, NVMY).

Remark:

- If failures are detected there are not-defined system reactions possible!
- If there is a failure in the Boot-software it it possible to have a passive ECU without error entry.

A.9.1 Flash test

Description:

The following three areas are checked by calculating the checksum:

- Boot software
- Applicative software
- Calibration data

For error healing one diagnosis cyle is necessary. If there is only transition key-ON /key OFF without end of diagnosis is reached then the error remains active.

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ └─> Error in Boot - SW                  (= SYM_0)
│ │ └───> Error in Applic - SW                (= SYM_1)
│ └─────> Error in Calibration data range     (= SYM_2)
└───────> -                                   (= SYM_3)
```

Application conditions

Initialisation: *all 0 at reset* ***or*** *clearing error memory*

Recurrence: *Boot software test is applied once, recurrency of applicative software and calibration data test is depending on length of each test (some minutes possible).*

Activation: at system start up after ignition-key-ON (applicative software and calibration-data test remains active for the engine run)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Setting of condition diag.
LV_CDN_DIAG_ECU_CKS = 1 at reset
Error detection
If one error symptom is detected
Then ERR_SYM_ECU_CKS = SYM_0 **or** SYM_1 **or** SYM_2
LV_ERR_ECU_CKS = 1 *//no debounce*
LV_END_DIAG_ECU_CKS = 1
Else ERR_SYM_ECU_CKS = NO_SYM
LV_ERR_ECU_CKS = 0
Endif
End of diagnosis with no error detection
after finishing each test once: LV_END_DIAG_ECU_CKS = 1

A.9.2 RAM test

Description:

The following two areas are tested by ECU internal test routine:

- Internal - RAM
- Timing processing unit - RAM
- External -RAM

Error symptoms are defined for this diagnosis function as:

```
|_|_|_|_|
 | | | └─> RAM error          (= SYM_0)
 | | └───> -                  (= SYM_1)
 | └─────> -                  (= SYM_2)
 └───────> -                  (= SYM_3)
```

Remark: LV_ERR_ECU_RAM will only deliver a valid result if Level 3 (processor monitoring) is not implemented yet. Otherwise Level 3 will detect a failed RAM-test thru LV_ERR_MON_3 and the corresponding symptom: ERR_SYM_MON_3 = SYM_1 (RAM error on MC).

Application conditions

Initialisation: *all 0 at reset* ***or*** *clearing error memory*

Recurrence: *once*

Activation: *at reset*

Formula section:

Setting of condition diag.
LV_CDN_DIAG_ECU_RAM = 1 at reset
Error detection
If one error symptom is detected *(RAM test error detected by L1)*
Then ERR_SYM_ECU_RAM = SYM_0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LV_ERR_ECU_RAM = 1 *(error is set for this engine run, no debounce)*
LV_END_DIAG_ECU_RAM = 1
Else after finishing each test once LV_END_DIAG_ECU_RAM = 1
Endif

A.9.3 NVMY test

Description:

The NVMY blocks are restored after each reset during the initialization phase after start up.
If one block is detected as faulty (see “Non volatile data” in chapter Basic SW general operation) only this datas are initialized.

Error symptoms are defined for this diagnosis function as:

```
□□□□
│ │ │ └─> NVMY error        (= SYM_0)
│ │ └───> -                 (= SYM_1)
│ └─────> -                 (= SYM_2)
└───────> -                 (= SYM_3)
```

Application conditions

Initialisation: *all 0 at reset* ***or*** *clearing error memory*
Recurrence: *40 ms (see formula section)*
Activation: *at reset*

Formula section:

at reset:

Error detection
If V_IGK < C_VB_MIN_OBD1 **or**
[LV_WARM_RST = 1 **and**
PWL_KRAM_SAVE == complement of PWL_KRAM_SAVE_CPL **and**
PWL_KRAM_SAVE = only BIT NVMY is set **]**
Then no diagnosis
Else LV_CDN_DIAG_ECU_NVMY = 1
If error symptom is detected
Then ERR_SYM_ECU_NVMY = SYM_0
LV_ERR_ECU_NVMY = 1 */*error is set for this engine run no debounce*/*
LV_END_DIAG_ECU_NVMY = 1
Else after finishing the test once LV_END_DIAG_ECU_NVMY = 1
Endif
LV_CDN_DIAG_ECU_NVMY = 0 *//reset to 0 after call of FMY*
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

40ms:

If (ECU_STATE == WAKE_UP **or**
ECU_STATE == PWL) **and**
T_PWL >= C_T_MIN_PWL **and**
PWL_LOCK_CDN Bit NVMY is set
Then LV_ECU_NVMY_LOCK = 1
Endif
If LV_ECU_NVMY_LOCK = 1
Then PWL_KRAM_SAVE = PWL_LOCK_CDN
PWL_KRAM_SAVE_CPL = complement of PWL_LOCK_CDN
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.11.1 SPI-Bus diagnosis for Multiple powerstage

Description:

Error-symptoms are defined to this diagnosis function as following :

```
|   |   |   └> -              (= SYM_0)
|   |   └───> -               (= SYM_1)
|   └───────> SPI bus off     (=SYM_2)
└───────────> -               (=SYM_3)
```

Application conditions

Initialization : `all 0 at LV_IGK 0->1 or reset`

Activation: *at every engine states*
Recurrency : 10 ms

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Diagnosis conditon:
LV_CDN_DIAG_SPI_MPS = 1
Error detection
IF BSW detects SPI bus error
THEN ERR_SYM_SPI_MPS = SYM_2 *//LV_ERR_SPI_MPS is set after debounce*
ELSE ERR_SYM_SPI_MPS = NO_SYM *//LV_ERR_SPI_MPS is reset after rebounce*
ENDIF
End of diagnosis:
LV_END_DIAG_SPI_MPS is calculated by error management if diagnosis condition is active.

A.11.2 SPI-Bus diagnosis for knock sensor

Description:

Error-symptoms are defined to this diagnosis function as following :

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> -              (= SYM_0)
 │ │ └───> -              (= SYM_1)
 │ └─────> SPI bus off    (=SYM_2)
 └───────> -              (=SYM_3)
```

Application conditions

Initialization : all 0 at LV_IGK 0->1 or reset

Activation: N_32 > 320 (1/ min)
Recurrency : 100 ms

Formula section:

Diagnosis conditon:
LV_CDN_DIAG_SPI_KNK = 1
Error detection
IF BSW detects SPI bus error
THEN ERR_SYM_SPI_KNK = SYM_2 *//LV_ERR_SPI_KNK is set after debounce*
ELSE ERR_SYM_SPI_KNK = NO_SYM *//LV_ERR_SPI_KNK is reset after rebounce*
ENDIF
End of diagnosis:
LV_END_DIAG_SPI_KNK is calculated by error management if diagnosis condition is active.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.12 O2 sensor (bin, down) heater circuit diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_INH_DIAG_LSH_DOWN [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
Inhibit flag for downstream oxygen sensor heater OBDI diagnosis					

Input data:

LV_CDN_VB_OBD1 {p. 1185}	LV_ERR_SPI_MPS {p. 4245}	LV_LS_DOWN_OBD_1_MAN_DEAC [NC_CBK_EX_NR] {p. 5449}	LV_ST_END {p. 1720}
NC_CBK_EX_NR {p. 1829}			

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

The diagnosis is inhibited due to low battery voltage, present error or if sensors are not learnt.

Application conditions

Initialisation: *LV_INH_DIAG_LSH_DOWN[i] = 1 at reset*

Recurrence: *The function shall be carried out once every 100 ms.*

Activation: *LV_ST_END = 1*

Deactivation: *LV_ST_END = 0 , set LV_INH_DIAG_LSH_DOWN[i] = 1*

Formula section:

If LV_CDN_VB_OBD1 = 0 **or**
LV_ERR_SPI_MPS = 1 **or**
LV_LS_DOWN_OBD_1_MAN_DEAC[i] = 1
Then LV_INH_DIAG_LSH_DOWN[i] = 1

Diagnostic XX	**Symptom description**	**Symptom**	**Filter type**
Downstream oxygen sensor heater OBDI diagnosis	*Short circuit to battery*	*SYM_0*	*MPL_STD_INI*
	Short circuit to GND	*SYM_1*	
LSH_DOWN[i]	*Open circuit*	*SYM_2*	
	4th symptom description	*SYM_3*	

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.
All symptoms of the current error code are handeled by anti-bouncing.
We assume that only one symptom of an error code can be active at the same time.

Description:

The error detection is effected via the ECU hardware.
The purpose of the diagnosis shall be to detect electrical faults within the oxygen sensor heater circuit as defined by OBD I requirements.
Error-symptoms and conditions: are defined to this diagnosis function as following

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
 ┌─┬─┬─┬─┐
 │ │ │ │ │
 └─┴─┴─┴─┘
  |  |  |  └─> Short circuit to battery (SCP)      (= SYM_0)
  |  |  └────> Short circuit to ground (SCG)       (= SYM_1)
  |  └───────> Open circuit                (OC)    (= SYM_2)
  └──────────> -                                   (= SYM_3)
```

The function is intended for use in a hardware configuration where the heater driver shall carry out the electrical fault diagnosis and provide the electrical status via status flags.

1. *Short circuit to Vbatt by Over-temperature **or** Overcurrent* (**SCP**)
2. *Short circuit to GND* (SCG)
3. *Open load* (**OC**)

The heater drivers named are capable of detecting an **OC** and **SCP** fault when in the ON state and only capable of detecting a SCG fault in the OFF state. As the heater power is controlled by a PWM signal, the driver will be placed alternately in an ON and then OFF state.
The diagnosis shall be activated should the following conditions be met:

- Engine leaving the engine start state as denoted by LV_IGK = 1
- Battery voltage falls between pre-set thresholds to protect against false errors at battery voltage extremes as indicated by **LV_VB_CDN_OBD_1**.
- CDN depending on duty cycle of LSHPWM_DOWN[i]
- Inhibit flag not set (LV_INH_DIAG_LSH_DOWN[i])

In exceptionally rare extreme environmental conditions for certain system configurations, it is possible that the heater driver may be driven into over-temperature during initial oxygen sensor heating. In this case, the driver automatically turns off the output stage in self-protection and sets the **SCP** electrical fault bit. In order to mask an incorrect oxygen sensor heater **SCP** fault, the function shall only allow the **SCP** to set a fault during the initial heater phase, if the exhaust gas temperature has exceeded a pre-determined calibrateable threshold.
The oxygen sensor heater fault detection shall be debounced by use of an anti-bounce counter. This shall be handled by the Dynamic Error Management.
Each of the above listed faults shall be described individually below:
Otherwise the diagnosis has to be suppressed (CDN_DIAG_LSH_DOWN[i] = 0). This is managed within the Diagnosis condition calculation.

Application conditions

Initialization: `at reset CDN_DIAG_LSHDOWN[i] = 0,`
`ERR_DIAG_LSH_DOWN[i] = 0`
`All other variables are initialized according filter type`

Activation : -

Deactivation: -

Recurrence: 100 ms

NOTE: The heater PWM frequency shall be at least 2 times faster than the diagnosis frequency to ensure that an oversampling effect does not occur!

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If **LV_IGK** = 1
And **LV_VB_CDN_OBD_1** = 1
and LV_INH_DIAG_LSH_DOWN[i] = 0
then
Usage of the diagnosis information (failure symptoms (raw value) **ERR_DIAG_LSH_DOWN[i]** and basic diagnosis conditions **CDN_DIAG_LSH_DOWN[i]**) received from the infrastructure:
ACTION_INFR_GetElDiagLshDown(IN <i>, **OUT**<CDN_DIAG_LSH_DOWN[i]>, **OUT**<ERR_DIAG_LSH_DOWN[i]>**)**

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_LSH_DOWN[i].
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_LSH_DOWN[i].

If Activation conditions are met for the NC_PSD_DLY_LSH_DOWN recurrence
Then
If LSHPWM_DOWN[i] < C_LSHPWM_MIN_DIAG_LSH_DOWN
or [(STATE_LSH_DOWN[i] = LSH_POW_RISE
or STATE_LSH_DOWN[i] = LSH_POW_RED)
and TEG_DYN_LS_DOWN[i] < C_TEG_DYN_MIN_DIAG_LSH_DOWN]
then bit 0 of CDN_DIAG_LSH_DOWN[i] = 0 *(**SCP** can not be detected))*
endif
If LSHPWM_DOWN[i] > C_LSHPWM_MAX_DIAG_LSH_DOWN
then bit 1 of CDN_DIAG_LSH_DOWN[i] = 0 *(**SCG** can not be detected)*
endif
If LSHPWM_DOWN[i] < C_LSHPWM_MIN_DIAG_LSH_DOWN
or LSHPWM_DOWN[i] > C_LSHPWM_MAX_DIAG_LSH_DOWN
then bit 2 of CDN_DIAG_LSH_DOWN[i] = 0 *(**OC** can not be detected)*
endif
Else
CDN_DIAG_LSH_DOWN[i] = 0
Endif
Else
CDN_DIAG_LSH_DOWN[i] = 0
endif

For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_LSH_DOWN[i] and ERR_DIAG_LSH_DOWN[i].
ACTION_ERRM_FilterMulticondition(IN <*XX*>, IN< CDN_DIAG_LSH_DOWN[i]>, IN< ERR_DIAG_LSH_DOWN[i]>, IN <C_ABC_INC_LSH_DOWN>, IN <C_ABC_MAX_LSH_DOWN>, OUT<LV_ERR_LSH_DOWN[i]>)

This algorithm determines:
ERR_SYM_LSH_DOWN[i] (= raw value ERR_DIAG_LSH_DOWN[i] filtered with CDN_DIAG_LSH_DOWN[i], detected error symptom for lambda sensor heater upstream [i] diagnosis)
LV_ERR_ LSH_DOWN[i] (Error flag for debounced error of for lambda sensor heater upstream [i])
LV_CDN_DIAG_ LSH_DOWN[i] (Diagnosis condition information)
LV_END_DIAG_ LSH_DOWN[i] (End of diagnosis information)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.14.1 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the PUC_LS_DOWN[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_PUC_LS_DOWN[i] data.
Within STATE_RBM_PUC_LS_DOWN[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions

Initialisation: *at ECU reset:*
bit 0, bit 1 and bit 2 of STATE_RBM_ PUC_LS_DOWN[i] = 0
LV_DC 0 ->1 transition:
bit 0 and bit 1 of STATE_RBM_ PUC_LS_DOWN [i] = 0
on failure memory reset:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

bit 1 of STATE_RBM_ PUC_LS_DOWN [i] = 0

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0 ->1 transition
bit 2 of STATE_RBM_ PUC_LS_DOWN [i] = 1
The pending status of the following failures has to be checked only once :

FUNCTION DESCRIPTION:

General information:

According the exhaust gas system shall the variables be defined for [i]=1 to NC_CBK_EX_NR.

The VLS_DOWN[i] value used for diagnosis purposes shall not be affected should the sensor be "pumped". The value prior to pumping shall be used until the sensor returns to normal operation (no pumping).
Once an electrical fault has been detected and debounced, the plausibility diagnosis shall not be carried out until the electrical fault has been diagnosed as being no longer present. The electrical diagnosis shall remain unaffected by the state of the plausibility diagnosis.
Once an electrical fault has been diagnosed and debounced, the application assistances (Functions that are defined to be affected by the state of the oxygen sensor signal) shall remain active for the remainder of the driving cycle. The restarting of the affected functions during the next driving cycle shall be carried out according to the project philosophy.
The measurement of the oxygen sensor voltage shall not be affected by the detection of a signal fault unless explicitly deactivated.

Description:

The oxygen sensor signal electrical diagnosis shall detect the following faults:

1. Short circuit of the oxygen sensor signal line to GND
2. Short circuit of the oxygen sensor signal line to Vbatt
3. Open circuit (line break) in the connection to oxygen sensor element

Each fault may set the boolean flag (LV_ERR_SCG_LS_DOWN[i]; LV_ERR_SCP_LS_DOWN[i]; LV_ERR_OC_LS_DOWN[i]) to signal that the particular fault is currently active. Should one of the electrical fault flags (A-C) be set, then a global error flag (LV_ERR_EL_LS_DOWN[i]) shall be set to indicate that an electrical fault currently exists on the particular oxygen sensor.
Each of the above listed erro shall be described individually in further detail below.

Application conditions

Initialisation: `all variables shall be initialised to 0 with LV_IGK = 0 -> 1 or reset or at clearing the error memory`

Recurrence: `100ms`

Activation:
If LV_IGK = 1
Deactivation:
If LV_IGK = 0

Formula section:

If LV_ERR_SCG_LS_DOWN[i] = 1
or LV_ERR_SCP_LS_DOWN[i] = 1
or LV_ERR_OC_LS_DOWN[i] = 1
then LV_ERR_EL_LS_DOWN[i] = 1
else LV_ERR_EL_LS_DOWN[i] = 0
endif

A.15.1 Short circuit of oxygen sensor signal to GND.

Description:

According the exhaust gas system shall the variables be defined for [i]=1 to NC_CBK_EX_NR.

In order to determine the electrical fault, short circuit to GND, the oxygen sensor signal voltage is compared to a calibrateable threshold (C_VLS_THD_DIAG_SCG_LS_DOWN) in conjunction with certain activation conditions.
Should a hard short to GND (i.e. approx. 0 Ω) exist on the oxygen sensor signal line, the signal voltage will tend to 0 V. This condition may also occur should the air-fuel mixture (AFR) become lean due to a fault in the injection system, due to an air leak, intentional or not, or due to a normal operating conditions. Hence the following additional fault conditions shall be required:
The ignition key shall be determined to be on (LV_IGK = 1) and the appropriate inhibit flag shall not be set (LV_INH_DIAG_SCG_LS_DOWN[i]).
Each time that timer T_ACT_PLS_DIAG_SCG_LS_DOWN[i] exceeded the minimum duration (C_T_DLY_DIAG_SCG_LS_DOWN) for the first time, e.g. first time after engine start or after timer T_ACT_PLS_DIAG_SCG_LS_DOWN[i] has been reset, the CTR_R_UPD_DIAG_SCG_LS_DOWN[I] shall be updated once only with the value CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. This shall ensure that only new internal resistance values be used for diagnosis purposes that have been determined since all the activation conditions have been met.
It shall be determined whether a new internal resistance has been determined by comparing the contents of counter CTR_R_UPD_DIAG_SCG_LS_DOWN[i] with that of CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. Should the counters be unequal, then a new value is available and CTR_R_UPD_DIAG_SCG_LS_DOWN[i] shall be updated with CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. If this conditions and all the above conditions be met, the diagnosis shall be considered to be active.
Should the diagnosis be determined to be active, the oxygen sensor signal voltage shall be compared to the threshold. Should the voltage fall below the threshold and the resistance condition R_IT_LS_DOWN[i] less than threshold be met, a pre - detection counter is incremented. The counter is reset to 0 if the above mentioned conditions are no more fulfilled. If the pre - detection counter counter reached the maximum value then the active check is triggered or if finished the error “Short to GND” is detected. Additionally the triggered active diagnosis can be switched of with LC_DIAG_ACT_CHK_INH = 1.

Application conditions

Initialisation: `all variables shall be initialised to 0 with LV_IGK = 0 -> 1 or reset or at clearing the error memory`

Recurrence: `T_SAMPLE = 100ms`

endif^{1}
ENDIF^{0}

A.15.2 Short circuit of oxygen sensor signal to VBATT

Description:

According the exhaust gas system shall the variables be defined for [i]=1 to NC_CBK_EX_NR.

Should a hard short to Vbatt (i.e. approx. 0 Ω) exist on the oxygen sensor signal line, the signal voltage will tend to Vbatt and the analogue digital converter value will tend to 5 V. This effect does not occur under normal conditions as the sensor delivers typically 1 V for rich AFR at the sensor location and may be used for short to Vbatt detection.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

In order to determine the electrical fault, short circuit to Vbatt, the oxygen sensor signal voltage (VLS_DOWN[i]) is compared to a calibrateable threshold (C_VLS_THD_DIAG_SCP_LS_DOWN) in conjunction with the herein mentioned activation conditions.
The ignition key shall be determined to be on (LV_IGK = 1) and the appropriate inhibit flag shall not be set (LV_INH_DIAG_SCP_LS_DOWN[i]).
Should the oxygen signal voltage exceed the said threshold, a signal short to Vbatt shall be determined to be present and the debounce counter shall be incremented otherwise the debounce counter shall be decremented.
The error flag LV_ERR_SCP_LS_DOWN[i] shall be set once the anti-bounce counter has reached its maximum value and reset should the anti-bounce counter reach 0.

Application conditions

Initialisation: *all variables shall be initialised to 0 with LV_IGK = 0 -> 1 or reset or at clearing the error memory*

Recurrence: *100ms*

Activation /Deactivation:

If LV_IGK = 1

then **If** VLS_DOWN[i] > C_VLS_THD_DIAG_SCP_LS_DOWN
then ***"Short to Vbatt fault present"***
% Error management automatically increment ABC counter
ERR_SYM_SCP_LS_DOWN[i] = SYM_0 *%SHORT TO PLUS*

else ERR_SYM_SCP_LS_DOWN[i] = "NO_SYM"
% Error management automatically decrement ABC counter
endif
endif

A.15.3 Open circuit (line break) in connection to oxygen sensor element.

Description:

According the exhaust gas system shall the variables be defined for [i]=1 to NC_CBK_EX_NR.

Should a complete open circuit occur in the oxygen sensor signal or return line, the measured voltage at the input to the microcontroller will tend to the voltage determined by the operative readiness potential divider (approx. 450 mV) and the measured internal resistance will be abnormally high.
In order to determine an open circuit electrical fault, the oxygen sensor internal resistance (R_IT_LS_DOWN[i]) is compared to a calibrateable threshold (C_R_IT_MIN_DIAG_OC_LS_DOWN) in conjunction with certain activation conditions shown below:
The ignition key shall be determined to be on (LV_IGK = 1) and the appropriate inhibit flag shall not be set (LV_INH_DIAG_OC_LS_DOWN[i]).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The sensor shall be determined to be in a state of operative readiness (LV_LS_DOWN_READY[i] = 1, possibly thorough forced activation) and the temperature operating conditions of the sensor shall be determined to be sufficient to permit normal operation, i.e. No fault shall be determined to be present in the appropriate downstream oxygen sensor heater (LV_ERR_LSH_DOWN[i] = 0) or if so that the operating temperature be determined to be sufficient for sensor operability (TEG_DYN_LS_DOWN[i] > C_TEG_DYN_MIN_DIAG_OC_LS_DOWN), and the appropriate heater shall be determined to being controlled normally (STATE_LSH_DOWN[i] = LSH_POW_CTL).

Should the above initial conditions be met, a timer (T_ACT_PLS_DIAG_OC_LS_DOWN[i]) shall be incremented. Should the conditions no longer be met, both timers shall be reset and flag LV_T_CDN_DIAG_OC_LS_DOWN[i] reset.

The oxygen sensor signal shall be determined to lie in a calibrateable voltage band (C_VLS_AFL_THD_DIAG_OC_LS_DOWN < VLS_DOWN[i] < C_VLS_AFR_THD_DIAG_OC_LS_DOWN).

Should the above listed pre-activation conditions be determined to have been met, a timer T_CDN_DIAG_OC_LS_DOWN[i] shall be started. The timer shall be required to equal or exceed a minimum calibrateable duration (C_T_CDN_DIAG_OC_LS_DOWN). When no longer met, T_CDN_DIAG_OC_LS_DOWN[i] and LV_T_CDN_DIAG_OC_LS_DOWN[i] shall be reset.

Each time that the T_CDN_DIAG_OC_LS_DOWN[i] has exceeded the minimum duration for the first time, e.g. first time after engine start or after the T_CDN_DIAG_OC_LS_DOWN[i] has been reset, the CTR_R_UPD_DIAG_OC_LS_DOWN[i] shall be updated once only with the value CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. This shall ensure that only new internal resistance values be used for diagnosis purposes that have been determined since all the activation conditions have been met.

It shall be determined whether a new internal resistance has been determined by comparing the contents of counter CTR_R_UPD_DIAG_OC_LS_DOWN[i] with that of CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. Should the counters be unequal, then a new value is available and CTR_R_UPD_DIAG_OC_LS_DOWN[i] shall be updated with CTR_CYCNR_R_IT_LS_DOWN_VLD[i] and a flag LV_R_IT_VLD_DIAG_OC_LS_DOWN[I] be set, thus indicating that the voltage lies within the set band and that a new resistance value is available.

If either LV_T_CDN_DIAG_OC_LS_DOWN[i] is set or T_ACT_PLS_DIAG_OC_LS_DOWN[i] equals or exceeds threshold C_T_DLY_DIAG_OC_LS_DOWN, the diagnosis shall be considered to be available.

Should the diagnosis be determined to be available and the condition LV_R_IT_VLD_DIAG_OC_LS_DOWN[I] has been met, the oxygen sensor internal resistance shall be compared to the said threshold. Should the resistance exceed the threshold, a signal open circuit shall be determined to be present and the debounce counter shall be incremented otherwise the debounce counter shall be decremented.

The error flag LV_ERR_OC_LS_DOWN[i] shall be set once the anti-bounce counter has reached its maximum and reset should the anti-bounce counter reach 0.

Application conditions

Initialisation: *all variables shall be initialised to 0 with LV_IGK = 0 -> 1 or reset or at clearing the error memory*

Recurrence: T_SAMPLE = *100ms*

Activation /Deactivation:

If LV_IGK = 1
and LV_INH_DIAG_OC_LS_DOWN[i] = 0
and LV_LS_DOWN_READY[i] = 1
and (LV_ERR_LSH_DOWN[i] = 0
or TEG_DYN_LS_DOWN[i] > C_TEG_DYN_MIN_DIAG_OC_LS_DOWN)
and STATE_LSH_DOWN[i] = LSH_POW_CTL
then

T_ACT_PLS_DIAG_OC_LS_DOWN[i] = T_ACT_PLS_DIAG_OC_LS_DOWN[i] +

T_SAMPLE

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. FUNCTION DESCRIPTION:

General information:

Due to possible oxygen sensor defects (e.g. reference air poisoning) or faults in the injection system (e.g. leaking fuel injector), the oxygen sensor may not provide the expected lean or rich AFR signal level during overrun fuel cut-off (PUC) or full load (FL) condition. Hence, the oxygen sensor signal shall be checked for plausibility during this engine operating states.

Description:

If the following conditions are met, then the general conditions for plausibility check are determined to be present:

1. Ignition key shall be determined to be on (LV_IGK = 1)
2. No electrical oxygen sensor fault shall be determined to be present on the sensor being diagnosed (LV_ERR_EL_LS_DOWN[i] = 0).
3. Sensor shall be in a state of operative readiness (LV_LS_DOWN_READY[i] =1).
4. The sensor shall be determined to be at operating temperature (STATE_LSH_DOWN[i] = LSH_POW_CTL & LV_ERR_LSH_DOWN[i] = 0).

The corresponding flag LV_DIAG_CDN_PLAUS_LS_DOWN[i] shall then be set.

For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions

Initialisation:

At the transition LV_IGK = 0 -> 1, reset or clearing the error memory, reset of all variables and bits to 0

Recurrence: **T_sample 10 ms**

Activation /Deactivation:

If LV_IGK = 1
and LV_ERR_EL_LS_DOWN[i] = 0
and LV_LS_DOWN_READY[i] = 1
and LV_ERR_LSH_DOWN[i] = 0
and STATE_LSH_DOWN[i] = LSH_POW_CTL
then **Diagnosis available**
LV_DIAG_CDN_PLAUS_LS_DOWN[i] = 1
else **Diagnosis NOT available**
LV_DIAG_CDN_PLAUS_LS_DOWN[i] = 0
endif

Formula section:

If LV_ERR_PUC_LS_DOWN[i] = 1
or LV_ERR_FL_LS_DOWN[i] = 1
then LV_ERR_PLAUS_LS_DOWN[i] = 1
else LV_ERR_PLAUS_LS_DOWN[i] = 0
endif

A.16.1 Overrun fuel cut-off (PUC) oxygen sensor signal plausibility

FUNCTION DESCRIPTION:

General information:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

Should the oxygen sensor signal voltage (VLS_DOWN[i]) exceed the calibrateable thresholds (C_VLS_MIN_DIAG_PUC_LS_DOWN) during engine operating state PUC and the following additional conditions are met, then a fault shall be determined to be present:

1. The appropriate inhibit flag shall not be set (LV_INH_DIAG_PUC_LS_DOWN[i]).
2. Plausibility check set to be possible (LV_DIAG_CDN_PLAUS_LS_DOWN[i] = 1)
3. The PUC state (LV_PUC = 1) shall be determined to be stable, as determined by comparing the mass air flow integral calculated after activation (MAF_INT_PUC_ACT) with the threshold range (C_MAF_INT_MIN_VLS_DOWN_DIAG; C_MAF_INT_MAX_VLS_DOWN_DIAG).
4. The energy transfer from the exhaust gas to the oxygen sensor shall exceed the calibratable threshold (C_MAF_INT_PUC_NOT_LS_DOWN_DIAG).
5. The reset of the MAF integral from the last fuel cut off phase must have taken place before activating the diagnosis. Otherwise there is a risk to set the conditions to 1 right at the beginning of the fuel cut off phase. At this time, the lambda sensor voltage downstream is still high and the error symptom would be set for one recurrence.
6. Prior to the PUC phase the VLS_DOWN[i] must have exceeded the voltage thresholds C_VLS_DOWN_PUC_PLAUS_VLD and C_VLS_DOWN_PUC_AFR_VLD.

The error flag LV_ERR_PUC_LS_DOWN[i] shall be set once the anti-bounce counter has reached its maximum value and reset should the anti-bounce counter reach 0.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Correlation between MAF integrals MAF_INT_PUC_ACT, MAF_INT_PUC_ACT_OLD and MAF_INT_PUC_NOT_LS_DOWN_DIAG and diagnosis activation :

A.16.2 Full load (FL) oxygen sensor signal plausibility

FUNCTION DESCRIPTION:

General information:

Description:

Should the oxygen sensor signal voltage (VLS_DOWN[i]) exceed the calibrateable thresholds (C_VLS_MAX_DIAG_FL_LS_DOWN) during engine operating state FL and the following additional conditions are met, then a fault shall be determined to be present:

1. The appropriate inhibit flag shall not be set (LV_INH_DIAG_FL_LS_DOWN[i]).
2. Plausibility check set to be possible (LV_DIAG_CDN_PLAUS_LS_DOWN[i] = 1)
3. The FL state (LV_FL = 1) shall be determined to be stable, as determined by comparing the mass air flow integral calculated after activation (MAF_INT_FL[i]) with the threshold range (C_MAF_INT_MIN_DIAG_FL_LS_DOWN; C_MAF_INT_MAX_DIAG_FL_LS_DOWN).

The error flag LV_ERR_FL_LS_DOWN[i] shall be set once the anti-bounce counter has reached its maximum value and reset should the anti-bounce counter reach 0.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions

Initialisation:
At the transition LV_IGK = 0 -> 1, reset or clearing the error memory, reset of all variables and bits to 0

Recurrence: **T_sample 100ms**

Activation /Deactivation:
If LV_DIAG_CDN_PLAUS_LS_DOWN[i] = 1
and LV_INH_DIAG_FL_LS_DOWN[i] = 0

endif
endif

A.16.3 Calculation of MAF_INT_FL

FUNCTION DESCRIPTION:

General information:

Description:

The calculation of MAF_INT_FL[i]expires in 20ms raster as long as either the operation status FL is fulfilled or VLS_UP[i] indicates rich conditions, depending on the setting of LC_MAF_INT_FL_CDN_AFR. The integral is calculated even when the application conditions for the plausibility check function

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

are not fulfilled. MAF_INT_FL[i] is limited to the maximum value if necessary in case of a longer FL (or rich) phase.
The value of MAF_INT_FL[i] should reset to 0 if the transition LV_FL = 1 -> 0 takes place resp. if VLS_UP[i] no longer indicates rich.

Remarks:
Although the upstream sensor signal is used here if LC_MAF_INT_FL_CDN_AFR = 1, the calculation is still usable for both linear and binary upstream sensors. Only one of the calibrateable VLS_UP limits should be calibrated for a given type: the upper limit for linear sensors, and the lower limit for binary sensors. The other one is not meaningful and should be set to the physical limit.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions

Initialisation:
At the transition LV_IGK = 0 -> 1 or reset reset of all variables and bits to 0

Recurrence: **Tsample = 20ms**

Activation /Deactivation:
If LV_ST_END = 1
then *calculation enabled*
else *calculation disabled*
endif

Formula section:

If (LC_MAF_INT_FL_CDN_AFR = 0 **and** LV_FL = 1) **or**
(LC_MAF_INT_FL_CDN_AFR = 1 **and**
VLS_UP[i] = C_VLS_UP_MIN_MAF_INT_AFR **and**
VLS_UP[i] = C_VLS_UP_MAX_MAF_INT_AFR)
then
MAF_INT_FL[i]$_n$ [g] = MAF_INT_FL[i]$_{n-1}$ [g] + MAF_CYL * T_SAMPLE [ms] * 1/3600 [(g*h) / (kg*ms)]
else
MAF_INT_FL[i] = 0
endif

Diagnostic XX	Symptom description	Symptom	Filter type
LSL_UP_IF[NC_CBK_EX_NR]	wrong initialisation of WRAF Sensor controller	SYM_0	NO
	SPI communication error	SYM_1	

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

This function shall detect an error during the initialization and/or operation of a WRAF sensor controller which uses a SPI comunication, like the CJ120 or ATIC42. For this task informations from the Basic Software (BSW) concerning the initialization and the communication between ASW and the controller are used to judge if the ASIC works properly.

After an ECU reset, the WRAF sensor controller is started and the diagnosis determines the time until the initialization of the ASIC has been performed (LV_LSL_IF_SPI_RST_END[i] = 1). If this doesnt happen after a certain time (C_T_RST_MAX_DIAG_LSL_UP_IF[I]) an error is present and the flag LV_ERR_LSL_UP_IF[i] shall be set. If the initialization occurs successfully, the difference is checked between the present error counter (CTR_ERR_LSL_IF_SPI_WR[i]) and the stored value of this error counter (CTR_ERR_SAVE_DIAG_LSL_UP_IF[i], stored at ECU reset, LV_IGK switch from 0 -> 1 or at clearing error memory and also after each function call in case that a difference between both counters was found). If there is a difference, another counter is incremented.
If this counter is bigger than a threshold, a SPI communication error is entered.

In any case the flag LV_ERR_LSL_UP_IF[i] = 1 the operation of the WRAF sensor shall be inhibited.

Application conditions

Initialisation:
```
At transition LV_IGK = 0 -> 1, at clearing error memory or at ECU re
LV_ERR_LSL_UP_IF[i] = 0
LV_END_DIAG_LSL_UP_IF[i] = 0
ERR_SYM_LSL_UP_IF[i] = 0
CTR_DELTA_LSL_UP_IF[i] = 0
CTR_ERR_SAVE_DIAG_LSL_UP_IF[i] = CTR_ERR_LSL_IF_SPI_WR[i]
Start TIMER_1 and TIMER_2
```

Recurrence:
```
The function shall run every 10 ms
```

Activation:
```
At LV_IGK=1 & LV_INH_DIAG_LSL_UP_IF[i]=0 the function shall
be started and  LV_CDN_DIAG_LSL_UP_IF[i] = 1
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Deactivation:
The deactivation occures if the activation conditions above are not fulfilled.

Formula section:

If LV_LSL_IF_SPI_RST_END[i] = 1 */init. of WRAF sensor controller done successfully*
Then
Stop TIMER_1

If CTR_ERR_LSL_IF_SPI_WR[i] =! CTR_ERR_SAVE_DIAG_LSL_UP_IF[i]
then CTR_DELTA_LSL_UP_IF[i]$_n$ = CTR_DELTA_LSL_UP_IF[i]$_{n-1}$+ 1
CTR_ERR_SAVE_DIAG_LSL_UP_IF[i] = CTR_ERR_LSL_IF_SPI_WR[i]

If CTR_DELTA_LSL_UP_IF[i] $>$ C_CTR_MAX_SPI_COM_LSL_UP[I]
Then
ERR_SYM_LSL_UP_IF[i] = sym_1
LV_ERR_LSL_UP_IF[i] = 1
LV_END_DIAG_LSL_UP_IF[i] = 1
Endif
Else
If TIMER_1 $>$ C_T_RST_MAX_DIAG_LSL_UP_IF[I]
Then
ERR_SYM_LSL_UP_IF[i] = sym_0 */no init. of WRAF sensor controller done*
LV_ERR_LSL_UP_IF[i] = 1
LV_END_DIAG_LSL_UP_IF[i] = 1
Else
Increment TIMER_1
Endif
Endif

If LV_END_DIAG_LSL_UP_IF[i] = 0
Then
If TIMER_2 $<$ C_T_END_DIAG_LSL_UP_IF[I]
Then Increment TIMER_2
Else
LV_END_DIAG_LSL_UP_IF[i] = 1 /for the diagnosis readines
Stop TIMER_2
Endif
Endif

A.18 O2 sensor (lin, up) controller SPI diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_INH_DIAG_LSL_UP_IF [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
Inhibit diagnosis					

Input data:

LV_ERR_EL_LSL_UP [NC_CBK_EX_NR] {p. 4293}	LV_ERR_LSL_UP_IF [NC_CBK_EX_NR] {p. 4285}	LV_ERR_SPI_MPS {p. 4245}	LV_IGK {p. 906}
LV_LS_UP_OBD_1_MAN_DEAC [NC_CBK_EX_NR] {p. 5449}	NC_CBK_EX_NR {p. 1829}		

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

This function shall set the inhibit bit LV_INH_DIAG_LSL_UP_IF[i] in case an electrical fault of the WRAF sensor. In this case, i.e., when LV_ERR_EL_LSL_UP[I] = 1, the communication between sensor and ASIC is stopped, therefore doesn t makes sense to run the ASIC diagnosis.

Application conditions

Initialisation:
At the transition LV_IGK = 0 -> 1
LV_INH_DIAG_LSL_UP_IF[i] = 0

Recurrence:
Every 10 ms

Activation:
At LV_IGK = 1

Deactivation:
If LV_ERR_LSL_UP_IF[i] = 1

Formula section:

If LV_ERR_EL_LSL_UP[I] = 1

A.19.1 Application Incidences of Electrical Fault Detection

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions:

Initialization:
The flag shall be initialized as follow during the transition LV_IGK = 0 to 1.
LV_INH_DIAG_EL_LSL_UP[i] = 0

Recurrence:
The function shall be carried out once every 10ms.

Activation:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Transition LV_IGK = 0 ->1

Deactivation:
Transition LV_IGK = 1 ->0. LV_INH_DIAG_EL_LSL_UP[i] shall be set to 1.

Formula section:

If LV_CDN_VB_OBD1 = 0 **or**
LV_ERR_LSL_UP_IF[i] = 1 **or**
LV_LS_UP_OBD_1_MAN_DEAC[i] = 1 **or**
LV_ERR_OFS_LSL_UP[i] = 1 **or**
LV_ERR_CTL_LSL_UP[i] = 1 **or**
STATE_LSL_IF_SPI_RD[i] *bit* LSL_ENA = 0
Then
LV_INH_DIAG_EL_LSL_UP[i] = 1
Else
LV_INH_DIAG_EL_LSL_UP[i] = 0
Endif

Application assistances:

The following list shows the influenced functions if a failure is detected.
Direct error reactions:
The following functions have to be direct deactivated:

- catalyst efficiency diagnosis
- diagnosis of the canister purge system (flow rate diagnosis)
- secondary air diagnosis (flow rate)
- secondary air valve diagnosis (mechanical)
- secondary air pump
- upstream oxygen sensor temperature acquisition
- WRAF Sensor controller diagnosis
- WRAF Sensor Plausibility Diagnosis
- WRAF Sensor dynamic diagnosis
- WRAF Sensor not mounted diagnosis
- WRAF Sensor plausibility diagnosis during PUC
- WRAF Sensor false start diagnosis
- WRAF Sensor heater coupling diagnosis
- WRAF Sensor OBD2 heater diagnosis

The following function has to be activated :

- canister purge function (min. operation)

A.19.3 WRAF Sensor Pump Current Controller Diagnosis

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Application conditions:

Initialization:
The flag shall be initialized as follow during the transition LV_IGK = 0 to 1.
LV_IPLSL_DIAG_INH_LSL_UP[i] = 0

Recurrence:
The function shall be carried out once every 10ms.

Activation:
Transition LV_IGK = 0 ->1

Deactivation:
Transition LV_IGK = 1 ->0. LV_IPLSL_DIAG_INH_LSL_UP[i] shall be set to 1.

Formula section:

If LV_CDN_VB_OBD1 = 0
Then
LV_IPLSL_DIAG_INH_LSL_UP[i] = 1
Else
LV_IPLSL_DIAG_INH_LSL_UP[i] = 0
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.20.1 HW-based Diagnosis with the ATIC42 (WRAF Sensor Controller)

FUNCTION DESCRIPTION:

General information:

This function shall debounce OBD-I errors at the Wide Range Air/Fuel (WRAF) Sensor detected by the ATIC42 and define a variable containing the diagnosis register of the controller.

If the error is recognised as debounced, the function shall generate an error flag and inhibit the SPI-communication between basic software (BSW) and ATIC42. This is necessary, because in case an electrical failure, the ATIC42 disconnect and reconnect all the PINs of the sensor by itself every recurrence of the BSW, by reading of the Diagnosis-register. This is harmful for the sensor and must be prevented.

According the exhaust gas system the variable shall be defined from [i]=1 to NC_CBK_EX_NR.

Error Symptoms are defined as follows:

```
[ | | | ]
 |  |  |  └─> Short circuit to battery "SCP" ( = SYM_0)
 |  |  └───> Short circuit to Ground "SCG"      ( = SYM_1)
 |  └──────> (not used)
 └─────────> (not used)
```

Application conditions

Initialisation:

The following variables, related to the diagnosis manager shall be initialized according to the filter type MEM .

(all 0 at LV_IGK 0->1 or at ECU reset or clearing error memory)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LV_ERR_EL_LSL_UP[i] = 0
LV_CDN_DIAG_EL_LSL_UP[i] = 0
LV_END_DIAG_EL_LSL_UP[i] = 0
ERR_SYM_EL_LSL_UP[i] = NO_SYM

The following data shall be set to 0 at LV_IGK 0->1 or at ECU reset or at clearing error memory

STATE_ERR_EL_LSL_UP[i] = No Fault
LV_LSL_UP_SPI_COM_INH[i] = 0
T_DLY_DIAG_EL_LSL_UP[i] = 0

Recurrence:
The function shall be carried out once every 10ms.

Activation /Deactivation:
If
LV_ST_END = 1 **and**
LV_ES = 0 **and**
LV_ERR_EL_LSL_UP[i] = 0 **and**
LV_LSL_IF_SPI_RST_END[i] = 1 **and**
LV_INH_DIAG_EL_LSL_UP[i] = 0
Then
LV_DIAG_ACT_EL_LSL_UP[i] = 1
The diagnosis shall be carried out
Else
LV_ DIAG_ACT_EL_LSL_UP[i] = 0
The diagnosis shall be deactivated
Endif

Formula section:

The variable STATE_ERR_EL_LSL_UP[i] is usefull during the development phase of the ASIC and shall be built up by the failure-bits STATE_ERR_VNLSL[i], STATE_ERR_VGLSL[i], STATE_ERR_VIPLSL[i], STATE_ERR_VRCLSL[i], delivered from the BSW. This variable shall have one of the following values according to the following table:

STATE_ERR_ VRCLSL[i]	STATE_ERR_ VIPLSL[i]	STATE_ERR_ VGLSL[i]	STATE_ERR_ VNLSL[i]	Value for STATE_ERR_ EL_LSL_UP
0	0	0	0	0H

A.20.2 WRAF Sensor Pump Current Controller Diagnosis

FUNCTION DESCRIPTION:

General information:

This function shall monitor the *pump current controller* inside the WRAF sensor controller ATIC42 in order to protect the oxygen sensor against operation with high pump current (Ip) during excessive time which can be harmfull to the sensor.

High pump current for long time is allowed only during the warm up phase of the WRAF sensor, when its ceramic temperature not high enough, but the Ip controller activaton is needed to detect the sensor operability as fast as possible. To avoid false error messages this function shall run only after the sensor heater achieves its steady state after the warm up phase, when it starts to work in closed loop.

To avoid any double diagnostic it shall be monitored if no sensor electrical failure exists (short circuit to ground or to battery voltage) or if the heater management works properly. In both cases it is possible due to a failure to flow a high Ip current through the sensor. Similarly it must be asked if the sensor requires an *reference air pump current* and in positive case, if this is active.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If a *pump current controller* failure symptom is detected, the use of the sensor is not more possible and the lambda controller shall be deactivated immediately. Should this symptom be completely debounced, the sensor shall not be used for any purpose during the current driving cycle and also the *pump current controller* shall be deactivated in order to avoid any sensor damage.

Description:

This diagnosis serves to debounce the information concerning the conditions of the *pump current controller* which *is* the delivered by the ATIC42 via its Basic Software.
As long as the Ip current is at their bounds, which is defined *per* hardware [1], the ATIC42 limits the *pump current controller* output and writes in a warning message in its diagnosis register, indicating that Ip current is too low or too high. The Basic Software dedicated to the ATIC42 reads out every 10 ms the diagnosis register and save this information in the variable STATE_ERR_IPLSL[i]. This shall be evaluated here and in failure case the symptom debounced.

[1] For more informations please see the ATIC42 specification.

Application conditions

Initialisation: At the transition LV_IGK = 0 -> 1, by ECU-reset or at clearing the error memory shall all variables be reseted.

Recurrence: The function shall be carried out once every 100ms.
Note: Altough the variable STATE_ERR_IPLSL[i] is updated every 10 ms, it is not necessary to evaluate it so frequently. The decision to stop the Ip controller must not be done with a resolution of miliseconds but seconds. It can be taken advantage to that point allowing to filter transient Ip-controller conditions.

Activation /Deactivation:

If **(**LAMB_SP[i] < C_LAMB_SP_AFR_IPLSL_DIAG_LSL_UP or
LAMB_SP[i] > C_LAMB_SP_AFL_IPLSL_DIAG_LSL_UP**)** **and**

Error treatment:

Diagnostic XX	Symptom description	Symptom	Filter type
OC_LSL_UP[NC_CBK_EX_NR]	Open Circuit on Nernst Cell (Vn)	SYM_0	NO
	Open Circuit on Virtual Ground (Vg)	SYM_1	
	Open Circuit on Pump Cell (Vip)	SYM_2	
	Open Circuit on comp. resistor (Vrc)	SYM_3	

FUNCTION DESCRIPTION:

General information:

This function shall use some debounced OBD2 lambda sensor faults to evaluate if an open circuit in any of the four electric lines (VN, VG, VIP and VRc) is present. The matrix below shows reaction of sensor/controller to each open line.

Open Circuit on Line	Measured Sensor Temp	Lambda Sensor
VN	V_Ri = 5 V (Ttip = 560 °C)	U_Lambda = 0 V (for NTK sensor only if R_I oscillator is turned off)
VG	V_Ri = 0 V (Ttip = 880 °C) (only applicable for some senosor types)	U_Lambda = 2.0 V (sensor stuck)
VIP	V_Ri plausible	U_Lambda = 2.0 V (sensor stuck)
VRc	V_Ri plausible	U_Lambda > 4.8 V in air

This function shall run only if at least one of the following diagnoses has set its readiness bit: Activity Check, Plausibility during PUC and Sensor Heater OBD2. The function shall go to the state = “active” if one of the above diagnoses debounced a fault.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The end flag for this diagnosis is set if all the related diagnosis functions have set their end flags or after changing to the STATE “end” with detection of an open circuit error.

OC in the VN line (LSU and ZFAS-Ux sensors) or VG line (ZFAS-Ux only) cause an OBD2 heater symptom. Therefore an OC error is assumed if a heater symptom is accompanied by other indications of these OC errors. For OC in VN, a very low VLS_UP_DIAG[i] will occur (for ZFAS-Ux, only if the Ri measurement oscillator is turned off), while for OC in VG this value will be around 2.0V (i.e. stuck at lambda=1). These conditions are tested with an open loop lambda setpoint shift requested here, monitoring of VLS_UP_DIAG[i] is coordinated with the detection of shifted lambda setpoint and disabled Ri measurement oscillator. If the lambda shift request is not fulfilled, the diagnosis looks for an activity symptom instead to decide if the VG/VIP line is open, but this probably takes much more time.

If VLS_UP_DIAG[i] is stuck at 2.0V, as detected by the PUC plausibility or activity diagnoses, OC in VG or VIP may be present. In ZFAS-Ux sensors, OC in VG would also cause a heater symptom, so further fault isolation is possible using T_WAIT_SYM_OBD_2_LSH_UP[i] to wait for this symptom. If C_T_WAIT_SYM_OBD_2_LSH_UP is set to 0, all faults causing VLS_UP_DIAG[i]= 2.0V are regarded as OC in VIP, even if the test was triggered by an OBD2 heater symptom.

Quite independently, OC in VRC shows up as a VLS_H_OC symptom in the PUC plausibility diagnosis and is consumed here. It will be overridden however by any other OC fault.

If any open circuit symptom could be detected the flag LV_ERR_OC_LSL_UP[i] shall be set to 1.

If two separate catalyst systems are concerned, then
    i = 1, for cylinder bank 1
    i = 2, for cylinder bank 2,
else
    i = 1.

Description:

A.22.1.1 Interface for Rate - Based - Monitoring OC_LSL_UP[I]

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

With this module the interface between the OC_LSL_UP[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_OC_LSL_UP[i] data.
Within STATE_RBM_OC_LSL_UP[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for catalyst diagnosis)

Application conditions

Initialisation:

```
at ECU reset:
    bit 0, bit 1 and bit 2 of STATE_RBM_OC_LSL_UP[i] = 0
LV_DC 0 → 1 transition:
     bit 0 and bit 1 of STATE_RBM_OC_LSL_UP[i] = 0
on failure memory reset:
    bit 1 of STATE_RBM_OC_LSL_UP[i] = 0
```

Recurrence: 1 s

Activation: LV_DC = 1

Formula section:

At LV_DC 0 → 1 transition
bit 2 of STATE_RBM_OC_LSL_UP[i] = 1
The pending status of the following failures has to be checked only once :

Dependence	Error			
	LV_ERR_CHG_LS_UP	LV_ERR_DIAGCPS	LV_ERR_EL_CPS	LV_ERR_FUP
	LV_ERR_FUP_MFP_PLAUS	LV_ERR_FUP_ORNG	LV_ERR_FUP_ST	LV_ERR_H_PRS_SYS

A.23 O2 sensor (up) heater circuit diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_INH_DIAG_LSH_UP [NC_CBK_EX_NR]	O/V	0... 1H	0 ...1	1	-
Inhibit flag for upstream oxygen sensor heater OBDI diagnosis					

Input data:

LV_CDN_VB_OBD1 {p. 1185}	LV_ERR_SPI_MPS {p. 4245}	LV_LS_UP_OBD_1_MAN_DEAC [NC_CBK_EX_NR] {p. 5449}	LV_ST_END {p. 1720}
NC_CBK_EX_NR {p. 1829}			

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
 i = 1, for exhaust cylinder bank 1
 i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
 i = 1, for single exhaust cylinder bank.

Description:

The diagnosis is inhibited due to low battery voltage, present error or if sensors are not learnt.

Application conditions

Initialisation: *LV_INH_DIAG_LSH_UP[i] = 1 at reset*

Recurrence: The function shall be carried out once every 100 ms.

Activation: *LV_ST_END = 1*

Deactivation: *LV_ST_END = 0 , set LV_INH_DIAG_LSH_UP[i] = 1*

Formula section:

```
If      LV_CDN_VB_OBD1 = 0              or
        LV_ERR_SPI_MPS = 1              or

	Short circuit to GND	*SYM_1*	
LSH_UP[i]	*Open circuit*	*SYM_2*	
	4th symptom description	*SYM_3*	

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
 i = 1, for exhaust cylinder bank 1
 i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
 i = 1, for single exhaust cylinder bank.

All symptoms of the current error code are handeled by anti-bouncing.
We assume that only one symptom of an error code can be active at the same time.

Description:

The error detection is effected via the ECU hardware.
The purpose of the diagnosis shall be to detect electrical faults within the oxygen sensor heater circuit as defined by OBD I requirements.
Error-symptoms and conditions: are defined to this diagnosis function as following

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │  │  │  └─> Short circuit to battery (SCP)      (= SYM_0)
 │  │  └───> Short circuit to ground (SCG)      (= SYM_1)
 │  └─────> Open circuit       (OC)             (= SYM_2)
 └───────> -                                   (= SYM_3)
```

The function is intended for use in a hardware configuration where the heater driver shall carry out the electrical fault diagnosis and provide the electrical status via status flags.

1. *Short circuit to Vbatt by Over-temperature **or** Overcurrent* (**SCP**)
2. *Short circuit to GND* (SCG)
3. *Open load* (**OC**)

The heater drivers named are capable of detecting an **OC** and **SCP** fault when in the ON state and only capable of detecting a SCG fault in the OFF state. As the heater power is controlled by a PWM signal, the driver will be placed alternately in an ON and then OFF state.
The diagnosis shall be activated should the following conditions be met:

- Engine leaving the engine start state as denoted by LV_IGK = 1
- Battery voltage falls between pre-set thresholds to protect against false errors at battery voltage extremes as indicated by **LV_VB_CDN_OBD_1**.
- CDN depending on duty cycle of LSHPWM_UP[i]
- Inhibit flag not set (LV_INH_DIAG_LSH_UP[i])

In exceptionally rare extreme environmental conditions for certain system configurations, it is possible that the heater driver may be driven into over-temperature during initial oxygen sensor heating. In this case, the driver automatically turns off the output stage in self-protection and sets the **SCP** electrical fault bit. In order to mask an incorrect oxygen sensor heater **SCP** fault, the function shall only allow the **SCP** to set a fault during the initial heater phase, if the exhaust gas temperature has exceeded a pre-determined calibrateable threshold.
The oxygen sensor heater fault detection shall be debounced by use of an anti-bounce counter. This shall be handled by the Dynamic Error Management.
Each of the above listed faults shall be described individually below:
Otherwise the diagnosis has to be suppressed (CDN_DIAG_LSH_UP[i] = 0). This is managed within the Diagnosis condition calculation.

Application conditions

Initialization: `at reset CDN_DIAG_LSH_UP[i] = 0, ERR_DIAG_LSH_UP[i] = 0`
`All other variables are initialized according filter type`

Activation : –

Deactivation: –

Recurrence: `100 ms`

NOTE: The heater PWM frequency shall be at least 2 times faster than the diagnosis frequency to ensure that an oversampling effect does not occur!

Formula section:

If LV_IGK = 1
and **LV_VB_CDN_OBD_1** = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

and LV_INH_DIAG_LSH_UP[i] = 0
then

Usage of the diagnosis information (failure symptoms (raw value) **ERR_DIAG_LSH_UP[i]** and basic diagnosis conditions **CDN_DIAG_LSH_UP[i]**) received from the infrastructure:
ACTION_INFR_GetElDiagLshUp(IN <i>, **OUT**<CDN_DIAG_LSH_UP[i]>, **OUT**<ERR_DIAG_LSH_UP[i]>**)**

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_LSH_UP[i].
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_LSH_UP[i].

If Activation conditions are met for the NC_PSD_DLY_LSH_UP recurrence
Then
If LSHPWM_UP[i] < C_LSHPWM_MIN_DIAG_LSH_UP
or [(STATE_LSH_UP[i] = LSH_POW_RISE
or STATE_LSH_UP[i] = LSH_POW_RED)
and TEG_DYN_LS_UP[i]< C_TEG_DYN_MIN_DIAG_LSH_UP]
then bit 0 of CDN_DIAG_LSH_UP[i] = 0 *(**SCP** can not be detected))*
endif
If LSHPWM_UP[i] > C_LSHPWM_MAX_DIAG_LSH_UP
then bit 1 of CDN_DIAG_LSH_UP[i] = 0 *(**SCG** can not be detected)*
endif
if LSHPWM_UP[i] < C_LSHPWM_MIN_DIAG_LSH_UP
or LSHPWM_UP[i] > C_LSHPWM_MAX_DIAG_LSH_UP
then bit 2 of CDN_DIAG_LSH_UP[i] = 0 *(**OC** can not be detected)*
endif
Else
CDN_DIAG_LSH_UP[i] = 0
Endif
Else
CDN_DIAG_LSH_UP[i] = 0
endif

Error Symptom calculation (raw value from I/O SW)

If bit 1 of ERR_DIAG_LSH_UP[i] = 1
then LV_LSH_SCG_ACT_LSH_UP[i] = 1
endif

If *abc-counter* = 0
then LV_LSH_SCG_ACT_LSH_UP[i] = 0
endif

For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_LSH_UP[i] and ERR_DIAG_LSH_UP[i].
ACTION_ERRM_FilterMulticondition(IN <*XX*>, IN< CDN_DIAG_LSH_UP[i]>, IN< ERR_DIAG_LSH_UP[i]>, IN <C_ABC_INC_LSH_UP>, IN <C_ABC_MAX_LSH_UP>, OUT<LV_ERR_LSH_UP[i]>)

This algorithm determines:
ERR_SYM_LSH_UP[i] (= raw value ERR_DIAG_LSH_UP[i] filtered with CDN_DIAG_LSH_UP[i], detected error symptom for lambda sensor heater upstream [i] diagnosis)
LV_ERR_ LSH_UP[i] (Error flag for debounced error of for lambda sensor heater upstream [i])

General information

The actuator valve position is determined by a measuring system. In order to reduce measurement inaccuracy, the sensor signal voltage is referenced to its sensor supply voltage. The electrical value of the lower and upper mechanical stop depends on the actuator characteristic, the actuator temperature and the valve coking therefore the electrical valve characteristic has to be learnt. After the actuator

A.25.1 Adaptation functionalities

The adaptation functionality consists of a complete adaptation of the actuator valve and a continuously adaptation only for the lower mechanical valve stop. The adaptation algorithms are controlled by the variable LV_ACR_AD_ACT and the related inhibition conditions. The variables are provided in corresponding application incidence module.

After the reset of the functionality a complete adaptation of the actuator valve is started if the variable LV_ACR_AD_ACT has been set otherwise the continuously adaptation of the lower mechanical stop will be performed.

The adaptation module contain own diagnostic functions for the check of the adaptation values and the correct function of the actuator valve.

Error symptoms for the actuator adaptation are defined as follows :

SYM_0 - Adaptation conditions not fulfilled
SYM_1 - Lower adaptation value outside range
SYM_2 - Adaptation position not reached
SYM_3 - Upper adaptation value outside range

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure A.25.3: ACRC_adaptation_and_diagnosis/Operate

State machine of the actuator adaptation

The state flow diagram of the actuator adaptation functionality contains the complete and the continuously adaptation functionality. The state machine is reset with a new reset event generated by the application conditions that means the functionality will be restarted on the default transition dependent on LV_ACR_AD_ACT.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The inhibition variable LV_INH_ACR_AD of the adaptation function is only check after the initialisation state has been finished. If the inhibition variable is set during the check then an error entry will be performed.

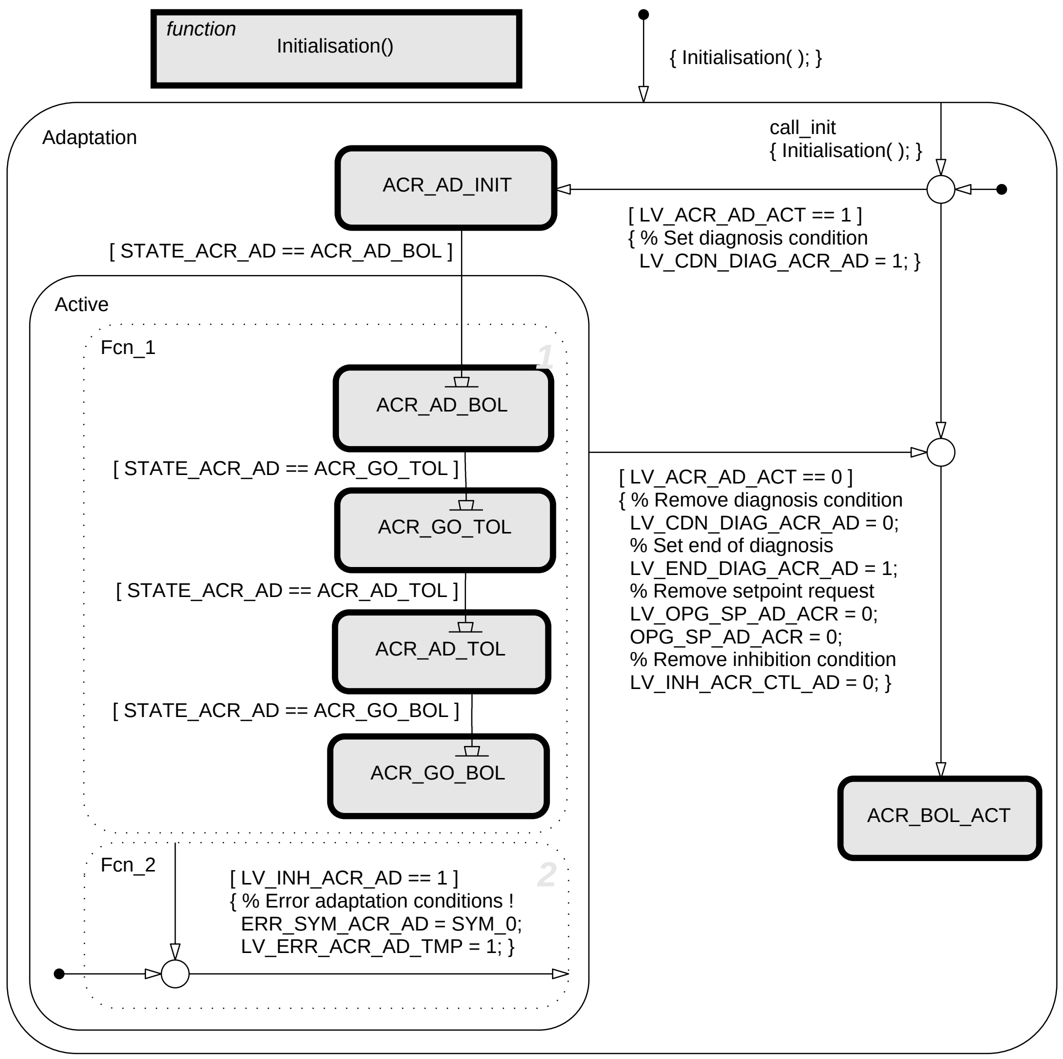

Figure A.25.4: ACRC_adaptation_and_diagnosis/Operate/Chart

Initialisation function

The following function is used for the initialisation of the actuator adaptation. The function is called from the application condition module and shall initialise the adaptation values, the used error and auxiliary values.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

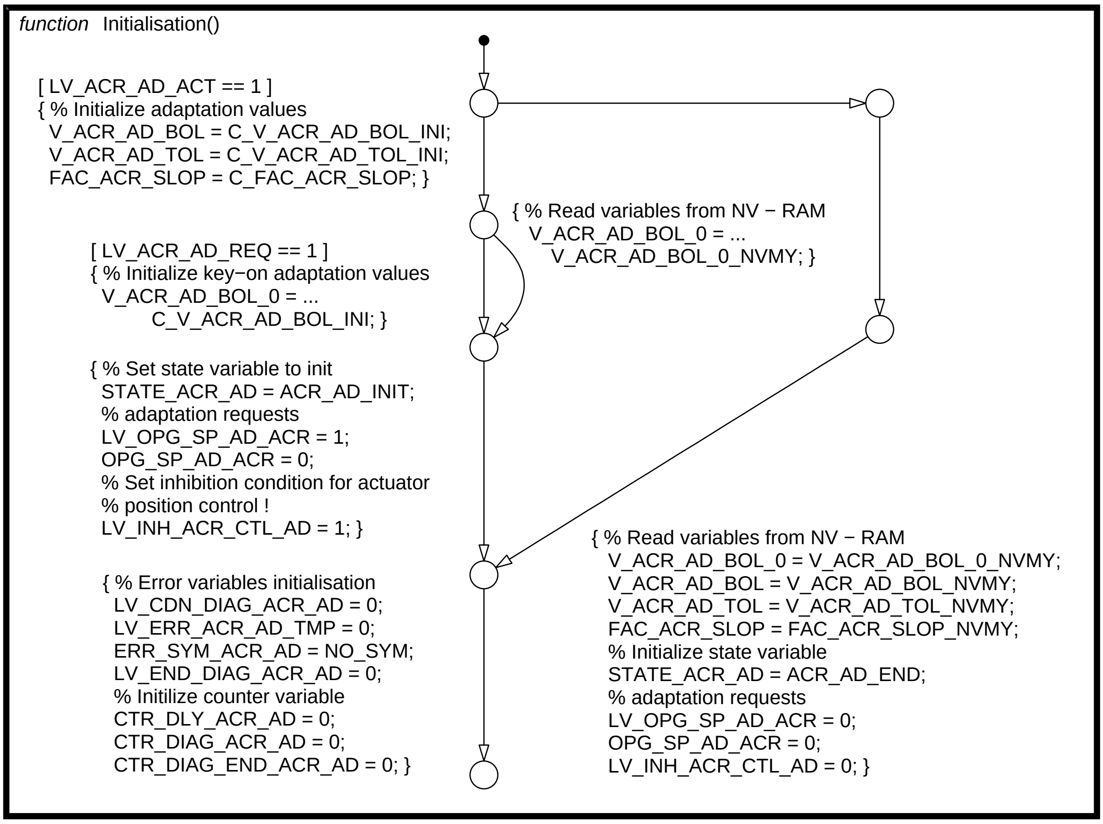

Figure A.25.5: ACRC_adaptation_and_diagnosis/Operate/Chart/Initialisation

Initialisation state of the actuator adaptation

At the start of the actuator adaptation the following initialisation function is necessary. During the initialisation state the adaptation waits a defined time for valid adaptation conditions.

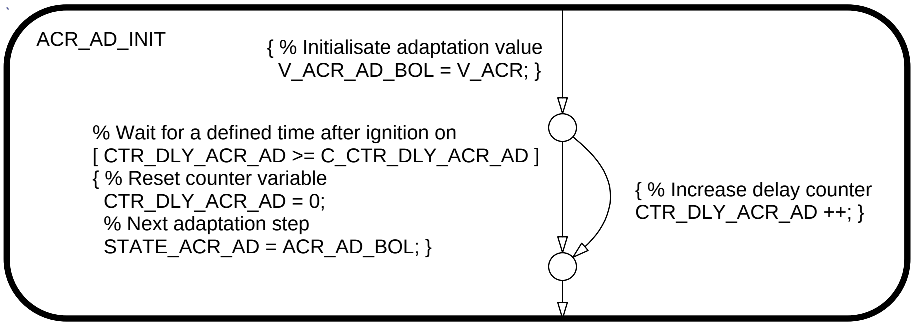

Figure A.25.6: ACRC_adaptation_and_diagnosis/Operate/Chart/Adaptation/ACR_AD_INIT

Adaptation of the lower mechanical stop

In the following state the lower mechanical stop of the actuator valve is learnt. The adaptation value is determined as moving mean value of the sensor signal voltage. The corresponding correlation constant

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

C_CRLC_ARC_AD defines the calculation of the adaptation value. The adaptation is performed only for a defined adaptation time to get a valid adaptation value. At the end of the algorithm the adaptation value is check of validity. If the adaptation value is outside of the valid range than an error entry will be performed.
Additionally the further adaptation functionality, the adaptation of the upper mechanical stop, can be chosen via configuration data LC_FAC_ACR_SLOP_AD_ENA. If the constant is set then the upper mechanical stop and the sensor slope will be learnt, otherwise the adaptation will be finished and the initialisation values will be used !

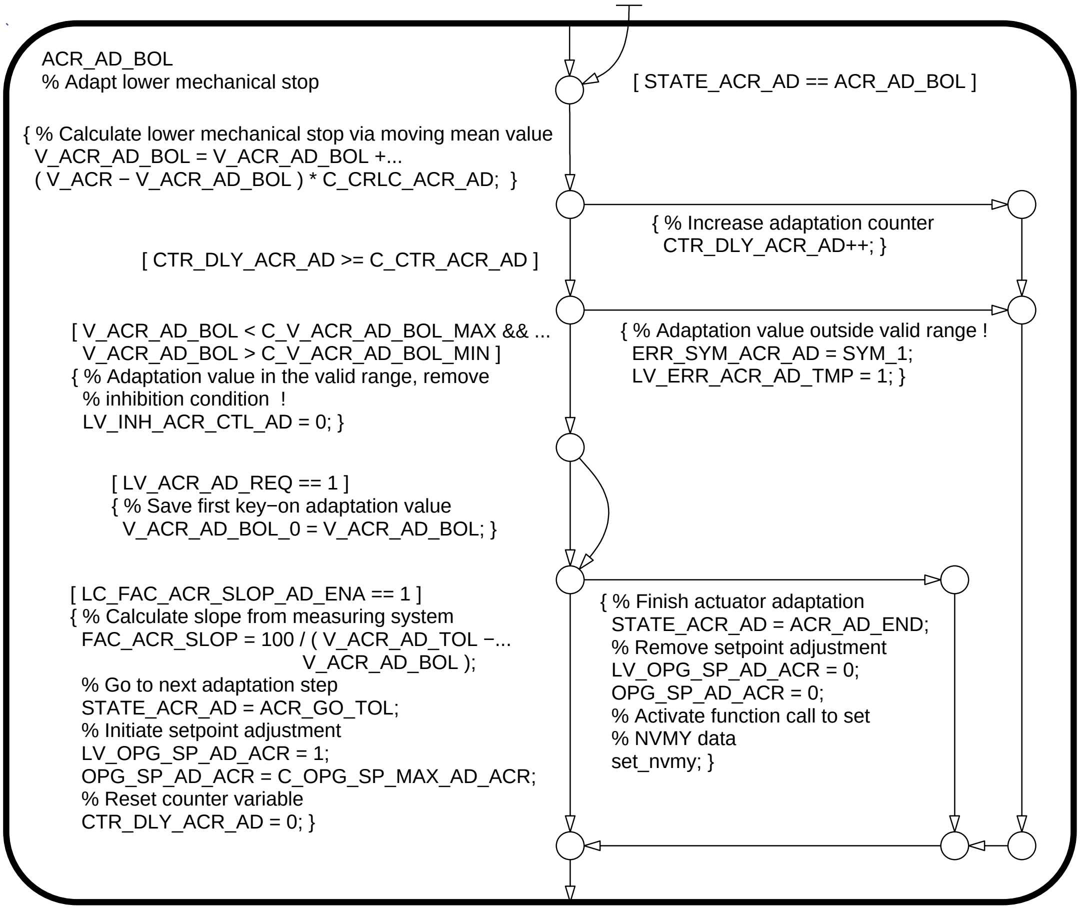

Figure A.25.7: ACRC_adaptation_and_diagnosis/Operate/Chart/Adaptation/Active/ACR_AD_BOL

Drive actuator in the upper mechanical stop

The following state drives the actuator valve in the upper mechanical stop via setpoint adjustment. At first the setpoint for closedloop position control is set to a defined start value and the power stage is switched on. Afterwards the setpoint is increased via change limitation to 100 %.
Additionally the state checks the correct function of the closedloop position control system. If the setpoint is set to 100 % then the actuator valve must exceed a diagnostic threshold otherwise an adaptation error is indicated and the adaptation is stopped.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

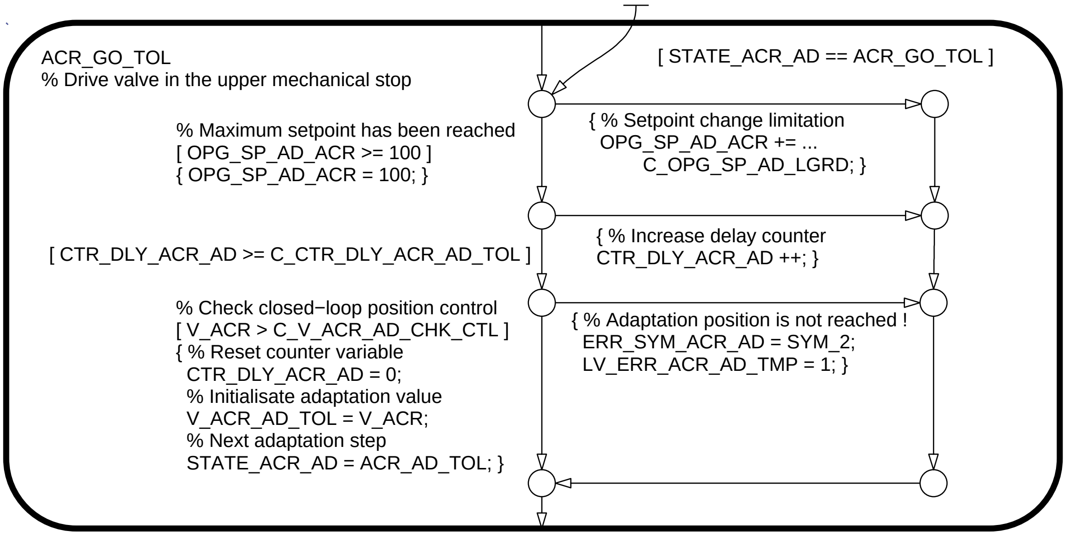

Figure A.25.8: ACRC_adaptation_and_diagnosis/Operate/Chart/Adaptation/Active/ACR_GO_TOL

Adaptation of the upper mechanical stop

In the next adaptation state the upper mechanical stop of the actuator valve is learnt. The adaptation value of the upper mechanical stop is determined as moving mean value of the sensor signal voltage. The corresponding correlation constant C_CRLC_ARC_AD defines the calculation of the adaptation value. The adaptation is performed only for a defined adaptation time to get a valid adaptation value. At the end of the algorithm the adaptation value of the upper mechanical stop is check of validity. If the adaptation value is outside of the valid range than an error entry will be performed.

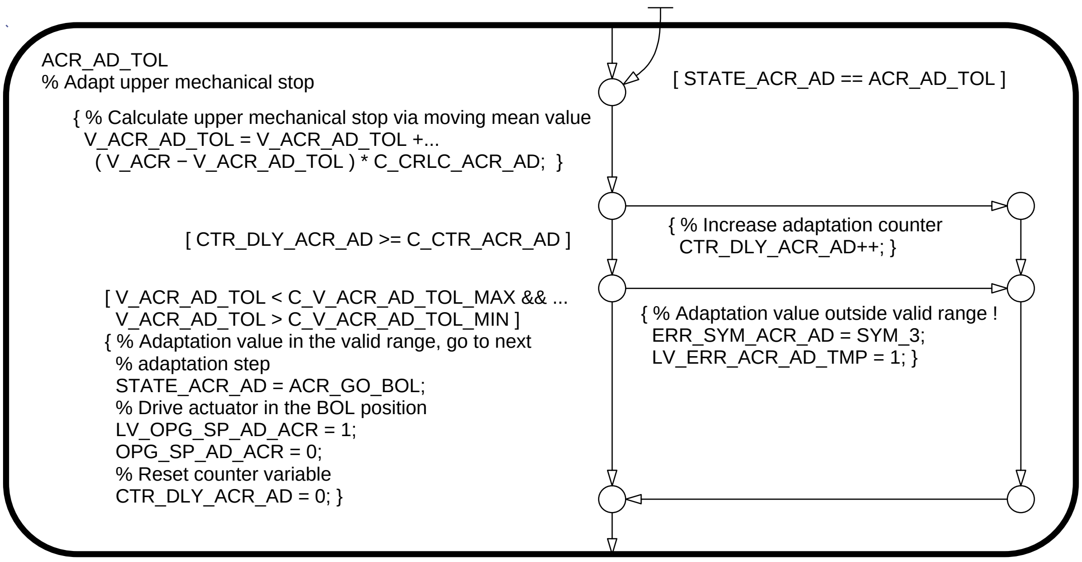

Figure A.25.9: ACRC_adaptation_and_diagnosis/Operate/Chart/Adaptation/Active/ACR_AD_TOL

Finish actuator adaptation

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The last state of the adaptation shall drive the actuator valve in the lower mechanical stop and calculate the sensor signal slop of the measuring system. The adaptation state will be left if a defined waiting time is elapsed.

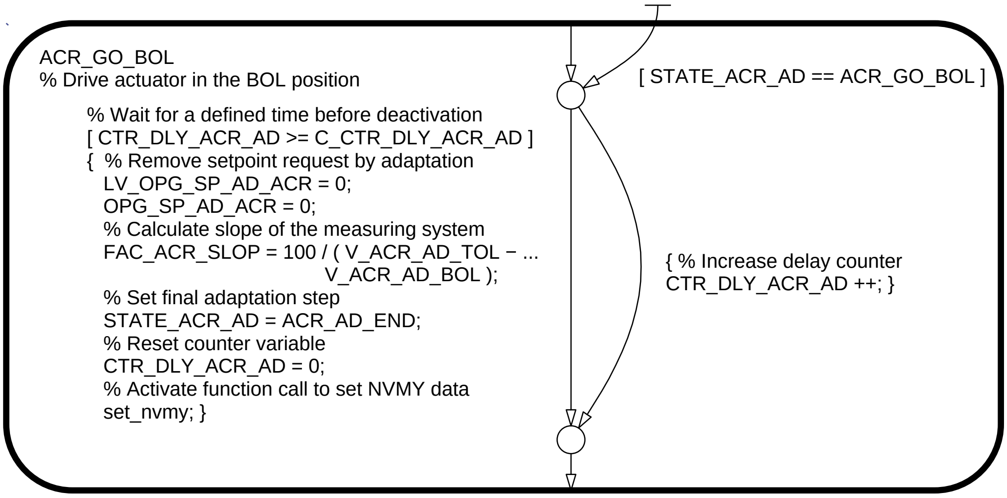

Figure A.25.10: ACRC_adaptation_and_diagnosis/Operate/Chart/Adaptation/Active/ACR_GO_BOL

Continuously adaptation of the lower mechanical stop

If the actuator valve is in closing position, then the adaptation of the lower mechanical stop will be started after a defined delay time. A closed actuator valve is indicated by the state variable STATE_ACR_CTL of the position control software. The adaptation value is determined as moving mean value of the sensor signal voltage. The corresponding correlation constant C_CRLC_ARC_AD defines the calculation of the adaptation value.
At the end of the algorithm the adaptation value is check of validity. If the adaptation value is outside of the valid range than an error entry will be performed.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Interface to the error management

The following algorithm set the detected error and the end of diagnosis information according the diagnostic result and delivers the result to Error Management.

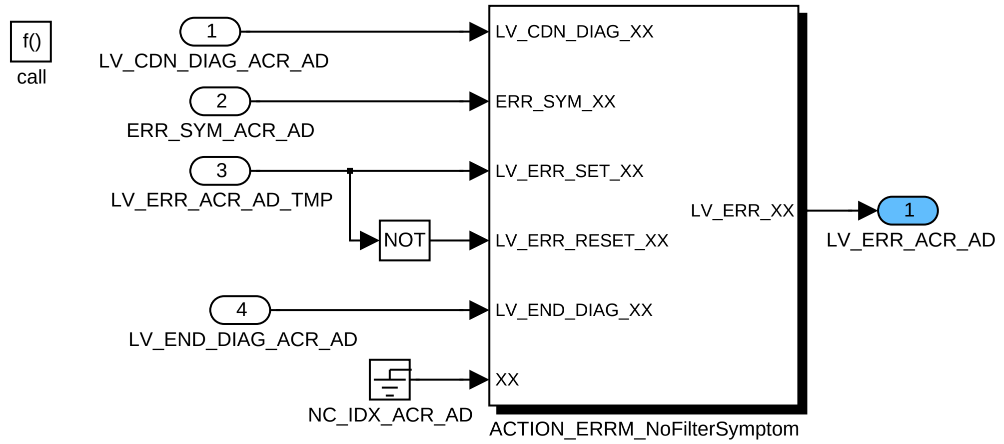

Figure A.25.13: ACRC_adaptation_and_diagnosis/Operate/Interface_to_ERRM

Manage non volatile variables

The last section describes the data handling of variables defined in the non-volatile memory. Three function calls are available for the initialisation, the readout and the update of the non-volatile memory. A special feature has been implemented for the data update. New adaptation values are only stored for an error free system and a successful adaptation end. Otherwise the last valid adaptation values will be used again for the NVRAM update!

General information

This module describes the coordination of the actuator adaptation with corresponding diagnosis functions. The actuator adaptation can be split in a standard adaptation during IGKON and post operation phase and a continuously adaptation only for the adaptation of the lower mechanical stop. Separate inhibition conditions for the described adaptations are available.

Application Condition

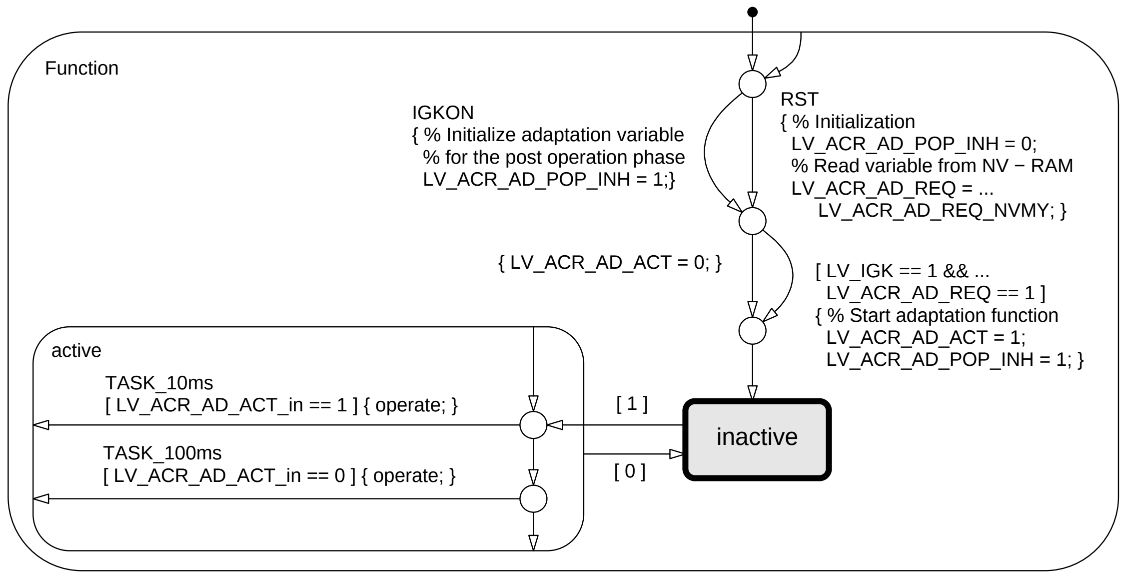

Figure A.26.1: ACRC_adaptation_and_diagnosis_ai/APP_CDN/APP_CDN

Function Description

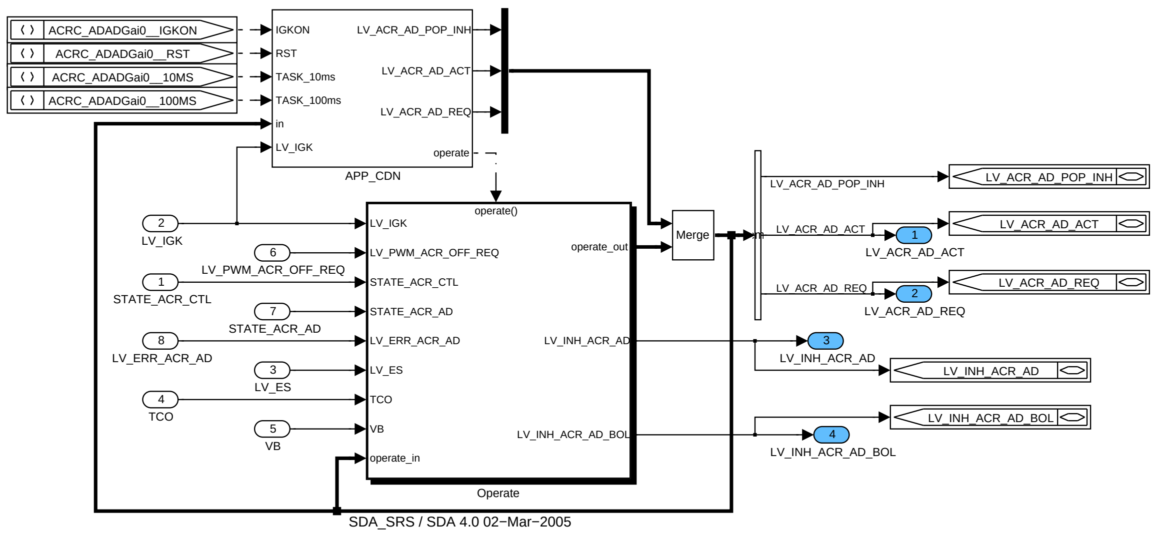

Figure A.26.2: ACRC_adaptation_and_diagnosis_ai

A.26.1 Coordination of the adaptation functionality

The adaptation request LV_ACR_AD_REQ is checked every time the control unit is switched on. If an adaptation is requested then a "first key on" adaptation will be performed with LV_ACR_AD_ACT = 1. The actuator adaptation is necessary in the following cases:

- In initial start (first engine run or control unit exchange), that means no adaptation values are stored in the non volatile memory
- Check sum error (NVMY - error) is current

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Copyright (C) Continental AG,2007

- Adaptation request bit LV_ACR_AD_REQ is set

Each of these points ends with a new adaptation request. After the activation of the "key on" actuator adaptation the corresponding inhibition condition will be checked continuously.

A second part of the adaptation functionality is the actuator adaptation in the post operating phase. After ignition off and engine stop the corresponding inhibition variable is once checked. If all activation conditions are fulfilled then the actuator adaptation will be started, the inhibition variable is **not** checked during the adaptation to avoid possible error entries.

General information

The task of this diagnosis is to detect an actuator valve error or a jammed actuator. The diagnostic observes the control deviation of the closedloop position control system dependent on the gradient of the actuator valve position setpoint.
Additionally the position controller output is monitored by this diagnostic function. If the moving mean value of PWM_ACR exceeds a defined threshold than an error will be indicated. The calculation of the moving mean value is done by an low pass filter first order.

Application Condition

Figure A.27.2: ACRC_actuator_diagnosis

A.27.1 Monitoring of the actuator valve function

The antibounce of the error detection is done at the end of the module without generic debounce algorithm. The increment and decrement value of the implemented algorithm can be calibrated.

The following error symptoms can be distinguished:

PWM error of the closed loop position control system

System deviation outside the admissible range

Error symptoms are defined to this diagnosis function as following:

SYM_0 - System deviation outside range

SYM_1 - PWM_ACR outside range

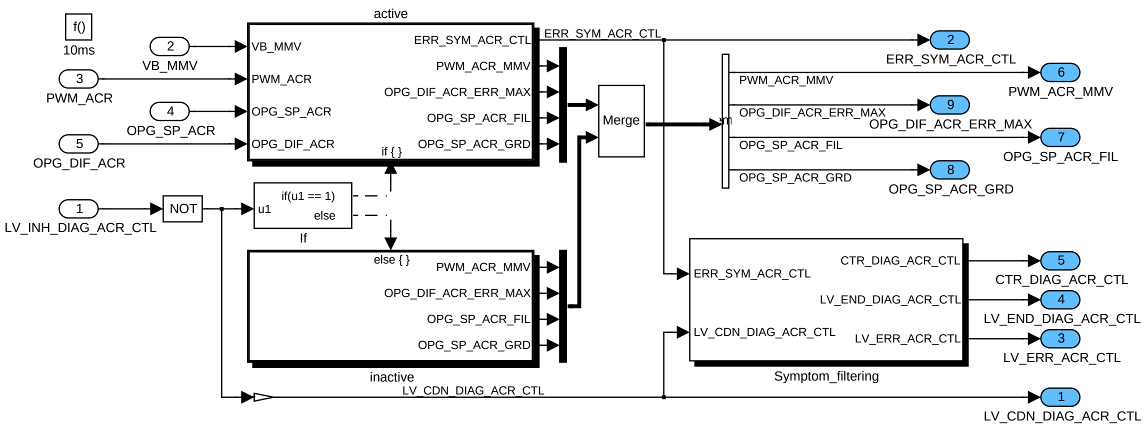

Figure A.27.3: ACRC_actuator_diagnosis/operate_10ms

Actuator failure detection

This chapter calculates the admissible error of the control deviation and the moving mean value of the position controller output, after than the error symptom determination will be performed !

A.29 Actuator limp home management

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_OPG_ACR_INI_REQ	O/V	0... 1H	0 ...1	1	-
Logical variable requests the replacement value for actuator signal acquisition					
LV_PWM_ACR_OFF_REQ	O/V	0... 1H	0 ...1	1	-
ACR position control deactivation requested from monitoring level 1					

Input data:

LV_ERR_ACR_AD {p. 4320}	LV_ERR_ACR_CTL {p. 4337}	LV_ERR_ACR_DR {p. 4347}	LV_ERR_SENS_ACR {p. 4352}
LV_ERR_VCC_ACR {p. 4355}			

General information

The limp home management monitors the diagnostic functions of the closed-loop actuator control system. In case of monitoring level 1 errors the limp home function requests the deactivation of the power stage and actuator position control. The following diagnostic functions for ACRC position control are available:

- ACRC position sensor diagnosis
- ACRC power stage diagnosis
- ACRC actuator diagnosis
- ACRC adaptation diagnosis

Application Condition

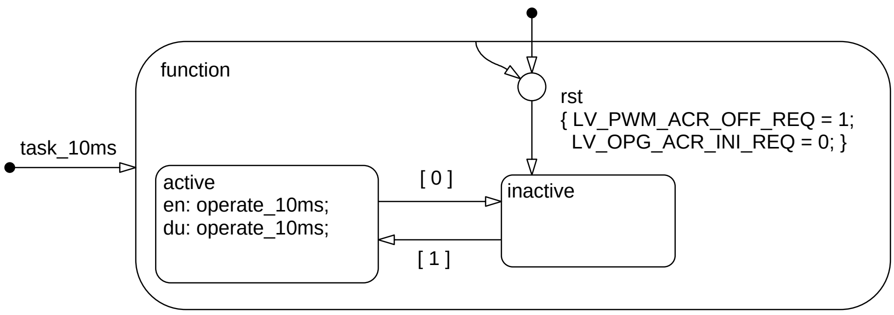

Figure A.29.1: ACRC_limp_home_management/APP_CDN/APP_CDN

Import actions:

ACTION_ERRM_FilterSymptom (**IN**<PRM_IDX_DIAG>,**IN**<PRM_LV_CDN_DIAG>,**IN**<PRM_ERR_SYM>,**IN**<PRM_C_ABC_INC>, **IN**<PRM_C_ABC_DEC>,**IN**<PRM_C_ABC_MAX>,**OUT**<PRM_LV_ERR>)
ACTION_INFR_GetElDiagAcrDr (**OUT**<Lv_state_acr_dr>)

General information

The used power stage is an intelligent full HBridge, designed for the control of DC and stepper motors in safety critical applications and under extreme environmental conditions. The HBridge is protected against overtemperature, short circuits and has an under voltage lockout for all supply voltages (main DC power supply). All malfunctions cause the output stages to go tristate.
In this application the power stage is implemented in the status flag mode, that means indicated errors can not be distinguished by the software. The following errors can be detected only by the power stage:
Undervoltage /Overcurrent /Overtemperature /hardware disabled manually
Errorsymptoms are defined to this diagnosis function as following:
SYM_0 ACR power stage error

Application Condition

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information

This diagnosis function is used to monitor the admissible input voltage range of the actuator valve position sensor system. The diagnostic is able to detect short circuit to battery, open circuit and short circuit to ground for the position sensor input according to the pull resistor at the input of the AD - converter.

Error symptoms are defined to this function as following:

SYM_0 Short circuit to battery or open load
SYM_1 Short circuit to ground

Application Condition

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. 	-	SYM_3	

Note :

- The data ERR_SYM_POIL_DR, LV_END_DIAG_POIL_DR and LV_CDN_DIAG_POIL_DR are not present in the output data table, because they are not used by other functions. Despite they are provided by the error management and are always visible.

Note :

ACTION_INFR_GetElDiagPoil_dr() is defined in the IRS (Infrastructure requirement specification)

FUNCTION DESCRIPTION:

General information:

The oil pressure actuator is driven by the ECU via an output driver. The failure detection is done by ECU Hardware.

The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

Description:

After activation conditions are met, the diagnosis activation is delayed for NC_PSD_DLY_POIL_DR executions, to avoid the usage of wrong infrastructure information.

Error-symptoms and conditions: are defined to this diagnosis function as following

```
□□□□
| | | └─> Short circuit to battery (SCP)        (= SYM_0)
| | └───> Short circuit to ground (SCG)         (= SYM_1)
| └─────> Open circuit  (OC)                    (= SYM_2)
└───────> -                                     (= SYM_3)
```

Application conditions

Initialisation:

```
at transition LV_IGK 0 - -> 1:
  LV_ERR_POIL_DR,
  ERR_SYM_POIL_DR,
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
LV_END_DIAG_POIL_DR
(according filter-type)
Set delay counter for NC_PSD_DLY_POIL_DR
at reset:
CDN_DIAG_POIL_DR = 0,
LV_ERR_POIL_DR = 0 and
ERR_SYM_POIL_DR = 0,
LV_CDN_DIAG_POIL_DR = 0,
LV_END_DIAG_POIL_DR = 0,
(according filter-type)
Set delay counter for NC_PSD_DLY_POIL_DR
```

Recurrence: *100 ms*

Activation: LV_IGK = 1 **and** LC_POIL_CTL_ENA = 1 **and** LV_ERR_SPI_MPS = 0

Deactivation: *LV_IGK = 0* ***or*** *LC_POIL_CTL_ENA = 0* ***or*** *LV_ERR_SPI_MPS = 1*

Formula section:

If LV_IGK = 1 **and**
LV_CDN_VB_OBD1 = 1
Then
Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_POIL_DR and basic diagnosis conditions CDN_DIAG_POIL_DR) received from the infrastructure:
ACTION_INFR_GetElDiagPoil_dr (OUT<Cdn_diag_poil_dr>, OUT<Err_diag_poil_dr>)

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_POIL_DR
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_POIL_DR

If Activation conditions are met for the NC_PSD_DLY_POIL_DR recurrence of the diagnosis
Then *{ Additional diagnosis conditions }*
If C_PWM_POIL_DR_MIN_DIAG_SCP > POIL_PWM
then bit 0 of CDN_DIAG_POIL_DR = 0 *{Diagnosis of SCP not possible }*
Endif
If POIL_PWM > C_PWM_POIL_DR_MAX_DIAG_SCG
then bit 1 of CDN_DIAG_POIL_DR = 0 *{Diagnosis of SCG not possible }*
Endif
If POIL_PWM < C_PWM_POIL_DR_MIN_DIAG_OC
Or POIL_PWM > C_PWM_POIL_DR_MAX_DIAG_SCG
then bit 2 of CDN_DIAG_POIL_DR = 0 *{Diagnosis of OC not possible }*
Endif
Else CDN_DIAG_POIL_DR = 0
Endif
Else
CDN_DIAG_POIL_DR = 0
Endif

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_POIL_DR and ERR_DIAG_POIL_DR.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_FilterMulticondition (IN<POIL_DR>, IN<CDN_DIAG_POIL_DR>, IN<ERR_DIAG_POIL_DR>, IN<C_ABC_INC_POIL_DR>, IN<C_ABC_MAX_POIL_DR>, OUT<LV_ERR_POIL_DR>)
This algorithm determines:

ERR_DIAG_POIL_DR (detected error symptom for POIL_DR diagnosis)
LV_ERR_POIL_DR (Error flag for debounced error of POIL_DR)
LV_CDN_DIAG_POIL_DR (Diagnosis condition information)
LV_END_DIAG_POIL_DR (End of diagnosis information)

A.34.1 Electrical diagnosis of oil pressure actuator for shortcut to ground (SCG)

FUNCTION DESCRIPTION:

General information:

In case of an electrical failure caused by a shortcut to ground (SCG) a special failure - reaction and a different warning - lamp (EML) - handling is necessary (caused by low oil - pressure the engine speed will be limited at 3000 rpm). Due to the need of a separate C_ERR_CLAS for this symptom of LV_ERR_POIL_DR it will be copied on LV_ERR_POIL_DR_SCG.

Error-symptoms and conditions: are defined to this diagnosis function as following

```
|_|_|_|_|
 | | | └> -                                  (= SYM_0)
 | | └──> Short circuit to ground (SCG)      (= SYM_1)
 | └────> -                                  (= SYM_2)
 └──────> -                                  (= SYM_3)
```

Application conditions

Initialisation: all output data according ABC configuration **"MEM"**
// LV_IGK 0->1 ***or*** *reset* ***or*** *at clearing error memory*
This action initialized the diagnostic result according the filtering
ACTION_ERRM_GetLvErr(IN<NC_IDX_DIAG_ POIL_DR_SCG >, OUT<LV_ERR_POIL_DR_SCG>)

Recurrence: *100 ms*

Activation: LV_IGK = 1 **and** LC_POIL_CTL_ENA = 1 **and** LV_ERR_SPI_MPS = 0

Deactivation: *LV_IGK = 0* ***or*** *LC_POIL_CTL_ENA = 0* ***or*** *LV_ERR_SPI_MPS = 1*

Formula section:

LV_CDN_DIAG_POIL_DR_SCG = LV_CDN_DIAG_POIL_DR
If ERR_SYM_POIL_DR = SYM_1
Then ERR_SYM_POIL_DR_SCG = SYM_1
Else ERR_SYM_POIL_DR_SCG = NO_SYM
Endif

For failure and error management treatment the anti-bounce mechanism is called with the parameters LV_CDN_DIAG_POIL_DR_SCG and ERR_SYM_POIL_DR_SCG.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_FilterSymptom (IN< POIL_DR_SCG >, IN< LV_CDN_DIAG_POIL_DR_SCG >, IN< ERR_SYM_POIL_DR_SCG >, IN< C_ABC_INC_POIL_DR_SCG >, IN< C_ABC_MAX_POIL_DR_SCG >,
IN< 1 >, OUT< LV_ERR_POIL_DR_SCG >)
This algorithm determines LV_ERR_POIL_DR_SCG and LV_END_DIAG_POIL_DR_SCG and delivers the result to Error Management.

A.34.2 Oil pressure switch diagnosis

FUNCTION DESCRIPTION:

General information:

Due to the ECU recognizing the oil pressure as “ok” during “switch open”, a diagnosis of the oil pressure switch is required in order to detect a fallen off plug (open load).

Description:

Error symptoms are defined to this diagnosis function as following:

```
|_|_|_|_|
 | | | └─>                          (= SYM_0)
 | | └───>                          (= SYM_1)
 | └─────> Open Load                (= SYM_2)
 └───────> -                        (= SYM_3)
```

Oil pressure sensor error present					

Input data:

LC_POIL_CTL_ENA {p. 903}	LV_IGK {p. 906}	V_POIL {p. 831}	

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_POIL	-	0... FFH	0... 255	1	-
Anti - bounce counter increment					
C_ABC_MAX_POIL	-	1... FFH	1... 255	1	-
Maximum value of the anti - bounce counter					
C_V_POIL_MAX_DIAG	-	0... 3FFH	0... 4.99511	4.883e-3	V
Maximum diagnostic value for the oil pressure sensor signal					
C_V_POIL_MIN_DIAG	-	0... 3FFH	0... 4.99511	4.883e-3	V
Minimum diagnostic value for the oil pressure sensor signal					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The signal of the oil pressure sensor on the A/D-input of the microcontroller is checked.

Description:

Error-symtoms are defined to this diagnosis function as following :

```
|_|_|_|_|
 | | | └─> Signal line short to battery voltage or 5 V power supply (= SYM_0)
 | | └───> Signal line short to ground or open load                (= SYM_1)
 | └─────> -                                                         (= SYM_2)
 └───────> -                                                         (= SYM_3)
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialization: all 0 at LV_IGK 0 - ->1 **or** reset

Recurrence: 100ms

Activation:
```
If      LV_IGK = 1    and    LC_POIL_CTL_ENA = 1
Then  LV_CDN_DIAG_SENS_POIL = 1
Else   LV_CDN_DIAG_SENS_POIL = 0
Endif
```

Deactivation: LV_IGK = 0 **or** LC_POIL_CTL_ENA = 0

Formula section:

Short circuit to VBatt or 5 V power supply:
If V_POIL > C_V_POIL_MAX_DIAG
Then ERR_SYM_SENS_POIL = SYM_0
Short circuit to ground or open load:
Else **If** V_POIL < C_V_POIL_MIN_DIAG
Then ERR_SYM_SENS_POIL = SYM_1
Else ERR_SYM_SENS_POIL = NO_SYM
Endif
Endif
Calculation of present error and end of diagnosis:
LV_ERR_SENS_POIL and LV_END_DIAG_SENS_POIL is calculated by the error management.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

	ER segment adaptation values at the limit	*1*	
		2	
SEG_AD_ER		*3*	

A.36.1 Engine roughness segment time acquisition error

FUNCTION DESCRIPTION:

The purpose of this error is to diagnose synchronisation errors on engine roughness segments measurement.
An error symptom *Missing/Adding 1 tooth or more on engine roughness segment acquisition* is detected when a crankshaft synchronisation error caused by 1 or 2 missing/additional tooth occurs on one crankshaft revolution.

Application conditions

Initialisation: *at ECU reset or KEY OFF/ KEY ON event*
LV_CDN_DIAG_T_SEG_ER = 0
ERR_SYM_T_SEG_ER = *Refer to filtering configuration for the initialisation value*
LV_ERR_T_SEG_ER = *Refer to filtering configuration for the initialisation value*
LV_END_DIAG_T_SEG_ER = *Refer to filtering configuration for the initialisation value*

Recurrence: each 360°Crk at segment task

Activation/Deactivation:

```
If      LV_DC = 1
And     LV_INH_DIAG_T_SEG_ER = 0
Then    LV_CDN_DIAG_T_SEG_ER = 1          diagnosis is active
Else    LV_CDN_DIAG_T_SEG_ER = 0          diagnosis is passive
```

EndIf

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Error detection

If LV_INH_MIS_CRK = 1
Then ERR_SYM_T_SEG_ER = SYM_1
(symptom "Missing/Adding 1 or 2 teeth on engine roughness segment acquisition" is active, ABC counter starts to increment)
LV_ERR_T_SEG_ER = 1 *(after anti-bounce)*
Else ERR_SYM_T_SEG_ER = NO_SYM
(no symptom is declared, ABC counter starts to decrement)
LV_ERR_T_SEG_ER = 0 *(after anti-bounce)*
EndIf

Symptoms are **unchanged** if condition for doing symptom detection is not fulfilled.

A.36.2 Engine roughness segment adaptive values out of range error

Description:

The purpose is to diagnose the ER segment adaptive values.
If during or at the end of the segment adaptive values learning process *(LV_SEG_AD_ER = 1 or LV_SEG_AD_ER = 1 -> 0)*, at least one of the engine roughness segment adaptation values is at the limit (LV_SEG_AD_LIM_ER = 1), the error symptom SEG_AD_ER engine roughness segment adaptation values at the limit is detected.

Application conditions

Initialisation:

```
at ECU reset or KEY OFF/ KEY ON event
LV_CDN_DIAG_SEG_AD_ER = 0
ERR_SYM_SEG_AD_ER = Refer to filtering configuration for the initialisation value
LV_ERR_SEG_AD_ER = Refer to filtering configuration for the initialisation value
LV_END_DIAG_SEG_AD_ER = Refer to filtering configuration for the initialisation value
```

Recurrence:

```
segment task
```

Activation/Deactivaton:

```
If     [ ( LV_SEG_AD_ER = 1 -> 0 And LC_CDN_DIAG_SEG_AD_ER = 0 )
Or       ( LV_SEG_AD_ER = 1 And LC_CDN_DIAG_SEG_AD_ER = 1 ) ]
And      LV_SEG_AD_AVL_ER = 1            // adaptive values available
And      LV_INH_DIAG_SEG_AD_ER = 0       // no application fade-out
Then     LV_CDN_DIAG_SEG_AD_ER = 1       // diagnosis is active
Else     LV_CDN_DIAG_SEG_AD_ER = 0       // diagnosis is passive
```

EndIf

ER reference value for ER diagnosis					

General Information

Conclusions on the combustion quality of a cylinder can be drawn by monitoring the crankshaft acceleration. This can be used in the workshop for diagnostic purposes.
The cylinder individual engine roughness values ER_CYL[NC_CYL_NR], which are determined for misfire diagnosis, are taken, related to a TCO- and operating point-dependent threshold and then smoothed by moving mean value calculation.
The 6 diagnostic values are transferred to the workshop tester via K-line. If an ER diagnostic value exceeds a determined threshold, it can be assumed that the corresponding cylinder has a malfunction.

Application Conditions

Initialization: RST
Recurrence: SEG
Activation: LV_IS==1
Deactivation: never

T_INH_ISC_DIAG_AST is calculated using IP Curve IP_T_INH_ISC_DIAG_AST with TCO_ST as input.

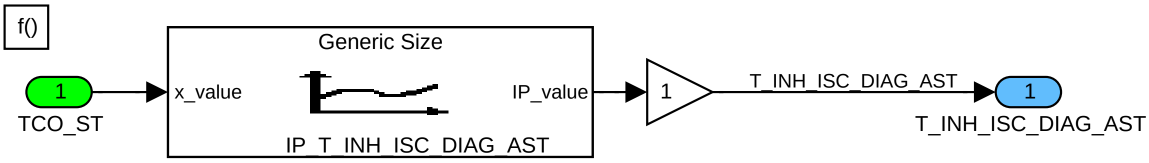

Figure A.39.6: ENSC_MA09C/EXIT_ST/EXIT_ST_CLC

A.39.3 Plausibility check

FUNCTION DESCRIPTION:
General information:

Engine speed deviation from the nominal engine speed is monitored either the vehicle is stopped and the throttle is settled after closing or after engine start. Due to different engine operating characteristics the coldstart-monitoring is performed by using limits depending on the temperature of cooling water and time after start.

If the difference to the nominal idle speed keeps too high or too low in spite of an activated idle speed controller, an idle speed control plausibility error is detected.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure A.39.7: ENSC_MA09C/OPM

Calculation of timer T_ISC_DIAG

The following timer is used for delaying the activation of the diagnosis algorithm when the idle speed controller is activated or speed is possibly excited due to strong disturbances such as ACC or drive train engaging (in order to prevent a diagnosis at high, normal speed deviations):

Figure A.40.1: :

General Information

A.40.1 Inhibition of diagnoses

Description:
If one of the following components fail, the ISC diagnoses function is stopped by LV_INH_DIAG_ISC = 1. The RBM of ISC diagnoses is stopped by
LV_INH_DIAG_RBM_ISC = 1.

Application Conditions

Initialization: RST, IGKON
Recurrence: 100MS
Activation: LV_IGK==1
Deactivation: never

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure A.40.13: :

A.40.3.2 Calculation at 100 ms recurrence

A.40.3.2.1 Calculation

For the special CSERS denomination of the idle speed control diagnosis under cold start conditions the accumulated time in state "catalyst heating" in keeping with "cold start idle speed setpoint active" is calculated here. The timer is only reset with the start of a new driving cycle.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Figure A.40.14: :

A.40.4 Interface for Rate - Based - Monitoring

General Information:
With this module the interface between the ISC /ISC_CST monitor and the rate based monitoring statistics is defined with STATE_RBM_ISC /STATE_RBM_ISC_CST data. Within STATE_RBM_ISC /ISC_CST, three different information are defined:
Conditions for monitoring are met long enough to detect manipulation (bit 0) (no intrusive operation, no short trip)
Monitor disabled because of system malfunction (bit 1) (depending on failure status: pending)
Monitor individual RBM conditions encountered within this DC(bit 2) (not valid for ISC daignosis)

Application Conditions

Initialization: RST, CLRFMY, DCON
Recurrence: 1S
Activation: LV_DC==1
Deactivation: LV_DC==0

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.41.1 External Inhibitions and filter type definitions

FUNCTION DESCRIPTION:

General information:

The flags LV_INH_DIAG_EXT_... allow to deactivate the corresponding diagnostic.

Application conditions

Initialisation:	`At reset : all = 0`
Recurrence:	`once at reset`
Activation:	`-/ -`
Deactivation:	`When the activation condition is not fulfilled`

Formula section:

LV_INH_DIAG_EXT_PER_CAM_IN(EX)[i] = 0
LV_INH_DIAG_EXT_SYN_CAM_IN(EX)[i] = 0
LV_INH_DIAG_EXT_REF_CRK_CAM_IN(EX)[i] = 0
LV_INH_DIAG_EXT_PLAUS_CAM_IN(EX)[i] = 0
LV_INH_DIAG_EXT_SYN_CRK_CAM_IN(EX)[i] = 0
LV_INH_DIAG_EXT_TOOTH_OFF_IN(EX)[i] = 0
LV_ERR_EXT_CAM_IN(EX)[i] = 0

A.41.2 Interface of TOOTH_OFF_IN/EX error for Rate-based-monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the TOOTH_OFF_IN/EX[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TOOTH_OFF_IN/EX[i] data.
Within STATE_RBM_TOOTH_OFF_IN/EX[i] , three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for TOOTH_OFF_IN/EX[i] diagnosis)

***Remark**: Calculation must be made seperate for ..._EX[i]   and ..._IN[i]*

Application conditions:

Initialisation :
at LV_DC 0 $\rightarrow$ 1 transition :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

bit 0 and bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 0
bit 2 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 1
on failure memory reset :
bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 0

Recurrence: 1 s

Activation: LV_DC 0 → 1 transition **and** LV_DC = 1

Formula section:

At LV_DC 0 → 1 transition

The pending status of the following failures has to be checked only once :
LV_ERR_SYN_CAM_IN/EX[i]
LV_ERR_PER_CAM_IN/EX[i]
LV_ERR_PLAUS_CAM_IN/EX[i]
LV_ERR_SYN_CRK_CAM_IN/EX[i]
LV_ERR_REF_CRK_CAM_IN/EX[i]

```
If(1)       { CPU optimization at LV_DC 0 → 1 transition }
              CTR_ERR_DYN_NR <> 0    { the dynamic failure memory isn't empty }
Then(1)
              While bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 0 do
                    with each XX failure of the above list :
                    ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<C

                    If(2)       XX has a pending status
                    Then(2)        bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 1
                    Endif(2)
              Endwhile
Else(1)     { the dynamic failure memory is empty }
              No action
Endif(1)
```

Every 1 s :

```
If     bit 0 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 0
Then         If      LV_END_DIAG_TOOTH_OFF_IN/EX[i] = 1
             Then    bit 0 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 1
             Endif
Endif

If     bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 0
Then
             If      LV_INH_DIAG_TOOTH_OFF_IN/EX[i] = 1
             Then    bit 1 of STATE_RBM_TOOTH_OFF_IN/EX[i] = 1
             Endif
Endif
```

A.42.1 Camshaft Position diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect when the camshaft reference position is outside of the designed range relative to the engine position from crankshaft. This allows to detect engine misbuilds (wrong assembly of the valve train), camshaft drive defects, or sensor failures that are not detected by the normal signal diagnosis.
i = 1...NC_NR_CAM_CBK z = 0...NC_NR_EDGE_CAM_IN/EX

Description:

Error-symptoms are defined for this diagnostic function as following:

```
□□□□
| | | └─> Camshaft to crankshaft reference violated "REF_CRK_CAM"   (= SYM_0)
| | └───> (not used)                                               (= SYM_1)
| └─────> (not used)                                               (= SYM_2)
└───────> (not used)                                               (= SYM_3)
```

Application conditions

Initialisation:

LV_CDN_DIAG_REF_CRK_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
LV_END_DIAG_REF_CRK_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
LV_ERR_REF_CRK_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
ERR_SYM_REF_CRK_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*

Recurrence: every update of the camshaft edge position adaptation values PSN_EDGE_AD_CAM_IN(EX)[z][i]

Activation: LV_VLD_PSN_CAM_IN(EX)[i] = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

And LV_INH_DIAG_REF_CRK_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_EXT_REF_CRK_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_ENSD = 0

When the activation conditions are fulfilled then LV_CDN_DIAG_REF_CRK_CAM_IN(EX)[i] = 1.

Deactivation:
When the activation conditions are not fulfilled then LV_CDN_DIAG_REF_CRK_CAM_IN(EX)[i] = 0

Formula Section

Symptoms calculation:
If PSN_EDGE_AD_CAM_IN(EX)[z][i] < - C_TOL_REF_CRK_CAM_IN(EX)
or
PSN_EDGE_AD_CAM_IN(EX)[z][i] > C_TOL_REF_CRK_CAM_IN(EX)
Then ERR_SYM_REF_CRK_CAM_IN(EX)[i] = SYM_0 {Detection of symptom REF_CRK_CAM}
Else ERR_SYM_REF_CRK_CAM_IN(EX)[i] = NO_SYM
Endif
Symptoms are **unchanged** if condition for doing symptom detection is not fulfilled.
Filtering :
apply filter on current symptoms
If filtering result available (after debounce)
then
LV_ERR_REF_CRK_CAM_IN(EX)[i] = filtering result
LV_END_DIAG_REF_CRK_CAM_IN(EX)[i] = 1
Deliver the result to Error Management
Endif

A.42.2 One-tooth-off diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect a sudden drift is the camshaft position.

i = 1...NC_NR_CAM_CBK z = 0...NC_NR_EDGE_CAM_IN/EX

Description:

Error-symptoms are defined for this diagnostic function as following:

```
 |_|_|_|_|
 | | | └─> Sudden drift "ONE_TOOTH_OFF"     (= SYM_0)
 | | └───> (not used)                       (= SYM_1)
 | └─────> (not used)                       (= SYM_2)

A.43.1 Camshaft Segment Period Diagnosis

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

Camshaft signal acquisition validates the segment period by minimum limits derived from the maximum engine speed. The diagnostic state indicates when a segment period was too short, e.g. due to supplementary signal transitions. The camshaft signal acquisition will filter out such signal transitions as far as possible. If there are too many additional pulses however, the camshaft signal acquisition may not be able to synchronize any more, or the accuracy of camshaft position measurement may be degraded.
i = 1...NC_NR_CAM_CBK

Description:

Error-symptoms are defined for this diagnostic function as following:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Camshaft segment period too short "CAM_PER"     (= SYM_0)
 │ │ └───> (not used)                                      (= SYM_1)
 │ └─────> (not used)                                      (= SYM_2)
 └───────> (not used)                                      (= SYM_3)
```

Application conditions

Initialisation:
LV_CDN_DIAG_PER_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
LV_END_DIAG_PER_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
LV_ERR_PER_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*
ERR_SYM_PER_CAM_IN(EX)[i] = *Refer to filtering configuration for the initialisation value*

Recurrence: *every camshaft signal edge*

Activation: LV_ACT_CAM_IN(EX)[i] = 1
And LV_INH_DIAG_PER_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_EXT_PER_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_ENSD = 0
When the activation conditions are fulfilled then LV_CDN_DIAG_PER_CAM_IN(EX)[i] = 1

Deactivation:
When the activation conditions are not fulfilled then *LV_CDN_DIAG_PER_CAM_IN(EX)[i] = 0*

Formula section:

Symptoms calculation:
If LV_ORNG_PER_CAM_IN(EX)[i] = 1
Then ERR_SYM_PER_CAM_IN(EX)[i] = SYM_0 {detection of symptom CAM_PER]
Else ERR_SYM_PER_CAM_IN(EX)[i] = NO_SYM
Endif

LV_END_DIAG_PER_CAM_IN(EX)[i] = 1

Deliver the result to Error Management

Endif

A.43.2 Camshaft Synchronization Diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect camshaft sensor failure. Each time the camshaft signal synchronization algorithm fails, it will set the diagnostic flag LV_ORNG_RATIO_CAM_IN(EX)[i] for the appropriate camshaft.

The camshaft signal acquisition will filter out supplementary signal transitions as far as possible. If there are too many additional pulses however, the camshaft signal acquisition will not be able to synchronize any more. Synchronization may also be impossible due to missing or inaccurate signal transitions of the sensor.

i = 1...NC_NR_CAM_CBK

Description:

Error-symptoms are defined for this diagnostic function as following:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘

LV_END_DIAG_CRK_OC	V	0H 1H	PASSIVE ACTIVE	-	-
Diagnosis result available					
LV_ERR_CRK_OC	O/V	0H 1H	PASSIVE ACTIVE	-	-
Crankshaft sensor failure open or short circuit present					

Input data:

LV_IGK {p. 906}	LV_INH_DIAG_CRK_OC {p. 4455}	LV_INH_DIAG_EXT_CRK_OC {p. 4439}	N_32 {p. 1525}

FUNCTION DESCRIPTION:

General information:

This dummy file replaces the MCPS circuit diagnosis for systems with ACPS. A circuit diagnosis for ACPS is not considered neceessary, since with any of the three lines open or short-circuited, the signal will be constantly high or low. The failure will then be detected by the functional diagnosis.

Application conditions

Activation:

```
LV_IGK = 1
     And LV_INH_DIAG_CRK_OC = 0
     And LV_INH_DIAG_EXT_CRK_OC = 0
```

When the activation condition is fulfilled then LV_CDN_DIAG_CRK_OC = 1.
Desactivation:
When the activation condition is not fulfilled then LV_CDN_DIAG_CRK_OC = 0.

Formula section:

ERR_SYM_CRK_OC = 0
LV_ERR_CRK_OC = 0
LV_END_DIAG_CRK_OC = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Maximum engine speed to enable tooth number diagnosis					

Error treatment:

See Appl. Inc.
See Appl. Inc.
See Appl. Inc.

General information:

The purpose of the function is to detect failures on the crankshaft signal while the system is synchronized.
The diagnosis is divided in three different parts: tooth number error, implausible tooth period, and loss of synchronization on crankshaft signal.

A.45.1 Crankshaft Sensor Diagnosis with Tooth Number Error

FUNCTION DESCRIPTION:

General information:

The number of teeth per crankshaft revolution is monitored by the crankshaft signal acquisition. The algorithm may tolerate a number of missing/additional teeth per revolution without loosing synchronization,

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

depending on the used target wheel and on configuration data. The bit LV_ORNG_NR_TOOTH_CRK indicates wrong tooth number during the most recent crankshaft revolution.
If a tooth was missing or added during one revolution, then all variables based on teeth counting will be produced with an error. This concerns for example spark advance, segment time, misfire segments, camshaft position, etc. The purpose of the function is to provide information when the crankshaft signal is inaccurate, in order to take the necessary actions.

Description:

Error-symptoms are defined for this diagnostic function as following:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Incorrect crankshaft tooth number "TOOTH_NUMBER"     (= SYM_0)
 │ │ └───> (not used)                                           (= SYM_1)

LV_END_DIAG_CRK_TOOTH = 1
Deliver the result to Error Management
Endif

<u>**Calculation of missing/added tooth information for misfire**</u>

Initialisation:
LV_INH_MIS_CRK = 0 at reset and at engine stalling (LV_STOP_ENG transition from 0 to 1).

Recurrence: once per crankshaft revolution, after detection of the reference gap, except in the first revolution after synchronization

Activation: LV_CRK_SYN = 1

Deactivation: LV_CRK_SYN = 0

<u>**Formula Section**</u>

<u>Symptoms calculation:</u>
If LV_ORNG_NR_TOOTH_CRK = 0
Then LV_INH_MIS_CRK = 0
Else LV_INH_MIS_CRK = 1
Endif
LV_ORNG_NR_TOOTH_CRK is reset after reading at the reference gap

A.45.2 Crankshaft Sensor Diagnosis with implausible Tooth Period

<u>**FUNCTION DESCRIPTION:**</u>

<u>**General information:**</u>

Crankshaft signal acquisition validates the tooth period by limits derived from the current engine speed. Before synchronization, LV_ORNG_TOOTH_PER_CRK indicates implausible gradient of the tooth period. This flag is also set if a reference gap occurs during valid teeth phase or when the first reference gap cannot be detected.
After synchronization, LV_ORNG_TOOTH_PER_CRK is set if spikes are detected outside the crankshaft window acceptance window.

<u>**Description:**</u>

Error-symptoms are defined for this diagnostic function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Endif

A.45.3 Crankshaft Sensor Diagnosis with Loss of Synchronization

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect crankshaft failure when the system looses synchronization on the crankshaft signal.
Synchronization will be lost if the reference gap is not detected at the correct position plus/minus a tolerance of missing/additional teeth, depending on the used target wheel and on configuration data.
If the signal fails completely (no more crankshaft signal edges are detected), then no error will be detected by this diagnosis, since the condition is similar to stopped engine. A failure then may be detected by the crankshaft sensor plausibility diagnosis (e.g. test against the camshaft signal).

Description:

Error-symptoms are defined for this diagnostic function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```

Application conditions:

Initialisation:

LV_CDN_DIAG_CRK_SYN = *Refer to filtering configuration for the initialisation value*
LV_END_DIAG_CRK_SYN = *Refer to filtering configuration for the initialisation value*
LV_ERR_CRK_SYN = *Refer to filtering configuration for the initialisation value*
ERR_SYM_CRK_SYN = *Refer to filtering configuration for the initialisation value*

Recurrence: *once per crankshaft revolution, after the reference gap, except in the first revolution after synchronization, or when the bit LV_LOST_SYN_CRK is set.*

Activation: LV_CRK_SYN = 1
And LV_INH_DIAG_CRK_SYN = 0
And LV_INH_DIAG_EXT_CRK_SYN = 0
And LV_INH_DIAG_ENSD = 0

When activation conditions are fulfilled then LV_CDN_DIAG_CRK_SYN = 1.

Deactivation:

When activation conditions not are fulfilled then LV_CDN_DIAG_CRK_SYN = 0.

A.47.1 Diagnosis of crankshaft sensor

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect a failure if synchronization on crankshaft signal cannot be achieved.
One of the available camshaft signals is selected for crankshaft synchronization by setting one of the flags LV_ACT_SYN_CRK_CAM_IN[i] in the engine position control function. The signal edge counter of that camshaft is observed while the crankshaft is not synchronized. If the count reaches a calibrated number, and the system is still not synchronized with the crankshaft signal, then crankshaft sensor plausibility error is set without further debouncing. If valid crankshaft teeth have already been detected, the symptom will be implausible signal , otherwise it will be missing signal .
i = 1...NC_NR_CAM_CBK

Description:

Error-symptoms are defined to this diagnostic function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Then LV_END_DIAG_CRK_PLAUS = 1
LV_ERR_CRK_PLAUS = 0
ERR_SYM_CRK_PLAUS = NO_SYM
Deliver the result to Error Management
Endif

A.47.2 Camshaft sensor plausibility diagnosis

FUNCTION DESCRIPTION:

General information:

The functional camshaft diagnosis cannot detect a failure when a camshaft sensor delivers no signal at all. Missing signal will be detected if the camshaft edge counter is not incremented at least once per engine cycle.
i = 1...NC_NR_CAM_CBK

Description:

Error-symptoms are defined to this diagnostic function as following:

```
┌─┬─┬─┬─┐

└─┴─┴─┴─┘

A.47.3 Camshaft Sensor Diagnosis for Crankshaft Synchronization

FUNCTION DESCRIPTION:

General information:

The purpose of the function is to detect a failure of the camshaft information for crankshaft synchronization.
Up to four camshaft signals may be available in the system (intake and/or exhaust on one or two cylinder banks). The Engine Position Control selects one camshaft for synchronization by activating the corresponding operating mode. The camshaft signal acquisition will indicate camshaft signal out of range for crankshaft synchronization by setting LV_ORNG_CAM_SYN_CRK, which has to be reset by the diagnosis after treatment. A counter is incremented at every recurrence if LV_ORNG_CAM_SYN_CRK is set. The error is detected when the counter reaches a calibrated maximum.
i = 1...NC_NR_CAM_CBK

Description:

Error-symptoms are defined to this diagnostic function as following:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Camshaft signal  not valid for crankshaft synchronization     (= SYM_0)
 │ │ └───> (not used)                                                    (= SYM_1)
 │ └─────> (not used)                                                    (= SYM_2)
 └───────> (not used)                                                    (= SYM_3)
```

Application conditions:

Initialisation:
LV_CDN_DIAG_SYN_CRK_CAM_IN(EX)[i] = 0 at reset
LV_END_DIAG_SYN_CRK_CAM_IN(EX)[i] = 0 at reset
ERR_SYM_SYN_CRK_CAM_IN(EX)[i] = NO_SYM at reset
LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 0 at reset
Recurrence: every crankshaft reference gap and every camshaft edge
Activation: LV_ACT_CRK = 1
And LV_INH_DIAG_SYN_CRK_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_EXT_SYN_CRK_CAM_IN(EX)[i] = 0
And LV_INH_DIAG_ENSD = 0

When the activation condition is fulfilled then LV_CDN_DIAG_SYN_CRK_CAM_IN(EX)[i] = 1

Deactivation:
When the activation condition is not fulfilled then LV_CDN_DIAG_SYN_CRK_CAM_IN(EX)[i] = 0.

Formula Section

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Symptoms calculation:

For LV_ACT_SYN_CRK_CAM_IN(EX)[i] = 1 (camshaft sensor currently selected for synchronization):

if LV_ORNG_CAM_SYN_CRK = 0
then ERR_SYM_SYN_CRK_CAM_IN(EX)[i] = NO_SYM
else ERR_SYM_SYN_CRK_CAM_IN(EX)[i] = SYM_0" {SIGNAL INVALID}
increment CTR_ORNG_CAM_SYN_CRK
endif

if CTR_ORNG_CAM_SYN_CRK > C_CTR_ORNG_CAM_SYN_CRK_MAX
then LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 1
LV_END_DIAG_SYN_CRK_CAM_IN(EX)[i] = 1
Deliver the result to Error Management
reset CTR_ORNG_CAM_SYN_CRK
endif

if LV_SYN_VLD = 1
then LV_END_DIAG_SYN_CRK_CAM_IN(EX)[i] = 1
ERR_SYM_SYN_CRK_CAM_IN(EX)[i] = NO_SYM
LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 0
Deliver the result to Error Management
reset CTR_ORNG_CAM_SYN_CRK
endif

For LV_ACT_SYN_CRK_CAM_IN(EX)[i] = 0 (camshaft sensor currently **not** selected for cam/crk synchronization):

if LV_SYN_CAM_IN(EX)[i] = 1
And
LV_AD_END_CAM_IN(EX)[i] = 1
then ERR_SYM_SYN_CRK_CAM_IN(EX)[i] = NO_SYM
If LC_CAM_ERR_ENA_VVT = 1
Then LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 0
LV_END_DIAG_SYN_CRK_CAM_IN(EX)[i] = 1
Deliver the result to Error Management
Endif
endif

LV_ERR_SYN_CRK_CAM_IN(EX)[i], ERR_SYM_SYN_CRK_CAM_IN(EX)[i] and CTR_ORNG_CAM_SYN_CRK are reset to initialization value at 0 to 1 transition of LV_IGK.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.48.1 Calculation of Fail Safe Delay

General information:

Calculation of the time delay to inhibit cam/crk diagnosis when there is a risk of reverse engine rotation.

Application conditions

Initialisation: `no initialization value.`

Recurrence: `10ms` **and** `1 to 0 transition of LV_IGK`

Activation: `no condition`

Deactivation: `no condition`

Formula section:

If LV_IGK = 0 **And** LV_INH_DIAG_ENSD = 0
Then *check N_TOOTH every 10ms*
If 0 < N_TOOTH < C_N_NOT_REST
Then *Inhibition of all diagnosis functions except sensor circuit diagnosis*
LV_INH_DIAG_ENSD = 1
Wait for a time C_T_DLY_REST_IGK
LV_INH_DIAG_ENSD = 0
Endif
Endif

If LV_STOP_ENG = 1 And LV_ENG_BACK_DET = 0
/* to be checked before LV_ENG_BACK_DET reset on LV_STOP_ENG transition */
And
/* don t activate fail safe delay if cam/crk synchronization is out of range */
LV_ORNG_CAM_SYN_CRK = 0
And
/* don't activate fail safe delay if tooth period is out of range */
LV_ORNG_TOOTH_PER_CRK = 0
And
LV_INH_DIAG_ENSD = 0
Then **If** 0 < N_TOOTH < C_N_NOT_REST
(N_TOOTH: most recently calculated engine speed)
Then *Inhibition of all diagnosis functions except sensor circuit diagnosis*
LV_INH_DIAG_ENSD = 1
Wait for a time C_T_DLY_REST_STALL

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Stop timer C_T_DLY_REST_STALL at 0 to 1 transition of LV_IGK
LV_INH_DIAG_ENSD = 0

Endif

Endif

A.48.2 Diagnosis general inhibition in case of engine backwards rotation detection

General information:

Inhibits cam/crk diagnosis when a reverse engine rotation has been detected until confirmation/nullification.

Application conditions

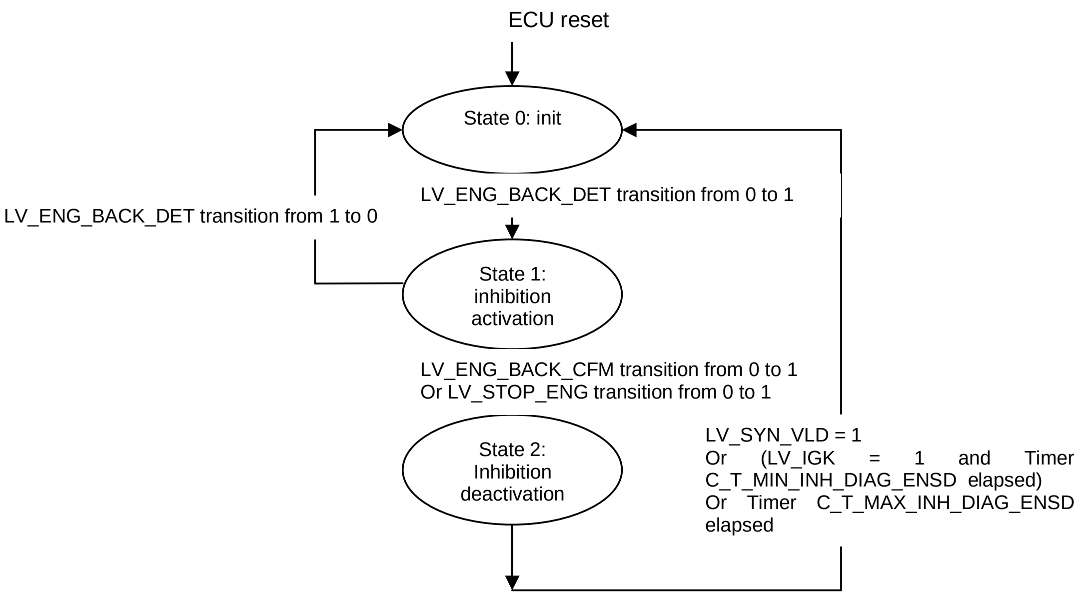
Initialisation: no initialization value.

Recurrence: 10ms **and** transition from 1 to 0 of LV_IGK **and** every update of LV_ENG_BACK_DET or LV_ENG_BACK_CFM **and** transition from 0 to 1 of LV_SYN_VLD **and** transition from 0 to 1 of LV_STOP_ENG

Activation: LC_ENG_BACK_INH = 0

Deactivation: when application conditions are not fulfilled

Formula section:



State 0: Initialisation

Input conditions:

External event : ECU reset

From state 1: LV_ENG_BACK_DET transition from 1 to 0

From state 2: LV_SYN_VLD = 1

Or (LV_IGK = 1 and timer C_T_MIN_INH_DIAG_ENSD elapsed)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Or timer C_T_MAX_INH_DIAG_ENSD elapsed

Output conditions:

To state 1: LV_ENG_BACK_DET transition from 0 to 1
And Timer C_T_DLY_REST_IGK stopped

Action in the state:

Set timer to C_T_MIN_INH_DIAG_ENSD
Set timer to C_T_MAX_INH_DIAG_ENSD

Transition action:

None

State 1: Inhibition activation

Input conditions:

From state 0: LV_ENG_BACK_DET transition from 0 to 1

Output conditions:

To state 0: ECU reset
Or LV_ENG_BACK_DET transition from 1 to 0

To state 2: LV_ENG_BACK_CFM transition from 0 to 1
Or LV_STOP_ENG transition from 0 to 1

Action in the state:

LV_INH_DIAG_ENSD = 1
LV_IGN_INJ_LOCK_REQ = 1
Stop timer C_T_MIN_INH_DIAG_ENSD if on-going
Stop timer C_T_MAX_INH_DIAG_ENSD if on-going

Transition action:

To state 0: LV_INH_DIAG_ENSD = 0
LV_IGN_INJ_LOCK_REQ = 0

To State 2: Start timer C_T_MAX_INH_DIAG_ENSD
Start timer C_T_MIN_INH_DIAG_ENSD if LV_IGK = 0

State 2: Inhibition deactivation

Input conditions:

From state 1: LV_ENG_BACK_CFM transition from 0 to 1
Or LV_STOP_ENG transition from 0 to 1

Output conditions:

To state 0: ECU reset
Or LV_SYN_VLD = 1
Or (LV_IGK = 1 and timer C_T_MIN_INH_DIAG_ENSD elapsed)
Or timer C_T_MAX_INH_DIAG_ENSD elapsed

Action in the state:

Start timer C_T_MIN_INH_DIAG_ENSD on transition of LV_IGK from 1 to 0

Transition action:

To state 0: LV_INH_DIAG_ENSD = 0
LV_IGN_INJ_LOCK_REQ = 0

Remark: if C_T_MIN_INH_DIAG_ENSD = 0, then timer is started at transition of LV_IGK from 1 to 0 and considered as elapsed immediately.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.48.3 Diagnosis Manager

General information:

One purpose of the diagnosis manager is to provide a summary of diagnostic information, in order to facilitate taking the necessary actions in case of a failure, e.g. switch to limp-home mode. The corresponding outputs are crankshaft limp-home request a general camshaft error flag for IVVT, and a general camshaft error for synchronization.
The other purpose is to avoid getting multiple error codes and freeze frames for the same failure. The corresponding outputs are the inhibit flags for the various diagnosis functions.
i = 1...NC_NR_CAM_CBK

Application conditions

Initialisation: `no initialization value.`

Recurrence:
```
every change in the error flags of one of the diagnostic functions
Or
when error memory is cleared
Or
At key 0 to 1 transition
```

Activation:

Deactivation:

Formula section:

LV_ERR_CRK

LV_ERR_CRK = 1 **if** LV_ERR_CRK_SYN = 1 **or** LV_ERR_CRK_TOOTH_PER = 1 **or** LV_ERR_CRK_TOOTH = 1 **or** LV_ERR_CRK_PLAUS = 1 **or** LV_ERR_CRK_OC = 1

LV_ERR_CRK = 0 **if** LV_ERR_CRK_SYN = 0 **and** LV_ERR_CRK_TOOTH_PER = 0 **and** LV_ERR_CRK_TOOTH = 0 **and** LV_ERR_CRK_PLAUS = 0 **and** LV_ERR_CRK_OC = 0.

If LV_ERR_CRK = 1, all other diagnoses on the crankshaft signal will be inhibited via the interfaces LV_INH_DIAG_CRK_SYN, LV_INH_DIAG_CRK_TOOTH, LV_INH_DIAG_CRK_TOOTH_PER, LV_INH_DIAG_CRK_PLAUS and LV_INH_DIAG_CRK_OC, except the one that detected the failure.

LV_ERR_CAM_IN(EX)[i]

LV_ERR_CAM_IN(EX)[i] = 1 **if** LV_ERR_SYN_CAM_IN(EX)[i] = 1 **or** LV_ERR_PER_CAM_IN(EX)[i] = 1 **or** LV_ERR_PLAUS_CAM_IN(EX)[i] = 1 **or** LV_ERR_REF_CRK_CAM_IN(EX)[i] = 1 **or** LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 1 **or** LV_ERR_TOOTH_OFF_IN(EX)[i] = 1.

LV_ERR_CAM_IN(EX)[i] = 0 **if** LV_ERR_SYN_CAM_IN(EX)[i] = 0 **and** LV_ERR_PER_CAM_IN(EX)[i] = 0 **and** LV_ERR_PLAUS_CAM_IN(EX)[i] = 0 **and** LV_ERR_REF_CRK_CAM_IN(EX)[i] = 0 **and** LV_ERR_SYN_CRK_CAM_IN(EX)[i] = 0 **and** LV_ERR_TOOTH_OFF_IN(EX)[i] = 0.

If LV_ERR_CAM_IN(EX)[i] = 1, other diagnoses on the same camshaft signal will be inhibited via the interfaces LV_INH_DIAG_SYN_CAM_IN(EX)[i], LV_INH_DIAG_PER_CAM_IN(EX)[i], LV_INH_DIAG_PLAUS_CAM_IN(EX)[i], LV_INH_DIAG_REF_CRK_CAM_IN(EX)[i] and LV_INH_DIAG_TOOTH_OFF_IN(EX)[i], except the one that detected the failure.

LV_ERR_CAM_TOT

VVT actuators existing in the system are given by a logical combination of the configuration data NLC_IVVT_IN(EX) and the calibration data LC_NOT_ADJ_CAM_IVVT_IN(EX)[i].

LV_ERR_CAM_TOT = 1 if LV_ERR_CAM_IN(EX)[i] = 1 for one of the sensors on camshafts with IVVT actuator.

LV_ERR_CAM_TOT = 0 if LV_ERR_CAM_IN(EX)[i] = 0 for all sensors on camshafts with IVVT actuator.

General information

This function is for detection of an overreving event and with non-volatile storage of environmental datas if triggered.

Description:

An overreving event starts at exceeding the engine speed C_N_LIM_MIN and active engine speed limitation (LV_N_MAX = 1).

At each overreving event, the event frequency counter CTR_N_MAX is incremented by 1. The timer T_SUM_N_MAX is always incremented at every active event and remains at the maximum value if reached. The timer T_N_TMP recorded the duration of each event and is used for the T_N_MAX calculation (= the duration with the highest event)

The remaining environmental data are stored at the first event but will be only overritten if the new event has a higher engine speed then the old one. At the end of a driving cylce the datas are stored in NVMY.

Application conditions:

Initialisation: `all data restored out of NVMY`

Activation: **at [** `LV_N_MAX = 1` **and** `LV_VS_MAX = 0` **]**

Deactivation: **at** `LV_N_MAX = 0`

Recurrence: `segment synchronous`

Function description:

Formula section:

determination of event-frequency-counter :

```
if      N > C_N_LIM_MIN
then    CTR_N_MAX = CTR_N_MAX + 1     ( only once per trigger )
else    CTR_N_MAX = CTR_N_MAX
endif
```

determination of total time :

```
if      N > C_N_LIM_MIN
then    starts timer T_SUM_N_MAX    (always incremented, remains at
                                      FFFFH  if reached)
else    stop timer T_SUM_N_MAX
endif
```

determination of individual time per event :

```
if      N > C_N_LIM_MIN
then    T_N_TMP ++
        N_MAX_TMP = MAX [ N ]
elseif       N_MAX_TMP > N_MAX     //stored in NVMY or stored at last event
    then     T_N_MAX = T_N_TMP     //update
    else     T_N_MAX = T_N_MAX     //unchanged
    endif
    T_N_TMP = 0         //reset
    N_MAX_TMP = 0       //reset
endif
```

determination of environmental data at first event :

```
if      N > C_N_LIM_MIN
then    N_MAX                      = N
        TRT_N_MAX                  = TRT
        CTR_KM_N_MAX               = CTR_KM_CAN
```

```
        N_GRD_N_MAX                = N_GRD
        VS_N_MAX                   = VS
        PV_AV_N_MAX                = PV_AV
        GEAR_EF_N_MAX              = GEAR_EF
        LV_CS_N_MAX                = LV_CS
        NR_PAT_SCC_N_MAX           = NR_PAT_SCC
endif
```

determination of environmental data at the next events:

```
if      N > C_N_LIM_MIN     and
        N > N_MAX                 (stored in NVMY or stored at last event)
then    update of all environmental data:
        N_MAX                      = N
        TRT_N_MAX                  = TRT
        CTR_KM_N_MAX               = CTR_KM_CAN
        N_GRD_N_MAX                = N_GRD
        VS_N_MAX                   = VS
        PV_AV_N_MAX                = PV_AV
        GEAR_EF_N_MAX              = GEAR_EF
        LV_CS_N_MAX                = LV_CS
        NR_PAT_SCC_N_MAX           = NR_PAT_SCC
else    old values remains unchanged:
        N_MAX                      = N_MAX
        TRT_N_MAX                  = TRT_N_MAX
        CTR_KM_N_MAX               = CTR_KM_N_MAX
        N_GRD_N_MAX                = N_GRD_N_MAX
        VS_N_MAX                   = VS_N_MAX
        PV_AV_N_MAX                = PV_AV_N_MAX
        GEAR_EF_N_MAX              = GEAR_EF_N_MAX
        LV_CS_N_MAX                = LV_CS_N_MAX
        NR_PAT_SCC_N_MAX           = NR_PAT_SCC_N_MAX
endif
```

A.50.1 Diagnosis algorithm

FUNCTION DESCRIPTION:

General information:

The engine off duration should be monitored concerning legislation requirements. Three different diagnosis are carried out concerning the time signal from CAN (LV_ERR_T_ES is set in error case). Two

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

different diagnosis ensure The plausibility of T_ES to TCO and TAM. (LV_ERR_T_ES_TCO_SLOW or LV_ERR_T_ES_TCO_FAST are set in error case)

Application conditions

Initialization: according ERRM initialization type **"STD_INI"**

```
At reset:          LV_IGK_DLY = 0

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LC_T_ES_DIAG_1_RBM_SWI	-	0... 1H	0 ...1	1	-
Switch to change the calculation logic for bit0 of STATE_RBM_T_ES.					

Import actions:

ACTION_ERRM_CheckPendingStatus (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR_PND>)

General information:

The calculation STATE_RBM_T_ES is based on the status of the 3 plausibility checks with the internal ECU-timer. In addition, two further RBM-ratios are calculated, namely STATE_RBM_T_ES_TCO_SLOW and STATE_RBM_T_ES_TCO_FAST.

Application conditions:

Initialisation:	`RST, DCON, CLRFMY, IGKON`
Recurrence:	`1S, 100MS`
Activation:	`1S: LV_DC==1 100MS: always`
Deactivation:	`if activation not true`

A.51.2.1 Calculation of STATE_RBM_T_ES

With this module the interface between the T_ES monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_T_ES data. With the switch LC_T_ES_DIAG_1_RBM_SWI, the calculation logic of bit0 of STATE_RBM_T_ES based on the END-flags of T_ES_DIAG_1, T_ES_DIAG_2 and T_ES_DIAG_3 can be changed.

Within STATE_RBM_T_ES, three different information are defined:
- Conditions for monitoring are met long enough to detect malfunction (bit 0)
(no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)
(depending on failure status: pending)
- Monitor indiv. RBM conditions encountered within this DC (bit 2 not valid for T_ES)

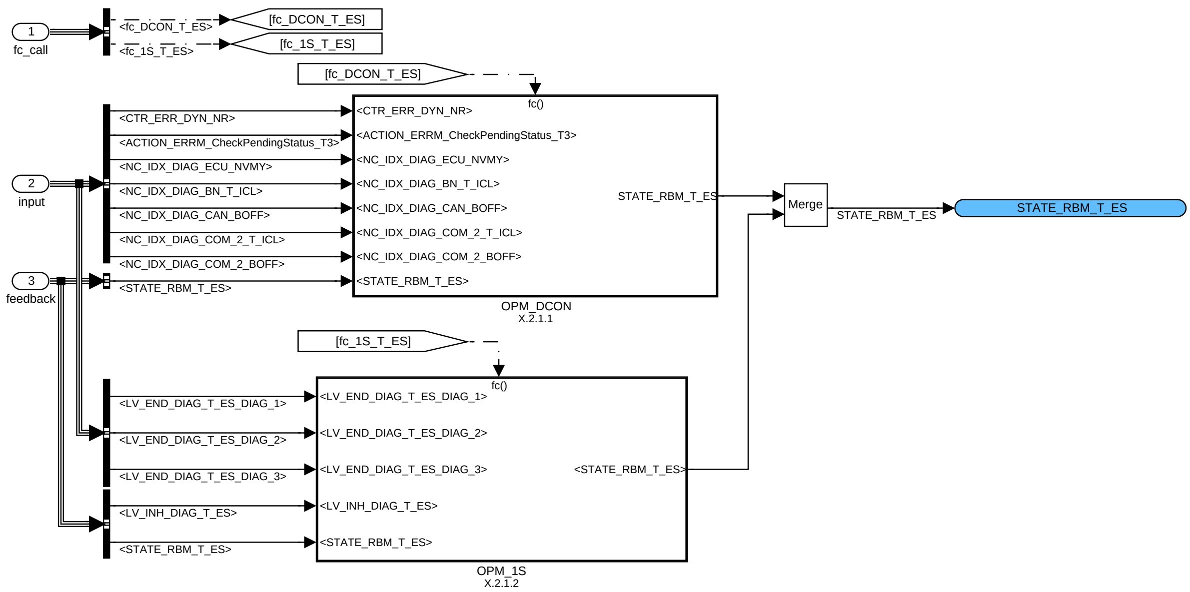

Figure A.51.6: :

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

General information:

The coolant temperature increase after engine start is most dependent on the ambient- and the engine operating conditions. To avoid monitoring failures within the diagnosis functions related to the coolant temperature behaviour, the influence of critical engine driving conditions must be taken into consideration. To allow a comparison to the time elapsed since engine start, the activation time of the critical driving conditions are calculated in percent of the elapsed time. The percentage values are used in several diagnosis functions to cancel monitoring in order to avoid failures.

Application conditions

Initialisation at Exit start (EXIT_ST): LV_CDN_ENA_RATIO_T_AST = 1
all other output data are set to 0 [phys]

Initialisation at Engine run to Engine stop (ERU_to_ES): LV_CDN_ENA_RATIO_T_AST = 0
T_DIAG_AST = 0 s

Recurrence: *1000 ms*

Activation: *LV_CDN_ENA_RATIO_T_AST = 1*

Deactivation: *LV_CDN_ENA_RATIO_T_AST = 0*

Formula section:

Calculation of the after start time for diagnosis functions:
If T_DIAG_AST < 65535 s
then T_DIAG_AST(n) = T_DIAG_AST(n-1) + 1 s
else T_DIAG_AST(n) = T_DIAG_AST(n-1)
endif

Calculation of the "idle speed" period after start:
If LV_IS = 1
then T_IS_AST(n) = T_IS_AST(n-1) + 1 s
else T_IS_AST(n) = T_IS_AST(n-1)
endif
RATIO_T_IS_AST = (T_IS_AST /T_DIAG_AST) * 100 %

Calculation of the " trailing throttle fuel cut-off " period after start:
If LV_PUC = 1
then T_PUC_AST(n) = T_PUC_AST(n-1) + 1 s
else T_PUC_AST(n) = T_PUC_AST(n-1)
endif
RATIO_T_PUC_AST = (T_PUC_AST /T_DIAG_AST) * 100 %

Calculation of the "low load" period after start:
If MAF_KGH <= IP_MAF_KGH_LOAD_MIN_AST
then T_LOAD_MIN_AST(n) = T_LOAD_MIN_AST(n-1) + 1 s
else T_LOAD_MIN_AST(n) = T_LOAD_MIN_AST(n-1)
endif
RATIO_T_LOAD_MIN_AST = (T_LOAD_MIN_AST /T_DIAG_AST) * 100 %

Calculation of the "low vehicle speed" period after start:
If VS <= C_VS_THD_VS_MIN_AST
then T_VS_MIN_AST(n) = T_VS_MIN_AST(n-1) + 1 s
else T_VS_MIN_AST(n) = T_VS_MIN_AST(n-1)
endif
RATIO_T_VS_MIN_AST = (T_VS_MIN_AST /T_DIAG_AST) * 100 %

C_VP_TCO_MIN_DIAG_TCO_EL	-	0... 7FFFH	0... 4.99984	152.6e-6	V
Minimum raw sensor signal voltage for the coolant temperature electrical diagnosis					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis function is to detect electrical failures as defined by OBD I and OBD II requirements. The coolant temperature raw sensor voltage (VP_TCO[0]) is measured with use of an 10bit A/D converter by the ECU hardware. The modified sensor signal is converted then into a measured temperature value (TCO_MES). Each by the ECU hardware measured raw sensor value is checked as well as the converted temperature signal.

Application conditions:

See separate chapters:

A.53.1 Global coolant temperature failure

FUNCTION DESCRIPTION:

General information:

A global coolant temperature error is set without debounce as soon as an electrical-, or signal gradient-, or stuck signal-, or plausibility- error is detected. All separate diagnosis functions are performed all the time if the diagnosis conditions are fulfilled. The deactivation of diagnosis functions with use of configuration switches is not possible.
In addition a preliminary coolant temperature error is set as soon as debouncing of an electrical-, or signal gradient- symptom occurs. The preliminary coolant temperature error will be stored in the non-volatile memory during the ECU's self-holding phase to be available at the beginning of the next driving cycle.

Application conditions:

Initialisation at Reset:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.53.2 Coolant temperature signal range diagnosis (TCO_EL)

FUNCTION DESCRIPTION:

General information:

The purpose of the signal range- or electrical diagnosis is to detect electrical errors in the input circuit of the coolant temperature sensor. The analog sensor input signal is converted into a digital value with use of an A/D converter. All symptoms of the error code are handled by anti-bouncing. Only one symptom can be active at a time.

Description:

Error-symptoms are defined to this diagnosis function as following:

```
 |_|_|_|_|
  | | | └─> Short circuit to  Vbatt or Open Circuit "SCP_OC"   (= SYM_0)
  | | └───> Short circuit to Ground "SCG"                       (= SYM_1)
  | └─────> (not used)                                          (= SYM_2)
  └───────> (not used)                                          (= SYM_3)
```

Application conditions:

Initialisation:

LV_ERR_TCO_EL	=	*Refer to filtering configuration for the initialisation*
LV_END_DIAG_TCO_EL	=	*Refer to filtering configuration for the initialisation*
LV_CDN_DIAG_TCO_EL	=	*Refer to filtering configuration for the initialisation*
ERR_SYM_TCO_EL	=	*Refer to filtering configuration for the initialisation*

Recurrence: 100 ms

Activation: LV_IGK = 1 **and**
LV_CDN_VB_MIN_DIAG = 1 **and**
LV_INH_DIAG_TCO_EL = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. ```

End of diagnosis:
For the calculation of LV_END_DIAG_TCO_EL see "Anti-bounce Algorithm, calculation of the end of diagnosis".

A.53.3 Coolant temperature signal gradient diagnosis (TCO_GRD)

FUNCTION DESCRIPTION:

General information:

The purpose of the signal gradient diagnosis is to detect a not plausible gradient on the measured coolant temperature sensor signal. The monitoring is based on a comparison between the actual measured and the last measure coolant temperature value. The symptom of the error code is handled by anti-bouncing.

Description:

Error-symptoms are defined to this diagnosis function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.54.4 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the TCO_STUCK monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TCO_STUCK data.
Within STATE_RBM_TCO_STUCK, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions:

Initialisation :
at ECU reset :
bit 0, bit 1 and bit 2 of STATE_RBM_TCO_STUCK = 0
at LV_DC 0 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_TCO_STUCK = 0
on failure memory reset :
bit 1 of STATE_RBM_TCO_STUCK = 0
Recurrence: 1 s
Activation: LV_DC = 1

Formula section:

At LV_DC 0 1 transition
The pending status of the following failures has to be checked only once :

LV_ERR_TCO_EL	LV_ERR_TCO_PLAUS	LV_ERR_TCO_GRD	LV_ERR_TCO_STUCK_RNG

If(1) { CPU optimization at LV_DC 0 1 transition }

A.55.1 Diagnostic information from infrastructure

FUNCTION DESCRIPTION:

Description:

The ECF control unit is controlled by a PWM signal line driven by the ATIC 39. The driver can distinguish between three symptoms: Short circuit to Vbatt , Short circuit to GND and Open Load .
This function reads the failure information (ERR_DIAG_ECFPWM[x]) from the infrastructure.
The [x] is the placeholder for [NC_ECF_NR].

Application conditions

Initialisation: reset or transition LV_IGK off - -> on or reset of failure memory
CDN_DIAG_ECFPWM_BAS[x] = 0
ERR_DIAG_ECFPWM[x] = 0

Recurrence: *100ms*

Activation: *every ECU state*

Formula section:

Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_ECFPWM[x] and diagnosis conditions CDN_DIAG_ECFPWM_BAS[x]) received from the infrastructure:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Diagnosis conditions are set according infrastructure info.: CDN_DIAG_ECFPWM_BAS[x]
Failure symptoms are set according infrastructure info.: ERR_DIAG_ECFPWM[x]

A.55.2 ECF control unit: Failure feedback recognition

FUNCTION DESCRIPTION:

If a failure is detected from the ECF control unit, a failure feedback is send to the ECU by pulling the signal line (interface ECU to the ECF control unit) to ground in a definited pattern. The time t_{low} is a identification for the failure.

Description:

If a failure is detected from the ECF control unit, a failure feedback is send to the ECU by pulling the signal line (interface ECU to the ECF control unit) to ground in a definited pattern. The time t_{low} is a identification for the failure.
For the recognition of the failure feedback the information, if a failure short circuit to ground is detected on the signal line between ECU and ECF control unit is used.

Application conditions

Initialisation: reset or transition LV_IGK off - -> on or reset of failure memory
ERR_ECFPWM_FB[x] = FFH
T_ECFPWM_FB[x] = 0
LV_ECFPWM_FB_VLD[x] = 0

Recurrence: *100ms*

Activation: LV_CDN_VB_MIN_DIAG = 1 **and**
LV_ERR_SPI_MPS= 0

Deactivation: at deactivation function is initialized one time

Formula section:

LV_ECFPWM_FB_VLD[x] = 0
If bit 1 of ERR_DIAG_ECFPWM[x] = 1 (SCG detected by HW)
Then T_ECFPWM_FB[x] = T_ECFPWM_FB[x] + 100ms
ERR_ECFPWM_FB[x] = FFH (failure feedback possible)
If C_T_ECFPWM_FB_MAX[x] T_ECFPWM_FB[x]
(T_ECFPWM_FB[x] out of range for FB)
Then ERR_ECFPWM_FB[x]= 00H
Endif
Else **If** C_T_ECFPWM_FB_MIN[x] T_ECFPWM_FB[x] C_T_ECFPWM_FB_MAX[x]
Then failure feedback detected
ERR_ECFPWM_FB[x] = 01H
LV_ECFPWM_FB_VLD[x] = 1
Else no failure feedback possible
ERR_ECFPWM_FB[x] = 00H
Endif
T_ECFPWM_FB[x] = 0
Endif

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.55.3 Electrical diagnosis of ECF

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver, which controls the electrical cooling fan.
The input signal is a modulated control pulse (PWM).

Description:

The driver can distinguish between three symptoms: Short circuit to Vbatt , Short circuit to GND and Open Load . The diagnosis of all these symptoms is possible at the same time in the duty cycle range C_ECFPWM_DIAG_MIN[[x] ... C_ECFPWM_DIAG_MAX[x].
The error detection algorithm in this function for short circuit to GND is respecting the status of the failure feedback recognition (ERR_ECFPWM_FB[x]). The failure, detected by the HW, is delivered from the infrastructure ERR_DIAG_ECFPWM[x].

Error-symptoms: are defined to this diagnosis function as following

```
 ┌─┬─┬─┬─┐
 │ │ │ │ │
 └─┴─┴─┴─┘
  │  │  │  └─> Short circuit to Vbatt          (= SYM_0)
  │  │  └────> Short circuit to GND            (= SYM_1)
  │  └───────> Open load                       (= SYM_2)
  └──────────> -                               (= SYM_3)
```

Application conditions

Initialization: according filter-type: MPL_STD_INI

Recurrence: 100ms

Activation: activation in all engine states

Formula section:

If LV_CDN_VB_MIN_DIAG = 1
and LV_ERR_SPI_MPS= 0
Then **If** Activation conditions are met for the NC_PSD_DLY_ECF_EL recurrence
and C_ECFPWM_DIAG_MIN[x] ECFPWM[NC_ECF_NR] C_ECFPWM_DIAG_MAX[x]

and ERR_ECFPWM_FB[x] = 00H (no failure feedback possible)
Then CDN_DIAG_ECF_EL[x] = CDN_DIAG_ECFPWM_BAS[x]
ERR_DIAG_ECFPWM[x] is used for debounce mechanism
Else CDN_DIAG_ECF_EL[x] = 0 (diagnosis not possible)
Endif
Else CDN_DIAG_ECF_EL[x] = 0
Endif

Failure filtering and error management treatment:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_ECF_EL[x] and ERR_DIAG_ECFPWM[x].

ACTION_ERRM_FilterMulticondition (IN<ECF_EL[x]>, IN<CDN_DIAG_ECF_EL[x] >, IN<ERR_DIAG_ECFPWM[x] >, IN<C_ABC_INC_ECF_EL[x] >, IN<C_ABC_INC_ECF_EL[x]>, OUT< LV_ERR_ECF_EL[X] >, SYNCRONIZATION<CALL>)

This algorithm determines:

ERR_SYM_ECF_EL[x] (detected error symptom for ECF diagnosis)
LV_ERR_ECF_EL[x] (Error flag for debounced error of ECF)
LV_CDN_DIAG_ECF_EL[x] (Diagnosis condition information)
LV_END_DIAG_ECF_EL[x] (End of diagnosis information)

A.55.4 ECF control unit: Failure feedback diagnosis

FUNCTION DESCRIPTION:

General information:

If a failure is detected by the ECF control unit, a failure feedback is send to the ECU.

Description:

According the possible failure feedback from the ECF control unit (defined by ERR_ECFPWM_FB[x] and LV_ECFPWM_FB_VLD[x]), the diagnosis is managing the following failure: LV_ERR_ECFPWM_FB[x].

Error-symptoms of failure LV_ERR_ECFPWM_FB[x]:

```
 □□□□
 | | | └─> not used                               (= SYM_0)

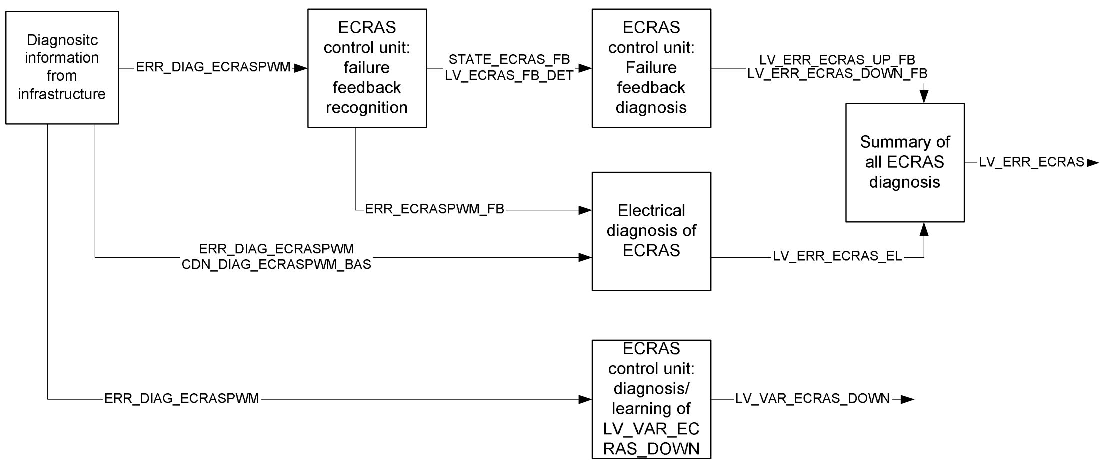
General information:

This modul consists of 6 parts. The parts and their correlation is described in the figure below. The diagnostic information from the infrastructure is used for detection of feedback from the ECRAS control unit and for the electrical diagnosis. The information from the infrastructure is also used for the diagnosis /learning of the ECRAS variant with the second flap (LV_VAR_ECRAS_DOWN). The recognised feedbacks from the ECRAS control unit are processed by the failure feedback diagnosis.



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.56.1 Summary of all ECRAS diagnosis

FUNCTION DESCRIPTION:

Description:

This function shall summarize all ECRAS failures in one flag only.

Application conditions

Initialisation: reset **or** reset of failure memory **or** LV_IGK = 0 -> 1 all = 0

Recurrence: *100ms*

Activation: *LV_VAR_ECRAS_UP = 1*

Formula section:

If LV_ERR_ECRAS_EL = 1 **or**
LV_ERR_ECRAS_UP_FB = 1 **or**
LV_ERR_ECRAS_DOWN_FB = 1
Then LV_ERR_ECRAS = 1
Else LV_ERR_ECRAS = 0
Endif

A.56.2 Diagnostic information from infrastructure

FUNCTION DESCRIPTION:

Description:

The ECRAS control unit is controlled by a PWM signal line driven by the ATIC 39. This driver is able to distinguish between three symptoms: Short circuit to Vbatt , Short circuit to GND and Open Load .

This function shall reads the failure information (ERR_DIAG_ECRASPWM) delivered from the infrastructure (basic software).

Application conditions

Initialisation: reset **or** reset of failure memory **or** LV_IGK = 0 -> 1 all = 0

Recurrence: *100ms*

Activation: *LV_VAR_ECRAS_UP = 1*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_ECRASPWM and diagnosis conditions CDN_DIAG_ECRASPWM_BAS) received from the infrastructure:

Diagnosis conditions are set according infrastructure info.: CDN_DIAG_ECRASPWM_BAS
Failure symptoms are set according infrastructure info.: ERR_DIAG_ECRASPWM

A.56.3 ECRAS control unit: Failure feedback recognition

FUNCTION DESCRIPTION:

Description:

If a failure is detected from the ECRAS control unit, a failure feedback is send to the ECU by pulling the signal line (interface ECU to the ECRAS control unit) to ground in a definited pattern. The time t_{low} is a identification for the failure. Depending on t_{low} a specific failure is identified and set in STATE_ECRAS_FB.
For the recognition of the failure feedback the information, if a failure short circuit to ground is detected on the signal line between ECU and ECRAS control unit is used.

Application conditions

Initialisation: `reset` **or** `reset of failure memory` **or** `LV_IGK = 0 -> 1`
`ERR_ECRASPWM_FB = FFH, all others = 0`

Recurrence: *100ms*

Activation: `LV_CDN_VB_MIN_DIAG = 1` **and**
`LV_ERR_SPI_MPS= 0` **and**
`LV_VAR_ECRAS_UP = 1` **and**
`LV_IGK = 1`

Deactivation: `at deactivation function is initialized one time`

Formula section:

STATE_ECRAS_FB = 0H

A.56.4 Electrical diagnosis of ECRAS

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver, which controls the electrical cooling fan.
The input signal is a modulated control pulse (PWM).

Description:

The driver can distinguish between three symptoms: Short circuit to Vbatt , Short circuit to GND and Open Load .
The error detection algorithm in this function for short circuit to GND is respecting the status of the failure feedback recognition (ERR_ECRASPWM_FB). The failure, detected by the HW, is delivered from the infrastructure ERR_DIAG_ECRASPWM .

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error-symptoms: are defined to this diagnosis function as following

```
┌─┬─┬─┬─┐
│ │ │ │ │
└─┴─┴─┴─┘
 │  │  │  └─> Short circuit to Vbatt          (= SYM_0)
 │  │  └────> Short circuit to GND            (= SYM_1)
 │  └───────> Open load                       (= SYM_2)
 └──────────> -                               (= SYM_3)
```

Application conditions

Initialization: according filter-type: **MPL_STD_INI**
LV_INTR_DIAG_ECRAS_EL = 0 at LV_IGK 0->1 **or** reset **or** clear FMY

Recurrence: 100ms

Activation: LV_VAR_ECRAS_UP = 1

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_ECRAS_EL and ERR_DIAG_ECRASPWM .
ACTION_ERRM_FilterMulticondition (IN<ECRAS_EL >,
IN<CDN_DIAG_ECRAS_EL >,
IN<ERR_DIAG_ECRASPWM >, IN<C_ABC_INC_ECRAS_EL >, IN<C_ABC_MAX_ECRAS_EL >,
OUT< LV_ERR_ECRAS_EL >,
SYNCRONIZATION<CALL>)

This algorithm determines:
ERR_SYM_ECRAS_EL (detected error symptom for ECRAS diagnosis)
LV_ERR_ECRAS_EL (Error flag for debounced error of ECRAS)
LV_CDN_DIAG_ECRAS_EL (Diagnosis condition information)
LV_END_DIAG_ECRAS_EL (End of diagnosis information)

A.56.5 ECRAS control unit: Failure feedback diagnosis

FUNCTION DESCRIPTION:

General information:

If a failure is detected by the ECRAS control unit (ECRAS_UP), a failure feedback is send to the ECU and recognized.

Description:

According the possible failure feedback from the ECRAS control unit (defined by ERR_ECRASPWM_FB and STATE_ECRAS_FB), the diagnosis is managing the following failure: LV_ERR_ECRAS_UP_FB, LV_ERR_ECRAS_DOWN_FB. Additional the diagnosis ability of the ECRAS control unit will be diagnosed (LV_DIAG_ECRAS / _END).

Error-symptoms of failure LV_ERR_ECRAS_UP_FB :

```
|_|_|_|_|
 | | | └─> electrical failure        (= SYM_0)
 | | └───> mechanical failure        (= SYM_1)
 | └─────> not used                  (= SYM_2)
 └───────> no answer of ECRAS        (= SYM_3)
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error-symptoms of failure LV_ERR_ECRAS_DOWN_FB :

A.56.6 ECRAS control unit: diagnosis/detecting of LV_VAR_ECRAS_DOWN

FUNCTION DESCRIPTION:

Description:

If an ECRAS control unit is detected (LV_VAR_ECRAS_UP) a learn algorithm /diagnosis for the variant LV_VAR_ECRAS_DOWN will be start once. LV_VAR_ECRAS_DOWN will be recognised by a pattern of short circiuit to ground and normal phases of the ECRASPWM signal set by the ECRAS control unit. For this mode the ECRAS control unit has to be driven by an ECRASPWM of 90% (learnig mode - see Calculation of ECRASPWM).

Application conditions

Initialisation: *all = 0 at reset* ***or*** *LV_IGK 0->1, except LV_ECRAS_DOWN_DET_SET and LV_VAR_ECRAS_DOWN from NVMY LV_ECRAS_DOWN_DET_SET = 0 and LV_VAR_ECRAS_DOWN = 0 at LC_AD_CLR_VAR 01*

Recurrence: *100 ms*

Activation: LV_CDN_VB_MIN_DIAG = 1 and
LV_IGK = 1

Fields information (For more information refers to Error Management file "Table of Failure") :

- ABC Type : STD_INI, STD, MEM, MEM_INI, DEC_CAL, STC, NO, MPL_STD_INI
- CARB Class : MIS, FSD, CC, CAT, HC, EVAP, SA, AC, LS, LSH, EGR, OTHER, NO.

FUNCTION DESCRIPTION:

General information:

A global electronically controlled thermostat error (LV_ERR_ECT) is set without debounce as soon as SCG (LV_ERR_ECT_EL) or a mechanical (LV_ERR_ECT_MEC) thermostat failure is detected. The activation of the mechanical thermostat diagnosis (ECT rationality check) is not configurable with a configuration switch. Both, the electrical- and mechanical thermostat diagnosis function are performed if the vehicle is equipped with an electrically controlled thermostat.

Application conditions

Initialisation at Reset: *LV_ERR_ECT = 0*

Recurrence: *500 ms*

Activation: *at every engine operating state*

Deactivation: –

Formula section:

```
If      LV_ERR_ECT_EL = 1          or
        LV_ERR_ECT_MEC = 1
then    LV_ERR_ECT = 1             (without debounce)
else    LV_ERR_ECT = 0
endif
```

A.57.1 ECT diagnosis (Electrical diagnostic with PWM output - - Multicondition filter)

FUNCTION DESCRIPTION:

General information:

The ECT is driven by the ECU via an output driver. The failure detection is done by ECU Hardware. The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

Description:

The purpose is to perform the electrical diagnosis of the ECT actuator. 3 symptoms are distinguished, each having its own error location:

Error-symptoms and conditions: are defined to this diagnosis function as following

```
□□□□
| | | └> Short circuit to battery "SCP"        (= SYM_0)
| | └──> (not used)                            (= SYM_1)

Else ERR_SYM_ECT_EL = NO_SYM
Endif
If bit 2 of ERR_DIAG_ECT_EL = 1 //OC
Then ERR_SYM_ECT_EL_OC = SYM_2
Else ERR_SYM_ECT_EL_OC = NO_SYM
Endif
LV_ERR_ECT_EL(_XX) and LV_END_DIAG_ECT_EL(_XX) are calculated by error management.

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanisms are called with the parameters ERR_SYM_ECT_EL(_XX) and LV_CDN_DIAG_ECT_EL(_XX).
ACTION_ERRM_FilterSymptom (IN<ECT_EL_XX>, IN<LV_CDN_DIAG_ECT_EL(_XX)>,
IN<LV_ERR_ECT_EL(_XX)>, IN<C_ABC_INC_ECT_EL(_XX)>, IN<C_ABC_MAX_ECT_EL(_XX)>,
OUT< LV_ERR_ECT_EL(_XX)>, SYNCRONIZATION<CALL>)

This algorithm determines:
ERR_SYM_ECT_EL(_XX) (detected error symptom for ECT diagnosis)
LV_ERR_ECT_EL(_XX) (Error flag for debounced error of ECT)
LV_CDN_DIAG_ECT_EL(_XX) (Diagnosis condition information)
LV_END_DIAG_ECT_EL(_XX) (End of diagnosis information)

A.59.3.1.2 Interface to ERRM

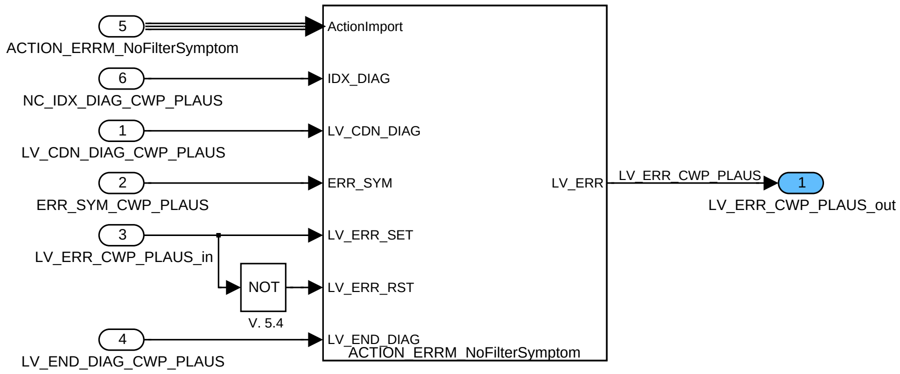

Figure A.59.16: :

A.59.3.2 Diagnosis of hardware input line for Limp Home Operation of CWP

General information:

This function detects an error in the hardware line for Limp Home Operation of the CWP.
A hardware signal is connected to the CWP to activate the limp home mode of the CWP in case of a BSD communication error. To detect the correct functionality of the hardware signal line, the CWP state is submitted to the ECU (EWM_ERR_3). The ECU compares the state of the LV_IGK or LV_CDN_VB_MIN_DIAG (dependend on a switch LC_SWI_CWP_INP) with the state of EWM_ERR3 register (LV_CWP_HW_LIH_IN_CHK). For no compliance a plausibility failure is set.

Description:

Error-symptoms are defined to this diagnosis function as following :

A.59.3.3.3 ERRM call and update for LV_END_DIAG and ERR_SYM by calling ERRM Actions

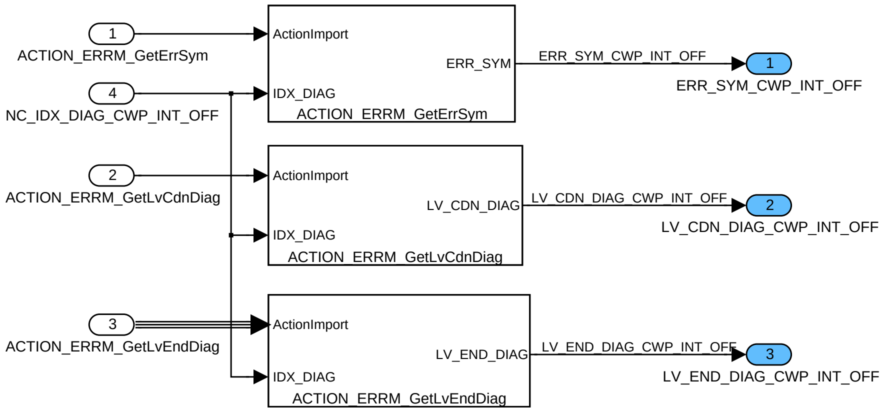

Figure A.59.29: :

A.59.3.4 Electrical controlled water pump Power Reduction Monitoring

FUNCTION DESCRIPTION:

This function monitors the power reduction modes of the coolant water pump.

General information:

If the operating conditions of the electrical coolant water pump deviates from the normal conditions the output power of the pump will be reduced by the power management. Depending on the actual state a calibratible power setpoint is given. The state is determined separately by a state machine.

Description:

This diagnosis function is the inteface between BSD driver and waterpump controller.

Error-symptoms are defined to this diagnosis function as following :

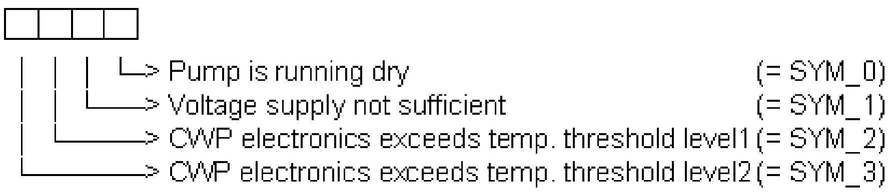

Figure A.59.30: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.59.3.4.1 Symptom determination

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.59.3.4.3 ERRM call and update for LV_END_DIAG and ERR_SYM by calling ERRM Actions

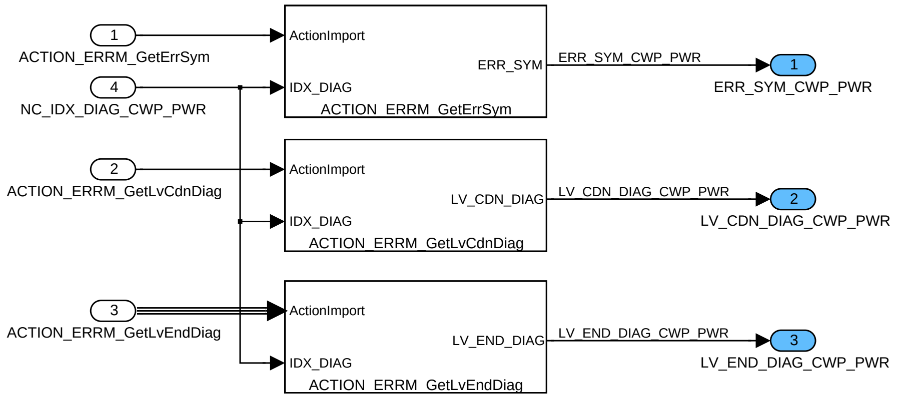

Figure A.59.34: :

A.59.3.5 Waterpump internal state

FUNCTION DESCRIPTION:

This state machine determines the operation mode of the coolant water pump. By distinguishing several operation modes a specific diagnosis of the CWP at different states is possible.

General information:

After initialization some transition conditions must be fulfilled to change from one state to the other.

Operating State of the CWP STATE_CWP_INT (controlled internally in the CWP electronics):

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

STATE_CWP_INT	Operating state of the CWP	Addition explanations concerning the operating State
0	initialization	Pump is initialized, not ready to operate
1	normal operation mode open loop control	No speed monitoring active (speed setpoint= actual speed) LV_N_MON_CWP_DEAC = 1
2	normal operation mode closed loop control	Speed Monitoring active, closed loop controlled operation LV_N_MON_CWP_DEAC = 0
3	power reduced mode	Power reduced operation due to low voltage supply Voltage suppy potetially not sufficient to achieve the required speed setpoint
4	power reduced mode	Power reduced operation due to high CWP electronics temperature (level 1) Pump is not able the achieve the required speed setpoint
5	power reduced mode	Power reduced operation due to high CWP electronics temperature (level 2) Pump is not able the achieve the required speed setpoint
6	pump running dry	Pump is running dry and limits threfore the max speed
7	temporary shut-off	High current consumption detected; automatic de-blocking disabled; max. 3 restarts are executed before permanent shut off
8	temporary shut-off	High current consumption detected; automatic de-blocking enabled; pump tries to de-block itself
9	permanent shut-off	Pump deactivates itself; possible reasons: - Voltage supply too high - Current consumption too high - CWP electronics temperature too high
10	unplausible operation	Actual pump speed deviates to desired pump speed; diagnosis active above opening temp. of the thermostat and voltage supply sufficient only

Error treatment:

Diagnostic Instance		Symptoms		ABC type	CARB class
Description	**Name (XX)**	**Description**	**Nr**		
Radiator shutter	RAS	Short circuit to Vbatt SCP	0	MPL_STD_INI	CC
		Short circuit to Ground SCG	1		
		Open Circuit OC	2		
		-	3		

Possible configuration for ABC type and CARB class (see also "Table of Failure")
ABC Type: STD_INI, STD, MEM, MEM_INI, DEC_CAL, STC, NO, MPL_STD_INI
CARB Class: MIS, FSD, CC, CAT, HC, EVAP, SA, AC, LS, LSH, EGR, OTHER, NO

FUNCTION DESCRIPTION:

General information:

The RAS is driven by the ECU via an output driver. The failure detection is done by ECU Hardware. The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements. The RAS can be switched on or off (no PWM-signal).

Description:

The purpose is to perform the electrical diagnosis of the RAS actuator. 3 symptoms are distinguished:

Application conditions

Initialisation: ERRM variables are initialized according Filter-type.
At Reset: All 0
Set delay counter for NC_PSD_DLY_RAS

Recurrence: *100ms*

Activation: LV_IGK = 1 **and** LC_RAS_ACT= 1

Deactivation: LV_IGK = 0 **or** LC_RAS_ACT= 0

Formula section:

If LV_ERR_SPI_MPS = 0
and LV_VB_CDN_OBD_1 = 1
Then
Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_RAS and diagnosis conditions CDN_DIAG_RAS) received from the infrastructure:
ACTION_INFR_GetElDiagRas (OUT<CDN_DIAG_RAS>, OUT<ERR_DIAG_RAS>)

Basic diagnosis conditions are set according to infrastructure information: CDN_DIAG_RAS
Failure symptoms (raw value) are set according to infrastructure information: ERR_DIAG_ RAS

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If Activation conditions are met for the NC_PSD_DLY_RAS recurrence
Then
{ No additional diagnosis conditions are necessary }
Else
CDN_DIAG_RAS = 0
Endif
Else
CDN_DIAG_RAS = 0
Endif

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_RAS and ERR_DIAG_RAS.
ACTION_ERRM_FilterMulticondition (IN<RAS_OUT>, IN<CDN_DIAG_RAS>,
IN<ERR_DIAG_RAS>, IN<C_ABC_INC_RAS>, IN<C_ABC_MAX_RAS>,
OUT< LV_ERR_RAS>)

This algorithm determines:

ERR_SYM_RAS	(detected error symptom for RAS diagnosis)
LV_ERR_RAS	(Error flag for debounced error of RAS)
LV_CDN_DIAG_RAS	(Diagnosis condition information)
LV_END_DIAG_RAS	(End of diagnosis information)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

C_VP_TCO_2_MAX_DIAG_TCO_2_EL	-	0... 7FFFH	0... 4.999847412	153e-6	V
Maximum raw sensor signal voltage for the coolant temperature (radiator outlet) electrical diagnosis					
C_VP_TCO_2_MIN_DIAG_TCO_2_EL	-	0... 7FFFH	0... 4.999847412	153e-6	V
Minimum raw sensor signal voltage for the coolant temperature (radiator outlet) electrical diagnosis					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis function is to detect electrical failures as defined by OBD I requirements. The coolant temperature (radiator outlet) raw sensor voltage (VP_TCO [1]) is measured with use of an 10bit A/D converter by the ECU hardware. The modified sensor signal is converted then into a measured temperature value at radiator outlet. Each by the ECU hardware measured raw sensor value is checked as well as the converted temperature signal.
A global coolant temperature (radiator outlet) error is set without debounce as soon as an electrical- or signal gradient- or coolant temperature (radiator outlet) plausibility error is detected. All separate diagnosis functions are performed all the time if the diagnosis conditions are fulfilled. The deactivation of diagnosis functions with use of configuration switches is not possible.
In addition a preliminary coolant temperature (radiator outlet) error is set as soon as debouncing of an electrical-, or signal gradient- symptom occurs. The preliminary coolant temperature (radiator outlet) error will be stored in the non-volatile memory during the ECU s self-holding phase to be available at the beginning of the next driving cycle.

Application conditions:

Initialisation at Reset:

LV_ERR_TCO_2 = 0
LV_CDN_ENA_TCO_2_PREL = 1
LV_ERR_TCO_2_PREL = LV_ERR_TCO_2_PREL_DET *(NVMY)*
LV_ERR_TCO_2_PREL_DET = LV_ERR_TCO_2_PREL_DET *(NVMY)*
(NVMY: stored in the non-volatile memory)

Initialisation at Engine stop to Engine run (ES_to_ERU):

LV_ERR_TCO_2_PREL_DET = 0
LV_CDN_ENA_TCO_2_PREL = 0

Initialisation at FMY clear:

LV_ERR_TCO_2 = 0
LV_ERR_TCO_2_PREL = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LV_ERR_TCO_2_PREL_DET = 0

Recurrence: 100 ms

Activation: at every engine operating state

Deactivation: -

Formula section:

If LV_ERR_TCO_2_EL = 1 **or**
LV_ERR_TCO_2_GRD = 1 **or**
LV_ERR_TCO_2_PLAUS = 1
then LV_ERR_TCO_2 = 1 (without debounce)
else LV_ERR_TCO_2 = 0
endif

A.61.1 Preliminary coolant temperature (radiator outlet) failure (at ES after RESET)

Application conditions

Recurrence: *100 ms*

Activation: *LV_CDN_ENA_TCO_2_PREL = 1*

Deactivation: *LV_CDN_ENA_TCO_2_PREL = 0*

Formula section:

If CTR_ABC_TCO_2_EL > 0 **or**
CTR_ABC_TCO_2_GRD > 0 **or**
LV_ERR_TCO_2_PREL_DET = 1
then LV_ERR_TCO_2_PREL = 1 (without debounce)
else LV_ERR_TCO_2_PREL = 0
endif

A.61.2 Preliminary coolant temperature failure (at ERU /at ES after ERU_to_ES)

Application conditions

Recurrence: *100 ms*

Activation: *LV_CDN_ENA_TCO_2_PREL = 0*

Deactivation: *LV_CDN_ENA_TCO_2_PREL = 1*

Formula section:

If CTR_ABC_TCO_2_EL > C_CTR_ABC_THD_TCO_2_PREL **or**
CTR_ABC_TCO_2_GRD > C_CTR_ABC_THD_TCO_2_PREL **or**
LV_ERR_TCO_2_PLAUS = 1
then LV_ERR_TCO_2_PREL_DET = 1 (irrevocable for current driving cycle)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

endif

If CTR_ABC_TCO_2_EL > 0 **or**
CTR_ABC_TCO_2_GRD > 0 **or**
LV_ERR_TCO_2_PLAUS = 1 **or**
then LV_ERR_TCO_2_PREL = 1 (without debounce)
else LV_ERR_TCO_2_PREL = 0
endif

A.61.3 Coolant temperature (radiator outlet) signal range diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the signal range- or electrical diagnosis is to detect electrical errors in the input circuit of the coolant temperature (radiator outlet) sensor. The analog sensor input signal is converted into a digital value with use of an A/D converter. All symptoms of the error code are handled by anti-bouncing. Only one symptom can be active at a time.

Description:

Error-symptoms are defined to this diagnosis function as following:

```
□□□□
| | | └─> Short circuit to  Vbatt or Open Circuit “SCP_OC”     (= SYM_0)
| | └───> Short circuit to Ground “SCG”                        (= SYM_1)
| └─────> (not used)                                           (= SYM_2)
└───────> (not used)                                           (= SYM_3)
```

Application conditions

Initialisation:
LV_ERR_TCO_2_EL = *Refer to filtering configuration for the initialisation*
LV_END_DIAG_TCO_2_EL = *Refer to filtering configuration for the initialisation*

LV_CDN_DIAG_TCO_2_EL = *Refer to filtering configuration for the initialisation*

ERR_SYM_TCO_2_EL = *Refer to filtering configuration for the initialisation*
Recurrence: *100 ms*
Activation: LV_IGK = 1 **and**
LV_CDN_VB_MIN_DIAG = 1 **and**
LV_INH_DIAG_TCO_2_EL = 0

Deactivation: Activation condition not true
At deactivation: LV_CDN_DIAG_TCO_2_EL = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Error detection:

```
if (1)              VP_TCO[1] < C_VP_TCO_2_MIN_DIAG_TCO_2_EL
                      // coolant temperature sensor (radiator outlet) voltage signal (VP_TCO[1])
then (1)              (error detection   Short circuit to GND )
                    LV_CDN_DIAG_TCO_2_EL = 1
                    ERR_SYM_TCO_2_EL =   SYM_1
                    LV_ERR_TCO_2_EL = 1                         (after debounce)
else (1)

A.61.4 Coolant temperature (radiator outlet) signal gradient diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the signal gradient diagnosis is to detect a not plausible gradient on the measured coolant temperature (radiator outlet) sensor signal. The monitoring is based on a comparison between the actual measured and the last measured coolant temperature value at radiator outlet. The symptom of the error code is handled by anti-bouncing.

Description:

Error-symptoms are defined to this diagnosis function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit

Remark : The present failure and the anti-bounce counter may be saved or not (see ‘Calculation of the Anti-bounce’)

A.63.1 Import Actions

#IF NC_ERR_DET_UPD = 1
ACTION_ERRM_UpdErrDet (IN<XX>)
This action indicates each occurrence of the detected error
#ENDIF

A.63.2 Export Actions

Name
ACTION_ERRM_FilterSymptom(IN< XX >, IN< lv_cdn_diag_XX >, IN< err_sym_XX >, IN< C_ABC_INC_XX >, IN< C_ABC_DEC_XX >, IN< C_ABC_MAX_XX >, OUT< LV_ERR_XX >)
This action computes the elementary anti-bounce filter for one failure treatment and returns filter result
ACTION_ERRM_NoFilterSymptom(IN< XX >, IN< lv_cdn_diag_XX >, IN< err_sym_XX >, IN< lv_err_set_XX >, IN< lv_err_reset_XX >, IN< lv_end_diag_XX >, OUT< LV_ERR_XX >)
This action computes the elementary treatment case no filtering is used
ACTION_ERRM_AbcFilterSymptomEnd(IN< XX >, IN< C_ABC_MAX_XX>, OUT< LV_ERR_XX >)
This action erases diagnostic failure and sets the end of diagnostic in case of antibounce filter type
ACTION_ERRM_NoFilterSymptomEnd(IN< XX >, OUT< LV_ERR_XX >)
This action erases diagnostic failure and sets the end of diagnostic in case of no filter
ACTION_ERRM_AbcFilterReset(IN< XX >, OUT< LV_ERR_XX >)
This action resets data filter in case of antibounce filter type
ACTION_ERRM_NoFilterReset(IN< XX >, OUT< LV_ERR_XX >)
This action resets data filter in case of no filter
ACTION_ERRM_GetLvErr(IN< XX >, OUT< LV_ERR_XX >)
This action is used to get LV_ERR_XX value
ACTION_ERRM_GetLvEndDiag(IN< XX >, OUT< LV_END_DIAG_XX >)
This action is used to get LV_END_DIAG_XX value
ACTION_ERRM_GetLvCdnDiag(IN< XX >, OUT< LV_CDN_DIAG_XX >)
This action is used to get LV_CDN_DIAG_XX value
ACTION_ERRM_GetErrSym(IN< XX >, OUT< ERR_SYM_XX >)
This action is used to get ERR_SYM_XX value

ERR_SYM_XX is defined like output data for each diagnosis as following :

Name	Mode	Hex. Limits	Phys. Limits	Resol.	Unit
ERR_SYM_XX	O/V	0..0FH	All combination	1	-
		0H	NO_SYM		
		1H	SYM_0		
		2H	SYM_1		
		4H	SYM_2		
		8H	SYM_3		
		FH	BENCH_MODE		
Symptom : failure without filtering of diagnosis XX					

It is possible to combine several symptoms.

FUNCTION DESCRIPTION:

General information:

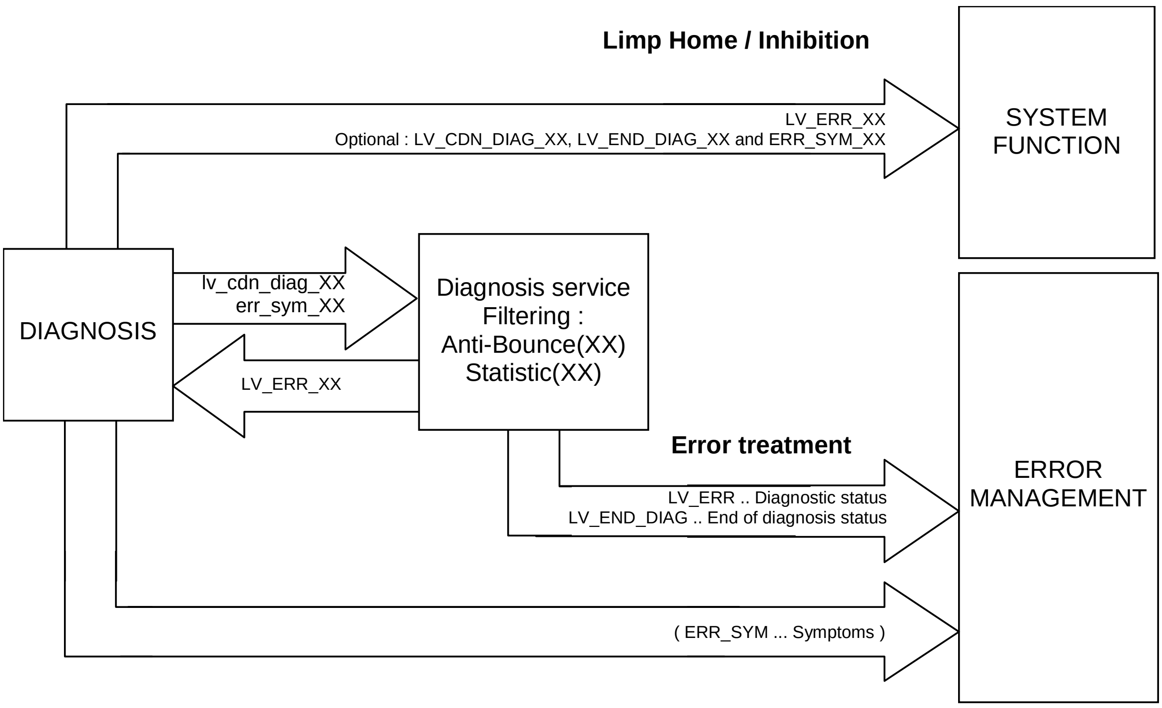
The filtering algorithm (anti-bounce or statistic) is used usually for the simple diagnosis (e.g. : usually OBD1 diagnosis). If there is another need, diagnosis manages itself the filtering and the end of diagnosis (e.g. : usually OBD2 diagnosis).
The filtering is used to filter the detected failure. The failure becomes present after filtering.
The end of diagnosis definition is realised after a time defined as the minimum time to detect a present failure.
The filtering algorithm (anti-bounce or statistic) uses one counter to check failure detection threshold and one counter to manage the end of diagnosis (Diagnostic result available).
Filter choice selection : according to the diagnostic filtering configuration the filtering algorithm used is the anti-bounce filtering (NLC_ABC_STC_XX = 0) or the standard statistical filtering (NLC_ABC_STC_ XX=1)
Signal flow diagram :

Diagnosis with an anti-bounce algorithm :



Diagnosis without anti-bounce algorithm :

LV_END_DIAG_XX = 0
Endif

If LV_ERR_XX = 0 **and** NLC_ABC_INI_VALUE_XX = 0
Then
{ all cases excepted MEM_INI configuration }
CTR_ABC_XX = 0
ERR_SYM_XX = 0
Endif

A.63.4 Recurrence

The recurrence is always managed by the diagnosis recurrence.

A.63.5 Filtering algorithm description

A.63.5.1 Description:

Syntax : ACTION_ERRM_FilterSymptom(IN<XX>, IN<lv_cdn_diag_XX>, IN< err_sym_xx>, IN<C_ABC_INC_XX>, IN<C_ABC_DEC_XX>,IN<C_ABC_MAX_XX>, OUT<LV_ERR_XX>)
Parameter(in) : XX Type: index to identify the Diagnostic
lv_cdn_diag_XX Type: Diagnostic condition
err_sym_XX Status of failure
C_ABC_INC_XX Anti-bounce counter increment
C_ABC_DEC_XX Anti-bounce counter decrement
C_ABC_MAX_XX Maximum value of anti-bounce counter
Parameter(out) : LV_ERR_XX Type: Boolean (=1 when failure)
Short Description : This action returns the filter result on symptoms detected at each diagnostic recurrence

A.63.5.2 Antibounce algorithm filtering type

A.63.5.2.1 Calculation of the anti-bounce counter

Description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Anti-bounce operation:

If the system failure is detected and the diagnosis conditions are fulfilled (LV_CDN_DIAG_XX = 1) then the failure is detected (ERR_SYM_XX 0) and the anti-bounce counter is incremented. In this case an action is called to manage some functionality (eg : to visualise the sporadic error of all diagnosis using this anti-bounce algorithm).

If the system failure isn't detected and the diagnosis conditions are fulfilled (LV_CDN_DIAG_XX = 1) then the failure isn't detected (ERR_SYM_XX = 0) and the anti-bounce counter is decremented.

If the diagnosis conditions aren't fulfilled (LV_CDN_DIAG_XX = 0) then the detected failure is unchanged (ERR_SYM_XX(N) = ERR_SYM_XX(N-1)) and the anti-bounce counter is unchanged.

The present failure is set when the anti-bounce counter has reached its MAX (unequal to zero).

The configuration allows:

- to save or not the present failure and the anti-bounce counter
- to initialise or not the present failure and the anti-bounce counter at transition LV_IGK 0 → 1
- to manage the decrement of the anti-bounce counter or not (the anti-bounce counter remains at the maximum value)
- to calibrate or not the decrement of the anti-bounce counter.

Anti-bounce bench mode:

To make easier the development phase, it may be interesting to force the LV_ERR_XX flag (present failure) and the associated symptoms in order to free the diagnosis and to test only the error management and/or the application incidence (limp home or inhibition) associated to the present failure. This mode is active only if the LC_ABC_BENCH and NLC_BENCH_MODE flags are set.

To set LV_ERR_XX to one and ERR_SYM_XX = FH (all detected error symptoms) :
Set the C_ABC_INC_XX calibration to the maximum value (FFH).
To set LV_ERR_XX to zero and ERR_SYM_XX = 0 (no detected error symptom) :
Set the C_ABC_INC_XX calibration to zero.
Note:
In this mode, the diagnosis condition (LV_CDN_DIAG_XX) and the end of diagnosis (LV_END_DIAG_XX) are set to 1 (LV_CDN_DIAG_XX = 1 means the ERR_SYM_XX is valid and LV_END_DIAG_XX = 1 means the LV_ERR_XX flag is valid).

Anti-bounce inhibition:

For specific needs, the anti-bounce filtering calculation (anti-bounce operation and anti-bounce bench mode) may be inhibited, with LV_ABC_INH inhibition flag.

Signal flow diagram:

1 -The anti-bounce counter may be decremented (NLC_ABC_NOT_DEC_XX = 0):

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.63.5.2.2 Calculation of the end of diagnosis

Description:

The end of diagnosis definition is set after a time defined like being the time necessary to evaluate the failure (present or not).

Signal flow diagram:

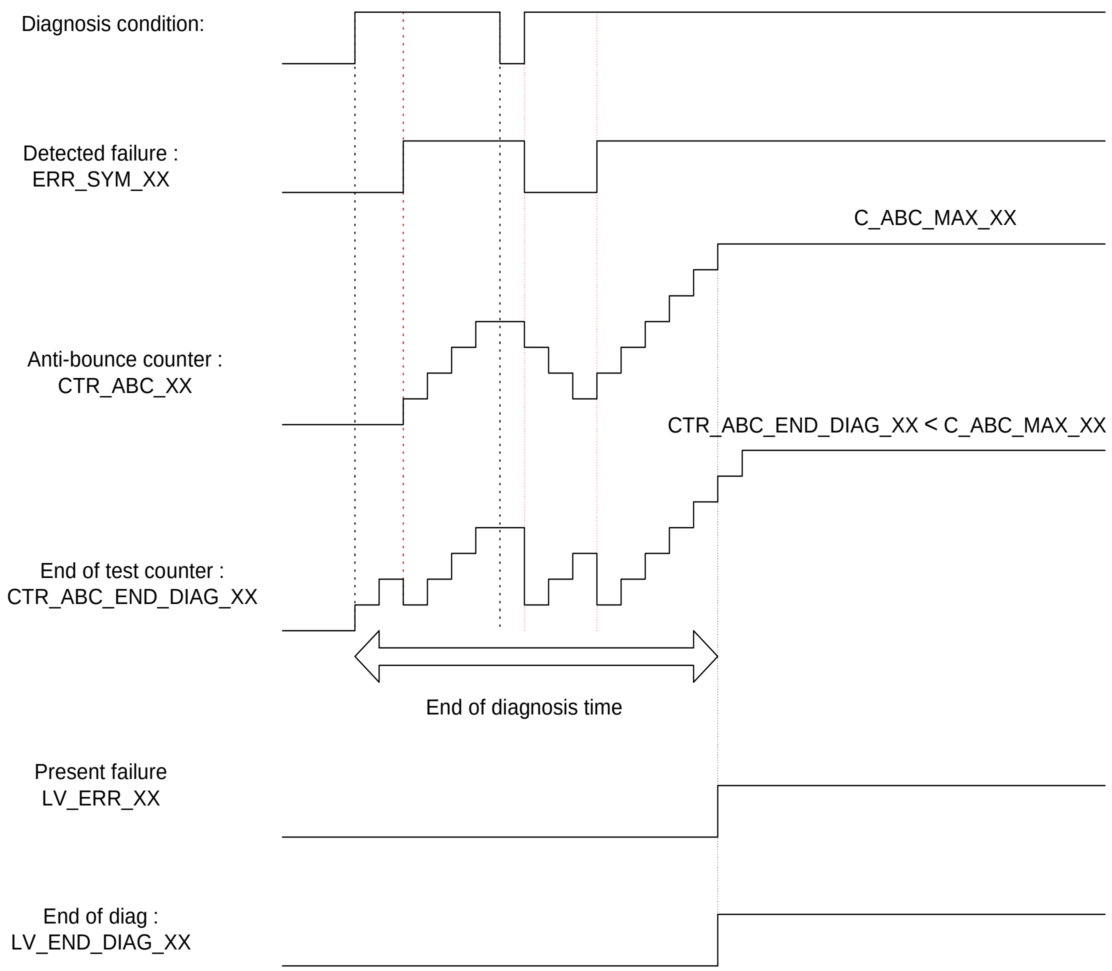
End of diagnosis algorithm illustration in standard case :

The end of diagnosis counter is reset at each transition of the detected failure.

When the failure becomes present : the end of diagnosis is set.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007



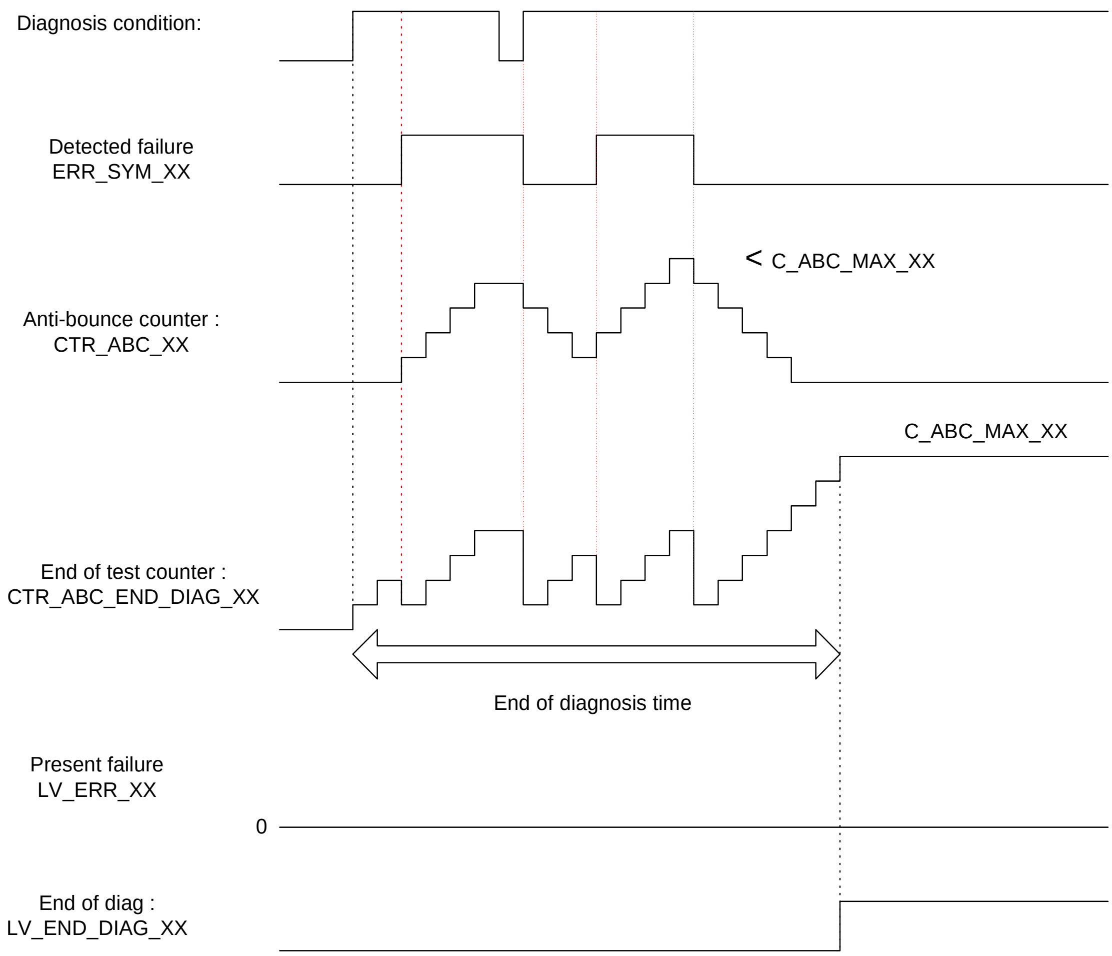
The detected failure will disappear and the anti-bounce counter won't reach the maximum value then the failure won't become present.

The end of diagnosis counter is reset at each transition of the detected failure.

When the detected failure is stable : the end of diagnosis counter is incremented until the maximum value while the diagnosis conditions are fulfilled.

When the end of diagnosis counter has reached the maximum value : the end of diagnosis is set.

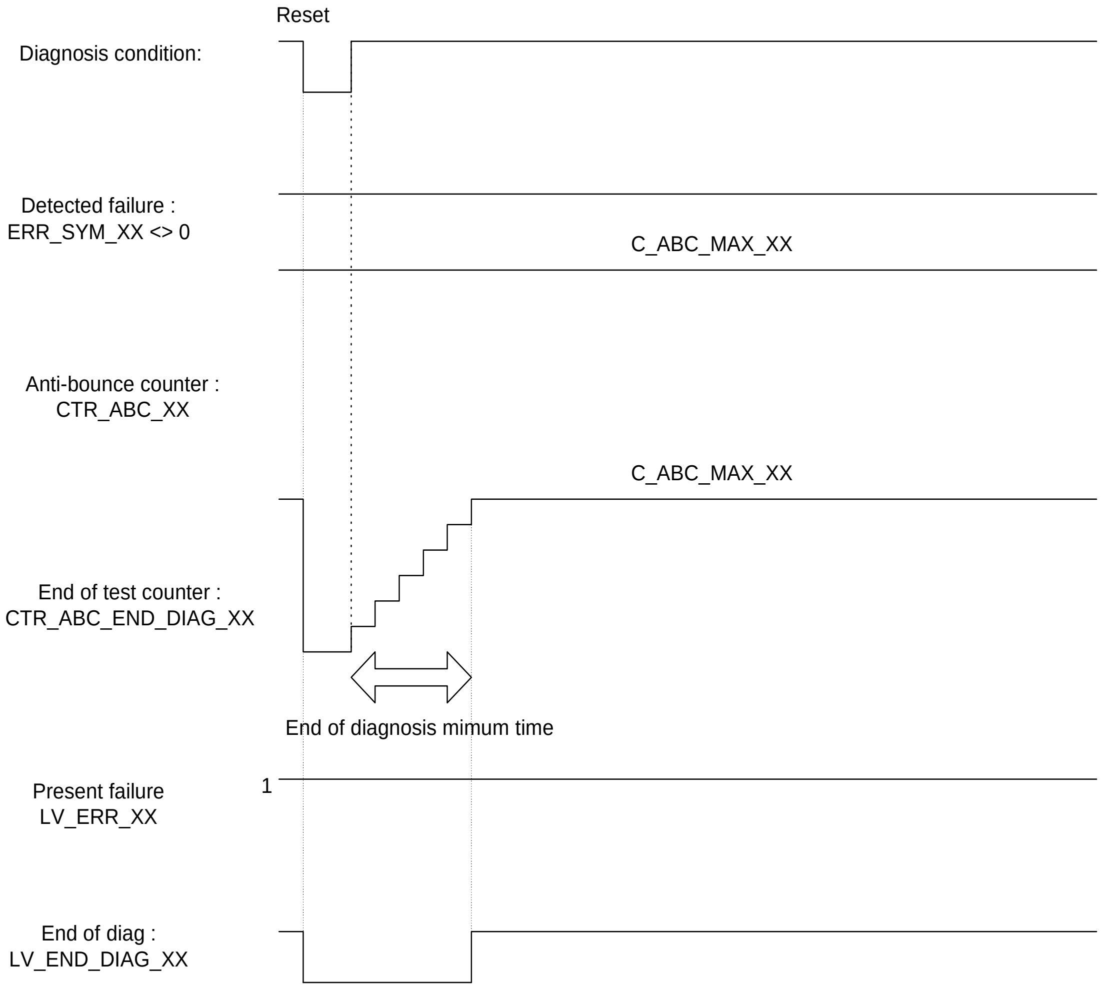
Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



End of diagnosis algorithm illustration in case of reset event :

After the reset event, the detected failure remains present (stable) : the end of diagnosis counter is incremented until the maximum value while the diagnosis conditions are fulfilled.
When the end of diagnosis counter has reached the maximum value : the end of diagnosis is set.
The failure has been present and remains present after reset.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Before the reset, the failure was detected until the failure became present.

After the reset, the detected failure appears during a glitch so the end of diagnosis counter is reset at each transition of the detected failure,

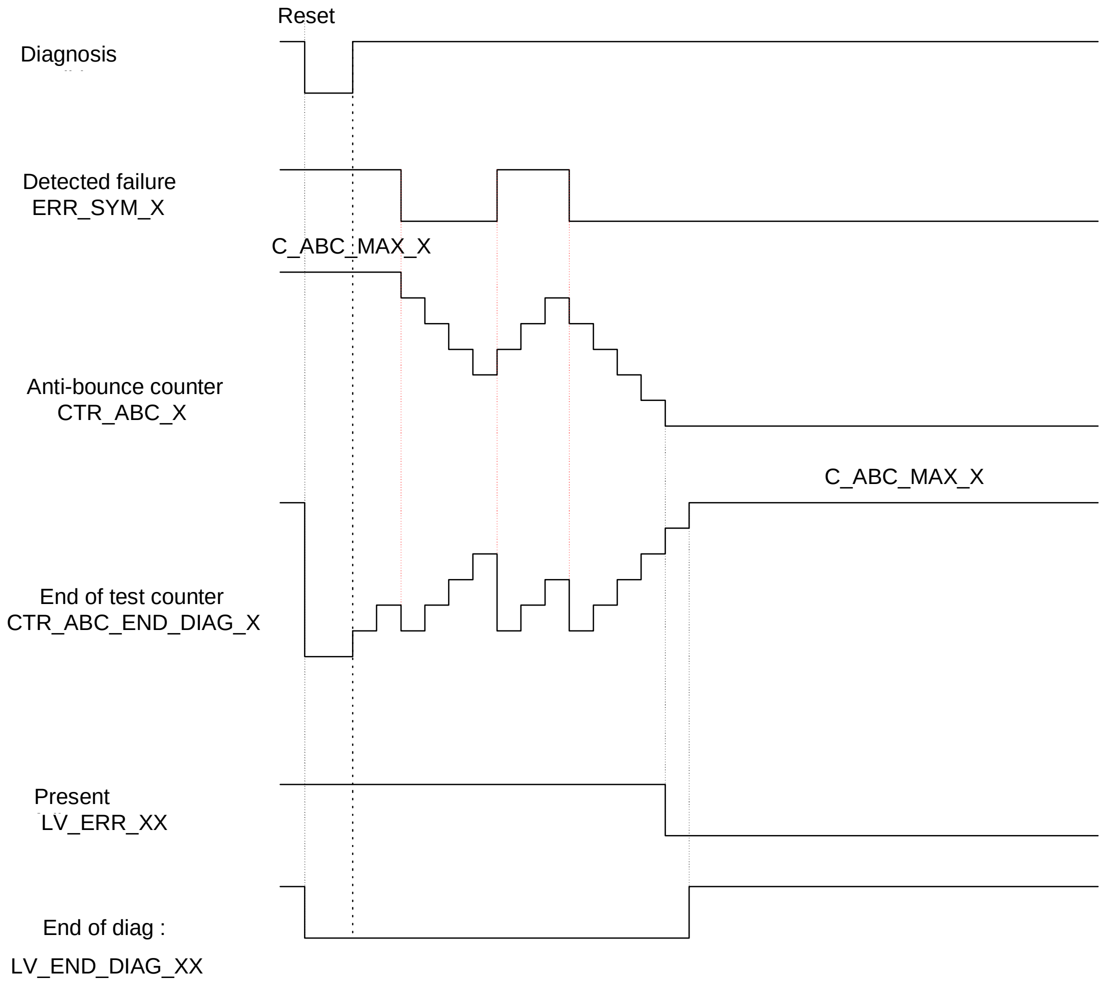
When the detected failure disappears after all (stable) then

- the present failure disappears
- the end of diagnosis counter is incremented until the maximum value while the diagnosis conditions are fulfilled.

When the end of diagnosis counter has reached the maximum value : the end of diagnosis is set.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

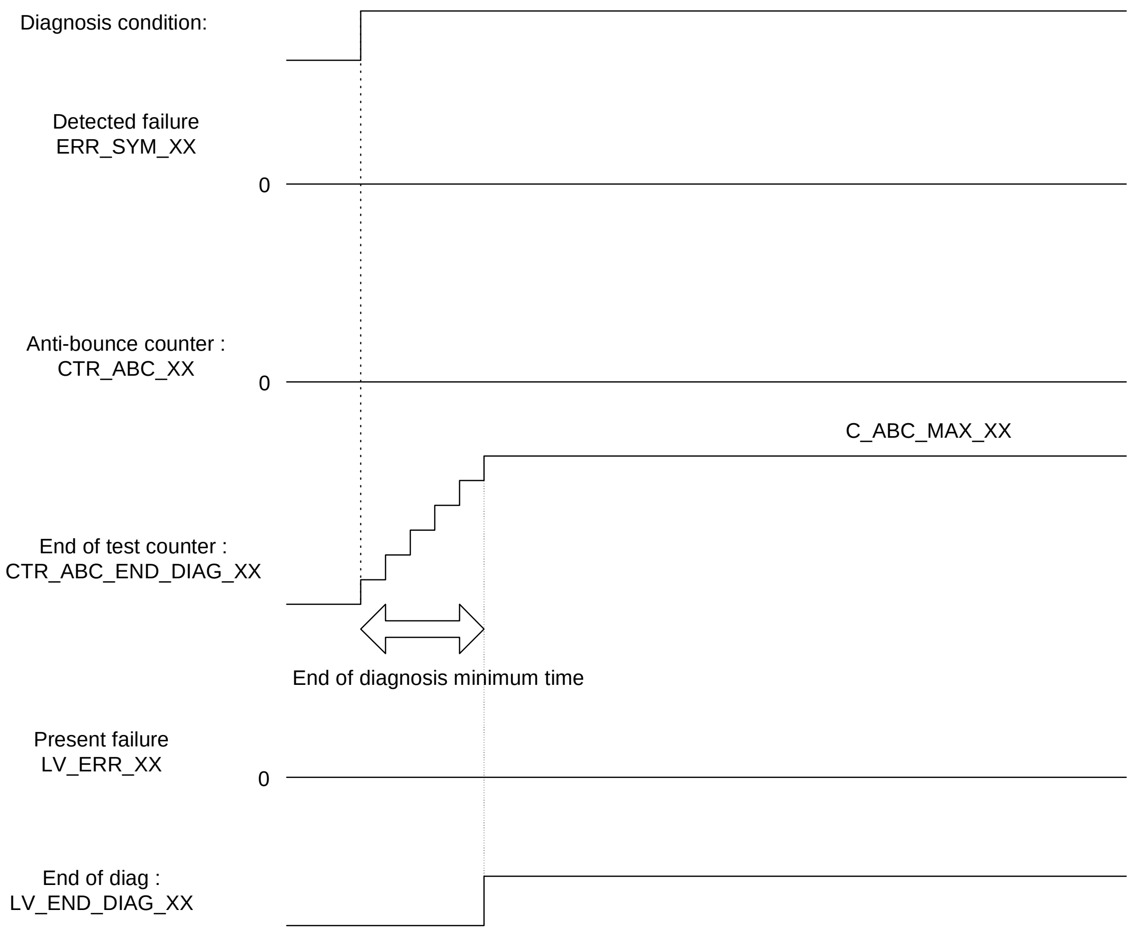
Copyright (C) Continental AG,2007



<u>End of diagnosis algorithm illustration when the time to reach the end of diagnosis is minimum</u>

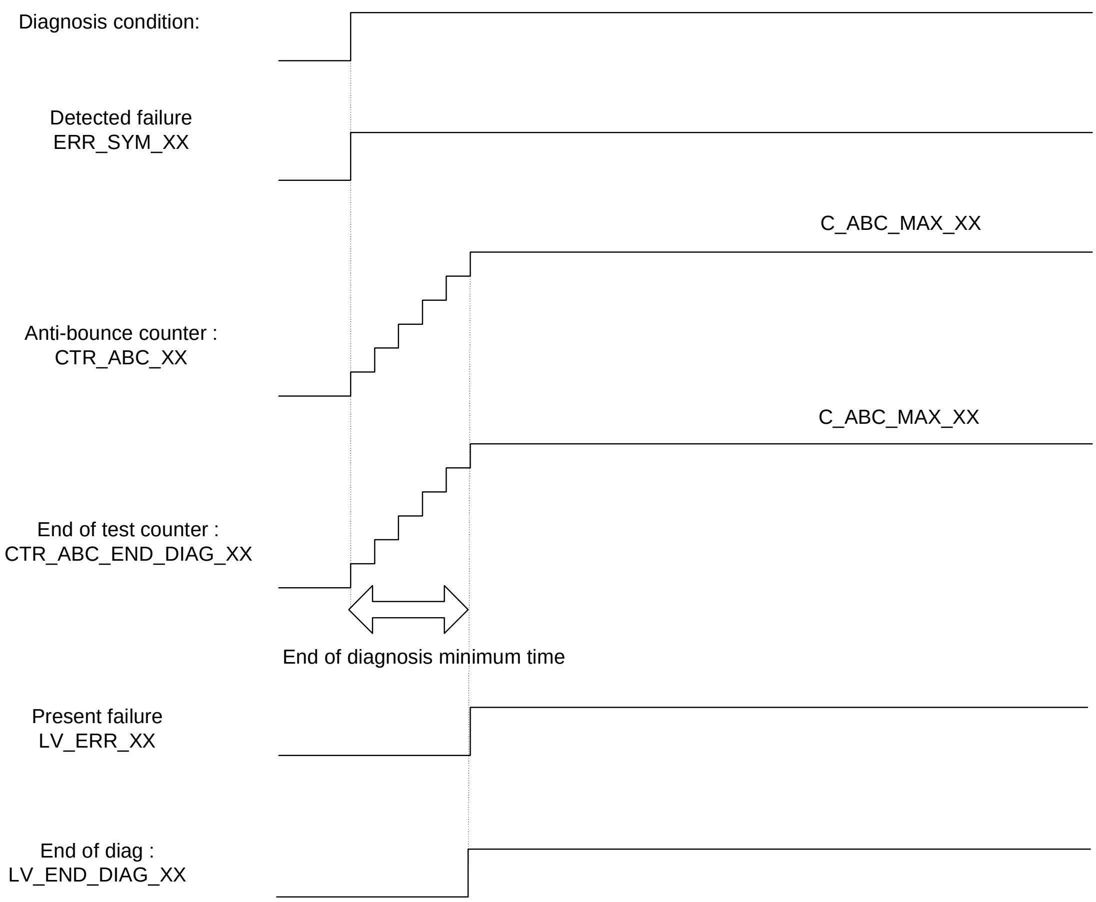
The failure isn't detected (stable) : the end of diagnosis counter is incremented until the maximum value while the diagnosis conditions are fulfilled.
When the end of diagnosis counter has reached the maximum value : the end of diagnosis is set.
The end of diagnosis appears after the minimum time (the detected failure doesn't appear).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



The failure is detected unchangingly (stable) : the end of diagnosis counter is incremented until the maximum value while the diagnosis conditions are fulfilled.
When the failure becomes present : the end of diagnosis is set.
The end of diagnosis and the failure appears after the minimum time (the detected failure is permanent).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.



Application conditions

Initialization: *See "Initialisation of anti-bounce, statistical and multi-conditions filters" paragraph*

{ERR_SYM_PREV_XX is updated at each diagnosis recurrence even during the inhibition, so that when the inhibition is removed ERR_SYM_PREV_XX is updated with the value calculated at the last diagnosis recurrence of the inhibition phase.}

ERR_SYM_PREV_XX = ERR_SYM_XX

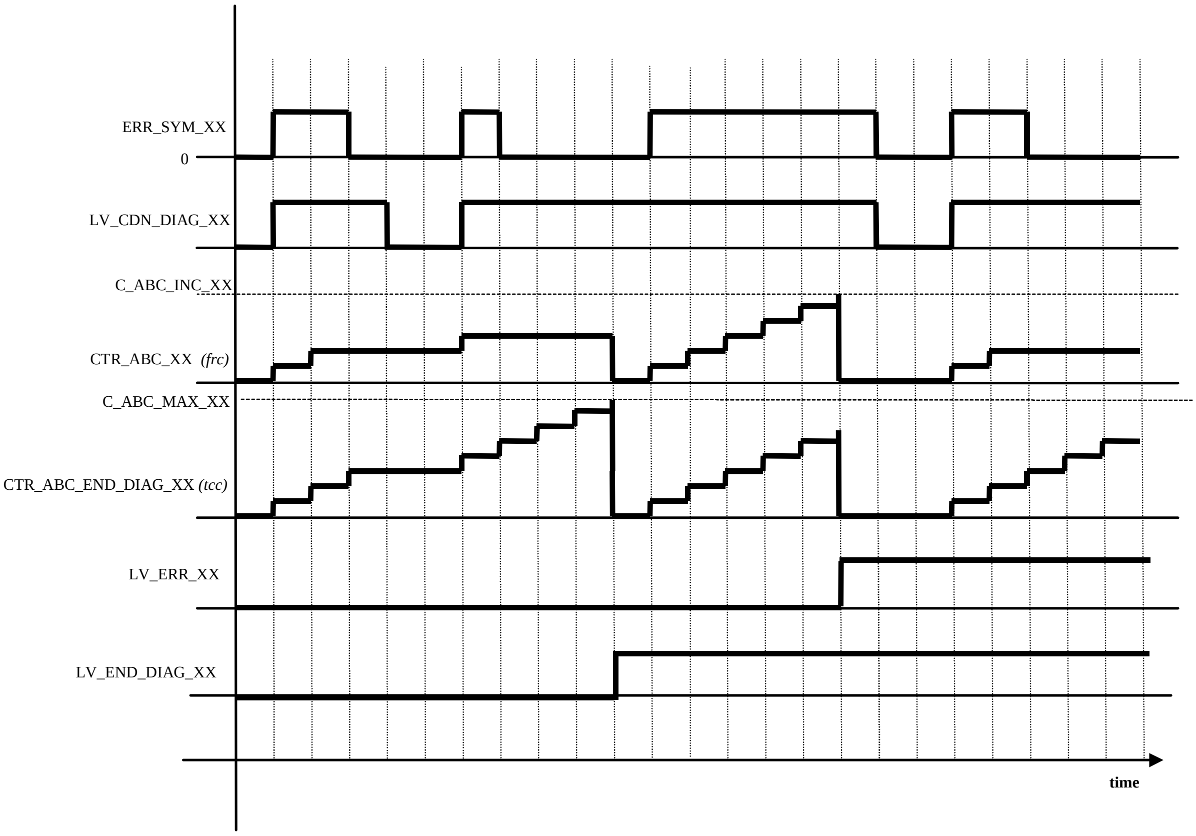
Endif(1)

Endif(0)

A.63.5.3 Standard statistical filtering type

General information:

The purpose is to make an error detection by statistical evaluation.
An error is only detected, if a symptom is active for C_ABC_INC_XX times within the test period C_ABC_MAX XX, with test symptom condition fulfilled (LV_CDN_DIAG_XX = 1).



In this chapter,

- the data CTR_ABC_XX represents the frequency counter
- the calibration C_ABC_INC_XX represents the maximum for frequency counter of the processed symptom
- the data CTR_ABC_END_DIAG_XX represents the period counter increment
- the calibration C_ABC_MAX_XX represents the maximum for test counter of the processed symptom

The calibration C_ABC_MAX_XX must be greater than C_ABC_INC_XX.

Formula section:

Anti-bounce in the bench mode :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
If              (LC_ABC_BENCH = 1 and NLC_BENCH_MODE=1)
          and

Endif
```

Period counter increment:

```
If              LV_CDN_DIAG_XX = 1
Then
          CTR_ABC_END_DIAG_XX = CTR_ABC_END_DIAG_XX + 1
Endif
```

Detection of the error state for the current symptom:

```
If              CTR_ABC_XX >= C_ABC_INC_XX
Then
          LV_ERR_XX = 1
          { The current symptom is entered to failure memory }
Endif
```

Detection of the error free symptom:

```
If              CTR_ABC_END_DIAG_XX = C_ABC_MAX_XX
       and CTR_ABC_XX < C_ABC_INC_XX
Then
          LV_ERR_XX = 0
Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

End of the diagnostic period for statistic symptom:

If CTR_ABC_END_DIAG_XX = C_ABC_MAX_XX
or CTR_ABC_XX = C_ABC_INC_XX
Then
CTR_ABC_XX = 0
CTR_ABC_END_DIAG_XX = 0
{ End of diagnostic period for statistic symptom is reached }
LV_END_DIAG_XX=1
Endif

A.63.6 Description for ACTION_ERRM_NoFilterSymptom :

Syntax : ACTION_ERRM_NoFilterSymptom(IN<XX>, IN<lv_cdn_diag_XX>, IN<err_sym_XX>, IN<lv_err_set_XX>, IN<lv_err_reset_XX>, IN<lv_end_diag_XX>, OUT<LV_ERR_XX>)

Parameter(in) : XX Type: index to identify the Diagnostic
lv_cdn_diag_XX Type: Diagnostic condition
err_sym_XX Status of failure
lv_err_set_XX Type: Boolean to set the failure
lv_err_reset_XX Type: Boolean to reset the failure
lv_end_diag_XX Type: Boolean (=1 when result available)
Parameter(out) : LV_ERR_XX Type: Boolean (=1 when failure)
Short Description : This action returns the result on symptoms detected at each diagnostic recurrence, when no filter is used.

A.63.7 System Description:

This action is used in case of diagnostics which don't need any filtering will use the “NO type” filter.
LV_ERR_XX is managed as a **STD** anti-bounce filtering type (saved in NVMY at end of power latch, ...).

LV_END_DIAG_XX is managed by error management (reset at DC transition, ...).
ERR_SYM_XX is updated at each diagnostic recurrence, to fulfil the diagnostic result.

Formula section :

If LV_ABC_INH = 0 *{No inhibition of anti-bounce filtering}*
Then
If lv_end_diag_XX = 1
Then
LV_END_DIAG_XX = 1
Endif

If lv_err_set_XX = 1

Syntax: ACTION_ERRM_NoFilterSymptomEnd(IN<XX>, OUT<LV_ERR_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): LV_ERR_XX Type: Boolean
Short Description: This action erases diagnostic failure and sets immediately the end of diagnostic information in case of no filter (NO)

Formula section :

If LV_ABC_INH = 0 *{No inhibition of anti-bounce filtering}*
Then
LV_CDN_DIAG_XX = 1
ERR_SYM_XX = NO_SYM
LV_ERR_XX = 0
LV_END_DIAG_XX = 1
Endif

A.63.10 Description for ACTION_ERRM_AbcFilterReset:

Syntax: ACTION_ERRM_AbcFilterReset(IN<XX>, OUT<LV_ERR_XX>)
Parameter(in): XX Type: index to identify the Diagnostic

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Parameter(out): LV_ERR_XX Type: Boolean
Short Description: This action resets data filter in case of ABC filter type

Formula section :

If LV_ABC_INH = 0 *{No inhibition of anti-bounce filtering}*
Then
LV_CDN_DIAG_XX = 0
ERR_SYM_XX = NO_SYM
LV_ERR_XX = 0
CTR_ABC_XX = 0
LV_END_DIAG_XX is unchanged
CTR_ABC_END_DIAG_XX is unchanged
Endif

A.63.11 Description for ACTION_ERRM_NoFilterReset:

Syntax: ACTION_ERRM_NoFilterReset(IN<XX>, OUT<LV_ERR_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): LV_ERR_XX Type: Boolean
Short Description: This action resets data filter in case of no filter usage

Formula section :

If LV_ABC_INH = 0 *{No inhibition of anti-bounce filtering}*
Then
LV_CDN_DIAG_XX = 0
ERR_SYM_XX = NO_SYM
LV_ERR_XX = 0
LV_END_DIAG_XX is unchanged
Endif

A.63.12 Description for ACTION_ERRM_GetLvErr:

Syntax: ACTION_ERRM_GetLvErr(IN<XX>, OUT<LV_ERR_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): LV_ERR_XX Type: Boolean
Short Description: This action returns the failure status for the diagnostic XX.

Formula section :

LV_ERR_XX = failure status for the diagnostic XX

A.63.13 Description for ACTION_ERRM_GetLvEndDiag:

Syntax: ACTION_ERRM_GetLvEndDiag(IN<XX>, OUT<LV_END_DIAG_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): LV_END_DIAG_XX Type: Boolean
Short Description: This action returns the end of diagnostic flag for the diagnostic XX.

Formula section :

LV_END_DIAG_XX = end of diagnostic flag for the diagnostic XX

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.63.14 Description for ACTION_ERRM_GetLvCdnDiag:

Syntax: ACTION_ERRM_GetLvCdnDiag(IN<XX>, OUT<LV_CDN_DIAG_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): LV_CDN_DIAG_XX Type: Boolean
Short Description: This action returns the condition status for the diagnostic XX.

Formula section :

LV_CDN_DIAG_XX = condition status for the diagnostic XX

A.63.15 Description for ACTION_ERRM_GetErrSym:

Syntax: ACTION_ERRM_GetErrSym(IN<XX>, OUT<ERR_SYM_XX>)
Parameter(in): XX Type: index to identify the Diagnostic
Parameter(out): ERR_SYM_XX Status of failure
Short Description: This action returns the symptoms for the diagnostic XX.

Formula section :

ERR_SYM_XX = symptoms for the diagnostic XX

A.63.16 CPU load optimisation mechanisms

General information:

This section describes the mechanism of optimisation. The principle is to suspend the filter algorithm execution when it is not necessary.

Formula section:

If NLC_BENCH_MODE = 0
Then
{ the bench mode isn't available whatever LC_ABC_BENCH value }
the CPU load is reduced
Else
{ the bench mode is available if LC_ABC_BENCH = 1 }
less CPU load reduction than with NLC_BENCH_MODE = 0
Endif

Case 1 : the diagnostic uses an anti-bounce filtering algorithm
If LV_ERR_XX = 0
and LV_END_DIAG_XX = 1
and ERR_SYM_XX = 0
and CTR_ABC_XX = 0
Then
{ it is not necessary to call the Error Management (including the filtering) }
LV_END_DIAG_XX = 1 *{ unchanged }*
LV_ERR_XX = 0 *{ unchanged }*
Endif

Case 2 : the diagnostic doesn't use an anti-bounce filtering algorithm
If (LV_ERR_XX = 0 **and** LV_END_DIAG_XX = 1 **and** ERR_SYM_XX = 0)
Then

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

{ it is not necessary to call the Error Management }
LV_END_DIAG_XX = 1 *{ unchanged }*
LV_ERR_XX = 0 *{ unchanged }*

Endif

A.63.17 Synchronisation between Anti-bounce algorithm and Error Management

General information:

This section describes the mechanism of synchronisation of the failure filtering with the Error Management core. The principle is to call the Error Management upon events.

LV_END_DIAG_XX 0 → 1 transition
LV_ERR_XX 0 → 1 transition
LV_ERR_XX 1 → 0 transition

This mechanism is followed whatever the filter (type STD, STD_INI, DEC_CAL, MEM, MEM_INI, STC) but also for diagnoses which don't use any filter (type NO).

A.63.18 Configuration and calibration data

NC_ABC_CONF_FCT_DIAG_XX :

```
bit 0 : NLC_ABC_NOT_SAVE_XX
bit 1 : NLC_ABC_INI_IGK_XX
bit 2 : NLC_ABC_INI_VALUE_XX
bit 3 : NLC_ABC_NOT_DEC_XX
bit 4 : NLC_ABC_CAL_DEC_XX
bit 5 : NLC_ABC_STC_XX
bit 6 : Not used
bit 7 : Not used
```

Bits definition

- NLC_ABC_NOT_SAVE_XX : if this bit is set to 0 the anti-bounce context (CTR_ABC_XX and LV_ERR_XX) is saved at the end of power latch, only when the failure is in dynamic memory, and restored at the event Reset.

Limitation : the saved configuration is only available if the NVMY manager take into account the filter environment data (LV_ERR_XX, CTR_ABC_XX).

- NLC_ABC_INI_IGK_XX : LV_ERR_XX and CTR_ABC_XX are reset at the transition LV_IGK 0 -> 1 and at the event reset.

- NLC_ABC_INI_VALUE_XX : if this bit is set to 1 then the anti-bounce counter is initialised with C_ABC_MAX_XX - C_ABC_INC_XX if there was a failure between the last and this initialisation (NLC_ABC_NOT_SAVE_XX = 0 to test the failure before this initialisation) else the anti-bounce counter is initialised with 0 value.

- NLC_ABC_NOT_DEC_XX : if this bit is set to 0 then the anti-bounce counter can be decremented if the condition for decrement are fulfilled. If this bit is set to 1 then the anti-bounce counter can be decremented if the condition for decrement are fulfilled until the anti-bounce counter hasn't reached the maximum value; when the anti-bounce counter has reached the maximum value then the anti-bounce counter and the failure remains (the anti-bounce counter can be decremented anymore) until a transition LV_IGK 0 → 1 or reset following the NLC_ABC_INI_IGK_XX bit configuration (If the NLC_ABC_NOT_DEC_XX bit is set to 1 then NLC_ABC_NOT_SAVE_XX must be set to 1).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

- NLC_ABC_CAL_DEC_XX : if this bit is set then the anti-bounce decrement is calibratable, the calibration is named C_ABC_DEC_XX else the anti-bounce decrement is equal to 1 and there isn't calibration.
- NLC_ABC_STC_XX : if this bit is set then the filter used is the statistical filter else the filter used is the anti-bounce filter (Standard configuration).

Predefined filter type :

	NLC_ABC_STC_XX	NLC_ABC_CAL_DEC_XX	NLC_ABC_NOT_DEC_XX	NLC_ABC_INI_VALUE_XX	NLC_ABC_INI_IGK_XX	NLC_ABC_NOT_SAVE_XX
STD_INI	0	0	0	0	1	1
STD	0	0	0	0	0	0
MEM	0	0	1	0	1	1
MEM_INI	0	0	1	1	1	0
DEC_CAL	0	1	0	0	0	0
STC	1	0	0	0	1	1
NO	0	0	0	0	0	0

The **standard configuration with initialisation (STD_INI)** is NC_ABC_CONF_FCT_DIAG_XX = 3H (default configuration)
The data CTR_ABC_XX and LV_ERR_XX are reset at the transition LV_IGK 0 → 1 and reset (NLC_ABC_NOT_SAVE_XX = 1, NLC_ABC_INI_IGK_XX = 1) and the anti-bounce counter is initialised to 0 value (NLC_ABC_INI_VALUE_XX = 0).
The anti-bounce counter may be decremented (NLC_ABC_NOT_DEC_XX = 0).
The decrement value is equal to 1 (NLC_ABC_CAL_DEC_XX = 0).
The filter used is the Anti-bounce (NLC_ABC_STC_XX = 0).

The **statistical configuration (STC)** is NC_ABC_CONF_FCT_DIAG_XX = 23H
The data CTR_ABC_XX and LV_ERR_XX are reset at the transition LV_IGK 0 → 1 and reset (NLC_ABC_NOT_SAVE_XX = 1, NLC_ABC_INI_IGK_XX = 1) and the frequency counter (CTR_ABC_XX) is initialised to 0 value (NLC_ABC_INI_VALUE_XX = 0).
The filter used is the statistical (NLC_ABC_STC_XX = 1).

The **standard configuration (STD)** is NC_ABC_CONF_FCT_DIAG_XX = 0H
The data CTR_ABC_XX and LV_ERR_XX are saved (NLC_ABC_NOT_SAVE_XX = 0, NLC_ABC_INI_IGK_XX = 0, NLC_ABC_INI_VALUE_XX = 0).
The anti-bounce counter may be decrement (NLC_ABC_NOT_DEC_XX = 0).
The decrement value is equal to 1 (NLC_ABC_CAL_DEC_XX = 0).

The **memory configuration (MEM)** is NC_ABC_CONF_FCT_DIAG_XX = BH

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The data CTR_ABC_XX and LV_ERR_XX are reset at the transition LV_IGK 0 → 1 and reset (NLC_ABC_NOT_SAVE_XX = 1, NLC_ABC_INI_IGK_XX = 1) and the anti-bounce counter is initialised to 0 value (NLC_ABC_INI_VALUE_XX = 0).
The anti-bounce counter can be decremented if the condition for decrement are fulfilled until the anti-bounce counter hasn't reached the maximum value; when the anti-bounce counter has reached the maximum value then the anti-bounce counter and the failure remains until a transition LV_IGK 0 → 1 or reset (NLC_ABC_NOT_DEC_XX = 1).
The decrement value is equal to 1 (NLC_ABC_CAL_DEC_XX = 0).

The **memory configuration (MEM_INI)** is NC_ABC_CONF_FCT_DIAG_XX = EH
The data CTR_ABC_XX and LV_ERR_XX are initialised at the transition LV_IGK 0 → 1 and reset (NLC_ABC_INI_IGK_XX = 1). The anti-bounce counter is initialised to the C_ABC_MAX_XX - C_ABC_INC_XX value (NLC_ABC_INI_VALUE_XX = 1) only if there was a failure between the last and this initialisation (NLC_ABC_NOT_SAVE_XX = 0 to test the failure before this initialisation) else the anti-bounce counter is initialised with 0 value. The data LV_ERR_XX is initialised with 0 value.
The anti-bounce counter can be decremented if the condition for decrement are fulfilled until the anti-bounce counter hasn't reached the maximum value; when the anti-bounce counter has reached the maximum value then the anti-bounce counter and the failure remains until a transition LV_IGK 0 → 1 or reset (NLC_ABC_NOT_DEC_XX = 1).
The decrement value is equal to 1 (NLC_ABC_CAL_DEC_XX = 0).

The **decrement calibratable configuration (DEC_CAL)** is set with NC_ABC_CONF_FCT_DIAG_XX = 10H
The data CTR_ABC_XX and LV_ERR_XX are saved (NLC_ABC_NOT_SAVE_XX = 0, NLC_ABC_INI_IGK_XX = 0, NLC_ABC_INI_VALUE_XX = 0).
The anti-bounce counter may be decrement (NLC_ABC_NOT_DEC_XX = 0).
The decrement value is calibratable (NLC_ABC_CAL_DEC_XX = 1).

The standard configuration is NLC_ABC_INI_DC_END_DIAG = 0 and NC_ERR_DET_UPD = 0 (default configuration).
Some functionalities (e.g. : to visualise the sporadic error of all diagnosis using this anti-bounce algorithm) aren't used when the failure is detected.
Remark :
The standard calibration is LC_ABC_BENCH = 0 **and** NLC_BENCH_MODE=0 (default calibration) then the bench mode isn't managed.
If the diagnosis doesn't manage calibratable decrement then the C_ABC_DEC_XX calibration isn't defined in calibration data (NLC_ABC_CAL_DEC_XX = 0).
Configuration detailed description:
NLC_ABC_INI_DC_END_DIAG
1 : Initialisation of LV_END_DIAG_XX at LV_DC 1→0 transition
0 : Initialisation of LV_END_DIAG_XX at LV_IGK 0→1 transition or ECU reset

A.64 Debounce algorithm (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CTR_ERR_INTM_NR	V	0... FFH	0... 255	1	-
Number of failures stored in intermittent failure array					
ERR_INTM_CTR_FRC [NC_NR_ERR_INTM]	V/S	0... FFH	0... 255	1	-
Frequency of reappearence of failure stored in ERR_INTM_DIAG_INST					
ERR_INTM_DIAG_INST [NC_NR_ERR_INTM]	V/S	0... FFFFH	0... 65535	1	-
Array of diagnosis instances with intermittent failure					
LV_ABC_INH	O/V	0... 1H	0 ...1	1	-
Anti-bounce filterings inhibition					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_NR_ERR_INTM	-	1... FFH	1... 255	1	-
Maximum number of diagnosis instances to be listed in ERR_INTM_DIAG_INST					

Action definition

ACTION_ERRM_InhibitFiltering (**IN**<InhibitFilter>)	Mode: O
This action shall be used to inhibit anti-bounce filtering calculations	

FUNCTION DESCRIPTION:

General information:

Intermittent failures are neither visualized nor stored with the following configuration :
NLC_ERR_DET_UPD = 00h

Application conditions

Initialisation:
```
ERR_INTM_DIAG_INST[0...NC_NR_ERR_INTM -1] = 0
ERR_INTM_CTR_FRC[0...NC_NR_ERR_INTM -1] = 0
CTR_ERR_INTM_NR = 0
```

Recurrence: -

Activation: *at ECU reset*

Formula section:

No action to be performed with this configuration.

A.64.1 Anti-bounce filtering inhibition

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

In addition, LV_ABC_INH flag must be securised to avoid any undesired inhibition.
To avoid failure recording during specific ECU phases (e.g. reprogramming,...), diagnoses are inhibited.
To realize this inhibition, anti-bounce filtering calculations are frozen.
This inhibition is generally used during reprogramming phase.

Syntax: ACTION_ERRM_InhibitFiltering (IN <InhibitFilter>)
Parameter(in): InhibitFilter filter inhibition
Parameter(out: No parameter
Short Description: This API permits to activate or deactivate the anti-bounce calculation.

Application conditions

Initialisation:
```
at ECU reset
  LV_ABC_INH = 0
(default value :  Anti-bounce calculation is not inhibited)
```

Recurrence: -

Activation: *at action request*

Formula section:

LV_ABC_INH = 0

A.67 Electrical diagnosis of power stage outputs

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CDN_DIAG_XX	-	0... 7H	0 ...7	1	-
Diagnosis condition for each symptom for XX					
ERR_DIAG_XX	-	0... 7H	0 ...7	1	-
Diagnosis symptom (raw value) for each symptom for XX					

Input data:

CDN_DIAG_XX {p. 4614}	ERR_DIAG_XX {p. 4614}	LV_IGK {p. 906}	LV_INH_DIAG_XX
XXPWM			

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_PSD_DLY	-	0... FFH	0... 255	1	-
The diagnosis is reactivated after (LV_INH_DIAG_XX 1->0 or CDN_DIAG_XX >0 (depending on case)) and LV_IGK 0->1 and reset and FMY reset after NC_PSD_DLY recurrences.					

Import actions:

ACTION_ERRM_FilterMulticondition (**IN**<XX>,**IN**<CDN_DIAG_>,**XX**>,<IN<>,**ERR_DIAG_XX**>,<IN>,<C_ABC_INC_XX>,**IN**<C_ABC_MAX_XX>,**OUT**<LV_ERR_XX>)
ACTION_ERRM_FilterMulticondition (**IN**<XX>,**IN**<CDN_DIAG_>,**XX**>,<IN<>,**ERR_DIAG_XX**>,<IN>,<C_ABC_INC_XX>,**IN**<C_ABC_MAX_XX>,**OUT**<LV_ERR_XX>)
ACTION_ERRM_FilterMulticondition (**IN**<XX>,**IN**<CDN_DIAG_>,**XX**>,<IN<>,**ERR_DIAG_XX**>,<IN>,<C_ABC_INC_XX>,**IN**<C_ABC_MAX_XX>,**OUT**<LV_ERR_XX>)

FUNCTION DESCRIPTION:

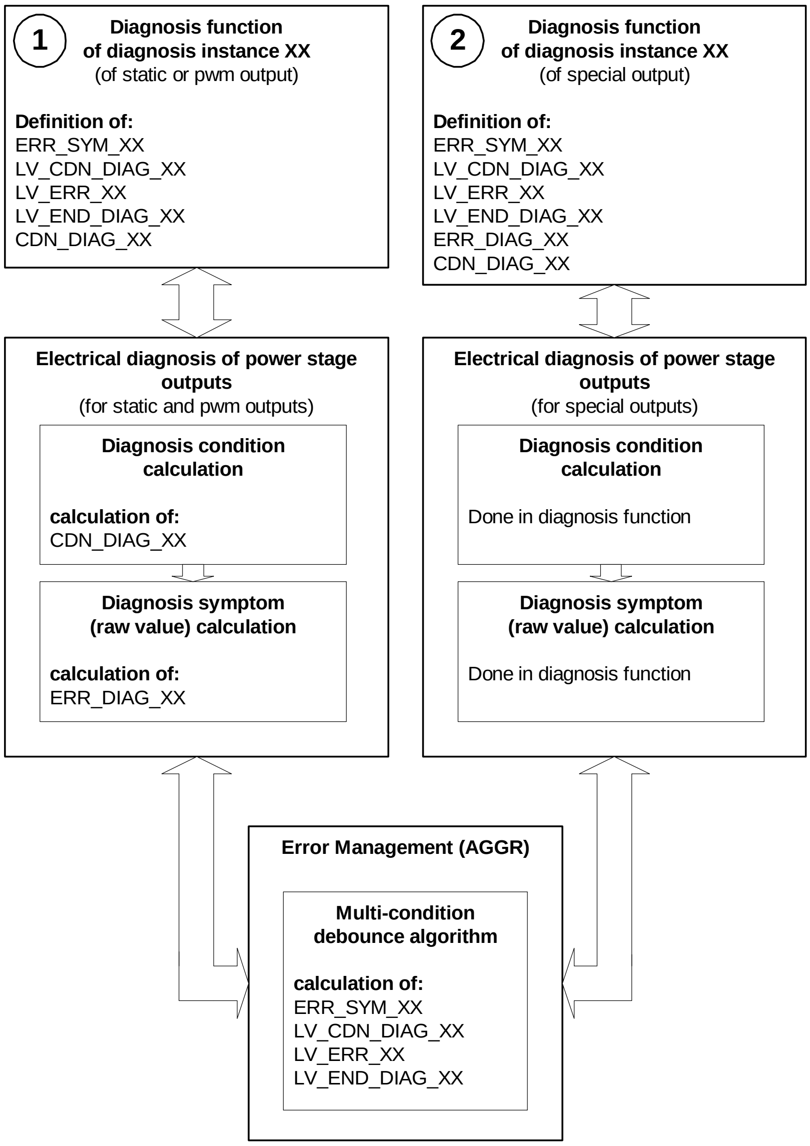
General information:

In this function description the electrical diagnosis of power stage outputs is specified. Because of the possibility of different hardware configurations, the specification is splited into three parts plus one common part for the symptom debounce and error management treatment.

- Diagnosis of static outputs (e.g. relays)
- Diagnosis of pwm outputs (e.g. VVT actuator)
- Diagnosis of special outputs (other hardware configurations)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007



According these three different kind of driver outputs the management of the electrical diagnosis is different between static/pwm outputs and special outputs (see previous picture case 1 and 2).
For all types of these diagnoses three main calculations must be done:

- Diagnosis condition calculation
- Diagnosis symptom (raw value) calculation
- anti-bounce mechanism with error management treatments

In the following chapter these treatments are described.

A.67.1 Diagnosis of static outputs

General information:

The purpose is to diagnose electrical errors detected by the hardware for static outputs. The signal is controlled by the ATIC 39.
The driver can distinguish between three symptoms: ‘Short to battery’ SCB, ‘Short to ground’ SCG and ‘Open circuit’ OC.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

By the diagnosis condition calculation the information given by the BSW ('Diagnosis of symptom ... is valid') that shows, that a diagnosis of a symptom was possible, since the last recurrence of the diagnosis function, is displayed for each symptom within the value CDN_DIAG_XX.
The information of the failure symptom is also delivered by the BSW ('Failure symptom ... detected by HW'). According this information the diagnosis symptom (raw value) calculation is performed to set ERR_DIAG_XX.
The calculation of LV_ERR_XX, LV_CDN_DIAG_XX, ERR_SYM_XX and LV_END_DIAG_XX is done in the Multi-condition debounce algorithm (part of Error Management AGGR).

Application conditions

Initialization: –

Recurrence: –

Activation:
```
every ECU state
reactivation in the NC_PSD_DLY recurrence after LV_INH_DIAG_
XX 1->0 and LV_IGK 0->1 and reset and FMY reset
```

Deactivation:
```
LV_INH_DIAG_XX = 1
 at deactivation:  CDN_DIAG_XX = 0
```

Formula section:

Diagnosis condition calculation:
CDN_DIAG_XX = 0

Diagnosis condition calculation for symptom 'Short to battery' SCB:
If 'Diagnosis of symptom SCB is valid' (BSW information)
Then bit 0 of CDN_DIAG_XX = 1
Endif

Diagnosis condition calculation for symptom 'Short to ground' SCG:
If 'Diagnosis of symptom SCG is valid' (BSW information)
Then bit 1 of CDN_DIAG_XX = 1
Endif

Diagnosis condition calculation for symptom 'Open circuit' OC:
If 'Diagnosis of symptom OC is valid' (BSW information)
Then bit 2 of CDN_DIAG_XX = 1
Endif

Diagnosis symptom (raw value) calculation:
Symptom calculation for 'Short to battery' SCB:
If 'Failure symptom SCB detected by HW' (BSW information)
Then bit 0 of ERR_DIAG_XX = 1
Else bit 0 of ERR_DIAG_XX = 0
Endif

Symptom calculation for 'Short to ground' SCG:
If 'Failure symptom SCG detected by HW' (BSW information)
Then bit 1 of ERR_DIAG_XX = 1
Else bit 1 of ERR_DIAG_XX = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Endif

Symptom calculation for 'Open circuit' OC:

If 'Failure symptom OC detected by HW' (BSW information)
Then bit 2 of ERR_DIAG_XX = 1
Else bit 2 of ERR_DIAG_XX = 0
Endif

ACTION_ERRM_FilterMulticondition (*XX*, CDN_DIAG_XX, ERR_DIAG_XX, LV_END_DIAG_XX, LV_ERR_XX, LV_CDN_DIAG_XX, ERR_SYM_XX)
Remark: For failure debouncing and error management treatment the algorithm Multi-condition debounce algorithm (part of Error Management AGGR) is used with the parameters CDN_DIAG_XX and ERR_DIAG_XX.

A.67.2 Diagnosis of PWM outputs

FUNCTION DESCRIPTION:

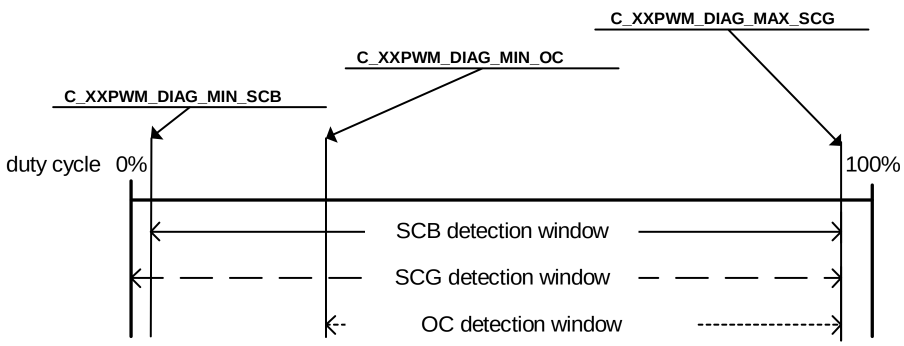
General information:

The purpose is to diagnose electrical errors detected by the hardware for PWM outputs. The signal is controlled by ATIC39.
The driver can distinguish between three symptoms: 'Short to battery' SCB, 'Short to ground' SCG and 'Open circuit' OC.

Because of the different filter times for SCB, SCG and OC detection, the diagnosis window, where a symptom can be detected, is defined for each symptom. A diagnosis window is defined by a minimum and a maximum duty cycle of the PWM signal controlled by the output of the driver.
SCB diagnosis window:
C_XXPWM_DIAG_MIN_SCB <- – – – –> C_XXPWM_DIAG_MAX_SCG

SCG diagnosis window:
0 <- – – – –> C_XXPWM_DIAG_MAX_SCG

OC diagnosis window:
C_XXPWM_DIAG_MIN_OC <- – – – –> C_XXPWM_DIAG_MAX_SCG



For some diagnosis it's not necessary to define different diagnosis windows for each symptom. This is possible for all diagnosis, where a limitation of the duty cycle range is made within the function which controls the corresponding output. The limitation must be made in this way, that a diagnosis of all three

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

symptoms can always (if LV_INH_DIAG_XX= 0) be made (CDN_DIAG_XX = 7H, LV_CDN_DIAG_XX = 1).

These two possibilities of a diagnosis condition calculation are described in the following chapter. It's distinguished between a "open range" (different diagnosis windows for each symptom necessary) and a "limited" duty cycle calculation.

A.67.2.1 Diagnosis condition calculation

A.67.2.1.1 Open range duty cycle

Description:

For an output with an "open range" duty cycle range, a diagnosis result of a symptom can be considered as valid, if the duty cycle of the PWM output was in the right window at least one time between two calculations of the diagnosis function and not only if diagnosis function is called. To have a better reflection of this behavior, the diagnosis condition is calculated independently of the diagnosis function.
If the recurrence of the 'diagnosis condition' calculation is the same like the 'symptom' calculation, the 'diagnosis condition' calculation must be treated after the 'symptom' calculation to have a new diagnosis condition CDN_DIAG_XX information of the following diagnosis window for the next symptom calculation.

Application conditions

Initialization: -

Recurrence: -

Activation: every ECU state
reactivation in the NC_PSD_DLY recurrence after LV_INH_DIAG_XX 1->0 and LV_IGK 0->1 and reset and FMY reset

Deactivation: LV_INH_DIAG_XX = 1
at deactivation CDN_DIAG_XX = 0

Formula section:

Diagnosis window calculation:

If 0 <= XXPWM < C_XXPWM_DIAG_MIN_SCB
Then bit 1 of CDN_DIAG_XX = 1
Diagnosis of SCG is valid

Else **If** XXPWM < C_XXPWM_DIAG_MIN_OC
Then bit 0 and bit 1 of CDN_DIAG_XX = 1
Diagnosis of SCB, SCG is valid

Else **If** XXPWM <= C_XXPWM_DIAG_MAX_SCG
Then bit 0, bit 1 and bit 2 of CDN_DIAG_XX = 1
Diagnosis of SCB, SCG and OC is valid
Endif
Endif
Endif

A.67.2.1.2 Limited duty cycle

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

For an output with a “limited” duty cycle range, the diagnosis result of a symptom can always be considered as valid, because of the current duty cycle. It only can be invalid because special conditions managed by the BSW.

Application conditions

Initialization: –

Recurrence: –

Activation: every ECU state
reactivation in the NC_PSD_DLY recurrence after LV_INH_DIAG_XX 1->0 and LV_IGK 0->1 and reset and FMY reset

Deactivation: LV_INH_DIAG_XX = 1
at deactivation: CDN_DIAG_XX = 0

Formula section:

bit 0, bit 1 and bit 2 of CDN_DIAG_XX = 1
Diagnosis of SCB, SCG and OC is valid

A.67.2.2 Diagnosis symptom (raw value) calculation

FUNCTION DESCRIPTION:

Application conditions

Initialization: –

Recurrence: –

Activation: every ECU state
reactivation in the NC_PSD_DLY recurrence after LV_INH_DIAG_XX 1->0 and LV_IGK 0->1 and reset and FMY reset

Deactivation: *LV_INH_DIAG_XX = 1*

Formula section:

Symptom calculation for ‘Short to battery’ SCB:
If ‘Failure symptom SCB detected by HW’ (BSW information)
Then bit 0 of ERR_DIAG_XX = 1
Else bit 0 of ERR_DIAG_XX = 0
Endif

Symptom calculation for ‘Short to ground’ SCG:
If ‘Failure symptom SCG detected by HW’ (BSW information)
Then bit 1 of ERR_DIAG_XX = 1
Else bit 1 of ERR_DIAG_XX = 0
Endif

Symptom calculation for ‘Open circuit’ OC:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If ‘Failure symptom OC detected by HW’ (BSW information)
Then bit 2 of ERR_DIAG_XX = 1
Else bit 2 of ERR_DIAG_XX = 0
Endif

Diagnosis condition from BSW verification:
Diagnosis condition calculation for symptom ‘Short to battery’ SCB:
If ‘Diagnosis of symptom SCB is not valid’ (BSW information)
Then bit 0 of CDN_DIAG_XX = 0
Endif
Diagnosis condition calculation for symptom ‘Short to ground’ SCG:
If ‘Diagnosis of symptom SCG is not valid’ (BSW information)
Then bit 0 of CDN_DIAG_XX = 0
Endif

Diagnosis condition calculation for symptom ‘Open circuit’ OC:
If ‘Diagnosis of symptom OC is not valid’ (BSW information)
Then bit 0 of CDN_DIAG_XX = 0
Endif

ACTION_ERRM_FilterMulticondition (*XX*, CDN_DIAG_XX, ERR_DIAG_XX, LV_END_DIAG_XX, LV_ERR_XX, LV_CDN_DIAG_XX, ERR_SYM_XX)
Remark: For failure debouncing and error management treatment the algorithm Multi-condition debounce algorithm (part of Error Management AGGR) is used with the parameters CDN_DIAG_XX and ERR_DIAG_XX.
CDN_DIAG_XX = 0 (after failure debouncing and error management treatment)

A.67.3 Diagnosis of special outputs

General information:

The purpose is to diagnose electrical errors detected by the hardware for special outputs. Special outputs are outputs, which cannot be treated like “normal” static or pwm outputs, like described in the previous chapters.

Description:

The diagnosis condition calculation for the driver output is done in the diagnosis function of the diagnosis instance XX. It’s displayed for each symptom within the value CDN_DIAG_XX. Also the diagnosis symptom (raw value) calculation (ERR_DIAG_XX) is performed in the diagnosis function for special outputs.
The calculation of LV_ERR_XX, LV_CDN_DIAG_XX, ERR_SYM_XX and LV_END_DIAG_XX is done in the Multi-condition debounce algorithm (part of Error Management AGGR).

Application conditions

Initialization: –

Recurrence: –

Activation:
```
every ECU state
reactivation in the NC_PSD_DLY recurrence after CDN_DIAG_XX
> 0 and LV_IGK 0->1 and reset and FMY reset
```

Deactivation: –

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Diagnosis condition /Diagnosis symptom (raw value) calculation:
CDN_DIAG_XX and ERR_DIAG_XX are calculated in the diagnosis function.

ACTION_ERRM_FilterMulticondition (*XX*, CDN_DIAG_XX, ERR_DIAG_XX, LV_END_DIAG_XX, LV_ERR_XX, LV_CDN_DIAG_XX, ERR_SYM_XX)
Remark: For failure debouncing and error management treatment the algorithm Multi-condition debounce algorithm (part of Error Management AGGR) is used with the parameters CDN_DIAG_XX and ERR_DIAG_XX.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. General information:

This specification defines all output-data and calibration data for all ATIC39 powerstage diagnosis as well as specific functions like limp home which are not covered by the generic ATIC39 basic algorithm for static and PWM outputs
Remark:
For all static outputs a minimum switch-on time of 50ms for error symptom detection is necessary.

A.68.1 Diagnosis of static outputs

A.68.1.1 Crankcase ventilation heater relay diagnosis (LV_ERR_RLY_CRCV_HEAT)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the crankcase ventilation heater relay.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

```
□□□□
| | | └─> Short circuit to Vbatt        (= SYM_0)
| | └───> Short circuit to GND          (= SYM_1)
| └─────> Open load                     (=SYM_2)
└───────> -                             (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 1000ms

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_RLY_CRCV_HEAT = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_RLY_CRCV_HEAT.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RLY_CRCV_HEAT.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_RLY_CRCV_HEAT and ERR_DIAG_RLY_CRCV_HEAT.

This algorithm determines:

ERR_SYM_RLY_CRCV_HEAT	(Detected error symptom)
LV_ERR_RLY_CRCV_HEAT	(Error flag for debounced error)
LV_CDN_DIAG_RLY_CRCV_HEAT	(Diagnosis condition information)
LV_END_DIAG_RLY_CRCV_HEAT	(End of diagnosis information)

Diagnosis inhibition:
If LV_IGK = 1 **and**
LV_CDN_VB_MIN_DIAG = 1 **and**
LV_ERR_SPI_MPS = 0

Then LV_INH_DIAG_RLY_CRCV_HEAT = 0
Else LV_INH_DIAG_RLY_CRCV_HEAT = 1
Endif

A.68.1.2 Air condition compressor relay diagnosis (LV_ERR_RLY_ACCOUT)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the air condition relay signal.
The diagnosis is only active if “Vehicle with ACC” is learnt.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

```
 |_|_|_|_|
  | | | └─> Short circuit to Vbatt        (= SYM_0)
  | | └───> Short circuit to GND          (= SYM_1)
  | └─────> Open load                     (=SYM_2)
  └───────> -                             (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 1s

Activation: LV_VAR_RLY_ACCOUT = 1 **AND**
LV_VAR_ACIN = 1

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_RLY_ACCOUT = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_RLY_ACCOUT .
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RLY_ACCOUT.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG RLY_ACCOUT and ERR_DIAG_RLY_ACCOUT.

This algorithm determines:
ERR_SYM_RLY_ACCOUT (Detected error symptom)
LV_ERR_RLY_ACCOUT (Error flag for debounced error)
LV_CDN_DIAG_RLY_ACCOUT (Diagnosis condition information)
LV_END_DIAG_RLY_ACCOUT (End of diagnosis information)

Diagnosis inhibition:
IF LV_IGK = 1 **AND**
LV_CDN_VB_MIN_DIAG = 1 **AND**
LV_ERR_SPI_MPS = 0
THEN LV_INH_DIAG_RLY_ACCOUT = 0
ELSE LV_INH_DIAG_RLY_ACCOUT = 1
ENDIF

A.68.1.3 DMTL change over valve diagnosis (LV_ERR_DMTLS)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the DMTL valve.
The diagnosis is only activated if DMTL is configurated.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> Short circuit to Vbatt       (= SYM_0)
 │ │ └───> Short circuit to GND         (= SYM_1)
 │ └─────> Open load                    (=SYM_2)
 └───────> -                            (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 100ms

Activation: LV_CONF_DMTL = 1

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_DMTLS = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_DMTLS.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_DMTLS.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_DMTLS and ERR_DIAG_DMTLS.

This algorithm determines:
ERR_SYM_DMTLS (detected error symptom)
LV_ERR_DMTLS (Error flag for debounced error)
LV_CDN_DIAG_DMTLS (Diagnosis condition information)
LV_END_DIAG_DMTLS (End of diagnosis information)

Diagnosis inhibition:
IF LV_CDN_VB_OBD1 = 1 **AND**
LV_ERR_SPI_MPS = 0 **AND**
ECU_STATE =! WAKE_UP
THEN LV_INH_DIAG_DMTLS = 0
ELSE LV_INH_DIAG_DMTLS = 1
ENDIF

A.68.1.4 DMTL pump diagnosis (LV_ERR_DMTL_PUMP)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the DMTL pump.
The diagnosis is only activated if DMTL is configurated.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Remark:
Due to hardware conditions and overtemperature protection for shunt resistor (max. time for SCB is 50ms) the SCB detection is only possible with monitoring the voltage V_DMTL.

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
│ │ │ └─> Short circuit to Vbatt          (= SYM_0)
│ │ └───> Short circuit to GND            (= SYM_1)
│ └─────> Open load                       (=SYM_2)
└───────> -                               (=SYM_3)
```

Application conditions

Initialisation: `according Filter-type` **`MPL_STD_INI`**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: `100ms for SCG/ OL detection`
`10ms for SCB detection`

Activation: *LV_CONF_DMTL = 1*

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_DMTL_PUMP = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_DMTL_PUMP.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_DMTL_PUMP.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_DMTL_PUMP and ERR_DIAG_DMTL_PUMP.

This algorithm determines:

ERR_SYM_DMTL_PUMP	(Detected error symptom)
LV_ERR_DMTL_PUMP	(Error flag for debounced error)
LV_CDN_DIAG_DMTL_PUMP	(Diagnosis condition information)
LV_END_DIAG_DMTL_PUMP	(End of diagnosis information)

Diagnosis inhibition:
IF LV_CDN_VB_OBD1 = 0 **OR**
LV_ERR_SPI_MPS = 1 **OR**
ECU_STATE = WAKE_UP **OR**
ERR_SYM_DMTL_PUMP = SYM_0
THEN LV_INH_DIAG_DMTL_PUMP = 1
ELSE LV_INH_DIAG_DMTL_PUMP = 0
ENDIF

Detection of SCB:

ENDIF(2)
ELSE(1) normal diagnosis algorithm OL/SCG
ENDIF(1)

A.68.1.5 DMTL heater diagnosis (LV_ERR_DMTLH)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the DMTL heater.
The diagnosis is only activated if DMTL is configurated.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

```
|_|_|_|_|
 | | | └─> Short circuit to Vbatt          (= SYM_0)

```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 1s

Activation: LV_CONF_DMTL = 1

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_DMTLH = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_DMTLH.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_DMTLH.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_DMTLH and ERR_DIAG_DMTLH.

This algorithm determines:
ERR_SYM_DMTLH (detected error symptom)
LV_ERR_DMTLH (Error flag for debounced error)
LV_CDN_DIAG_DMTLH (Diagnosis condition information)
LV_END_DIAG_DMTLH (End of diagnosis information)

Diagnosis inhibition:
IF LV_CDN_VB_OBD1 = 1 **AND**
LV_ERR_SPI_MPS = 0 **AND**
ECU_STATE =! WAKE_UP
THEN LV_INH_DIAG_DMTLH = 0
ELSE LV_INH_DIAG_DMTLH = 1
ENDIF

A.68.1.6 E-box cooling fan diagnosis (LV_ERR_EBOX_CFA)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the signal from the driver which controls the EBOX cooling fan.
The input signal is modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

```
[ | | | ]
 | | | └─> Short circuit to Vbatt        (= SYM_0)
 | | └───> Short circuit to GND          (= SYM_1)
 | └─────> Open load                     (=SYM_2)
 └───────> -                             (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 1s

Activation: LV_VAR_EBOX_CFA = 1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_EBOX_CFA = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_EBOX_CFA.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_EBOX_CFA.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_EBOX_CFA and ERR_DIAG_EBOX_CFA.

This algorithm determines:
ERR_SYM_EBOX_CFA (detected error symptom)
LV_ERR_EBOX_CFA (Error flag for debounced error)
LV_CDN_DIAG_EBOX_CFA (Diagnosis condition information)
LV_END_DIAG_EBOX_CFA (End of diagnosis information)

Diagnosis inhibition:
IF LV_IGK = 1 **AND**
LV_CDN_VB_MIN_DIAG = 1 **AND**
LV_ERR_SPI_MPS = 0

ELSE LV_INH_DIAG_EBOX_CFA = 1
ENDIF

A.68.1.7 Exhaust flap diagnosis (LV_ERR_EF)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the exhaust flag signal from the driver which controls the exhaust flap.

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
│ │ │ │
│ │ │ └─> Short circuit to Vbatt      (= SYM_0)
│ │ └───> Short circuit to GND        (= SYM_1)

└───────> -                           (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 1s

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation: `LV_VAR_EF = 1`

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_EF = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_EF.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_EF.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_EF and ERR_DIAG_EF.

This algorithm determines:

ERR_SYM_EF	(Detected error symptom)
LV_ERR_EF	(Error flag for debounced error)
LV_CDN_DIAG_EF	(Diagnosis condition information)
LV_END_DIAG_EF	(End of diagnosis information)

Diagnosis inhibition:

IF LV_IGK = 1 **AND**
LV_CDN_VB_MIN_DIAG = 1 **AND**
LV_ERR_SPI_MPS = 0
THEN LV_INH_DIAG_EF = 0
ELSE LV_INH_DIAG_EF = 1
ENDIF

A.68.1.8 Starter relay output diagnosis (LV_ERR_RLY_ST)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the starter signal from the driver which switches the output signal for the CAS - ECU. This diagnosis detects electrical faults as defined by OBD I requirements. The diagnosis is only performed if the variant "BN2000" is enabled.

Description:

For error detection algorithm see "Electrical diagnosis of powerstage outputs ATIC39"

Error-symptoms are defined to this diagnosis function as following :

```
 [ | | | ]
  |  |  |  └─> Short circuit to Vbatt        (= SYM_0)
  |  |  └───> Short circuit to GND           (= SYM_1)

A.68.2 Diagnosis of PWM outputs

A.68.2.1 IVVT solenoid valve diagnosis (LV_ERR_SLV_IVVT_IN /EX)

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults in the IVVT unit.
The input signal is a modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.
The diagnosis condition calculation is done according **“Open range”** duty cycle, thus a definition of the PWM diagnosis windows is neccessary (see calibration data).

Error-symptoms are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Action definition

ACTION_ERRM_FilterMulticonditio (**IN**<PRM_IDX_DIAG>,**IN**<PRM_CDN_DIAG>,**IN**<PRM_ERR_DIAG>,**IN**<PRM_ABC_INC>,**IN**<PRM_ABC_MAX>,**OUT**<PRM_LV_ERR>)	Mode: O
This action compute the elementary antibounce filter for one failure treatment and return filter result.	

Parameter	Type	Hex.Limits	Phys.Limits	Resol.	Unit
PRM_IDX_DIAG	in	0... FFFFH	0... 65535	1	-
Diagnostic symptom instance.					
PRM_CDN_DIAG	in	0... 7H	0 ...7	1	-
Diagnosis condition for each symptom of SAP; bit 0: Set, if diagnosis condition for symptom SCP is fulfilled; bit 1: Set, if diagnosis condition for symptom SCG is fulfilled; bit 2: Set, if diagnosis condition for symptom OC is fulfilled					
PRM_ERR_DIAG	in	0... 7H	0 ...7	1	-
Raw value of error symptom for SAP; bit 0: Set, if raw value of error symptom SCP is set; bit 1: Set, if raw value of error symptom SCG is set; bit 2: Set, if raw value of error symptom OC is set					
PRM_ABC_INC	in	0... FFH	0... 255	1	-
Anti bounce increment					
PRM_ABC_MAX	in	0... FFH	0... 255	1	-
Anti-bounce maximum					
PRM_LV_ERR	out	0... 1H	0 ...1	1	-
Error flag for diagnostic instance					

ACTION_ERRM_MultiFilterReset (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR>)	Mode: O

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

This action resets data filter in case of antibounce filter type					
Parameter	**Type**	**Hex.Limits**	**Phys.Limits**	**Resol.**	**Unit**
PRM_IDX_DIAG	in	0... FFFFH	0... 65535	1	-
Diagnostic symptom instance.					
PRM_LV_ERR	out	0... 1H	0 ...1	1	-
Error flag for diagnostic instance					

ACTION_ERRM_MultiFilterSymEnd (**IN**<PRM_IDX_DIAG>,**IN**<PRM_ABC_MAX>,**OUT**<PRM_LV_ERR>)					Mode: O
This action returns the filter result on symptoms detected at each diagnostic recurrence					
Parameter	**Type**	**Hex.Limits**	**Phys.Limits**	**Resol.**	**Unit**
PRM_IDX_DIAG	in	0... FFFFH	0... 65535	1	-
Diagnostic symptom instance.					
PRM_ABC_MAX	in	0... FFH	0... 255	1	-
Anti-bounce maximum					
PRM_LV_ERR	out	0... 1H	0 ...1	1	-
Error flag for diagnostic instance					

General information

Import actions:

#IF NC_ERR_DET_UPD = 1 and NLC_ENA_MULTI_CDN = 1
ACTION_ERRM_UpdErrDet (IN<XX>)
This action indicates each occurrence of the detected error
#ENDIF

According the diagnosis condition information CDN_DIAG_XX and the diagnosis symptom (raw value) information the symptom calculation ERR_SYM_XX is performed. Then the failure symptom is debounced to set the present failure LV_ERR_XX.

A special readiness calculation is done to set the end of diagnosis information. LV_END_DIAG_XX is set only if there was enough time to make a diagnosis of all symptoms or a failure gets present.

Note:

To set the LV_END_DIAG_XX is necessary to have the conditions for all symptoms at the same time for a given time.

Restrictions:

In case of multiple symptoms at the same time, only one symptom will be taken into account according the following priority rule: SYM_0 ==> SYM_3 ; Priority max ==> Priority Min

Only the last symptom present will be taken into account in this algorithm, so in case of symptom change, only the last symptom will be used to increment and decrement the counters.

Application conditions:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.69.1 Multi-condition anti-bounce filter algorithm description

Description for ACTION_ERRM_FilterMulticondition:

Syntax : ACTION_ERRM_FilterMulticondition (IN<XX>, IN<CDN_DIAG_XX>, IN<ERR_DIAG_XX>, IN<C_ABC_INC_XX>, IN<C_ABC_MAX_XX>, OUT<LV_ERR_XX>)

Parameter(in):	XX	Type: index to identify the Diagnostic
	CDN_DIAG_XX	Type: Byte carrier (Each symptom condition)
	ERR_DIAG_XX	Type: Byte carrier (Raw value symptom)
	C_ABC_INC_XX	Type: Calibration byte for the increment value
	C_ABC_MAX_XX	Type: Calibration byte for the maximum value
Parameter(out):	LV_ERR_XX	Type: Boolean (=1 when failure)

Short Description: This action returns information necessary for the diagnostic and the error management.

Formula section:

```
Anti-bounce bench mode :

If(0) LV_ABC_INH = 0
Then
If(1) (LC_ABC_BENCH = 1  and  NLC_BENCH_MODE=1) and  ((C_ABC_INC_XX = 0) or  (C_
ABC_INC_XX = FFH))
Then(1)
        If(2)  C_ABC_INC_XX = 0
        Then(2)
```

A.69.2 Description for ACTION_ERRM_MultiFilterSymEnd :

Syntax: ACTION_ERRM_MultiFilterSymEnd(IN<XX>, IN<C_ABC_MAX_XX>, OUT<LV_ERR_XX>)

Parameter(in): XX Type: index to identify the Diagnostic
C_ABC_MAX_XX Type: Calibration byte for the maximum value

Parameter(out): LV_ERR_XX Type: Boolean

Short Description: This action erases diagnostic failure and sets immediately the end of diagnostic information in case of multi-conditions filter (MPL_STD_INI)

Formula section :

```
LV_CDN_DIAG_XX = 1
ERR_SYM_XX = NO_SYM
LV_ERR_XX = 0
CTR_ABC_XX = 0
LV_END_DIAG_XX = 1
CTR_ABC_END_DIAG_XX = C_ABC_MAX_XX
```

A.69.3 Description for ACTION_ERRM_MultiFilterReset:

Syntax: ACTION_ERRM_MultiFilterReset(IN<XX>, OUT<LV_ERR_XX>)

Parameter(in): XX Type: index to identify the Diagnostic

Parameter(out): LV_ERR_XX Type: Boolean

Short Description: This action resets data filter in case of Multiconditions filter type

Formula section :

```
LV_CDN_DIAG_XX = 0
ERR_SYM_XX = NO_SYM
LV_ERR_XX = 0
CTR_ABC_XX = 0
LV_END_DIAG_XX is unchanged
CTR_ABC_END_DIAG_XX is unchanged
```

A.69.4 Synchronization between multi-condition algorithm & Error Management

This section describes the mechanism of synchronisation of the failure filtering with the Error Management core. The principle is to call the Error Management upon events.

LV_END_DIAG_XX 0 → 1 transition
LV_ERR_XX 0 → 1 transition
LV_ERR_XX 1 → 0 transition

A.69.5 Mechanism for CPU load optimisation

This section describes the mechanism of optimisation. The principle is to suspend the filter algorithm execution when is not necessary. When the bench mode is used for a diagnostic XX the mechanism of CPU load optimisation is disabled for this instance.

Formula section:

```
If      LV_ERR_XX = 0
        and LV_END_DIAG_XX = 1
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. ```
        and   ERR_SYM_XX = 0
        and   CTR_ABC_XX = 0
Then
    It is not necessary to call error management (including filtering)
    LV_END_DIAG_XX = 1      {unchanged}
    LV_ERR_XX = 0           {unchanged}
Endif
```

A.69.6 Configuration data

Configuration data detailed description:

Symptoms 0 and 1 available: 03H
Symptoms 0, 1 and 2 available: 07H (typical value)
Symptoms 0, 1, 2 and 3 available: 0FH

Predefined filter type:

	NLC_ ABC_ STC_XX	NLC_ ABC_ CAL_ DEC_ XX	NLC_ ABC_ NOT_ DEC_ XX	NLC_ ABC_ INI_ VALUE_ XX	NLC_ ABC_ INI_ IGK_XX	NLC_ ABC_ NOT_ SAVE_ XX
MPL_STD_INI	0	0	0	0	1	1

The **standard configuration with initialisation (MPL_STD_INI)** is NC_ABC_CONF_FCT_DIAG_XX = 3H (default configuration)

The data CTR_ABC_XX and LV_ERR_XX are Reset at the transition LV_IGK 0 → 1 and Reset (NLC_ABC_NOT_SAVE_XX = 1, NLC_ABC_INI_IGK_XX = 1) and the anti-bounce counter is initialised to 0 value (NLC_ABC_INI_VALUE_XX = 0).

The anti-bounce counter may be decremented (NLC_ABC_NOT_DEC_XX = 0).
The decrement value is equal to 1 (NLC_ABC_CAL_DEC_XX = 0).
The filter used is the Anti-bounce (NLC_ABC_STC_XX = 0).

A.70 Table of failures

FUNCTION DESCRIPTION:

General information:

This specification is automatic generated out from SW and Dataset.
Listing of all implemented diagnosis instances (LV_ERR_xx) including all calibration data (proposal) like error class (C_ERR_CLAS_xx), Environmental data (ID_ERR_ENVD_xx), Trouble codes (ID_ERR_DTC_xx).

Remark:
All diagnosis instances marked with grey colour do have a missing calibration !

A.70.1 Calibration part (sorted by alphabetic order)

Made from dataset file 3KBIJHZA auf XKC0S gemischt [E93_N54_DKG_LEV_240KW] mit Vorbedatung_BMW_30Mar11_1+LEV2_1

A.71 Canister purge valve diagnosis

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CDN_DIAG_EL_CPS	V	0... 7H	0 ...7	1	-
Diagnosis condition for each symptom of CPS; bit 0: diagnosis condition for symptom SYM_0; bit 1: diagnosis condition for symptom SYM_1; bit 2: diagnosis condition for symptom SYM_2					
CPPWM_LIH	O/V	0... FFH	0... 99.60937	0.390625	%
PWM signal for CPS opening limp home value					
ERR_DIAG_EL_CPS	-	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	-	-
Raw value of error symptom for CPS (only parameter)					
ERR_SYM_EL_CPS	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	-	-
Symptoms of the failure					
LV_ERR_EL_CPS	O/V/S	0... 1H	0 ...1	1	-
Logical value for present electrical canister purge valve failure					

Input data:

CPPWM_CPS {p. 3749}	LV_IGK {p. 906}	LV_INH_DIAG_EL_CPS {p. 4712}	LV_ST {p. 1720}

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_EL_CPS_DIAG	-	0... FFH	0... 255	1	-
Antibounce counter increment					
C_ABC_MAX_EL_CPS_DIAG	-	0... FFH	0... 255	1	-
Maximum value for antibounce counter					
C_CPPWM_DIAG_MAX_SCG	-	0... FFH	0... 99.60937	0.390625	%
Maximum threshold for SCG diagnosis window					
C_CPPWM_DIAG_MIN_OC	-	0... FFH	0... 99.60937	0.390625	%
Minimum threshold for OC diagnosis window					
C_CPPWM_DIAG_MIN_SCP	-	0... FFH	0... 99.60937	0.390625	%
Minimum threshold for SCP diagnosis window					
C_CPPWM_SUB_DIAG_1	-	0... FFH	0... 99.60937	0.390625	%
cppwm substitute when SCG failure					
C_CPPWM_SUB_DIAG_2	-	0... FFH	0... 99.60937	0.390625	%
cppwm substitute when SCB or OL failure					

Configuration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
NC_PSD_DLY_CPS	-	1... FH	1... 15	1	-
Number of recurrences with diagnosis deactivation after diagnosis activation conditions are met (typical 2)

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit

Import actions:

ACTION_ERRM_FilterMulticondition	(**IN**<XX>,**IN**<CDN_DIAG_>,**XX**>,<IN<>,**ERR_DIAG_XX**>,<IN>,<C_ABC_INC_XX>,**IN**<C_ABC_MAX_XX>,**OUT**<LV_ERR_XX>)
ACTION_INFR_GetElDiagCPS	(**OUT**<CDN_DIAG_EL_CPS>,**OUT**<ERR_DIAG_EL_CPS>)

Error treatment:

Diagnostic CPS	Symptom description	Symptom	Filter type
CPS Diagnostic	*SCP*	*SYM_0*	*MPL_STD_INI*
	SCG	*SYM_1*	
	OC	*SYM_2*	

General information:

The CPS is driven by the ECU via an output driver. The failure detection is done by ECU Hardware.
The purpose of the diagnosis is
The purpose is to perform the electrical diagnosis of the CPS actuator to detect electrical faults as defined by OBD I requirements. Three symptoms are distinguished:

Error-symptoms and conditions: are defined to this diagnosis function as following

```
 □□□□
 | | | └─> Short circuit to battery (SCP)      (= SYM_0)
 | | └───> Short circuit to ground (SCG)       (= SYM_1)
 | └─────> Open circuit (OC)                   (= SYM_2)
 └───────> Not used                            (= SYM_3)
```

Application conditions

Initialisation: `LV_ERR_EL_CPS is initialized according filter-type.`
`at reset: CDN_DIAG_EL_CPS = 0`

Recurrence: *100ms*

Activation: –

Deactivation: –

Formula section:

// Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_EL_CPS and diagnosis conditions CDN_DIAG_EL_CPS) received from the infrastructure:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.72 Canister purge valve diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_INH_DIAG_EL_CPS	O/V	0... 1H	0 ...1	1	-
Inhibits canister purge valve diagnosis					

Input data:

LV_CDN_VB_OBD1 {p. 1185}	LV_ERR_SPI_MPS {p. 4245}	LV_IGK {p. 906}	

General information:

This chapter describes the canister purge valve diagnosis inhibition.

Application conditions

Initialisation: `LV_INH_DIAG_EL_CPS = 0 at LV_IGK = 0->1 or reset`

Recurrence: `100 ms & every transition of an error flag.`

Activation: `at every engine operating state`

Deactivation: `- -`

Formula section:

If LV_IGK = 1 **and**

Max value from sum. counter for TQ_AV check for continuous TEG diagnosis					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements.
VP_TEG_PCAT_DOWN is monitored for invalid gradients and values (see also exhaust gas temperature in chapter system variables).
The diagnosis for "short circuit to Vbatt or open load" is only performed:

- either by reaching a certain voltage on the pin or after a calibrateable time after start or counter for activation of diagnosis reached calibrateable value
- and at the moment of diagnosis additional conditions are fullfilled

This functionality shell prevent a wrong failure detection due to too low sensor temperatures, i.e. at cold start.

Description:

Error-symptoms are defined to this diagnosis function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. FUNCTION DESCRIPTION:

General Information:
Analog input signal in the A/D-Input from the Microprocessor.

Description

Error-symtoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
 │ │ │ └─> Short circuit in signal wire to VB or wire break    (= SYM_0)
 │ │ └───> Short circuit in signal wire to ground              (= SYM_1)
 │ └─────> -                                                   (= SYM_2)
 └───────> -                                                   (= SYM_3)
```

Remark: Calculation of LV_END_DIAG_FUP see generic calculation “End of diagnosis” in anti bounce algorithm.

Application conditions

Initialization:

LV_CDN_DIAG_FUP = *Refer to filtering configuration for the initialisation value*
LV_END_DIAG_FUP = *Refer to filtering configuration for the initialisation value*
LV_ERR_FUP = *Refer to filtering configuration for the initialisation value*
ERR_SYM_FUP = *Refer to filtering configuration for the initialisation value*

Recurrence: 40 ms

Activation:

```
        if      LV_IGK = 1 AND LV_ INH_DIAG_FUP = 0
                AND N_32 <= C_N_32_FUP_DIAG_MAX
        Then    LV_CDN_DIAG_FUP = 1
                (diagnosis is active)
        else    LV_CDN_DIAG_FUP = 0
                (diagnosis is inactive)
        endif
```

Deactivation:
When the activation condition is not fulfilled then LV_CDN_DIAG_FUP = 0.

Formula section:

```
{ SYM_0 : Short circuit in signal wire to VB or wire break }
If        V_FUP_MV > C_V_FUP_MV_MAX_DIAG
then
   ERR_SYM_ FUP = SYM_0                          { Symptom SCP or OC is active }
else
   { SYM_1 : Short circuit in signal wire to ground }
   If        V_FUP_MV < C_V_FUP_MV_MIN_DIAG
   then
             ERR_SYM_ FUP = SYM_1                { Symptom SCG is active }
   else
             ERR_SYM_FUP = NO_SYM                { No failure has been detected }
        endif

endif
```

Symptoms are **unchanged** if condition for doing symptom detection is not fulfilled.

Diagnostic **VCV**	**Symptom description**	**Symptom**	**Filter type**
Diagnostic description	*SCP*	*SYM_0*	*MPL_STD_INI*
	SCG	*SYM_1*	
	OC	*SYM_2*	

Note :

- The data ERR_SYM_VCV, LV_END_DIAG_VCV and LV_CDN_DIAG_VCV are not present in output data, because they are not used by other functions. Despite the data are not present in output these data are provided in error management and always visible.

Note :
ACTION_INFR_GetElDiagVcv() is defined in the IRS (Infrastructure requirement specification)

FUNCTION DESCRIPTION:

General information:

The Volume controlled valve (VCV) is driven by the ECU via an output driver. The failure detection is done by ECU Hardware.
The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

Description:

After activation conditions are met, the diagnosis activation is delayed for NC_PSD_DLY_VCV executions, to avoid the usage of wrong infrastructure information.
Error-symptoms and conditions: are defined to this diagnosis function as following

```
 | | | └─> Short circuit to battery (SCP)      (= SYM_0)
 | | └───> Short circuit to ground (SCG)       (= SYM_1)
 | └─────> Open circuit        (OC)                (= SYM_2)
 └───────> -                                   (= SYM_3)
```

Application conditions

Initialisation:

```
at transition lv_igk 0->1:
   LV_ERR_VCV = 0 and
   ERR_SYM_VCV,
   LV_END_DIAG_VCV
   (according Filter-type)
   Set delay counter for NC_PSD_DLY_VCV
   at reset:
   CDN_DIAG_VCV = 0,
   LV_ERR_VCV = 0 and
   ERR_SYM_VCV = 0,
   LV_CDN_DIAG_VCV = 0,
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

```
LV_END_DIAG_VCV = 0,
(according Filter-type)
Set delay counter for NC_PSD_DLY_VCV
```

Recurrence: *100 ms*

Activation: –

Deactivation: *When the activation condition is not fulfilled*

Formula section:

If LV_IGK = 1
and LV_CDN_VB_OBD1 = 1
and LV_INH_DIAG_VCV = 0
Then
Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_VCV and basic diagnosis conditions CDN_DIAG_VCV) received from the infrastructure:
ACTION_INFR_GetElDiagVcv (OUT<Cdn_diag_vcv>, OUT<Err_diag_vcv>)

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_VCV
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_VCV

If Activation conditions are met for the NC_PSD_DLY_VCV recurrence of the diagnosis
Then { *Additional diagnosis conditions* }
If C_PWM_VCV_MIN_DIAG_SCP > PWM_VCV
then bit 0 of CDN_DIAG_VCV = 0 {*Diagnosis of SCP not possible* }
Endif
If PWM_VCV > C_PWM_VCV_MAX_DIAG_SCG
then bit 1 of CDN_DIAG_VCV = 0 { *Diagnosis of SCG not possible* }
Endif
If PWM_VCV < C_PWM_VCV_MIN_DIAG_OC
Or PWM_VCV > C_PWM_VCV_MAX_DIAG_SCG
then bit 2 of CDN_DIAG_VCV = 0 { *Diagnosis of OC not possible* }
Endif
Else CDN_DIAG_VCV = 0
Endif
Else
CDN_DIAG_VCV = 0
Endif

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_VCV and ERR_DIAG_VCV.
ACTION_ERRM_FilterMulticondition (IN<*VCV*>, IN<CDN_DIAG_VCV>, IN<ERR_DIAG_VCV>, IN<C_ABC_INC_VCV>, IN<C_ABC_MAX_VCV>, OUT<LV_ERR_VCV>)
This algorithm determines:
ERR_SYM_VCV (detected error symptom for VCV diagnosis)
LV_ERR_VCV (Error flag for debounced error of VCV)
LV_CDN_DIAG_VCV (Diagnosis condition information)
LV_END_DIAG_VCV (End of diagnosis information)

General information:

Analog input signal to the A/D-Input of the Microprocessor.

Possible configuration for ABC type and CARB class (see also Table of Failure)
ABC Type: STD_INI, STD, MEM, MEM_INI, DEC_CAL, STC, NO, MPL_STD_INI
CARB Class: MIS, FSD, CC, CAT, HC, EVAP, SA, AC, LS, LSH, EGR, OTHER, NO

Remark: Calculation of LV_END_DIAG_FUP_EFP see generic calculation End of diagnosis in anti bounce algorithm.

In case of slave ECU (LV_ECU_SLA = 1) the error management interface information (LV_END_DIAG_FUP_EFP, LV_ERR_FUP_EFP) is imported from master ECU and used for the calculation of the error information on the slave ECU.
The slave ECU will set or reset the error without antibounce filtering (different Error Management call in comparison to master ECU)

Application conditions:

Initialisation:	`RST, IGKON, CLRFMY`
Recurrence:	`10MS`
Activation:	`always`
Deactivation:	`never`

Function description:

Formula section:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

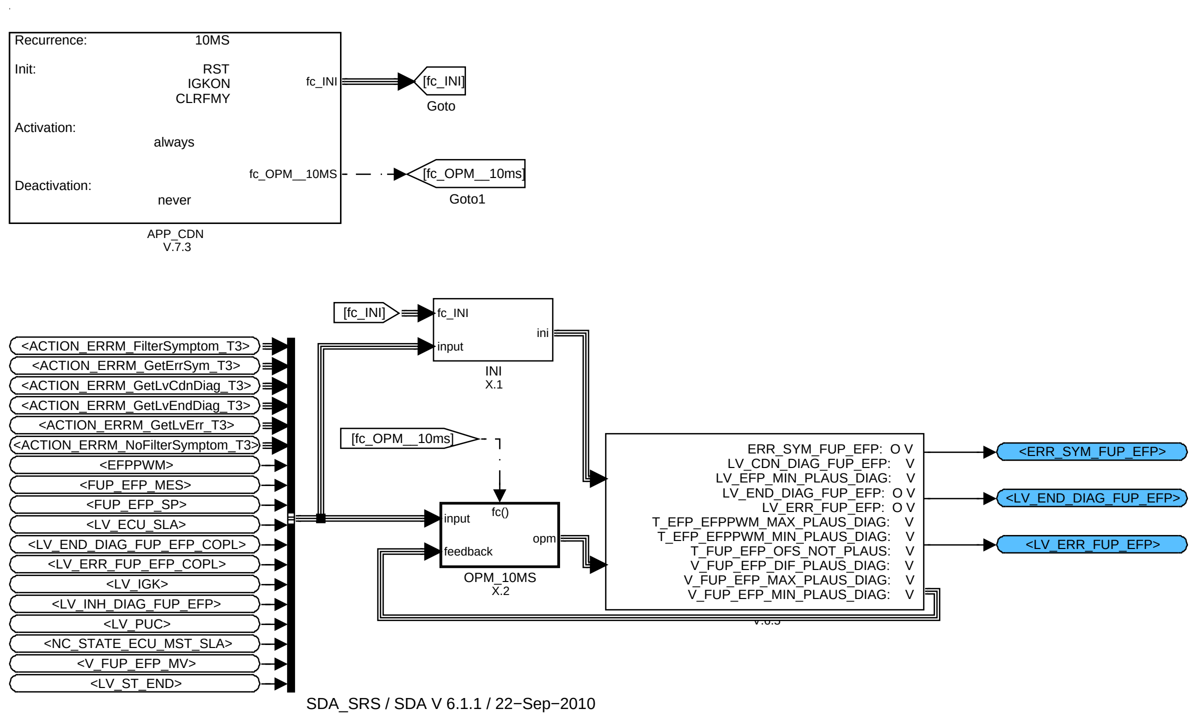

Figure A.79.1: :

A.79.1 Initialization

A.79.1.1 Initialisation of diagnostic data

In this subsystem all data that has to be reset at failure clearance is initialised.

A.79.1.2 Initialization of the error managment interfaces according to antibounce mechanism "STD_INI"

The timer T_FUP_EFP_OFS_NOT_PLAUS is initialised with it's calibration value at ECU-reset.

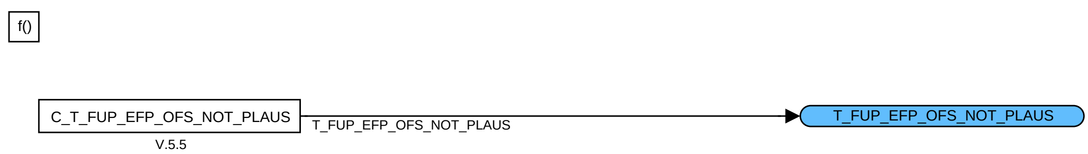

Figure A.79.2: :

A.79.2 Formula section

In case of master-/slave-ECU-configuration the failure evaluation (subsystem CLC) is not done at the slave-ECU. Here, the failure is received from the master-ECU as LV_ERR_FUP_EFP_COPL for further treatment at error management.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

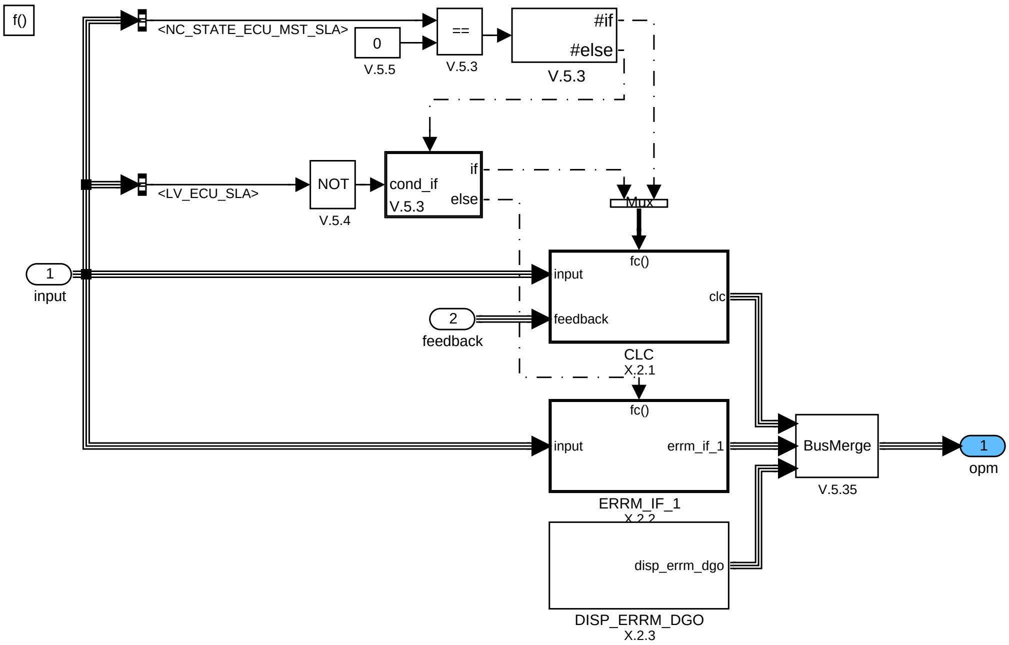

Figure A.79.3: :

A.79.2.1 Calculation on master ECU

A.79.2.1.1 Evaluation of diagnostic condition on master ECU

In case no symptom concerning a signal wire problem is detected, the LV_CDN_DIAG is delayed for the time C_T_FUP_EFP_OFS_NOT_PLAUS. This is the same time the symptom ’open line in ground wire’ needs for being detected.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

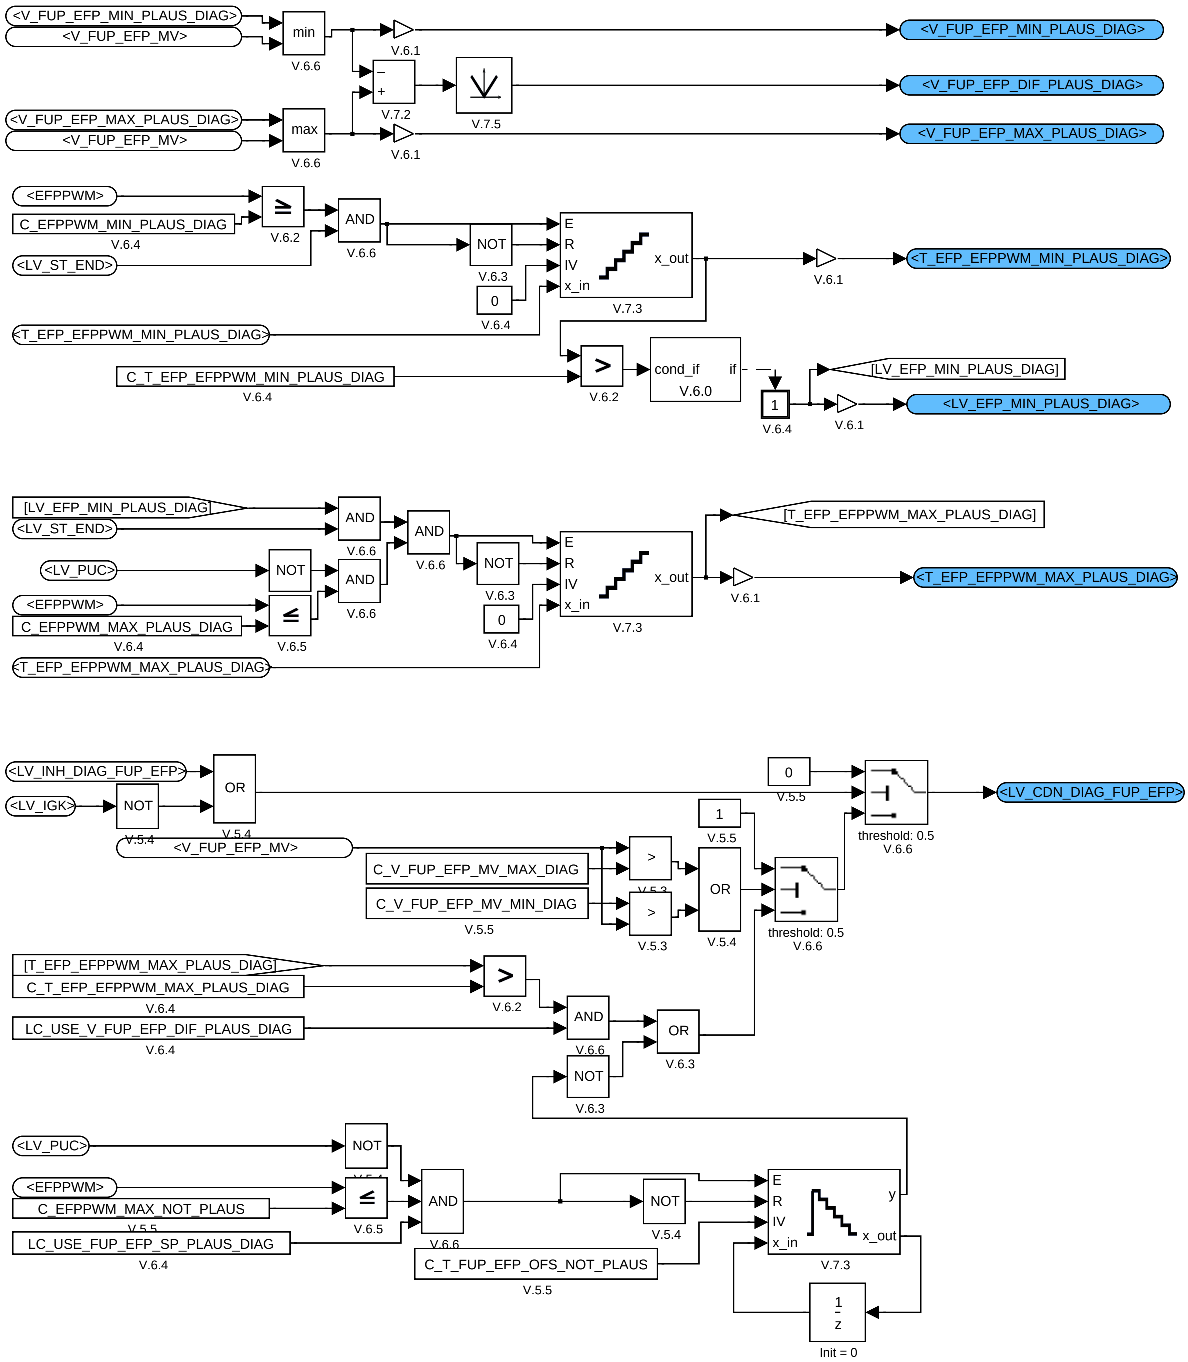

Figure A.79.4: :

A.79.2.1.2 Symptom determination on master ECU

Short circuit or open line in signal wire lead to very low or very high signal voltage. This is detected by comparison of the signal voltage with according thresholds.

In case the ground wire of the sensor is broken, the signal voltage is approx. 3.6 V, which is -alone- a plausible value. But as this value is no more connected to the real fuel pressure, the pressure controler will not be able to adjust the measured FUP_EFP to it's setpoint. So if this failure occurs, the FUP_EFP_MES will take a defined value corresponding 3.6 V and a deviation to the FUP_EFP_SP cannot be eliminated by the FUP_EFP controler. This is enquired by the error symptom SYM_3.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

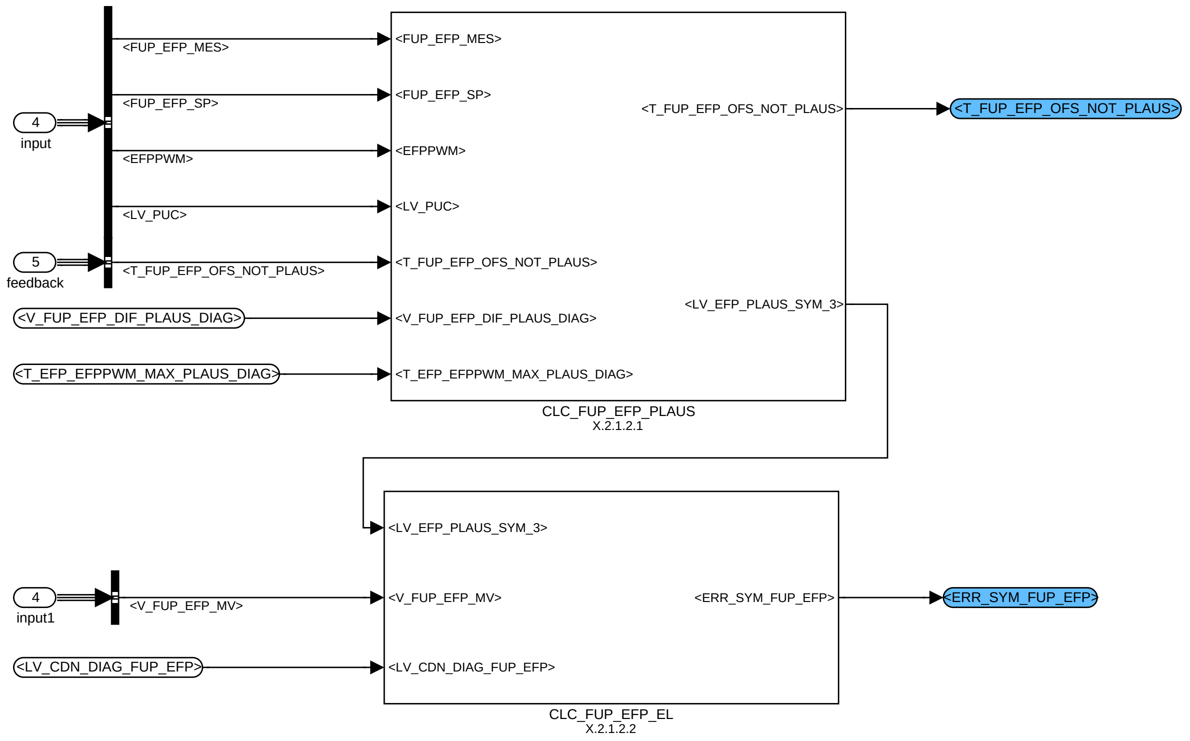

Figure A.79.5: :

A.79.2.1.2.1 Evaluation of plausibility diagnosis

In case the ground wire of the sensor is broken, the signal voltage is approx. 3.6 V, which is -alone- a plausible value. But as this value is no more connected to the real fuel pressure, the pressure controler will not be able to adjust the measured FUP_EFP to it's setpoint. So if this failure occurs, the FUP_EFP_MES will take a defined value corresponding 3.6 V and a deviation to the FUP_EFP_SP cannot be eliminated by the FUP_EFP controler. This is enquired by the error symptom SYM_3.

Additionally the plausibility of the sensor signal can be determined by checking the sensor dynamics after start. If the difference between minimum and maximum of the sensor mean value over a certain time does not exeed a calibratable threshold it is assumed that the sensor is hanging.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

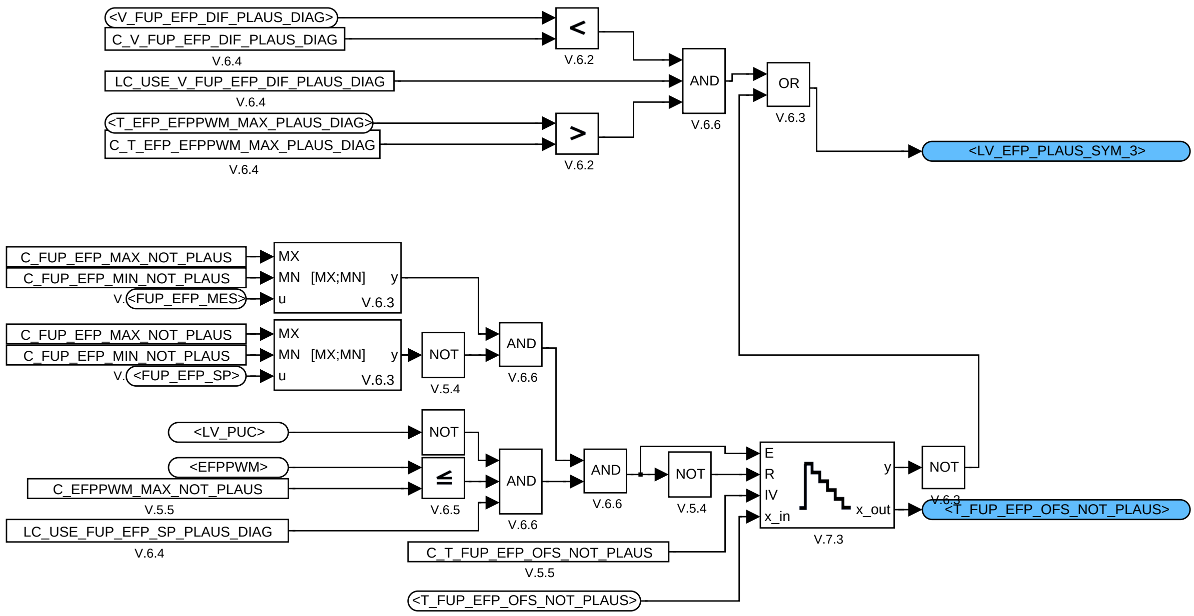

Figure A.79.6: :

A.79.2.1.2.2 Electrical diagnosis and determination of error symptom

Short circuit or open line in signal wire lead to very low or very high signal voltage. This is detected by comparison of the signal voltage with according thresholds. The electrical symptoms have a higher priority then the plausibility diagnosis symptom SYM_3.

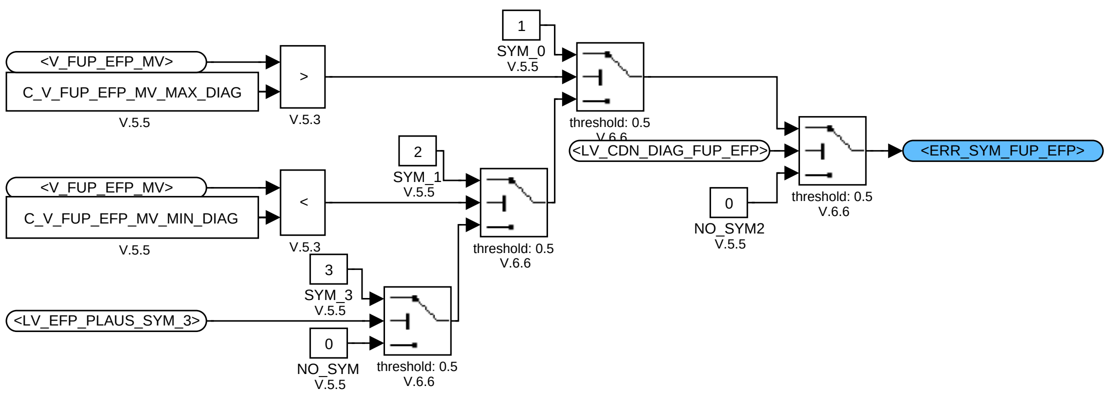

Figure A.79.7: :

A.79.2.1.3 Interface to ERRM on master ECU

A.79.2.1.3.1 Interface to ERRM on master ECU

Calculation of present error and end of diagnosis:
LV_ERR_FUP_EFP and LV_END DIAG_FUP_EFP is calculated by error management.

Antibouncing of the error symptom with calibrateable parameters C_ABC_INC... and C_ABC_MAX....

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

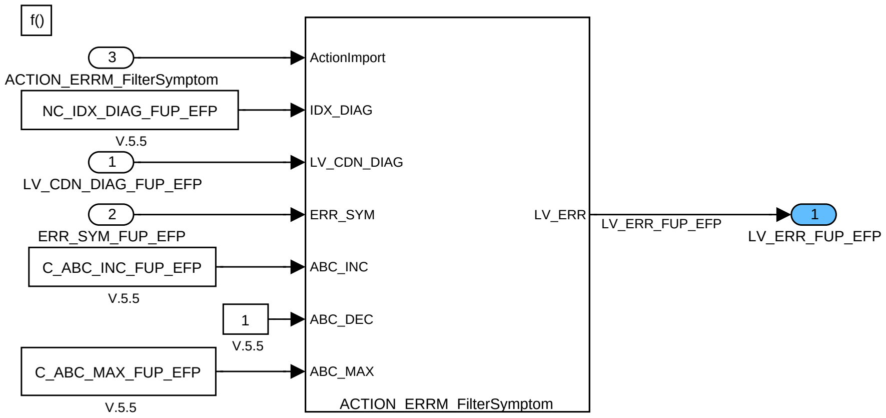

Figure A.79.8: :

A.81.2 Fuel tank level (Plausibility error)

General information:
This diagnosis is for collecting the failure bit of the fuel tank level plausibility function.
In case of Slave ECU (LV_ECU_SLA = 1) the error management interface information (LV_ERR_FTL_OBD) is imported from the Master ECU and used for the calculation of the error information on the Slave ECU.
The Slave will set or reset the error without antibounce filtering (different Error Management call compared to Master).
Description:
Error-symptoms are defined to this diagnosis function as following :

```
| | | └─> -                          (= SYM_0)
| | └───> -                          (= SYM_1)
| └─────> -                          (= SYM_2)
└───────> FTL plausibility error     (= SYM_3)
```

LV_INH_DIAG_FTL_OBD	O/V	0... 1H	0 ...1	1	-
Inhibition of FTL_OBD diagnosis					
LV_INH_DIAG_RBM_FTL_OBD	V	0... 1H	0 ...1	1	-
Inhibition of RBM for FTL diagnosis					
STATE_RBM_FTL_OBD	O/V	0... 7H	0 ...7	1	-
Interface of FTL_OBD monitor with the Rate-Based Monitoring statistics					

Input data:

CTR_ERR_DYN_NR {p. 5767}	LV_DC {p. 5746}	LV_ECU_SLA {p. 800}	LV_END_DIAG_FTL_OBD {p. 4745}
LV_ERR_FTL_LE_CAN {p. 4745}	LV_ERR_FTL_RI_CAN {p. 4745}	NC_IDX_DIAG_FTL_LE_CAN	NC_IDX_DIAG_FTL_RI_CAN

General information:

General information:
With this module the interface between the FTL_OBD monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_FTL_OBD data. The inhibition of FTL_OBD diagnosis is also calculated in this module.
Within STATE_RBM_FTL_OBD, three different information are defined:
Conditions for monitoring are met long enough to detect malfunction (bit 0)
(no intrusive operation, no short trip)
Monitor disabled because of system malfunction (bit 1)
(depending on failure status: pending)
Monitor individual RBM conditions encountered within this DC (bit 2)
(not valid for FTL_OBD diagnosis)

Application conditions:

Initialisation: `CLRFMY, DCON, RST`
Recurrence: `1S`
Activation: `always`
Deactivation: `never`

Function description:

A.83.2 Diagnosis Function

General information:

The intention of this diagnosis is to deteced a fuel level getting empty. An analysis is done based on the two chambers fuel level of the fuel tank.

Application conditions

Initialisation: **at** reset **or** LV_IGK 0 to 1 **or** (LV_ES 1 to 0 **and** LC_FTL_MIN_ES_INI_INH=0)
LV_ERR_FTL_MIN, RATIO_FTL, RATIO_FTL_INI, LV_CDN_DIAG_ FTL_MIN, CTR_FTL_MIN_ACT, ER_FTL_MIN, ERR_SYM_FTL_MIN, LV_LAMB_PLAUS_FTL_MIN_DIAG_TMP, LV_FUP_AVL_DIAG_TMP, LV_FTL_LE_RE_ACT
all with 0 physical
FTL_RI_MMV = *FTL_RI*
FTL_RI_MMV_H_RES = *FTL_RI*
FTL_LE_MMV = *FTL_LE*
FTL_LE_MMV_H_RES = *FTL_LE*

Recurrence: 100ms

Activation: LV_FTL_MIN_ACT =1 **and** LV_ERR_FTL_MIN = 0

Deactivation: LV_FTL_MIN_ACT = 0 **or** LV_ERR_FTL_MIN = 1

Description:

Error-symptoms are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ATM46 = 01H
ATIC29 = 02H
SHUNT (not supported today)
Typical value for debug = ATIC29

FUNCTION DESCRIPTION:

General information:

The purpose of this diagnosis function is to detect all major failures, which can happen between ECU output and ignition coils.
This function is adaptable on every engine but the type of spark plugs and ignition coils must be taken into account.
The diagnosis is performed separate for each ignition coil. The feedback signal from the specific ignition coil (following the firing order) is evaluated by the microcontroller.

A.84.1 Short circuit to plus: SCP

Description:

In some hardware driver the ignition power stage is not protected against short circuit to ground and they are not able to withstand an overload current for a long time so it is necessary to switch off the power stage by software.
For ignition coil actuator tests purpose, the SCP diagnostic function has to be enabled, activated and monitored upon the tests requests
The same case and comments (see before) apply here also.
The Ignition output diagnosis function detects short circuit to battery and sets LV_IGC_SCP[x]. It cuts off the ignition driver after a delay time which is defined in the IGBT Protection function. In the ignition diagnosis function the error is debounced.

Application conditions

Normal Engine Running mode

Initialization: *all ERRM output data according Filter type (see Applic. Inc.), all other output data 0 at reset*

Recurrence:

```
If  NC_IGN_DIAG_TYP =ATM46 every segment
If  NC_IGN_DIAG_TYP =ATIC29 every 100 ms
```

Activation:

```
If      LV_INH_IGC[x] = 0
And     LV_ERR_CAM = 0
And     N_32 > C_N_32_MIN_SCP_IGC_DIAG
And     LV_INH_DIAG_IGC_SCP = 0
And     if    NC_IGN_DIAG_TYP =ATIC29
Failure information for current cylinder
from ATIC29 is valid
        Endif
Then    LV_CDN_DIAG_IGC_SCP[x] = 1
Else    LV_CDN_DIAG_IGC_SCP[x] = 0
Endif
```

Ignition Actuator Tests mode

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation:

```
all output variables of the function have to be set to 0 at
reset ECU
                    (except saved error flag)
```

Recurrence:

```
if      NC_IGN_DIAG_TYP =ATM46
        On transition of IGC_x_EXT_ADJ from 1 to 0
       for reading the SCP failure status
```

Activation:

```
For              x = 0 to NC_CYL_NR - 1
    If               LV_INH_IGC[x]  = 0
    And     LV_ERR_CAM = 0
      [And    LV_ES          = 1         // Actuator tests activation
          And      LV_IGK        = 1
          And      LV_IGC_x_EXT_ADJ = 1]
    Then          LV_CDN_DIAG_IGC_SCP[x]  = 1
    Else           LV_CDN_DIAG_IGC_SCP[x]  = 0
    Endif
EndFor
```

Formula section:

If LV_CDN_DIAG_IGC_SCP =1
Then **If** LV_SCP_IGC[x] = 1
Then ERR_SYM_IGC_SCP[x] = SYM_0
Else ERR_SYM_IGC_SCP[x] = NO_SYM
Else No action on the antibounce counter
Endif

Debounce:

Anti - bounce counter increment: according ABC type
Maximum value of anti - bounce counter: according ABC type
If LV_CDN_DIAG_IGC_SCP[x] =1
Then **If** ERR_SYM_IGC_SCP[x] = SYM_0
Then the antibounce counter is started according ABC type
Else The antibounce counter is decremented according ABC type
Endif
Endif

Ignition cut off conditions:

If C_ABC_MAX_IGC_SCP delay is reached
Then LV_INH_IGC[x] = 1
Endif

Ignition restart after cut off:

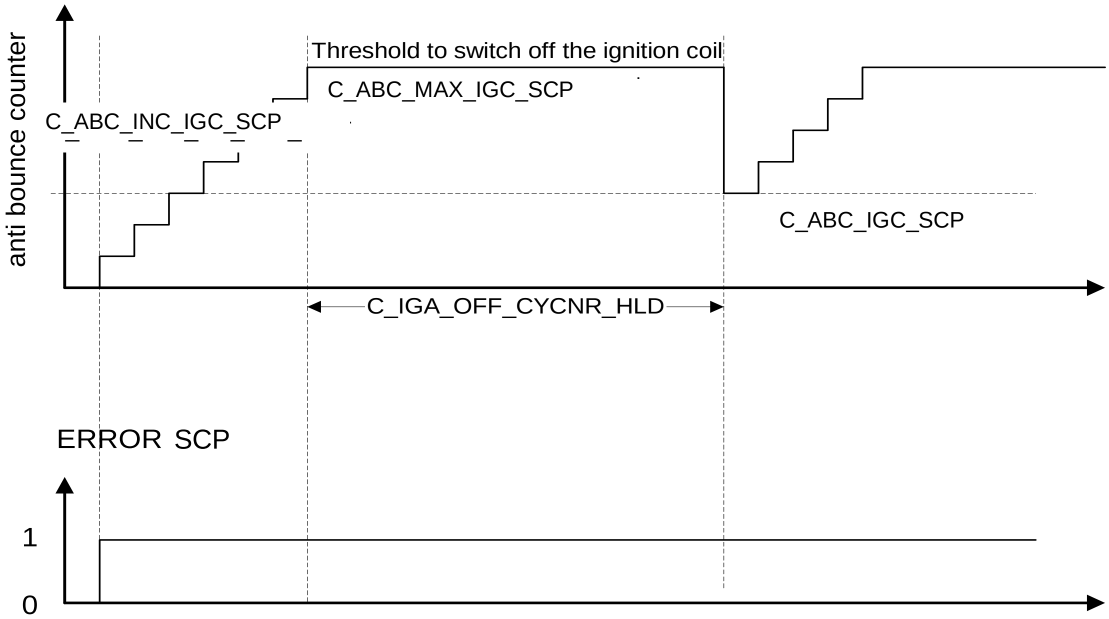
To regenerate the power stage the diagnosis will be switched off (LV_INH_IGC[x] = 1) for C_IGA_OFF_CYCNR_HLD recurrence number (see graphic, failure reaction in case of error).
After the refreshing cycle the debounce counter is set to C_ABC_IGC_SCP (see graphic below) and the ignition will be switched on to test the operating stage again. In case of error it will be debounced again.
This procedure is executed C_SUM_IGC_SCP times before the coil is absolutely switched off, until reset for ATM46 not for ATIC29

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

In next engine cycle the error is kept present. To take sure that the vehicle is able to restart the ignition will be switched on, till the diagnosis conditions are fulfilled and the diagnosis restarts.

Failure reaction in case of error



Application hint:

Some driver as ATM46 does not cut itself in case of SCP failure. For better Driver protection The counter threshold C_ABC_IGC_SCP mustn't exceed 4 cycles For the same reason the counter C_ABC_MAX_IGC_SCP must be set below 12 cycles.

The function can be disabled by the 'enable byte' C_ESB_IGN_CUT_DIAG.

A.84.2 SCG diagnosis

Description

The diagnosis is based on SCG information from the ignition output diagnosis function.
Please note that this diagnosis is valid also for Open Load detection.

Application conditions

Initialisation: all ERRM output data according Filter type (see Applic. Inc.), all other output data 0 at reset

Recurrence: *if NC_IGN_DIAG_TYP =ATM46 every segment*
if NC_IGN_DIAG_TYP =ATIC29 every 100 ms

Activation:

```
If      LV_ES = 0
And     LV_ST = 0
And     N_32 > C_N_32_MIN_OL_SCG_IGC_DIAG
And     TCO > C_TCO_MIN_IGC_DIAG
And     LV_INH_IGC[x] = 0
And     LV_ERR_CAM = 0
And     No low voltage battery (LV_CDN_VB_OBD1 = 1)
And     Counter Number of recurrence > NC_IGC_DLY
And     LV_INH_DIAG_IGC_SCG = 0
And     if      NC_IGN_DIAG_TYP =ATIC29
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

```
Failure information for current cylinder
from ATIC29 is valid
       endif
 Then   LV_CDN_DIAG_IGC_SCG[x] =1
 Else    LV_CDN_DIAG_IGC_SCG[x] = 0
   Endif
```

Formula section:

If LV_CDN_DIAG_IGC_SCG[x] =1
Then **If** LV_SCG_IGC[x] = 1
Then ERR_SYM_IGC_SCG[x] = SYM_1
Else ERR_SYM_IGC_SCG[x] = NO_SYM
Endif
Else No action on the antibounce counter
Endif

Debounce:

Anti - bounce counter increment: C_ABC_INC_IGC_SCG

Maximum value of anti - bounce counter: C_ABC_MAX_IGC_SCG

If LV_CDN_DIAG_IGC_SCG[x] =1
Then **If** ERR_SYM_IGC_SCG[x] = SYM_1
Then the antibouce SCG counter is started according ABC type
Else The antibounce SCG counter is decremented according ABC type
Endif
Endif

A.84.3 Loss of power supply for all ignition coils

Description:

If all flags V_DUR_IGC[x] are equal to 0 at the same time it is assumed that the power supply for all ignition coils is lost or damaged. in this case LV_ERR_DUR_IGC_MPL is set.

Application conditions

Initialisation: according ABC type
LV_INH_INJ_DIAG_IGC = 0 at LV_IGK 0 - ->1 or reset or clearing FMY

Recurrence: every segment

Activation:
If LV_ES = 0
And LV_ST = 0
And LV_IGK = 1
And LV_INH_DIAG_DUR_IGC_MPL = 0
Then LV_CDN_DIAG_DUR_IGC_MPL = 1
Else LV_CDN_DIAG_DUR_IGC_MPL = 0
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

```
If      LV_CDN_DIAG_DUR_IGC_MPL =1
Then    If     all V_DUR_IGC[x] = 0 ms          // for all cylinders

        Then   ERR_SYM_DUR_IGC_MPL =  SYM_3
               If     LV_ERR_DUR_IGC_MPL = 1
               Then   LV_INH_INJ_DIAG_IGC = 1
               Endif
        Else   ERR_SYM_DUR_IGC_MPL = NO_SYM
               LV_INH_INJ_DIAG_IGC = 0
        Endif
Else    No action on the antibounce counter
Endif
```

LV_ERR_DUR_IGC_MPL and LV_END_DIAG_DUR_IGC_MPL are calculated by error management.

A.84.4 Or of ignition failure

Initialisation: output variable has to be set to "0" at reset
Recurrence: **If** NC_IGN_DIAG_TYP =ATM46 every segment
If NC_IGN_DIAG_TYP =ATIC29 every 100 ms

Activation:

Formula section:

LV_ERR_IGC = LV_ERR_IGC_SCP[x] **OR** LV_ERR_IGC_SCG[x]

A.84.5 Unfiltered ignition error information for misfire detection

Application conditions

Initialisation: IGC_DIAG_MIS = 0 at reset ECU

Recurrence: **If** NC_IGN_DIAG_TYP =ATM46 every segment
If NC_IGN_DIAG_TYP =ATIC29 every 100 ms

Formula section:

```
If      LV_SCP_IGC[x]        = 1
Or      LV_SCG_IGC[x]        = 1
Then    set the bit for the actual cylinder in IGC_DIAG_MIS = 1
Else    reset the bit for the actual cylinder in IGC_DIAG_MIS = 0
Endif
```

Description:

The error information of the ignition system should not be filtered. The different error detections are linked by a wired "OR". As soon as an ignition error is detected the information should be available as output cylinder individually in the byte IGC_DIAG_MIS.
IGC_DIAG_MIS

General information:

IMOB diagnosis is performed to provide error-symptom-information by setting of LV_ERR_IMOB_i and entry in error memory in case of ECU-blocking/error detection.

Defined in non-public specification:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_LOCK_IMOB	V/O	0...1H	0...1	1	[-]
LV indicates locking of IGN and INJ by IMOB					
INH_IV_IMOB	V/O	0...FFH	0...255	1	[-]
Locking request for INJ by IMOB					

FUNCTION DESCRIPTION:

This diagnosis calculates the error LV_ERR_IMOB_0

Copyright (C) Continental AG,2007

Imob: Manipulation

Application conditions

Initialisation:
```
LV_CDN_DIAG_IMOB_0  = STD_INI

A.87.2 Checking plausiblity of injector programming value "Energie"

FUNCTION DESCRIPTION:

General information:

Goal of this chapter is to check the plausiblity of injector programming value "Energie".

Application conditions

Initialisation at reset: *first calculation*

Recurrence: *1 s*

Activation: *at every engine operating state*

Deactivation: –

Formula section:

```
For i = 0 to (NC_CYL_NR -1)
do
        if  EGY_SP_IV_EXT_ADJ[i] < C_EGY_SP_IV_CAL_MIN
            or
            EGY_SP_IV_EXT_ADJ[i] > C_EGY_SP_IV_CAL_MAX
        then
                  set bit i of LF_ERR_PLAUS_IV_EGY_CAL to "1"
        else
                reset bit i of LF_ERR_PLAUS_IV_EGY_CAL to "0"
        endif
endfor
```

A.87.3 Error detection for injector programming plausibility

FUNCTION DESCRIPTION:

General information:

The flag LV_ERR_PLAUS_IV_CAL indicates an at least one not plausible injector programming values. That occurs if injector programming was not done by testerservice or at least one written value by testerservice is out of allowed range.

Description:

Error-symptoms are defined to this diagnosis function as following :

```
 _______________
|   |   |   |   |
 |  |  |  └─>-                              (= SYM_0)
 |  |  └───>-                               (= SYM_1)
 |  └─────> unplausible Energie             (= SYM_2)
 └───────> unplausible Kleinmenge           (= SYM_3)
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions:

Initialisation: all output data according ABC configuration "**STD_INI**"
// LV_IGK 0->1 ***or*** *reset* ***or*** *at clearing error memory*
This action initialized the diagnostic result according the filtering configuration :
ACTION_ERRM_GetLvErr(IN<NC_IDX_DIAG_GS>, OUT<LV_ERR_GS>)

```
Activation:      if      LV_IGK = 1 and LV_ST_END = 0
                 then    LV_CDN_DIAG_PLAUS_IV_CAL = 1
                 endif
Deactivation:    if      LV_IGK = 0   or   LV_ST_END = 1
                 then    LV_CDN_DIAG_PLAUS_IV_CAL = 0
                 endif
Recurrence:      10ms
```

Formula section:

```
if(1)          LF_ERR_PLAUS_IV_EGY_CAL =   0
       and     LF_ERR_PLAUS_IV_MFF_CAL   = 0
then(1)        ERR_SYM_PLAUS_IV_CAL =   NO_SYM
 else(1)
       if(2)     N   >=   C_N_MIN_PLAUS_IV_VAL
                 if(3)              LF_ERR_PLAUS_IV_EGY_CAL <> 0
                 then(3)            ERR_SYM_PLAUS_IV_CAL =   SYM_2
                 elseif(3)          LF_ERR_PLAUS_IV_MFF_CAL <> 0
                 then(3)            ERR_SYM_PLAUS_IV_CAL =   SYM_3
                 endif(3)
       endif(2)
endif(1)
```

For failure and error management treatment the anti-bounce mechanism is called with the parameters LV_CDN_DIAG_PLAUS_IV_CAL and ERR_SYM_PLAUS_IV_CAL.

```
ACTION_ERRM_FilterSymptom
      ( IN< GS >,
        IN< LV_CDN_DIAG_GS >,
      IN< ERR_SYM_GS >,
        IN< C_ABC_INC_GS >,
        IN< 1 >,
      IN< C_ABC_MAX_GS >,
        OUT< LV_ERR_GS >
   )
```

This algorithm determines LV_ERR_PLAUS_IV_CAL and LV_END_DIAG_PLAUS_IV_CAL and delivers the result to Error Management.

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LC_DIAG_INH_PBK_IV_ERR_ENA	-	0... 1H	0 ...1	1	-
Flag to enable inhibition of cylinders due to injection power bank errors					
LC_DIAG_INH_PBK_IV_ERR_ST_ENA	-	0... 1H	0 ...1	1	-
Flag to enable inhibition of cylinders due to injection power bank start up errors					

FUNCTION DESCRIPTION:

General information:

The flag LV_INH_DIAG_PBK_IV deactivates (freezes) the power stage online diagnostic of all injection valve drivers.

If a de-bounced injector error is present at the end of the driving cycle (LV_ERR_PBK_IV = 1), the flag LV_ERR_PBK_IV_LST_CYC is set and is stored in the non-volatile memory.

The variable INJ_DR_PBK_IV_REF[NC_PBK_IV_NR] represents an inhibit pattern, which inhibits all cylinders assigned to the injection power bank revered to by the array index.

A.88.1 Calculation of INJ_DR_PBK_IV_REF[NC_PBK_IV_NR]

Application conditions

Activation: `every engine state`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Deactivation: –

Initialisation: –

Recurrence: `only once at reset`

Formula section:

The variable INJ_DR_PBK_IV_REF[p] represents an inhibit pattern where all cylinders on bank m are inhibited (corresponding bits are set to 1) due to injection power bank errors.

Initial value:
FOR p = 0 **TO** NC_PBK_IV_NR - 1 **DO**
INJ_DR_PBK_IV_REF[p] = 0
ENDFOR

Calculation of INJ_DR_PBK_IV_REF[NC_PBK_IV_NR]:
FOR x = 0 **TO** NC_CYL_NR - 1 **DO**
Bit x of INJ_DR_PBK_IV_REF[NC_IDX_CYL_PBK_IV_REF[x]] = 1
ENDFOR

A.88.2 Calculation of LV_INH_DIAG_PBK_IV

Application conditions

Activation: *(LV_IGK = 1) AND (STATE_PBK_IV_INI = "INIT_FINISHED")*

Deactivation: –

Initialisation: `at reset, at transition of LV_IGK 0 -> 1 DO:`
`LV_INH_DIAG_PBK_IV = 1`
`INH_PBK_IV_DIAG_ERR = 0`

Recurrence: `segment synchronous`

Formula section:

Overview

The purpose of the injection valve power stage diagnosis is to detect electrical faults of used ATIC drivers. STATE_ERR_PBK_IV is the general error state after de-bouncing for limp-home reactions.

All symptoms of the current error code are handled by anti-bouncing.
We assume that only one symptom of an error code can be active at the same time.

The error detection is effected via the ECU hardware.

Please Note:

A valid diagnosis of all failures can only be detected when the injector was operated at least one time since the last changes and the filter times are observed.

Formula section:

A.90.1 Electrical Injection Valve Diagnosis - selection of the current cylinder number

Determine the previous cylinder:
NR_CYL_INJ_BAS_PREV_DIAG_IV_TMP = NR_CYL_INJ_BAS_PREV
Determine the current cylinder:
NR_CYL_INJ_BAS_DIAG_IV_TMP = NR_CYL_INJ_BAS
Check cylinder numbers under consideration of re-entrance capability:
(1) IF NR_CYL_INJ_BAS_ PREV_DIAG_IV_TMP ≠ NR_CYL_INJ_BAS_PREV
(1) THEN
NR_CYL_INJ_BAS_PREV_DIAG_IV_TMP = NR_CYL_INJ_BAS_PREV
NR_CYL_INJ_BAS_DIAG_IV_TMP = NR_CYL_INJ_BAS
(1) ENDIF

A.90.2 Electrical Injection Valve Diagnosis - diagnosis routine call

(1) IF NR_CYL_DIAG_IV = NR_CYL_INJ_BAS_DIAG_IV_TMP
(1) THEN
Nothing to do! The last diagnosis cycle is equal to the current.
(1) ELSE
Diagnosis Cycle has to be done:
(1) IF NR_CYL_DIAG_IV ≠ NR_CYL_INJ_BAS_PREV_DIAG_IV_TMP
(1) THEN
Diagnosis Cycle has to be done for the previous cylinder, because its missing:
EXECUTE "1.3 Common Diagnosis Operations" for cylinder x = NR_CYL_INJ_BAS_PREV_DIAG_IV_TMP
(1) ENDIF
Diagnosis Cycle has to be done for the current cylinder:
EXECUTE "1.3 Common Diagnosis Operations" for cylinder x = NR_CYL_INJ_BAS_DIAG_IV_TMP

Update cylinder number of the done diagnosis cycle:
NR_CYL_DIAG_IV = NR_CYL_INJ_BAS_DIAG_IV_TMP
(1) ENDIF

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.91 Injection valve diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
INH_IV_DIAG_ERR	O/V	0... FFH	0... 255	1	-
Cylinder shut off request from injection valve diagnosis (cylinder allocated)					
INJ_DR_CYL_REF [NC_CYL_NR]	O/V	0... FFH	0... 255	1	-
Assignment between logical cylinders and injector drivers					
LV_ERR_IV_LST_CYC	O/V/S	0... 1H	0 ...1	1	-
Flag that indicates if a debounced injector error is present at the end of the driving cycle					
LV_INH_DIAG_IV	O/V	0... 1H	0 ...1	1	-
Inhibition condition for the IV diagnostic					

Input data:

ERR_SYM_IV [NC_CYL_NR] {p. 4802}	LV_ERR_MU_MC {p. 7072}	LV_ERR_SPI_MPS {p. 4245}	LV_ERR_TMP_MU_MC {p. 7072}
LV_IGK {p. 906}	LV_INJ_OFF_TMR_INJ_ENA {p. 7158}	LV_MC_SOPC_INH_DI {p. 7186}	NC_CYL_NR {p. 1526}
NC_IDX_CYL_PBK_IV_REF [NC_CYL_NR] {p. 626}	STATE_ERR_IV {p. 4803}	TCO {p. 1100}	

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_TCO_THD_INH_DIAG_IV	-	0... FEH	-48... 142.5	0.75	°C
TCO threshold below which the injector diagnosis is inhibited					
LC_INH_IV_DIAG_ERR_ENA	-	0... 1H	0 ...1	1	-
Manual switch for activation of INH_IV_DIAG_ERR					

FUNCTION DESCRIPTION:

General information:

The flag LV_INH_DIAG_IV deactivates (freezes) the power stage diagnostic of all injection valves.

The injector diagnosis has to be deactivated in case of:

- TCO is below the threshold C_TCO_THD_INH_DIAG_IV

If a de-bounced injector error is present at the end of the driving cycle (LV_ERR_IV = 1), the flag LV_ERR_IV_LST_CYC is set and is stored in the permanent RAM.

A.91.1 Calculation of INJ_DR_CYL_REF[NC_CYL_NR]

Application conditions

Activation: *every engine state*

Deactivation: –

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Initialisation: –

Recurrence: only once at reset

Formula section:

The variable INJ_DR_CYL_REF[x] represents an inhibit pattern where all cylinders on the same bank as cylinder x are inhibited (corresponding bits are set to 1) due to injection valve errors.

Calculation of INJ_DR_CYL_REF[NC_CYL_NR]:
Note: m reveres to the injection power stage bank within this loop

```
FOR x = 0 TO NC_CYL_NR - 1 DO
   INJ_DR_CYL_REF[x] = 0
   m = NC_IDX_CYL_PBK_IV_REF[x]
   FOR y = 0 TO NC_CYL_NR - 1 DO
            IF NC_IDX_CYL_PBK_IV_REF[y] = m   // cylinder y is on bank m
            THEN
                     Bit y of INJ_DR_CYL_REF[x] = 1
            ENDIF
   ENDFOR
ENDFOR
```

A.91.2 Calculation of LV_INH_DIAG_IV

Application conditions

Activation: *every engine state*

Deactivation: –

Initialisation: at reset: LV_INH_DIAG_IV = 1

Recurrence: segment synchronous and 'at first valid tooth'

Formula section:

```
(1)IF TCO < C_TCO_THD_INH_DIAG_IV
   OR LV_MC_SOPC_INH_DI = 1
      OR LV_ERR_TMP_MU_MC = 1
         OR LV_ERR_MU_MC = 1
         OR LV_ERR_SPI_MPS = 1
      OR LV_INJ_OFF_TMR_INJ_ENA = 0
(1)THEN
   LV_INH_DIAG_IV = 1
(1)ELSE
   LV_INH_DIAG_IV = 0
(1)ENDIF
```

A.91.3 Calculation of LV_ERR_IV_LST_CYC

Application conditions

Activation: *LV_IGK = 1 → 0*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Deactivation: –

Initialisation: –

Recurrence: only once at LV_IGK = 1 → 0

Formula section:

(1) IF
STATE_ERR_IV ≠ 0
(1) THEN
LV_ERR_IV_LST_CYC = 1
(1) ELSE
LV_ERR_IV_LST_CYC = 0
(1) ENDIF

Note: In case of "checksum error" after power latch or reset the flag LV_ERR_IV_LST_CYC has to be set to zero.

A.91.4 Shut off request from injection valve diagnosis

General information:

In this chapter the diagnosis information for ATIC 63 PIEZO driver will be analysed. In the case of a short circuit error (SC) except the case of a high side to low side short circuit error (HL) all the injectors, which are connected to the same injection driver have to be switched off to prevent wrong fuel mass on not affected injection valves. In the case of an OC or HL error only the injector with a diagnosed error has to be switched off.

Application conditions

Activation: *LV_IGK = 1*

Deactivation: –

Initialisation: at reset, at transition of LV_IGK 0 -> 1 and at global clearing of failure memory DO:
INH_IV_DIAG_ERR = 0

Recurrence: segment synchronous
Note: The chapter 1.4 Shut off request from injection valve diagnosis has to be calculated after the module "Injection valve diagnosis".

Formula section:

(1) IF (STATE_ERR_IV ≠ 0) **AND** (LC_INH_IV_DIAG_ERR_ENA = 1)
(1) THEN
INH_IV_DIAG_ERR = STATE_ERR_IV
(Switch off all injectors with an error symptom)
(1) FOR x = 0 **TO** (NC_CYL_NR -1) **DO:**
(2) IF (Bit x of STATE_ERR_IV = 1) **AND** (ERR_SYM_IV[x] = 'SC-Error')
(Check if a short circuit error (without HL-error) was detected)
(2) THEN
(Switch off all the injectors which are connected to the same driver additionally)

maximum acceptable percentage of out of range T_PER_MAF_FRQ_SUM[NC_MAF_NR] per ms					

FUNCTION DESCRIPTION:

The whole electrical diagnostic feature for frequential MAF sensor consists of four parts:
The error detection itself is done within the signal acquisition. Every 1 ms the mean period time per ms of mass air flow sensor (T_PER_MAF_FRQ_BAS[NC_MAF_NR]) is evaluated. Whenever an error is detected (per ms) the corresponding counter (CTR_T_PER_MAF_FRQ_RNG[NC_MAF_NR] or CTR_T_PER_MAF_FRQ_GRD[NC_MAF_NR]) gets incremented and this value itself is neglected.
Here in the diagnostic function these summed up error counters as well as the summed up counter for valid values per segment (CTR_MAF_FRQ_KGH_SUM[NC_MAF_NR]) are evaluated at the end of each segment.

A.92.1 Frequential MAF Sensor: Period Range Check per ms

General information:

The diagnosis described in this section is performed for each MAF sensor separately [NC_MAF_NR].
The purpose is to check the range of the mean period time per ms of mass air flow sensor (T_PER_MAF_FRQ_BAS[NC_MAF_NR]). The diagnostic instance consists of the following symptom:

- SYM_0: MAF-sensor-[NC_MAF_NR]: mean period time per ms exceeding limit

MAF_FRQ_RNG[NC_MAF_NR]

Description:

Activation **If** LV_VAR_MAF = 1
then if LV_IGK = 1 **and**
LV_CDN_VB_OBD1 = 1 **and**
LV_ST_END = 1 **and**
N > C_N_THD_MAF_FRQ_RNG_MIN **and**
FAC_MAF_REL > C_FAC_MAF_REL_THD_MAF_RNG_MIN
Then LV_CDN_DIAG_MAF_FRQ_RNG[NC_MAF_NR] = 1
Else LV_CDN_DIAG_MAF_FRQ_RNG[NC_MAF_NR] = 0
endif
else LV_END_DIAG_MAF_FRQ_RNG[NC_MAF_NR] = 1
LV_CDN_DIAG_MAF_FRQ_RNG[NC_MAF_NR] = 0
Endif

Initialization: STD_INI
Recurrence: every segment

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If LV_CDN_DIAG_MAF_FRQ_RNG[NC_MAF_NR] = 1
then if
[CTR_T_PER_MAF_FRQ_RNG[NC_MAF_NR] /
(CTR_MAF_FRQ_KGH_SUM[NC_MAF_NR] + CTR_T_PER_MAF_FRQ_RNG[NC_MAF_NR] + CTR_T_PER_MAF_FRQ_GRD[NC_MAF_NR])]
> C_RATIO_T_PER_MAF_FRQ_RNG_DIAG **AND**
LV_CTR_T_PER_MAF_FRQ_SENS[NC_MAF_NR] = 0 **AND**
LV_CTR_T_PER_MAF_FRQ_EL[NC_MAF_NR] = 0
then ERR_SYM_MAF_FRQ_RNG[NC_MAF_NR] = SYM_0
else ERR_SYM_MAF_FRQ_RNG[NC_MAF_NR] = NO_SYM
endif
endif

Calculation end of diagnosis
LV_END_DIAG_MAF_FRQ_RNG[NC_MAF_NR] is calculated by error management if diagnosis is active.

A.92.2 Frequential MAF Sensor: Gradient Check per ms

General information:

The diagnosis described in this section is performed for each MAF sensor separately (j = 0 ... NC_MAF_NR - 1).
Purpose is to check the gradient of consecutively measured mean period times per ms (absolute value) of mass air flow sensor (T_PER_MAF_FRQ_BAS[NC_MAF_NR]). This allows to detect a completely unplausible increase or decrease of it caused by a loose contact. The diagnostic instance consists of the following error symptom:

- SYM_0: MAF-sensor-[NC_MAF_NR]: unplausible gradient of mean period time per ms
  MAF_FRQ_GRD[NC_MAF_NR]

Description:

Activation **If** LV_VAR_MAF = 1
then **if** LV_IGK = 1 **and**
LV_CDN_VB_OBD1 = 1 **and**
LV_ST_END = 1
Then LV_CDN_DIAG_MAF_FRQ_GRD[NC_MAF_NR] = 1
Else LV_CDN_DIAG_MAF_FRQ_GRD[NC_MAF_NR] = 0
endif
else LV_END_DIAG_MAF_FRQ_GRD[NC_MAF_NR] = 1
LV_CDN_DIAG_MAF_FRQ_GRD[NC_MAF_NR] = 0
Endif

then ERR_SYM_MAF_FRQ_GRD[NC_MAF_NR] = SYM_0
else ERR_SYM_MAF_FRQ_GRD[NC_MAF_NR] = NO_SYM
endif
endif

Calculation end of diagnosis

LV_END_DIAG_MAF_FRQ_GRD[NC_MAF_NR] is calculated by error management if diagnosis is active.

A.92.3 MAF electrical diagnosis

General information:

The diagnosis described in this section is performed for each MAF sensor separately (j = 0 ... NC_MAF_NR - 1).
Purpose is to recognize a problem due to an electrical error (SCG, SCB of open line) of the mass air flow sensor (within the sensor on the wiring harness) or a self diagnosis problem is recognized. The diagnostic instance consists of the following error symptom:

- SYM_0: MAF-sensor-[NC_MAF_NR]: electrical fault
- SYM_1: 'MAF-sensor-[NC_MAF_NR]: sensor error recognized

Activation **If** LV_VAR_MAF = 1
then **if** LV_IGK = 1 **and**
LV_CDN_VB_OBD1 = 1 **and**
LV_ST_END = 1
Then LV_CDN_DIAG_MAF_FRQ_EL[NC_MAF_NR] = 1
Else LV_CDN_DIAG_MAF_FRQ_EL[NC_MAF_NR] = 0
endif
else LV_END_DIAG_MAF_FRQ_EL[NC_MAF_NR] = 1
LV_CDN_DIAG_MAF_FRQ_EL[NC_MAF_NR] = 0
Endif

Initialization: STD_INI

Interface of MAF monitor with the Rate-Based Monitoring statistics Bit 0: conditions for monitoring are met long enough to detect malfunction (bit 0 = 1) Bit 1: inhibition of the monitor because of system failure(s) (bit 1 = 1) Bit 2: individual RBM conditions of the monitor were encountered within this DC (bit 2 = 1)					

Input data:

LV_BRAKE_DET {p. 4209}	LV_DC {p. 5746}	LV_END_DIAG_MAF {p. 4814}	LV_ERR_BLS_PLAUS {p. 4209}
LV_ERR_MAF {p. 4815}	LV_VAR_MAF {p. 656}		

General information:

LV_MAF_BLS_DIAG is used by engine speed limit coordination and torque request at clutch.

Application conditions

Initialisation: *0 at reset*

Recurrence: *10ms*

Activation: *LV_VAR_MAF = 1*

Deactivation: *LV_VAR_MAF = 0*

Formula section:

LV_INH_DIAG_MAF = 0

If LV_ERR_MAF = 1 **and**
[LV_BRAKE_DET = 1 **or**
LV_ERR_BLS_PLAUS = 1]
Then LV_MAF_BLS_DIAG = 1
Else LV_MAF_BLS_DIAG = 0
Endif

A.93.1 Interface for Rate - Based - Monitoring

FUNCTION DESCRIPTION:

General information:

With this module the interface between the MAF monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_MAF data.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Within STATE_RBM_MAF, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for MAF diagnosis)

Application conditions:

Initialisation :
at LV_DC 0 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_MAF = 0
on failure memory reset :
bit 1 of STATE_RBM_MAF = 0
Recurrence: 1 s
Activation: LV_DC 0 1 transition **and** LV_DC = 1

Formula section:

Bit 0:
If bit 0 of STATE_RBM_MAF = 0
then

A.94 Ambient pressure sensor diagnosis

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
ERR_SYM_AMP	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	-	-
Detected symptom AMP					
LV_CDN_DIAG_AMP	O/V	0... 1H	0 ...1	1	-
Diagnosis condition AMP					
LV_END_DIAG_AMP	O/V	0... 1H	0 ...1	1	-
End of Diagnosis AMP					
LV_ERR_AMP	O/V	0... 1H	0 ...1	1	-
AMP error present					

Input data:

LV_ES {p. 1720}	LV_IGK {p. 906}	LV_ST {p. 1720}	V_AMP {p. 831}

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_AMP	-	0... FFH	0... 255	1	-
Anti - bounce counter increment					
C_ABC_MAX_AMP	-	1... FFH	1... 255	1	-
Maximum value of the anti - bounce counter					
C_V_AMP_MAX_DIAG	-	0... 3FFH	0... 4.99511	4.88e-3	V
Maximum diagnostic value for the ambient pressure value					
C_V_AMP_MIN_DIAG	-	0... 3FFH	0... 4.99511	4.88e-3	V
Minimum diagnostic value for the ambient pressure value					

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements.
The signal of the altitude pressure sensor on the A/D-input of the microcontroller is checked.

Description:

Error-symtoms are defined to this diagnosis function as following :

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> Signal Line Short to Battery Voltage or Open load   (= SYM_0)
 │ │ └───> Signal Line Short to Ground                         (= SYM_1)
 │ └─────> -                                                   (= SYM_2)
 └───────> -                                                   (= SYM_3)
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions

Initialization: `all 0 at LV_IGK 0->1` **or** `reset`

Recurrence: `100ms`

Activation

```
If        LV_IGK = 1          and
          LV_ES = 0           and
          LV_ST = 0
Then      LV_CDN_DIAG_AMP = 1
Else      LV_CDN_DIAG_AMP = 0
Endif
```

Formula section:

Short circuit to VBatt or open load
If V_AMP > C_V_AMP_MAX_DIAG
Then ERR_SYM_AMP = SYM_0
Short circuit to ground
ElseIf V_AMP < C_V_AMP_MIN_DIAG
Then ERR_SYM_AMP = SYM_1
Else ERR_SYM_AMP = NO_SYM
Endif
Calculation of present error and end of diagnosis:
LV_ERR_AMP and LV_END_DIAG_AMP is calculated by error management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.95.1 Electrical diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements.
The signal of the manifold differential pressure sensor on the A/D-input of the microcontroller is checked.

Description:

Error-symtoms are defined to this diagnosis function as following :

```
□□□□
│ │ │ └──→ Signal Line Short to Battery Voltage or Open load    (= SYM_0)
│ │ └────→ Signal Line Short to Ground                          (= SYM_1)
│ └──────→ -                                                    (= SYM_2)
└────────→ -                                                    (= SYM_3)
```

Application conditions

Initialization: according ABC type **STD_INI** (all 0 at LV_IGK 0→1 or at reset)

Recurrence: 100ms

Activation

```
If     LV_IGK = 1        and
       LV_ES = 0         and
       LV_ST = 0
Then   LV_CDN_DIAG_MAP_DIP_SENS = 1
Else   LV_CDN_DIAG_MAP_DIP_SENS = 0
Endif
```

Formula section:

Short circuit to VBatt or open load
If V_MAP > C_V_MAP_BAS_MAX_DIAG
Then ERR_SYM_MAP_DIP_SENS = SYM_0
Short circuit to ground
ElseIf V_MAP < C_V_MAP_BAS_MIN_DIAG
Then ERR_SYM_MAP_DIP_SENS = SYM_1
Else ERR_SYM_MAP_DIP_SENS = NO_SYM
Endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Calculation of present error and end of diagnosis:
LV_ERR_MAP_DIP_SENS and LV_END_DIAG_MAP_DIP_SENS is calculated by error management.

A.95.2 Plausibility diagnosis

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect an unplausible shift of the sensor characteristic. The deviation and the maximum allowed deviation from the nominal curve are determined by the module "Pressure Variables (MAP-Sensor) /Adaptation of sensor characteristic".

Description:

Error-symtoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─→ -                                   (= SYM_0)
 │ │ └───→ -                                   (= SYM_1)
 │ └─────→ -                                   (= SYM_2)
 └───────→ signal offset out of limit          (= SYM_3)
```

Application conditions

Initialization: according ABC type **STD** (init. from nonvolatile error memory)

Recurrence: 100ms

Activation

```
If    ECU_STATE                    = PWL    and
      TPS_AV  C_TPS_V_MAP_AD_MIN   and
      LV_ERR_TPS                   = 0      and
      LV_ERR_MAP_DIP_SENS          = 0      and
LV_ERR_TPS_AD                      = 0      and

LV_ERR_TPS_AD_BOL                  = 0      and

LV_ERR_TPS_ST_CHK_2                = 0      and

LV_ERR_LOAD_TPS_PLAUS = 0                   and
      LV_ERR_MAP_TPS_PLAUS         = 0
Then  LV_CDN_DIAG_MAP_DIP_SHIFT = 1
Else  LV_CDN_DIAG_MAP_DIP_SHIFT = 0
Endif
```

A.96 Pressure up throttle sensor diagnosis

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
ERR_SYM_PUT_EL	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	-	-
Detected symptom electrical PUT sensor					
LV_CDN_DIAG_PUT_EL	O/V	0... 1H	0 ...1	1	-
Status of diagnosis for electrical PUT sensor					
LV_END_DIAG_PUT_EL	O/V	0... 1H	0 ...1	1	-
End of pressure up throttle sensor diagnosis					
LV_ERR_PUT_EL	O/V	0... 1H	0 ...1	1	-
electrical PUT sensor error detected					

Input data:

LV_VAR_TCHA {p. 656}	LV_VB_CDN_OBD_1 {p. 1046}	V_PUT {p. 1198}	V_PUT_MV_MAX_DIAG {p. 4830}
V_PUT_MV_MIN_DIAG {p. 4830}			

FUNCTION DESCRIPTION:

General Information:
Analog input signal in the A/D-Input from the Microprocessor.

Description

Error-symtoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
│ │ │ └─> Circuit high input        (= SYM_0)
│ │ └───> Circuiit low input        (= SYM_1)
│ └─────> -                         (= SYM_2)
└───────> -                         (= SYM_3)
```

Remark: Calculation of LV_END_DIAG_PUT see generic calculation “End of diagnosis” in anti bounce algorithm.

Application conditions

Activation: LV_VAR_TCHA = 1

Deactivation:

```
If          LV_VAR_TCHA = 0
   Then  LV_END_DIAG_PUT_EL = 1
   Endif
```

Action definition

ACTION_AGGR_SetBsdGlobalCom (**IN**<CTR_BSD_CPT_COM_OK>)	Mode: O
Action which delivers at the end of the BSD scheduling timing table the status of the communication of all BSD components of the list (counter = 0 ; no communication occured at all)	

ACTION_AGGR_SetBsdSingleCom (**IN**<STATE_BSD_CPT>,**IN**<STATE_BSD_COM>)	Mode: O
Action which delivers at the end of the BSD timing slot the status of the communication of the actual BSD device of the scheduling list	

A.98.1 Global BSD Error - No communication to any of the BSD components

Description for actions:

ACTION_COMS_*SetBsdGlobalCom _COM* (<CTR_BSD_CPT_COM_OK>)					
Action which delivers at the end of the BSD timing table the status of the communication of all BSD devices of the list; number of successful communications for one scheduling timing list cycle					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
CTR_BSD_CPT_COM_OK	IN	0...FFH	0...255	1	-
Number of the ‘ok’ communications per total scheduling timing list cycle of the BSD devices					

FUNCTION DESCRIPTION:

General information:

This diagnosis is to detect a malfunction in the BSD-line (**B**it-**S**erial-**D**ata transfer). There could be several components be connected to the BSD bus (alternator, intelligent battery sensor, oil quality sensor, electrical coolant water pump).
The diagnosis works with the help of basic software information. To detect an error symptom it is necessary to have a data tranfer before, thus the information is stored until the next recurreny of the diagnosis. The error symptoms are set exclusive per data transfer.
There is a certain scheduling defined to serve the several components via BSD bus. In total for one complete cycle (defined in the BSD scheduling timing table) several time slots have to be passed after a decision can be made wether the communication to at least one BSD component has successfully been passed. Is there no positve acknowegde from none of the BSD components, the counter CTR_BSD_CPT_COM_OK = 0 is indicating a global communication.
Each component is linked to certain time slots.
In general each component can be either configered by a calibration switch (must component; e.g. alternater, electrical coolant water pump, oil quality sensor) or can be learnt (intelligent battery sensor).

Description:

As soon as the communication via BSD has been started the ECU expects in all time slots correct messages (positive acknowledge). In case none of the messages have been received the global BSD error is set after debounce followed by inhibiting of the individual BSD communication errors.
After the error has been detected, the BSD timing coordinator is still serving the BSD components in the hope that the problem which disturbed the global communication disapears.

The error symptom detection is made out of basic software information BIOS_BSD_xx:
If one of the following error symptoms are detected:

- To less Bits were received (*BIOS_BSD_TOO_FEW_BITS_ERR* is set)
- To many Bits were received (*BIOS_BSD_TOO_MANY_BITS_ERR* is set)
- At least one data-bit was not inside the puls (*BIOS_BSD_BIT_LVL_ERR* is set)
- Receiver send NAK (*BIOS_BSD_ACK_ERR* is set)
- Receiver does not respond (*BIOS_BSD_SLAVE_TO_ERR* is set)
- One of the parity-bits in the data frame is wrong (*BIOS_BSD_PARITY_ERR* is set)
- Period of last measured bit was not o.k. (*BIOS_BSD_PER_ERR* is set)

then the error symptom BSD signal error is set to active.

For error symptom calculation (*ERR_SYM_BSD*) the symptom position is:

```
|_|_|_|_|
 | | | └─> -                  (= SYM_0)
 | | └───> -                  (= SYM_1)
 | └─────> BSD signal error   (= SYM_2)
 └───────> -                  (= SYM_3)
```

Application conditions

Initialisation: `all 0 at LV_IGK 0->1` **or** `at reset`

Recurrence: *Function called after each communication block (see BSD timing table)*

Activation: **If** `LV_CDN_VB_MIN_DIAG = 1 and`
`Communication on BSD started`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
Then      LV_CDN_DIAG_BSD = 1
Else      LV_CDN_DIAG_BSD = 0
Endif
```

Error management:

If LV_CDN_DIAG_BSD = 1
Then If CTR_BSD_CPT_COM_OK = 0 *//no BSD com occured at all conf. CPT*
Then ERR_SYM_BSD = SYM_2 *//Error symptom detected, ABC increments*
Else ERR_SYM_BSD = NO_SYM *//No error symptom detected, ABC decrements*
Endif
Endif

Remark: LV_ERR_BSD and LV_END_DIAG_BSD are calculated by error management if diagnosis is active.

A.98.2 Single BSD component errors (ALTER, QOIL, CWP, SENS_BAT_SMT)

Description for actions:

ACTION_COMS_*SetBsdSingleCom* (<STATE_BSD_CPT>,<STATE_BSD_COM>)					
Action which delivers at the end of the BSD timing slot the status of the communication of the actual BSD device of the scheduling list					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
STATE_BSD_CPT	IN	0...FFH	0...255	1	-
BSD device, which communicates actually with the ECU via BSD					
STATE_BSD_COM	IN	0...FFH	0...255	1	-
Status of the communication to the BSD devices (faulty /o.k.)					

FUNCTION DESCRIPTION:

General information:

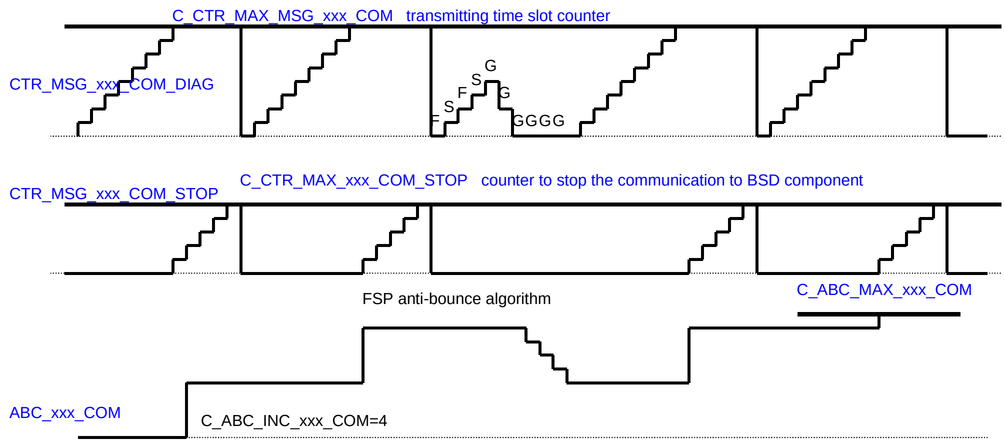
In addition to the global diagnosis of the BSD communication a selective diagnosis for each individual BSD component (alternator, intelligent battery sensor, oil quality sensor, electrical coolant water pump) is performed. There are several counters introduced to control the diagnosis. A counter (CTR_MSG_xxx_COM_DIAG) which monitors the transmitting slot of each individual component is incremented as soon as a faulty transmitting slot has been detected by the BSW (symptoms of the error please see Global BSD Error - No communication to any of the BSD components). In case of a faulty transmitting slot (no positive acknowledge) has been detected the next corresponding transmitting slot is served by a 22 synchronisation pulse phase and an incrementation of the counter CTR_MSG_xxx_COM_DIAG by 1+1 (1 for the missing acknowledge and 1 for the 22 synchronisation pulses).
The 22 synchronisation pulse phase is followed by new communication trial in the transmitting slot of the corresponding component determined by the timing coordinator. In case of a positive acknowledge the counter CTR_MSG_xxx_COM_DIAG is decremted by 2, otherwise it is proceeded as decribed above.
As soon as the counter CTR_MSG_xxx_COM_DIAG exceeds the threshold C_CTR_MAX_MSG_xxx_COM, a break for certain transmitting time slots can be applied by starting the counter CTR_MSG_xxx_COM_STOP (displayed in the flags LV_MSG_xxx_COM_STOP) in combination with the call of the anti-bounce algorithm of the error management and resetting the counter CTR_MSG_xxx_COM_DIAG after

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

the counter CTR_MSG_xxx_COM_STOP has reached the threshold C_CTR_MAX_xxx_COM_STOP. The counter CTR_MSG_xxx_COM_STOP is incremented in each corresponding transmitting time slot until the threshold C_CTR_MAX_xxx_COM_STOP has been reached. During this period the timing coordinator does not serve the corresponding component. After the break in the communication to the corresponding component has elapsed (C_CTR_MAX_xxx_COM_STOP reached) the next test cycle is started as described above. This occurs until the error has been debounced by the anti-bounce algorithm. After the debounce of the error the component is no longer served in this driving cycle by the timing coordinator.
If the counter threshold C_CTR_MAX_xxx_COM_STOP to stop the communication to the corresponding BSD component is calibrated to = 0, no break of the communication occurs.
Special treatment if the counter threshold is calibrated to C_CTR_MAX_xxx_COM_STOP = FFFFH. In that case no break of the communication occurs and the component is served although the error has been detected.

With xxx: ALTER - alternator
CWP - electrical coolant water pump
QOIL - oil quality sensor (QLT)
SENS_BAT_SMT - intelligent battery sensor (IBS)

Description:



F -- faulty
G -- good
S -- 22 sync. pulse

Application conditions

Initialisation: *all 0 at LV_IGK 0->1* ***or*** *at reset*

Recurrence: *Function called after each communication time slot (see BSD timing table)*

Activation:

```
If      LV_CDN_VB_MIN_DIAG = 1            and
        Communication on BSD started      and
        LV_ERR_BSD = 0
Then    LV_CDN_DIAG_xxx_COM = 1
Else    LV_CDN_DIAG_xxx_COM = 0
Endif
```

A.99.1 PT-CAN bus off diagnosis

FUNCTION DESCRIPTION

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

General information:

This diagnosis is working for BN2000 and CAN11H.

Description:

From CPU- CAN- controller a message is sent if CAN bus is on or off (internal). This diagnosis takes place every 10 ms at all engine operating states with ignition key on.
If CAN bus off is active the anti bounce counter is incremented by C_ABC_INC_CAN_BOFF. If the anti bounce counter reaches the calibratable threshold C_ABC_MAX_CAN_BOFF then the error bit LV_ERR_CAN_BOFF is set to 1.

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │  │  │  └─> -                                        (= SYM_0)
 │  │  └───> -                                         (= SYM_1)
 │  └─────> CAN bus off controller                     (= SYM_2)
 └───────> -                                           (= SYM_3)
```

Application conditions

Initialisation: *STD_INI*

Recurrence: *10 ms*

Activation:

```
If    LV_CDN_VB_CAN_DIAG = 1
  Then   LV_CDN_DIAG_CAN_BOFF = 1
Else   LV_CDN_DIAG_CAN_BOFF = 0
Endif
```

Formula section:

Detection of error symptom

If CAN bus off = active
Then ERR_SYM_CAN_BOFF = SYM_2
LV_ERR_CAN_BOFF = 1 *(after debounce)*
Else ERR_SYM_ CAN_BOFF = NO_SYM
LV_ERR_CAN_BOFF = 0 *(after rebounce)*
Endif

Calculation end of diagnosis
LV_END_DIAG_CAN_BOFF is calculated by error management

A.99.2 LOCAN bus off diagnosis

FUNCTION DESCRIPTION

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This diagnosis is working for LOCAN applications like EFP - control or NOX - sensors.

Description:

From CPU hardware a message is sent if CAN bus is on or off (internal). This diagnosis takes place every 10 ms at all engine operating states with ignition key on.
If CAN bus off is active the anti bounce counter is incremented by C_ABC_INC_LOCAN_BOFF. If the anti bounce counter reaches the calibratable threshold C_ABC_MAX_LOCAN_BOFF then the error bit LV_ERR_LOCAN_BOFF is set to 1.

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │  │  │  └─> -                              (= SYM_0)
 │  │  └───> -                               (= SYM_1)
 │  └─────> LOCAN bus off                    (= SYM_2)
 └───────> LOCAN TxWARN or RxWARN            (= SYM_3)
```

Application conditions

Initialisation: *STD_INI*

Recurrence: *10 ms*

Activation:

```
If      LV_CDN_VB_CAN_DIAG = 1
  Then  LV_CDN_DIAG_LOCAN_BOFF = 1
Else    LV_CDN_DIAG_LOCAN_BOFF = 0
Endif
```

Formula section:

Detection of error symptom

If LOCAN bus off = active
Then ERR_SYM_LOCAN_BOFF = SYM_2
LV_ERR_LOCAN_BOFF = 1 *(after debounce)*
Else ERR_SYM_ LOCAN_BOFF = NO_SYM
LV_ERR_LOCAN_BOFF = 0 *(after rebounce)*
EndIf

Calculation end of diagnosis
LV_END_DIAG_LOCAN_BOFF is calculated by error management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. FUNCTION DESCRIPTION:

General information:

The torque functionality detects if the torque requests via CAN are not plausible.

As a consequence of that further torque requests of the respective control unit are rejected. The purpose of this diagnosis is to provide the information when a ECU is rejected by error-entry in the FMY. Through environmental data (STATE_TQ_CAN_PLAUS) the information is given which ECU has been rejected.
Additional there is the possibility to calibrate via LC_TQ_CAN_PLAUS which failure of the respective ECU lead to the error entry.

If a torque-plausibility-error is detected by the torque calculation (STATE_TQ_xxx_PLAUS =) the error symptom is set and the anti bounce counter is incremented by C_ABC_INC_TQ_REQ_CAN. If the plausibility error is not present any longer, the anti bounce counter is decremented.

Application conditions

Initialisation:
```
according ERRM initialization type "STD_INI"
  //reset at LV_IGK 0->1 or reset
```

Recurrence:
```
10 ms
```

Activation:
```
If     LV_CDN_VB_BN_DIAG = 1           and
           LV_ES   = 0
  Then   LV_CDN_DIAG_TQ_REQ_CAN = 1
```

Deactivation:
```
If     LV_CDN_VB_BN_DIAG = 0           or
           LV_ES   = 1                  or
       ECU_STATE = PWL
  Then   LV_CDN_DIAG_TQ_REQ_CAN = 0
  Endif
```

End of diagnosis NOX_SENS_i					

Input data:

LV_CDN_VB_CAN_DIAG {p. 1185}	LV_ERR_LOCAN_BOFF {p. 4846}	LV_IGK {p. 906}	

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_TOUT_NOX_SENS	-	0... FFH	0... 255	1	-
anti bounce counter increment - diagnosis of timeout CAN message NOX_SENS					
C_ABC_MAX_TOUT_NOX_SENS	-	1... FFH	1... 255	1	-
anti bounce counter maximum value - diagnosis of timeout CAN message NOX_SENS					
C_NOX_SENS_CYCNR_MAX	-	1... FFH	1... 255	1	-
maximum number of missing NOX_SENS messages for error debounce counter increment					

FUNCTION DESCRIPTION

General information:

The following CAN diagnosis are defined:

- Timeout CAN messages NOX

A.102.1 Timeout CAN messages NOX

Description:

The counter CYC_CTR_NOX_SENS_i_DIAG are always incremented if the CAN messages NOX_SENS_i have not been received. The counter are set to 0 if a CAN message NOX_SENS_i has been received or if the counter has reached his maximum value C_NOX_SENS_CYCNR_MAX.
If these counters have reached the calibratable threshold C_NOX_SENS_CYCNR_MAX and there is no CAN message NOX_SENS_i then the error symptom is set and the anti bounce counter is incremented by C_ABC_INC_TOUT_NOX_SENS. If a CAN message NOX_SENS_i is received, the anti bounce counter is decremented. If the anti bounce counter has reached his maximum value C_ABC_MAX_TOUT_NOX_SENS the timeout error CAN message NOX_SENS (LV_ERR_TOUT_NOX_SENS_i) is set.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ └─> -                                (= SYM_0)
│ │ └───> -                                (= SYM_1)
│ └─────> Timeout signal NOX_SENS_i        (= SYM_2)
└───────> -                                (= SYM_3)
```

Application conditions

Initialisation: all 0 at Transition LV_IGK 0->1 or reset or at clearing error memory

Recurrence: *10 ms*

Activation:

```
If      LV_CDN_VB_CAN_DIAG =  1       and
    NOX-message has been received via LoCAN at least for once
and
    LV_ERR_LOCAN_BOFF = 0
    Then      LV_CDN_DIAG_TOUT_NOX_SENS_i = 1
 Else      LV_CDN_DIAG_TOUT_NOX_SENS_i = 0
 Endif
```

Formula section:

Calculation of time-out counter

If no CAN message NOX_SENS_i received

Then CYC_CTR_NOX_SENS_i_DIAG $_N$ = CYC_CTR_NOX_SENS_i_DIAG $_{N-1}$ +1

Else CYC_CTR_NOX_SENS_i_DIAG = 0 *(reset)*

EndIf

Detection of error symptom

If(1) CYC_CTR_NOX_SENS_i_DIAG = C_NOX_SENS_CYCNR_MAX

Then(1) CYC_CTR_NOX_SENS_i_DIAG = 0 *(reset)*

If(2) no CAN message NOX_SENS_i is received

Then(2) ERR_SYM_TOUT_NOX_SENS_i = SYM_2 *Timeout is detected*

ABC counter starts to increment

LV_ERR_TOUT_NOX_SENS_i = 1 *(after debounce)*

Else(2) ERR_SYM_TOUT_NOX_SENS_i = NO_SYM

ABC counter starts to decrement

LV_ERR_TOUT_NOX_SENS_i = 0 *(after rebounce)*

EndIf(2)

EndIf(1)

Calculation end of diagnosis

LV_END_DIAG_TOUT_NOX_SENS_i is calculated by error management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. C_CTR_DIAG_TOUT_MAX_WHEEL_CAN	-	0... FFH	0... 255	1	-
Maximum number of missing messeges events before error detection of message WHEEL_CAN					

A.103.1 Table of BN2000 diagnosis

FUNCTION DESCRIPTION:

General information:

This chapter is for the definition of all ERRM relevant output - data using the general BN2000 diagnosis algoritm.

The CAN diagnosis for BN input messages are only enabled if the variant has been recognized. In case of a modul (e.g. Kombi) which is not a variant but implemented in every vehicle the diagnosis is always enabled.

A.103.1.1 Diagnosis ACC module (Distance cruise control)

A.103.1.1.1 DREHMOMENT_ANF_ACC (LV_ERR_BN_TQ_DCC)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation: `LV_VAR_DCC = 1`

Description:

Error symptoms are defined for this diagnosis function as:

```
□□□□
|  |  |  └> -                                      (= SYM_0)
|  |  └——> Alive counter did not count              (= SYM_1)
|  └————> Timeout                                  (= SYM_2)
└——————> Sent checksum ≠ calculated checksum        (= SYM_3)
```

A.103.1.2 Diagnosis ARS module

A.103.1.2.1 STAT_ARS (LV_ERR_BN_ARS)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation: `LV_VAR_ARS = 1`

Description:

Error symptoms are defined for this diagnosis function as:

```
□□□□
|  |  |  └> -                                      (= SYM_0)
|  |  └——> Alive counter did not count              (= SYM_1)
|  └————> Timeout                                  (= SYM_2)
└——————> -                                          (= SYM_3)
```

A.103.1.3 Diagnosis AFS module (Active front steering)

A.103.1.3.1 DREHMOMENT_ANF_AFS (LV_ERR_BN_TQ_PSTE_2)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation: `LV_VAR_PSTE_2 = 1`

Description:

Error symptoms are defined for this diagnosis function as:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

 │ └─────> Timeout                            (= SYM_2)
 └───────> Sent checksum ≠ calculated checksum (= SYM_3)
```

A.103.1.4 Diagnosis EHB module (Electro-hydraulic brake)

A.103.1.4.1 DREHMOMENT_ANF_STE (LV_ERR_BN_TQ_PSTE_3)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation: *LV_VAR_PSTE_3 = 1*

Description:

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> -                                  (= SYM_0)
 │ │ └───> Alive counter did not count        (= SYM_1)
 │ └─────> Timeout                            (= SYM_2)
 └───────> Sent checksum ≠ calculated checksum (= SYM_3)
```

A.103.1.5 Diagnosis EMF module (Electro-mechanical parke brake)

A.103.1.5.1 STELLANF_EMF (LV_ERR_BN_REQ_PBR)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation:

```
LV_VAR_PBR = 1
//set LV_END in case of not learnt variant:
if          LV_VAR_PBR = 0
then        LV_END_DIAG_BN_REQ_PBR = 1
endif
```

Description:

Error symptoms are defined for this diagnosis function as:

A.103.1.7.4 STAT_DSC (LV_ERR_BN_TCS)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation: `in every engine operating state`

Description:

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ │ └─> -                         (= SYM_0)
│ │ └───> -                           (= SYM_1)
│ └─────> Timeout                     (= SYM_2)
└───────> -                           (= SYM_3)
```

A.103.1.8 Diagnosis EGS (Electronic transmission control unit)

A.103.1.8.1 DREHMOMENT_ANF_EGS (LV_ERR_BN_TQ_ETCU)

General information:

See general BN2000 diagnosis algorithm

Application conditions

Activation:

```
LV_AT = 1
If          LV_AT = 0
(AT not learnt if C_T_DET_VAR_CAN elapsed after LV_IGK 0  1)
Then     LV_END_DIAG_BN_TQ_ETCU = 1  (set for readiness)
 Endif
```

Description:

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ │ └─> -                                    (= SYM_0)
│ │ └───> Alive counter did not count            (= SYM_1)
│ └─────> Timeout                                (= SYM_2)

A.103.2 BN2000 diagnosis algorithm

FUNCTION DESCRIPTION:

General information:

All diagnosis are only activated if the variant BN2000 is valid (LV_VAR_BN = 1).
For the diagnosis each message is monitored.

XXX is the variable for each different input message (see “CAN messages BN2000, Enable condition for BN2000 diagnosis).

Description:

The following symptoms can be detected:

- Alive counter did not count
- Timeout of the message
- Sent checksum is not equal to the calculated checksum of the message

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

For detailed information of Alive-counter, checksum calculation and timeout see (see “CAN messages BN2000).

If symptom “Timeout” is detected (counter CTR_DIAG_TOUT_XXX ≠ 0), the remaining symptom detection is inhibited.

If C_CTR_DIAG_TOUT/CKS/TCC_CAN_MAX_XXX are calibrated to 0 then the diagnosis of the symptom TOUT/CKS/TCC_CAN is inhibited.

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ │ └> -                                    (= SYM_0)
│ │ └───> Alive counter did not count          (= SYM_1)
│ └─────> Timeout                              (= SYM_2)
└───────> Sent checksum ≠ calculated checksum  (= SYM_3)
```

<u>**Application conditions**</u>

Initialisation: *all 0 at LV_IGK 0->1* **or** *reset* **or** *at clearing error memory*

Recurrence: *each message is diagnosed*

Activation:

Integrator voltage threshold to detect the error via the ’Slave Algorithm’					

FUNCTION DESCRIPTION:

The array NC_CBK_EX_NR refers to sensor number (0 is KNKS_1; 1 is KNKS_2).

General information:

The task of the function "knock sensor diagnosis" lies in the input signal monitoring of the respective knock sensor.

The sensor signal is checked continuously regarding plausibility. This is done by observation of the signal noise value NL[NC_CYL_NR] (’Range Check’) and with two algorithms (Master - and Slave - Algorithm). The bandwidth (DYW_KNKS_DIAG) of the signal will be observed with these two algorithms. Both algorithms have to indicate the same system condition before the debounce counter is started.

The debounce counter will be called up every 720 °KW. The three test algorithms will be called up segment synchronously which will be done under consideration of the configuration values NC_KNKS_CONF (which knock sensor "hears" which cylinder), KNKS_1_DIAG and KNKS_2_DIAG (which cylinder will be taken for which knock sensor regarding diagnosis).

Range Check

In the range check a test will be done to find out if the output signal of the knock-IC is in the allowed working range between the calibratable minimum fault detection threshold and maximum fault detection threshold. A fault case is given if the minimum threshold is fallen-below or the maximum limit is exceeded. The ERR_SYM_KNKS is set when one (or more) of the monitored signals infringe a fault threshold.

Master -Algorithm

In the master-algorithm the bandwidth of the signal (DYW_KNKS_DIAG = NL[NC_CYL_NR] - KNKS[NC_CYL_NR] will be calculated for the concerned cylinder which is allocated to the concerned knock sensor regarding diagnosis purposes. The calculated bandwidth will be compared to the calibrated threshold value IP_DYW_MIN_KNKS_DIAG.

At short circuit against ground or VB as well as a broken signal line the bandwidth of the signal does not exceed the threshold value. In this case the counter CYCNR_DYW_KNKS_DIAG will be incremented in each monitored segment.

As soon as the bandwidth of the sensor signal exceeds the value IP_DYW_MIN_KNKS_DIAG again and LV_ERR_KNKS is not set the value will be reset again. In the case of LV_ERR_KNKS already set the value CYCNR_DYW_KNKS_DIAG will be decremented by 5 units.

If the counter reaches the value C_CYCNR_KNKS_DIAG a failure of the knock sensor will be set if the ’slave’-algorithm confirms this failure. When a failure has already debounced the SYM_3 is set as long as the counter of the master-algorithm is above 5. This is to delay the failure recovery.

The counter will be reset at transition LV_CDN_DIAG_KNKS = 0=>1.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Slave -Algorithm

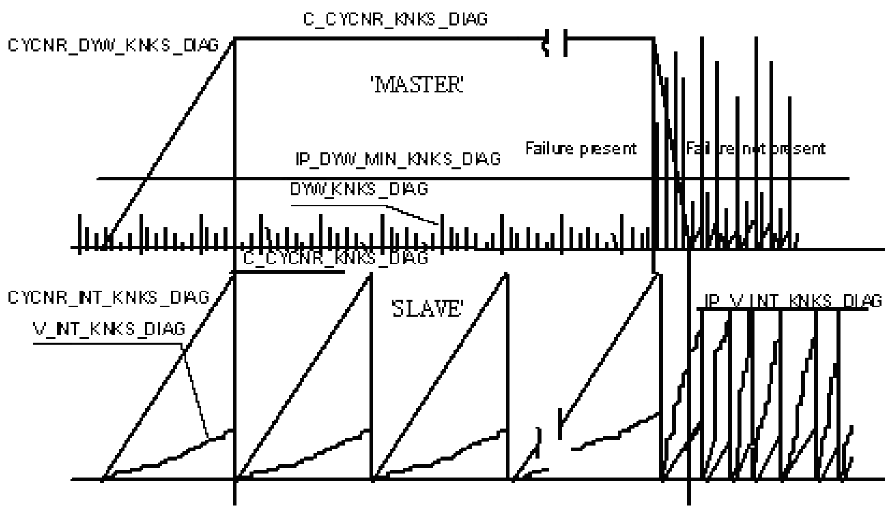
In the slave-algorithm the bandwidth of the sensor signal will also be used as an input signal. It will be recorded in its chronological process and will be integrated by means of an appropriate integration method. The calculated integral value V_INT_KNKS_DIAG will be compared to the threshold value IP_V_INT_KNKS_DIAG.

As soon as the threshold value is reached or exceeded the counter CYCNR_INT_KNKS_DIAG will be reset. Otherwise it will be incremented by '1' in each monitored segment. When the counter reaches the value C_CYCNR_KNKS_DIAG the sensor failure will be confirmed through the slave-algorithm and value CYCNR_INT_KNKS_DIAG and value V_INT_KNKS_DIAG reset to 0.

The counter will be reset at transition LV_CDN_DIAG_KNKS = 0=>1.

If a sensor failure is recognized by both algorithms the debounce will get started.

Description:



Application conditions

Initialisation:

Error treatment:

For each cylinder a separate fault location is used
symptoms for cylinder[NC_CYL_NR]

Diagnostic KNK_PRE	Symptom description	Symptom	Filter type
knock control pre-ignition cylinder shut off *cylinder[NC_CYL_NR]*		-	STD_INI
		-	
		-	
	knock control pre-ignition cylinder shut off	*SYM_3*	

FUNCTION DESCRIPTION:

General information:

Workshops must be able to get information about cylinder shut off caused by pre-ignition detection e.g. in case of engine damages.

Description:

For error management failures on single cylinders should be set after a certain number of detected Pre-Ignitions by knock control.
The fault is detected by the error management.

Application conditions

Initialisation:
```
according filter type 'STD_INI'
         (ERR_SYM_KNK_PRE[0 to NC_CYL_NR-1] = NO_SYM,
         LV_ERR_KNK_PRE[0 to NC_CYL_NR-1] = 0, ...)
         (clear general failure memory variables)
 according filter type 'STD_INI'
         CTR_ABC_KNK_PRE_DIAG[0 to NC_CYL_NR-1] = 0
         tmp_err_sym_knk_pre[0 to NC_CYL_NR-1] = NO_SYM
         (clear individual detection delay counter and temporary
failure symptom also, e.g.  at failure memory reset)
```

Recurrence:
```
segment synchronous (analogous knock control)
 every 720° CRK for the individual cylinder - update for cylinder
x
 only in the corresponding segment, where injection shut off
bit could change
```

Activation:
```
If            LV_KNK_CTL_PRE_ENA = 1
       Then      LV_CDN_DIAG_KNK_PRE[CYL_ID_KNK] = 1
```

Deactivation:
```
If            LV_KNK_CTL_PRE_ENA = 0
       Then      LV_CDN_DIAG_KNK_PRE[CYL_ID_KNK] = 0
```

Formula section:

If LV_KNK_PRE_DET = 1
Then CTR_ABC_KNK_PRE_DIAG[CYL_ID_KNK] =
CTR_ABC_KNK_PRE_DIAG[CYL_ID_KNK] + IP_ABC_INC_KNK_PRE_DIAG(N_32)
If CTR_ABC_KNK_PRE_DIAG[CYL_ID_KNK] >=
C_ABC_MAX_KNK_PRE_DIAG
Then ERR_SYM_KNK_PRE[CYL_ID_KNK] = SYM_3
Endif
Endif
The debounce algorithm is realized by a customized functionality.
Because of that C_ABC_INC_KNK_PRE must be set >= C_ABC_MAX_KNK_PRE.
The bits LV_ERR_xx and LV_END_DIAG_xx are set by the error management after debounce.
N.B.: CYL_ID_KNK represents, where the corresponding cylinder is evaluated by the module 'Knock Control'

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

Short circuit to ground:

If V_SOF_SWI < C_V_SOF_SWI_MIN **AND**
CONF_SOF_SWI = 1
Then ERR_SYM_SOF_REQ = SYM_1
LV_ERR_SOF_REQ = 1 *(after debounce)*
Endif

Short circuit to Ubatt or open line:

If V_SOF_SWI > C_V_SOF_SWI_MAX
Then ERR_SYM_SOF_REQ = SYM_0
LV_ERR_SOF_REQ = 1 *(after debounce)*
Endif

Calculation of end of diagnosis:

For calculation of LV_END_DIAG_SOF_REQ see Anti-bounce - algorithmus, calculation of the end of diagnosis .

A.107.2 Sound flap diagnosis (LV_ERR_SOF)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the sound flap signal from the driver which controls the sound flap. Diagnosis is only done if variant sound flap is choosen.

Description:

For error detection algorithm see "Electrical diagnosis of powerstage outputs ATIC39".
(Static control of PIN)

```
|_|_|_|_|
 | | | └─> Short circuit to Vbatt      (= SYM_0)
 | | └───> Short circuit to ground     (= SYM_1)
 | └─────> Open load                   (= SYM_2)
 └───────> -                           (= SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK = 0 1 or ECU reset)

Recurrence: *100ms*

Activation: *LV_VAR_SOF = 1*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_SOF = 1) the diagnosis conditions are set according infrastructure information: CDN_DIAG_SOF.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_SOF.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_SOF and ERR_DIAG_SOF
This algorithm determines:
ERR_SYM_SOF (Detected error symptom)
LV_ERR_SOF (Error flag for debounced error)
LV_CDN_DIAG_SOF (Diagnosis condition information)
LV_END_DIAG_SOF (End of diagnosis information)

Diagnosis inhibition:

```
IF      LV_IGK = 1                  AND
        LV_CDN_VB_MIN_DIAG = 1      AND
        LV_ERR_SPI_MPS = 0
THEN    LV_INH_DIAG_SOF = 0
ELSE    LV_INH_DIAG_SOF = 1
ENDIF
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

Copyright (C) Continental AG,2007

General information:

The NOx sensor has an own Electronic Control Unit (ECU), which monitors the cable connection between sensor element and sensor ECU on electrical faults like open circuits or short circuits. The actual monitoring result/the actual diagnosis result is cyclic transmitted to the EMS by the CAN messages, which include the sensor measurement signals.
The purpose of this diagnosis is to evaluate the cyclic received sensor ECU diagnosis result. If the sensor ECU reports an electrical fault (OBDI error between sensor element and sensor ECU) then this error is debounced and stored within error memory by use of standard error memory algorithm.
At ERR_SYM_NS_OBD_1_HTP, ERR_SYM_NS_OBD_1_NOX, ERR_SYM_NS_OBD_1_LAMB and ERR_SYM_NS_OBD_1_VLS combinations of error symptoms are possible (0...0x0F).
The following table describes the meaning of NOx sensor status byte:
Remark: The meaning of NOx sensor error byte was copied from NOx sensor specification of sensor manufacturer. If the sensor manufacturer makes a change at sensor error byte meaning, then this specification will not be updated!

NOx sensor error byte: ERR_NS[i]								
B7	B6	B5	B4	B3	B2	B1	B0	Function
0	0	0	0	0	0	0	0	no failure detected
							1	open wire at heater circuit
						1		open wire at NOx circuit
					1			open wire at linear Lambda circuit
				1				open wire at binary Lambda circuit
			1					short circuit at heater circuit
		1						short circuit at NOx circuit
	1							short circuit at linear Lambda circuit
1								short circuit at binary Lambda circuit

Specific diagnostic information to the project are defined in chapters Diagnostic general information or application incidence (EOL, DTC, error code number, symptom number...).

Description:

Error-symptoms of heater diagnosis are defined as following:

A.109.1 Inhibition of NOx sensor error byte evaluation

FUNCTION DESCRIPTION:

General information:

The flag LV_INH_DIAG_NS_OBD_1[i] allows to inhibit the NOx sensor OBDI diagnosis, which evaluates the NOx sensor error byte.

Application conditions

Initialisation: at reset, at deactivation: LV_INH_DIAG_NS_OBD_1[i] = 1

Recurrence: *100ms*

Activation: *LV_ST_END = 1*

Deactivation: *LV_ST_END = 0*

Formula section:

if *(NOx message has not been received via LOCAN at least for once - LV_VAR_NOX)*

LV_VAR_NOX = 0 **OR**

LV_CDN_VB_CAN_DIAG = 0

then LV_INH_DIAG_NS_OBD_1[i] = 1

else LV_INH_DIAG_NS_OBD_1[i] = 0

endif

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.111.1 LV_ERR_EGY_MIN for production and garage mode

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis shall be to detect an activated energy spare mode. There are different energy spare modes. In this chapter the production and the garage mode are treated.

Application conditions

Initialisation:
```
all 0 at LV_IGK 0 -> 1 or  reset
 LV_END_DIAG_EGY_MIN is initialized by ERRM
```

Recurrence: *1s*

Activation:
```
If          LV_IGK = 1 and  LC_EGY_MIN_DIAG = 1
 Then       LV_CDN_DIAG_EGY_MIN = 1
 Endif
```

Deactivation:
```
If          LV_IGK = 0 or  LC_EGY_MIN_DIAG = 0
 Then       LV_CDN_DIAG_EGY_MIN = 0
 Endif
```

Formula section:

If STATE_EGY_MIN_KWP = 0 **or** STATE_EGY_MIN_KWP = 2
Then LV_ERR_EGY_MIN = 0
ERR_SYM_EGY_MIN = NO_SYM
Else LV_ERR_EGY_MIN = 1

A.112.1 Plausibility check between signal from CAn and HW-signal

FUNCTION DESCRIPTION:

Description:

For BN2000-vehicles there are two possibilities of getting the LV_IGK-signal:

1. via CAN (from the control unit CAS)
2. via HW-signal (“Weckleitung”)

In order to detect a CAS error or a HW-error (e.g. shortcut to ground) a plausibility check has to be done between CAN-signal and HW-signal. SYM_0, SYM_1 and SYM_3 are debounced with the recurrence of Klemmenstatus or Klemmen message. SYM_2 is debounced with the recurrence of 10 ms (no message with Klemmen informnation available).

Application conditions

Initialisation: *all 0 at reset*

Recurrence: *10ms*

Activation:

```
if          LV_VAR_BN = 1
Then     if       (VB > = C_VB_MIN_IGK_DIAG)
      then     LV_CDN_DIAG_PLAUS_IGK_BN = 1
      endif
       Else      LV_CDN_DIAG_PLAUS_IGK_BN = 0
       Endif
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Deactivation:

```
if        (VB < C_VB_MIN_IGK_DIAG)      or
     at   State bus sleep
then      LV_CDN_DIAG_PLAUS_IGK_BN = 0
endif
```

Formula section:

IF STATE_PLAUS_IGK_BN = 0H **and**
Klemmen or Klemmenstatus message from CAS received
THEN ERR_SYM_PLAUS_IGK_BN = NO_SYM
LV_ERR_PLAUS_IGK_BN = 0 after rebounce
ELSEIF STATE_PLAUS_IGK_BN = 1H
THEN ERR_SYM_PLAUS_IGK_BN = SYM_0 **//SCB, Master CAN**
LV_ERR_PLAUS_IGK_BN = 1 after debounce
ELSEIF STATE_PLAUS_IGK_BN = 2H
THEN ERR_SYM_PLAUS_IGK_BN = SYM_1 **//SCG, Master CAN**
LV_ERR_PLAUS_IGK_BN = 1 after debounce
ELSEIF STATE_PLAUS_IGK_BN = 4H
THEN ERR_SYM_PLAUS_IGK_BN = SYM_2 **//CAS error, Master HW**
LV_ERR_PLAUS_IGK_BN = 1 after debounce
ELSEIF STATE_PLAUS_IGK_BN = 8H
LV_ERR_PLAUS_IGK_BN = 1 after debounce
THEN ERR_SYM_PLAUS_IGK_BN = SYM_3 **// CAN-signal not plausible**
ENDIF

For calculation of condition-diagnosis-bit and end of diagnosis-bit LV_END_DIAG_PLAUS_IGK_BN see “Anti-bounce - algorithmus, calculation of the end of diagnosis”

For failure and error management treatment the anti-bounce mechanism is called :
ACTION_ERRM_FilterSymptom(IN<NC_IDX_DIAG_PLAUS_IGK_BN>, IN<LV_CDN_DIAG_PLAUS_IGK_ BN >, IN<ERR_SYM_PLAUS_IGK_ BN >, IN<ABC_INC_PLAUS_IGK_ BN >, IN<1>, IN<ABC_MAX_PLAUS_IGK_ BN >, OUT<LV_ERR_ PLAUS_IGK_ BN >)

A.112.2 Diagnosis of KL15-3 with plausibility check to the signals from CAN and HW-signal KL15-WUP

FUNCTION DESCRIPTION:

Description:

The HW-signal KL15-3 is redundant to the Kl15WUP, but the engine won’t start if KL15-3 is not available. To make the reason of a non starting engine in the case of a missing KL15-3-line visible, a diagnosis for the signal is necessary.
To detect a error at the input KL15-3, a plausibility check to the Kl15WUP and the CAN-singal has to be done.
SYM_0, SYM_1 are debounced with the recurrence of Klemmenstatus or Klemmen message).

Application conditions

Initialisation: *all 0 at reset*

Recurrence: *10ms*

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. General information

The Main Relay Diagnosis is performed to detect if the Main Relay has switched and remains on after Key-On and if it has switched off after the Power Latch Phase

A.113.1 Main relay "switch on" /"switched off" diagnosis

General information:

Description:

The diagnosis is delayed for C_T_DLY_RLY_MAIN_DIAG to allow the relay to switch on/off. After this the actual VB is compared with a diagnostic threshold. If the error conditions are fulfilled the error is debounced.

If an error is detected after the Power Latch Phase the ECU is switched off after T_RLY_MAIN_DIAG has elapsed.

Error-symptoms are defined to this diagnosis function as following :

```
 ┌─┬─┬─┬─┐
 │ │ │ │ │
 └─┴─┴─┴─┘
  |  |  |  └─> Main relays has not switched off      (= SYM_0)
  |  |  └────> Main relays has not switched on       (= SYM_1)
  |  └───────> -                                     (= SYM_2)
  └──────────> -                                     (= SYM_3)
```

Figure A.113.1:

Application conditions:

Initialisation: `all 0 at LV_IGK 0->1 or reset or at clearing error memory`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

	but T_RLY_MAIN_DIAG is calculated as described below
Activation:	see Formula section
Deactivation:	-
Recurrence:	The application recurrence for the Diagnosis is 10 ms; The "Main Relay Off"-Detection is performed only once after power latch.

Function description:

Formula section:

Detection if Main Relay is on during Key-On

Call I/O Power-Stage-Diagnosis (Short to Ubatt) and ignore return value in order to restart the Power-Stage after shut off due to short circuit to battery

//this is done to try to wake up the power stage after instable battery voltage

```
ACTION_INFR_GetElDiagRlyMain (OUT<cdn_diag_rly_main>, OUT<err_rly_main>)

If(1)   LV_RLY_MAIN = 1              and
        LV_END_DIAG_RLY_MAIN = 0     and
        V_IGK   >  C_V_IGK_RLY_MAIN_DIAG
            //direct connection to the battery,
            to ensure a battery voltage that would be able to switch the relay

Then(1)     wait time: C_T_DLY_RLY_MAIN_DIAG
            //time to allow the relay to switch, set only once.  For continuos
            diagnosis set to 0

Endif
// because the OFF-diagnosis is used only in L4 projects, the PWL_LOCK_CDN should
be set only in L4 projecs.
```

Calculation end of diagnosis

LV_END_DIAG_RLY_MAIN is calculated by error management after diagnosis is active

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Detection if Main Relay is off after Power Latch Phase:

```
If(1)       LV_RLY_MAIN = 0 and LV_VAR_L6 = 0  // no Relay-OFF-diagnosis at L6
Then(1)     LV_END_DIAG_RLY_MAIN = 0
            LV_ERR_RLY_MAIN = 0 //reset of error to be able to set it with
                                 new symptom
            start time:    C_T_DLY_RLY_MAIN_DIAG
            //time to allow the relay to switch
   If(2)        PWL_LOCK_CDN is set and
                C_T_DLY_RLY_MAIN_DIAG has run out
   Then(2)      start  T_RLY_MAIN_DIAG  for  C_T_RLY_MAIN_DIAG
               (start the time window during  the diagnosis is performed)
      If(3)         T_RLY_MAIN_DIAG  is still running
      Then(3)        LV_CDN_DIAG_RLY_MAIN = 1
        If(4)         VB   >  C_VB_RLY_MAIN_DIAG
                      //connection to battery via main relay
        Then(4)       ERR_SYM_RLY_MAIN = SYM_0
                      LV_ERR_RLY_MAIN = 1           //after debounce
        Else(4)       ERR_SYM_RLY_MAIN = NO_SYM
                      LV_ERR_RLY_MAIN = 0           //after rebounce
        Endif(4)
      Else(3)       LV_CDN_DIAG_RLY_MAIN = 0
                    erase lock condition for power latch phase (PWL_LOCK_CDN)
   Else(2)      T_RLY_MAIN_DIAG = 0                 //reset
                LV_CDN_DIAG_RLY_MAIN = 0            //no switched off Diagnosis
   Endif(2)
Else(1)    LV_CDN_DIAG_RLY_MAIN = 0                 //no Diagnosis
Endif(1)
```

A.113.2 Main relay “switched on too slow” diagnosis for pre-drive check

General information:

Description:

The main relay diagnosis is performed at reset to detect if the main relay has been switched on within the correct timing. This diagnostic is comparable to main relay switch on, but is separated for having faster reaction time.

Once no failure has been found, diagnosis is then disabled.

The diagnosis starts after LV_IGK 0->1. After this the actual VB is compared with a diagnostic threshold. If the error conditions are fulfilled the error is debounced.

Error-symptoms are defined to this diagnosis function as following :

```
 _______________
|___|___|___|___|
  |   |   |   └─> Main relay hasn't switched before predrive check (= SYM_0)
  |   |   └───> -                                                  (= SYM_1)
  |   └─────> -                                                    (= SYM_2)
  └───────> -                                                      (= SYM_3)
```

ACTION_INFR_GetElDiagIGK_OFF (**OUT**<Cdn_diag_ack_igk_off>,**OUT**<Err_diag_ack_igk_off>)

Note :
ACTION_INFR_GetElDiagIGK_OFF(), ACTION_INFR_SetElDiagIGK_OFF() are defined in the IRS (Infrastructure requirement specification)

FUNCTION DESCRIPTION:

General information:

The HW line acknowledge IGK off /starter relay for start stop automatic (STST) is driven by the ECU via an output driver. The failure detection is done by ECU Hardware.
The purpose of the diagnosis is to detect electrical faults as defined by OBD I requirements.

Description:

After activation conditions are met, the diagnosis activation is delayed for NC_PSD_DLY_ACK_IGK_OFF executions, to avoid the usage of wrong infrastructure information.
Error-symptoms and conditions: are defined to this diagnosis function as following

Diagnostic Instance		Symptoms		ABC type	CARB class
Description	**Name**	**Description**	**Nr**		
HW line acknowledge IGK_OFF / starter relay for start stop automatic (STST)	ACK_IGK_OFF	Sym 0 Short circuit to battery (SCP)	0	MPL_STD_INI	CC
		Sym 1 Short circuit to ground (SCG)	1		
		Sym 2 Open circuit (OC)	2		
		Sym 3 -	3		

Application conditions

Initialisation:
```
at transition LV_IGK 0 - -> 1:
  Set delay counter for NC_PSD_DLY_ACK_IGK_OFF
  at reset:
  Set delay counter for NC_PSD_DLY_ACK_IGK_OFF
```

Recurrence:
```
If      LV_IGK_OFF_ACK = 0
   then    100 ms
   else     20ms
 endif
```

Activation: `LC_IGK_OFF_ACK = 1  and  LV_IGK_OFF_ACK_ENA = 1`

Deactivation: *`LC_IGK_OFF_ACK  = 0 or  LV_IGK_OFF_ACK_ENA = 0`*

Formula section:

If LV_IGK = 1 **and**
LV_CDN_VB_OBD1 = 1
Then
Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_ACK_IGK_OFF and basic diagnosis conditions CDN_DIAG_ACK_IGK_OFF) received from the infrastructure:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_INFR_GetElDiagIGK_OFF (OUT<Cdn_diag_ack_igk_off>, OUT<Err_diag_ack_igk_off>)

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_ACK_IGK_OFF
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_ACK_IGK_OFF

If Activation conditions are met for the NC_PSD_DLY_ACK_IGK_OFF recurrence of the diagnosis
Then *[CDN_DIAG_ACK_IGK_OFF valid from Infrastructure]*
Else CDN_DIAG_ACK_IGK_OFF = 0
Endif

Else
CDN_DIAG_ACK_IGK_OFF = 0
Endif

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_ACK_IGK_OFF and ERR_DIAG_ACK_IGK_OFF.
ACTION_ERRM_FilterMulticondition (IN<ACK_IGK_OFF>, IN<CDN_DIAG_ACK_IGK_OFF>, IN<ERR_DIAG_ACK_IGK_OFF>, IN<C_ABC_INC_ACK_IGK_OFF>, IN<C_ABC_MAX_ACK_IGK_OFF>, OUT<LV_ERR_ACK_IGK_OFF>)
This algorithm determines:

ERR_DIAG_ACK_IGK_OFF	(detected error symptom for ACK_IGK_OFF diagnosis)
LV_ERR_ACK_IGK_OFF	(Error flag for debounced error of ACK_IGK_OFF)
LV_CDN_DIAG_ACK_IGK_OFF	(Diagnosis condition information)
LV_END_DIAG_ACK_IGK_OFF	(End of diagnosis information)

and LV_IGK = 1

Then

Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_AEB and diagnosis conditions CDN_DIAG_AEB) received from the infrastructure:
ACTION_INFR_GetElDiagAEB (OUT<CDN_DIAG_AEB>, OUT<ERR_DIAG_AEB>)

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_AEB
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_AEB

If Activation conditions are met for the NC_PSD_DLY_AEB recurrence
Then
{ No additional diagnosis conditions are necessary }
Else
CDN_DIAG_AEB = 0
Endif
Else
CDN_DIAG_AEB = 0
Endif

Failure filtering and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_AEB and ERR_DIAG_AEB.
ACTION_ERRM_FilterMulticondition (IN<*AEB*>, IN<CDN_DIAG_AEB>,
IN<ERR_DIAG_AEB>, IN<C_ABC_INC_AEB>, IN<C_ABC_MAX_AEB>,
OUT< LV_ERR_AEB>)

This algorithm determines:

ERR_SYM_AEB	(detected error symptom for AEB diagnosis)
LV_ERR_AEB	(Error flag for debounced error of AEB)
LV_CDN_DIAG_AEB	(Diagnosis condition information)
LV_END_DIAG_AEB	(End of diagnosis information)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.116.1 Diagnosis of successful BMW coding of variants via KWP

FUNCTION DESCRIPTION:

General information:

If not disabled by C_IDX_COD_CONV, this function checks the successful BMW coding of variants via KWP. Therefore the CAL-ID (identifier of the calibration- dataset) which is actual programmed in Flash memory is compared with the CAL-ID in the E2PROM. The CAL-ID is written to E2PROM memory only by receiving the tester command $3B_90 - Kurze Fahrgestellnummer schreiben. The receiving of this command is interpreted as successful coding.
If the two Call-IDs are not equal, a error is written into error memory. This error can only be erased by clearing the error memory.

Description:

Error symptoms are defined for this diagnosis function as:

- → - (= SYM_0)
- → - (= SYM_1)
- → Coding data in E2PROM lost (= SYM_2)
- → New calibration data might not be plausible (= SYM_3)

Application conditions

Initialisation: `all output data are set to 0 at clearing error memory`

Recurrence: `1000 ms`

Activation: `LV_IGK = 1` **and** `LV_ERR_VAR_COD = 0`

Deactivation: `not activation`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ERR_SYM_VAR_COD = SYM_3
endif(3)
endif(2)
endif(1)

A.116.2 Diagnosis of incorrect engine power variant

General information:

If not disabled by LC_VEH_POW_VAR_(TUN_)ERR_DIS = 1, this function checks the plausibility of the programmed (tuning) engine power variant.

Description:

Error symptoms are defined for this diagnosis function as:

Bit	Symptom	
0	-	(= SYM_0)
1	Tuning protection (SWT) intervention active	(= SYM_1)
2	Timeout CAN signal	(= SYM_2)
3	Programmed engine power variants are not identical	(= SYM_3)

Application conditions

Initialisation: *according ABC filter Type* ***MEM;*** *all other output data are set to 0*
at LV_IGK 01 ***or*** *reset* ***or*** *at clearing error memory*

Recurrence: 100 ms

Activation: LV_IGK = 1

Deactivation: not activation

Formula section:

// General engine power variant check
If(0) LV_ERR_CAN_BOFF = 0
then(0)
If(1) LC_VEH_POW_VAR_ERR_DIS = 0
then(1) T_VEH_POW_VAR_ACT = T_VEH_POW_VAR_ACT$_{n-1}$ + 100 ms ,

Maximum vehicle speed treshold for adaptation					

FUNCTION DESCRIPTION:

General information:

The throttle position is determined by a two-channeled sensor system (contact potentiometer). Both channels deliver inverse dispersing voltage signals. In order to reduce the measurement inaccuracy, the two signal voltages will be referenced to their supply voltage. After the initial engine start and component change the characteristic Potentiometer value is learnt within an adaptation routine. The value for the lower stop is stored at the end of the driving cycle in the non-volatile memory.

A plausibilization unit monitors both sensor signals, as well as the belonging supply voltage and from them establishes the system state of the THR-position acquisition (undisturbed, disturbed, THR-position not recognizable). From the voltages of both TPS-channels, the THR-position for each channel is determined, taking into consideration the adaptation values for the lower stop. Based on the determined state of the system, the resulting THR-position is determined by the individual values. In case of a disturbance of the position acquisition (LV_ERR_TPS_x 0, see chapter TPS diagnosis), the selection of the position is conducted from one of the two TPS-channels - respectively, in case of a complete collapse, the THR-control is switched off (limp home).

Application conditions

Initialisation: all error memory outputs are initialized with 0 (LV_ERR_..., LV_CDN_DIAG_..., ERR_SYM_..., LV_END_DIAG_...)
LV_TPS_ST_BOL_END = 0 at transition LV_IGK 0 → 1
remaining outputs see chapters

Recurrence: *5ms*

Activation: *see Chapters*

Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The acquisition of the throttle position includes two sections: the start-check routine and adaptation routine. The start-check routine is a kind of slightly reduced adaptation routine with own thresholds and the possibility to be aborted after a first LIH-check by engine start. It is carried out at every switch on the engine control unit. In the case engine is started before start routine is finished, old adaption values for the lower mechanical stop are used. The adaptation routine starts only if the adaptation is requested.

A.117.2 Initialization

General information:

The delivered voltage from the TPS-poti is a measurement for the throttle position. Because of the electrical and the mechanical tolerances, the characteristic potentiometer values must be adapted. The adaptation and diagnosis of the Poti-voltages for the lower mechanical stops and Limp Home (LIH) occurs within a set routine. By learning and checking of the Limp Home position it delivers information whether there has been an exchange in the throttle actuator. The adapted lower mechanical stop and the upper check position are used as a reference point for the calculation of the throttle valve position. The upper mechanical stop is not learned. During the adaptation phase no limitations of the THR-setpoint are active. The learned value for the lower stop and the upper position is stored at the end of the driving cycle as non-volatile .

Formula section:

At the beginning of the adaptation (either 1^{st} adaptation at end of line or adaptation requested by failed start check) the values are described with the following EEPROM- and Default-values:
Default (only if adaptation requested LV_TPS_AD_REQ = 1):

V_TPS_AD_LIH_1 = C_V_TPS_SP_LIH_1
V_TPS_AD_LIH_2 = C_V_TPS_SP_LIH_2
V_TPS_AD_EL_BOL_1 = C_V_TPS_AD_BOL_INI_1
V_TPS_AD_EL_BOL_2 = C_V_TPS_AD_BOL_INI_2
TPS_AD_SLOP_GAIN_1 = C_TPS_AD_SLOP_GAIN_INI_1
V_TPS_AD_OFS_GAIN_1 = C_V_TPS_AD_OFS_GAIN_INI_1
TPS_LIH_1 = TPS_LIH_2= TPS_SP_AD = TPS_LIH_INI

Always:

TPS_LIH_INI = C_TPS_SLOP /2 * (C_V_TPS_SP_LIH_1- C_V_TPS_AD_BOL_INI_1- C_V_TPS_SP_LIH_2+ C_V_TPS_AD_BOL_INI_2)
TPS_SP_AD = TPS_LIH_1

A.117.3 Calculation of ERRM output variables

A.117.3.1 Diagnosis condition definition

Description:

The diagnosis condition for LV_ERR_TPS_AD is true as long as the adaptation routine is active.
The diagnosis condition for LV_ERR_TPS_ST_CHK_1 is true if TPS_AD_STEP = ST_LIH_2.
The diagnosis condition for LV_ERR_TPS_ST_CHK_2 is true if TPS_AD_STEP = ST_UP_POS **or** ST_LIH_2.
The diagnosis condition for LV_ERR_TPS_AD_BOL is true if TPS_AD_STEP = ST_BOL.

Formula section:

If TPS_AD_STEP = 5H **or** 6H **or** 7H **or** 8H **or** 9H **or** AH
Then LV_CDN_DIAG_TPS_AD = 1
Else LV_CDN_DIAG_TPS_AD = 0
Endif

        Endif
          If        TPS_AD_STEP = AD_END            or
                    LV_TPS_AD_REQ = 0
        Then        LV_END_DIAG_TPS_AD = 1
        Endif
Endif
```

A.117.4 Requests to activate the adaptation-routine or start-check

Description

After the control unit is switched on the activation bit for start-check or adaptation is set (LV_TPS_AD_ACT=1).

If the adaptation request LV_TPS_AD_REQ is set then the adaptation-routine will start otherwise the start-routine is activated.

Conditions for setting LV_TPS_AD_REQ:

- In initial start (first engine run or control unit exchange), that means no adaptation values are stored in the non volatile memory
- After a component exchange , if the poti values are lie outside the tolerance window
- Check sum error is current
- Initiated by the tester
- Adaptation demand requested by diagnosis e.g. if adaptation or start-check was failled

Formula section:

```
If              Adaptation request is active
Then        LV_TPS_AD_REQ = 1
Endif

If              LV_IGK 0->1
Then        LV_TPS_AD_ACT = 1              //activation bit for adaptation or start-check
              LV_TPS_AD_CUR_OFF = 1               //request to switch off ETC
            INH_IV_TPS_AD = 63             //inhibition of injection
      If                  LV_TPS_AD_REQ = 0
      Then                   Start routine
                     TPS_AD_STEP = ST_LIH_1
  Else                     Start of adaptation routine
                     TPS_AD_STEP = AD_LIH_1
  Endif
Endif
```

A.117.4.1 Monitoring of adaptation or start-check conditions

Description:

To get a plausible battery voltage the check of conditions for adaptation or start-check is delayed 80 ms after control unit is switched on.
If the conditions are exceeded the routine (adaptation or start-check) is stopped, injection will be re-leased.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

If the conditions are exceeded during the adaptation routine then:

- Error Adaptations conditions exceeded is set
- ETC limp home 2 EMB is activated
- New adaptation in the next driving cycle is requested

If the conditions are exceeded during the start check routine, it will be ignored without error entry.

Formula section:

```
If(1)        LV_TPS_AD_ACT = 1          and        //Adaptation or Start-check is active
             time delay of 80ms after LV_IGK = 1 is ellapsed
Then(1)
  If(2)      LV_IGK = 0                               or
             VB  <  C_VB_MIN_TPS_AD                   or
             N  >  C_N_MAX_TPS_AD                     or
             VS  >  2km/h (NC_VS_MAX_TPS_AD)          or
             TIA  ≤ C_TIA_MIN_TPS_AD                  or
             TCO  ≤  C_TCO_MIN_TPS_AD                 or
             TCO  ≥  C_TCO_MAX_TPS_AD                 or

A.117.5 Start check routine

General information:

The Start-check routine includes:

- First limp home check and Adaptation of the Limp Home Position
- Limp home spring test
- Second limp home check
- Adaption of lower mechanical stop

A.117.5.1 First Check of Limp Home position at Start routine (ST_LIH_1)

Description:

When checking the Limp Home position the throttle valve is staying without current hold by spring power in the Limp Home position. The actual sensor-signals are compared with their adaptations in the non-volatile memory.
If the actual voltage values during the time interval are outside the hysteresis (Fig. 4) then no agreement is recognised and a new adaptation is necessary or an engine start must be cancelled (Fig. 3).

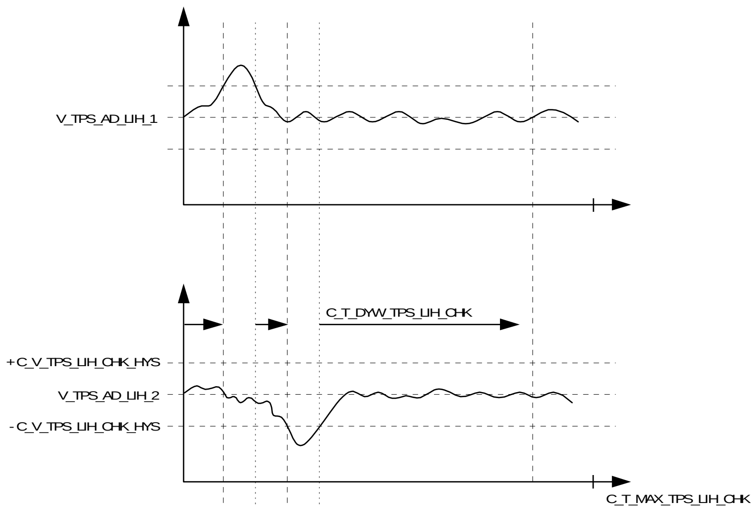

Figure A.117.2: Checking the Limp Home position (CHK_LIH)

Formula section:

TPS_AD_STEP = ST_LIH_1

LIH Check:

IF(1) LV_TPS_AD_ACT = 1 **and**
LV_MTC_CUR_OFF = 1 **and**
LV_TPS_AD_REQ = 0

Then(1) Start Time: C_T_MAX_TPS_LIH_CHK
If(2) T< C_T_MAX_TPS_LIH_CHK
Then (2) Start Time:C_T_DYW_TPS_LIH_CHK
IF(3) V_TPS_X - V_TPS_AD_LIH_x C_V_TPS_LIH_CHK_HYS (X = Poti 1, 2)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Then (4) V_TPS_AD_LIH_x = C_V_TPS_AD_WIN_LIH + C_V_TPS_SP_LIH_x
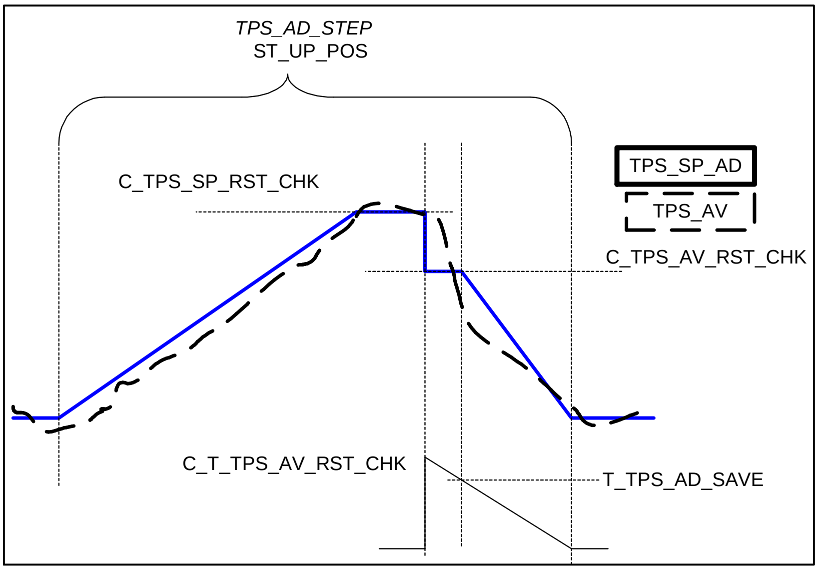
Else (4) V_TPS_AD_LIH_x =C_V_TPS_SP_LIH_x - C_V_TPS_AD_WIN_LIH
Else(2) start **"Then (1)"** again
Else(1) continue with the old adaptation values
Endif

A.117.5.2 Spring Test at the Start routine (ST_UP_POS)

Description:

Out of the Limp home position the throttle position setpoint is increased using the changing limitation until the setpoint for testing the retracting spring is reached. Now a timer is started. The actual value of the throttle position has to reach the setpoint within the hysteresis within a limit maximum of time.
Regarding certain cases with closed throttle at the limp home position it is necessary to switch on the position controller near the lower mechanical stop to prevent that the throttle is going into the lower mechanical stop with high acceleration.

Signal flow diagram:



Formula section:

A.117.5.4 Adaption of lower mechanical stop and limp home spring test opening at Start routine (ST_BOL)

Description:

During a complete start check (not aborted by a quick start), the lower mechanical stop is learnt. After successful adaptation, the adaptation values V_TPS_AD_EL_BOL_1/2 are saved in the non-volatile memory. If the adaptation is not completed successfully (e.g. abnormal termination due to violation of the activation conditions), the adaptation value learnt last remains valid.
During adaptation, all voltage values must be within the adaptation window V_TPS_AD_EL_BOL_X C_V_TPS_AD_WIN_2_BOL; otherwise LV_ERR_TPS_AD_BOL is set.
A hysteresis band C_V_TPS_AD_HYS is placed around the first detected value (pots 1 and 2). If all values are within this hysteresis band during the adjustable time C_T_TPS_AD_HYS, the adaptation values are determined from the first and last value each (Fig. 6). If the value of a pot is outside of the hysteresis band, the operation is re-started for the two pots. The learning algorithm is limited by the maximum time C_T_MAX_ST_CHK_AD_MEC_BOL.

A.117.6 Adaptation routine

General information:

The Adaption routine includes:

- Limp home check and Adaptation of Limp Home Position
- Limp home spring test closing and adaptation of upper position
- Limp home check
- Limp home spring test opening and Adaptation of lower mechanical stop
- Limp home check

A.117.6.1 Adaption of Limp Home position at Adaption routine (AD_LIH_1)

Description:

The first step is the adaptation of the Limp Home position. The actuator is without current and is forced by the spring power in the limp home position.

The learning of the adaptation value depict the algorithm in Fig. 6. During the adaptation all the voltage values must be in the adaptation windows. A hysteresis band is set up around each of the first recorded values (poti 1 and 2). If all the values lie in this hysteresis band during an adjustable time then the

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

adaptation values are determined from each first and last value. If the Poti-value lies outside the hysteresis band then the process is newly started for both Poti's. The learning algorithm is limited by the maximum time. This procedure is the same for the Limp home position and the lower mechanical stop. Just the calibration values are different.
An error memory entry occurs only at the adaptation after ECU-first initialisation not at the continuous LIH-adaptation. An error is detected if the adaptation could not be carried out during the max. time C_T_MAX_TPS_AD.

Formula section:

TPS_AD_STEP = AD_LIH_1

A.117.6.2 Spring test at the adaptation routine (AD_UP_POS)

Description:

After passing the check of limp home position the adaptation routine goes on with the spring test. Out of the Limp home position the throttle position set point is increased using the changing limitation until the set point for testing the retracting spring is reached. Now a timer is started. The actual value of the throttle position has to reach the set point within the hysteresis and a limit of time. Then the upper position will be adapted and the throttle is returning currentless.

Formula section:

FUNCTION DESCRIPTION:

General information:

This diagnosis is to detect a throttle valve error or a jammed actuator.

The following diagnosis are performed:

- Pulse width modulation check
- Control difference check

Description:

Pulse width modulation check:

If the given pulse width modulation signal MTCPWM exceeds the position controller permissible maximum value C_MTCPWM_PI_MAX_DIAG for longer than C_T_MTCPWM_PI_DIAG then the error is detected and a reversible limp home is applied.

If the pulse width modulation signal lies below the threshold C_MTCPWM_PI_MAX_DIAG as long as T < C_T_MTCPWM_PI_DIAG_CUR_OFF then the jammed throttle valve could break free (LV_ERR_MTC_CTL_1 is reset to 0) and the reversible limp home is passive.

If the pulse width modulation signal lies below the threshold C_MTCPWM_PI_MAX_DIAG for longer then C_T_MTCPWM_PI_DIAG_CUR_OFF then a irreversible limp home is applied (Throttle is switched off).

Error symptoms are defined to this diagnosis as:
MTC_CTL_1

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
□□□□
 |  |  |  └─> MTC; pulse width modulation <1s exceeded     (= SYM_0)
 |  |  └────> -                                             (= SYM_1)
 |  └───────> -                                             (= SYM_2)
 └──────────> -                                             (= SYM_3)

 └──────────> -                                             (= SYM_3)
```

Checking the control difference
If the throttle valve control difference TPS_DIF exceeds the permissible maximum value C_TPS_DIF_MAX_DIAG for longer than C_T_TPS_DIF_DIAG then a error is detected and a irreversible limp home is applied (Throttle is switched off).

Error symptoms are defined to this diagnosis as:

MTC_CTL_3

```
□□□□
 |  |  |  └─> MTC; control difference check     (= SYM_0)
 |  |  └────> -                                  (= SYM_1)

FUNCTION DESCRIPTION:

General information:

The following TPS/ETC-Limp Home system reactions are defined:

- **TPS-EMERGENCY-MAX** *(STATE_TPS_DIAG = TPS_LIH_MAX)*
- **TPS-EMERGENCY-X** *(STATE_TPS_DIAG = TPS_LIH_X)*
- **ETC-LIMP-HOME-1** *(STATE_ETC_LIH = ETC_LIH_1)*
- **ETC-LIMP-HOME-2-REV** *(STATE_ETC_LIH = ETC_LIH_2_REV)*
- **ETC-LIMP-HOME-2 (SAS)** *(STATE_ETC_LIH = ETC_LIH_2)*
- **ETC-LIMP-HOME-3** *(STATE_ETC_LIH = ETC_LIH_3)*

All **ETC-LIMP-HOME-..** have a higher priority then all **TPS-EMERGENCY-..**

Application conditions

Initialization: `all outputs = 0 at LV_IGK 0->1 or reset or at clearing error memory`
`LV_ERR_TPS according ABC type` **`STD_INI`**

Recurrence: `5ms`

Activation: `LV_IGK = 1`

Deactivation: `LV_IGK = 0 (set LV_CDN_DIAG_TPS = 0)`

A.119.1 TPS-EMERGENCY-MAX

(STATE_TPS_DIAG = TPS_LIH_MAX)

Description:

If TPS-Emergency MAX is activ, there is a maximum selection between the two channels (see Determination of the Throttle Position).

Formula section:

If LV_DET_ERR_TPS_RATIO = 1
Then STATE_TPS_DIAG = TPS_LIH_MAX
Endif

A.119.2 TPS-EMERGENCY-X

(STATE_TPS_DIAG = TPS_LIH_X)

Description:

If one TPS channel (=Y) is detected as faulty then TPS-EMERGENCY-X is active.
If TPS-EMERGENCY-X is active, the throttle position acqusition is done with a leading Poti-X (see Acqusition of the throttle position).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

If LV_ERR_TPS_Y = 1 **or**
LV_ERR_TPS_MAF_Y = 1
Then STATE_TPS_DIAG = TPS_LIH_X
Endif
Idle speed demand:
If STATE_TPS_DIAG = TPS_LIH_X **and**
LV_CT = 1
Then LV_TPS_MTC_N_LIM = 1 (see Engine speed limit coordination)
Endif

A.119.3 ETC-LIMP-HOME-1 /ETC-LIMP-HOME-2-REV

(STATE_ETC_LIH = ETC_LIH_1) /(STATE_ETC_LIH = ETC_LIH_2_REV)

Description:

ETC-LIMP-HOME-1 is demanded by the ETC diagnosis (see Engine throttle diagnosis and adaptation) and the ETC driver diagnosis.

During ETC-LIMP-HOME-1 the following limp home measures are defined:

- Throttle valve without power (hold by spring power in the Limp-Home position)
- Engine speed limitation in limp home mode (with considering the drivers request)

ETC-LIMP-HOME-2-REV is initiated reversible until the ETC-Limp Home throttle position (for calibration data and additional information see: Check of the Limp-Home position in chapter Engine throttle diagnosis and adaptation) has been safely reached.
If the Limp-Home Position is reached ETC-LIMP-HOME-1 is set, if not ETC-LIMP-HOME-2 is set.

During ETC-LIMP-HOME-2_REV the following limp home measures are defined:

- Throttle valve without power (hold by spring power in the Limp-Home position)
- Engine speed limitation in limp home mode (without considering the drivers request)

Formula section:

Activation condition of ETC-LIMP-HOME-1:
If(1) [STATE_ETC_LIH = ETC_NO_LIH **and**
LV_ERR_MTC_DR = 1 **or**
LV_ERR_MTC_CTL_3 = 1 **or**
LV_TPS_AD_DIAG_CUR_OFF = 1]
Or
[STATE_ETC_LIH = ETC_LIH_3 **and**
LV_ERR_MTC_CTL_2 = 1
Then(1)
Activation of ETC-LIMP-HOME-2-REV:
STATE_ETC_LIH = ETC_LIH_2_REV
LV_MTC_CUR_OFF_REQ = 1 (ETC without power request)
LV_N_LIM_ETC_LIH = 1
LV_TPS_MTC_N_LIM = 1 (see Engine speed limit coordination)
Check of Limp Home position:
Start Time: C_T_MAX_TPS_LIH_CHK
IF(2) T < C_T_MAX_TPS_LIH_CHK **and**
IV_TPS_X - V_TPS_AD_LIH_XI < C_V_TPS_LIH_CHK_HYS

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Within the interval: C_T_DYW_TPS_LIH_CHK

Activation of ETC-LIMP-HOME-1/Deactivation of ETC-LIMP-HOME-2-REV:

Then(2) Check limp home ok
STATE_ETC_LIH = ETC_LIH_1
LV_MTC_LIH_CUR_OFF = 1
LV_N_LIM_ETC_LIH = 0
LV_TPS_MTC_N_LIM = 0

Activation of ETC-LIMP-HOME-2:

Else(2) STATE_ETC_LIH = ETC_LIH_2
Endif(2)
Else(1) STATE_ETC_LIH = ETC_NO_LIH
Endif(1)

A.119.4 ETC-LIMP-HOME-2 (SAS)

(STATE_ETC_LIH = ETC_LIH_2)

Description:

ETC-LIMP-HOME-2 (German abbreviation: SAS = Sicherheitsschubabschalten) is demanded by the ETC diagnosis (see Engine throttle diagnosis and adaptation) and/or the TPS diagnosis (if both TPS channels are faulty). ETC-LIMP-HOME-2 is set unreversible for the engine run.
During ETC-LIMP-HOME-2 the following limp home measures are defined:

- Throttle valve without power (hold by spring power in the Limp-Home position)
- Engine speed limitation in limp home mode (without considering the drivers request)

Formula section:

Activation of ETC-LIMP-HOME-2:

If STATE_ETC_LIH = ETC_NO_LIH **or**
STATE_ETC_LIH = ETC_LIH_1 **or**
STATE_ETC_LIH = ETC_LIH_2_REV **or**
STATE_ETC_LIH = ETC_LIH_3
and
LV_N_LIM_TPS_AD **or**
LV_ERR_V_REF_1 = 1 **or**
[LV_ERR_TPS_1 = 1 **and**
LV_ERR_TPS_2 = 1] **or**
[LV_ERR_TPS_MAF_1 = 1 **and**
LV_ERR_TPS_MAF_2 = 1] **or**
[LV_ERR_TPS_X = 1 **and**
LV_ERR_TPS_MAF_Y = 1]
Then STATE_ETC_LIH = ETC_LIH_2
LV_N_LIM_ETC_LIH = 1
LV_MTC_CUR_OFF_REQ = 1 (ETC without power request)
LV_TPS_MTC_N_LIM = 1 (see Engine speed limit coordination)
Endif

A.119.5 ETC-LIMP-HOME-3

(STATE_ETC_LIH = ETC_LIH_3)

Description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

ETC-LIMP-HOME-3 is demanded by the ETC position controller diagnosis (see Engine throttle diagnosis and adaptation). ETC-LIMP-HOME-3 is set reversible for the engine run.
During ETC-LIMP-HOME-3 the following limp home measures are defined:

- Engine speed limitation in limp home mode (without considering the drivers request)

Formula section:

Activation of ETC-LIMP-HOME-3:

If STATE_ETC_LIH = ETC_NO_LIH **and**
LV_ERR_MTC_CTL_1 = 1
Then STATE_ETC_LIH = ETC_LIH_3
LV_N_LIM_ETC_LIH_REV = 1
LV_TPS_MTC_N_LIM = 1 (see Engine speed limit coordination)
Else STATE_ETC_LIH = ETC_NO_LIH
Endif

A.119.6 Calculation of LV_ERR_TPS

Description:

LV_ERR_TPS is used for MIL activation and inhibition of functions. The error is set depending the present status of ETC limp-home (combination of operation-mode and present TPS errors).

Formula section:

LV_CDN_DIAG_TPS = 1
If STATE_ETC_LIH = ETC_LIH_1 **or**
STATE_ETC_LIH = ETC_LIH_2_REV **or**
STATE_ETC_LIH = ETC_LIH_2
Then ERR_SYM_TPS = SYM_2
Else ERR_SYM_TPS = NO_SYM
Endif
LV_ERR_TPS, LV_END_DIAG_TPS is calculated by error management.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.120.1 Diagnosis of the admissible voltage ranges V_TPS_1 /V_TPS_2

FUNCTION DESCRIPTION:

Description:

In the case of an error-free system, the potentiometer voltages must be within admissible limits. The following errors symptoms can be distinguished:

ERR_SYM_TPS_1:

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> Short circuit to Vbatt or Open load    (= SYM_0)
 │ │ └───> Short circuit to Ground                (= SYM_1)
 │ └─────> -                                      (= SYM_2)
 └───────> -                                      (= SYM_3)
```

ERR_SYM_TPS_2:

```
 ┌─┬─┬─┬─┐
 │ │ │ └─> Short circuit to Vbatt                 (= SYM_0)
 │ │ └───> Short circuit to Ground or Open load   (= SYM_1)
 │ └─────> -                                      (= SYM_2)
 └───────> -                                      (= SYM_3)
```

Application conditions

Initialisation: according filtertype **STD_INI** *(all 0 at LV_IGK 0->1 or reset)*

Recurrence: 5ms

Activation:

```
If          LV_IGK = 1              and
   LV_ERR_V_REF_1 = 0        and
   LV_ERR_TPS_1/ 2 = 0        and
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```
Then          LV_CDN_DIAG_TPS_1/ 2 = 1
Else           LV_CDN_DIAG_TPS_1/ 2 = 0
Endif
```

Formula section:

Calculation End of Diagnosis:
For calculation of LV_END_DIAG_TPS_1/2 see Anti-bounce algorithm, calculation of the end of diagnosis .
Error detection TPS_1 short circuit to ground:
If V_TPS_1 < C_V_TPS_MIN_DIAG_1
Then ERR_SYM_TPS_1 = SYM_1
LV_ERR_TPS_1 = 1 *//after debounce, remains active until next initialization*

Error detection TPS_1 short circuit to Vbatt or open load:
ElseIf V_TPS_1 > C_V_TPS_MAX_DIAG_1
Then ERR_SYM_TPS_1 = SYM_0
LV_ERR_TPS_1 = 1 *//after debounce, remains active until next initialization*

Else ERR_SYM_TPS_1 = NO_SYM
Endif
Error detection TPS_2 short circuit to ground or open load:
If V_TPS_2 < C_V_TPS_MIN_DIAG_2
Then ERR_SYM_TPS_2 = SYM_1
LV_ERR_TPS_2 = 1 *//after debounce, remains active until next initialization*

Error detection TPS_2 short circuit to VBatt:
ElseIf V_TPS_2 > C_V_TPS_MAX_DIAG_2
Then ERR_SYM_TPS_2 = SYM_0
LV_ERR_TPS_2 = 1 *//after debounce, remains active until next initialization*
Else ERR_SYM_TPS_2 = NO_SYM
Endif

A.120.2 Ratio - check between TPS values V_TPS_1 /V_TPS_2

FUNCTION DESCRIPTION:

General information:

In the case of an error-free system, the Poti-voltages V_TPS_1 and V_TPS_2 must not differ by more than C_V_TPS_RATIO_HYS. The voltage V_TPS_2 is inverted in order to carry out the channel comparison.

Description:

If the threshold C_V_TPS_RATIO_HYS is exceeded, the TPS_RATIO error will be debounced.
Error symptoms are defined for this diagnosis function as:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

```

 └──────────> TPS - Ratio exeeded              (= SYM_3)
```

Application conditions

Initialisation: *according filter type* ***STD_INI***

Recurrence: *5ms*

Activation:

```
If          LV_IGK = 1
  and   LV_ST_END = 1
  and   LV_ERR_V_REF_1 = 0
  and   LV_ERR_TPS_1/ 2 = 0    both channels must be errorfree
 and       LV_ERR_TPS_MAF_1/ 2 = 0
 Then              LV_CDN_DIAG_TPS_RATIO = 1
 Else              LV_CDN_DIAG_TPS_RATIO = 0
     LV_DET_ERR_TPS_RATIO = 0
 Endif
```

Formula section:

If | V_TPS_1 - (5[V] - V_TPS_2) | > C_V_TPS_RATIO_HYS

Then ERR_SYM_TPS_RATIO = SYM_3 *//anti bounce increment*

LV_DET_ERR_TPS_RATIO = 1

Else ERR_SYM_TPS_RATIO = NO_SYM *//anti bounce decrement*

LV_DET_ERR_TPS_RATIO = 0

Endif

LV_ERR_TPS_RATIO , LV_END_DIAG_TPS_RATIO is calculated by error management

A.120.3 TPS /TPS_SUB_DIAG plausibility check after RATIO-error is detected

FUNCTION DESCRIPTION:

General information:

This function is only performed if calibrated LC_USE_MAF_TPS_DIAG = 1.
If RATIO error is detected the algorithm is used to decide if channel one or two or both are not plausible.
It is based on the modelled TPS value TPS_SUB_DIAG.
X = channel 1 and 2

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Description:

Detection of TPS fist error:
The integration is done for C_T_TPS_DIF_INT if diagnosis conditions are active.
TPS_DIF_DIAG_X is the difference between the mesured value TPS_AV_X and the modelled TPS value TPS_SUB_DIAG.
TPS_DIF_DIAG_COR_X is the corrected value based on N, MAF_SP_TQI, PQ.
TPS_SUM_DIF_DIAG_COR_X is the integrated value of TPS_DIF_DIAG_COR_X.
Depending on TPS_SUM_DIF_DIAG_COR_X channel one or two or both are set as not plausible and the diagnosis is switched off.
The plausibility check cannot be performed if TPS_SUB_DIAG cannot be calculated in the right way because an active lambda-sensor fault or a load-sensor fault.
In this case, the two channels are declared as faulty when LV_DET_ERR_TPS_RATIO is set for C_T_TPS_DIF_INT.

Continuous TPS /TPS_SUB_DIAG monitoring for single channel
In the case of one channel is diagnosed as faulty, a plausibility check for the remaining channel to the other one is no longer possible. In this case, the substitute value TPS_DIF_DIAG_COR_X is used for the plausibility check while the engine is running. The difference between the measured TPS_AV value and the substitute value TPS is normalized and the mean value is established with a correlation constant.
The plausibility check cannot be performed when a mass air flow signal is missing; in this case, the channel is declared as faulty.
Error symptom definition see TPS-FIRST-ERROR diagnosis.

Check of the combustion mode with active TPS error
In order to perform the first /second error diagnosis the combustion-mode must be homogeneous, thus there’s a delay timer which runs after a present Ratio /Single TPS error.
If the timer is elapsed without active HOM mode, a TPS double fault is set and the throttle is switched off.

Error symptoms are defined for this diagnosis function as:

ERR_SYM_TPS_MAF_1:

```
 _______________
|___|___|___|___|
 |   |   |   └──> -                           (= SYM_0)

Debounce counter maximum value, MTC driver diagnosis					

FUNCTION DESCRIPTION:

General information:

Error detection is effected via the ECU hardware (MTC H-Bridge IC).

Description:

The following errors symptoms (Error state BIOS_HBR_FAULT_STATUS_MTC is delievered from the basic software) can be distinguished:

- Undervoltage
- Overcurrent
- Overtemperature

Error-symptoms are defined to this diagnosis function as following:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_FilterMulticondition (**IN**<XX>,**IN**<CDN_DIAG_>,**XX**>,<IN<>,**ERR_DIAG_XX**>,<IN>,<C_ABC_INC_XX>,**IN**<C_ABC_MAX_XX>,**OUT**<LV_ERR_XX>)	
ACTION_INFR_GetElDiagMTCHEAT (**OUT**<Cdn_diag_rly_mtc_heat>,**OUT**<Err_diag_rly_mtc_heat>)	

Error treatment:

Diagnostic **RLY_MTC_HEAT**	**Symptom description**	**Symptom**	**Filter type**
Diagnostic description	*SCP*	*SYM_0*	*MPL_STD_INI*
	SCG	*SYM_1*	
	OC	*SYM_2*	

Note : ACTION_INFR_GetElDiagMTCHEAT() is defined in the IRS (Infrastructure requirement specification AGGR THRO)

FUNCTION DESCRIPTION:

General information:

The signal from the driver which controls the throttle housing heater relay is diagnosed. The relay is driven by the ECU via an output driver. The failure detection is done by ECU Hardware and given to ASW. The purpose of the diagnosis is based on the detection of electrical faults as defined by OBD I requirements.

Description:

After activation conditions are met, the diagnosis activation is delayed for NC_PSD_DLY_RLY_MTC_HEAT executions, to avoid the usage of wrong infrastructure information. The error detection algorithm operates the electrical diagnosis of powerstage outputs of ATIC39.

Error-symptoms are defined to this diagnosis function as following :

```
 |_|_|_|_|
  |  |  |  └-> Short circuit to Vbatt(SCP)        (= SYM_0)
  |  |  └----> Short circuit to GND(SCG)          (= SYM_1)
  |  └-------> Open load(OC)                      (=SYM_2)
  └----------> -                                  (=SYM_3)
```

Application conditions

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)
Set delay counter for NC_PSD_DLY_RLY_MTC_HEAT

Recurrence: 100 ms

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_RLY_MTC_HEAT = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_RLY_MTC_HEAT.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RLY_MTC_HEAT.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_RLY_MTC_HEAT and ERR_DIAG_RLY_MTC_HEAT.

ACTION_ERRM_FilterMulticondition (IN<RLY_MTC_HEAT>, IN<CDN_DIAG_RLY_MTC_HEAT>, IN<ERR_DIAG_RLY_MTC_HEAT>, IN<C_ABC_INC_RLY_MTC_HEAT>, IN<C_ABC_MAX_RLY_MTC_HEAT>, OUT<LV_ERR_RLY_MTC_HEAT>)

This algorithm determines:
ERR_SYM_RLY_MTC_HEAT (Detected error symptom)
LV_ERR_RLY_MTC_HEAT (Error flag for debounced error)
LV_CDN_DIAG_RLY_MTC_HEAT (Diagnosis condition information)
LV_END_DIAG_RLY_MTC_HEAT (End of diagnosis information)
Diagnosis inhibition:
If LV_IGK = 1 **and**
LV_CDN_VB_MIN_DIAG = 1 **and**
LV_ERR_SPI_MPS = 0
Then LV_INH_DIAG_RLY_MTC_HEAT = 0
Else LV_INH_DIAG_RLY_MTC_HEAT = 1
Endif

If LV_INH_DIAG_RLY_MTC_HEAT = 0

Then
Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_RLY_MTC_HEAT and basic diagnosis conditions CDN_DIAG_RLY_MTC_HEAT) received from the infrastructure:

ACTION_INFR_GetElDiagMTCHEAT (OUT<Cdn_diag_rly_mtc_heat>, OUT<Err_diag_rly_mtc_heat>)

Basic diagnosis conditions are set according infrastructure information: CDN_DIAG_RLY_MTC_HEAT
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RLY_MTC_HEAT

If Activation conditions are met for the NC_PSD_DLY_RLY_MTC_HEAT recurrence of the diagnosis
Then *[CDN_DIAG_RLY_MTC_HEAT valid from Infrastructure]*
Else CDN_DIAG_RLY_MTC_HEAT = 0
Endif
Else
CDN_DIAG_RLY_MTC_HEAT = 0
Endif

A.124 Mass air flow trottle control diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
STATE_RBM_TPS	O/V	0... 7H	0 ...7	1	-
Interface of TPS monitor with the Rate-Based Monitoring statistics					

Input data:

LV_END_DIAG_MTC_ CTL_3 {p. 4977}	LV_END_DIAG_TPS_AD {p. 4950}	LV_END_DIAG_TPS_AD_ BOL {p. 4950}	

FUNCTION DESCRIPTION:

General information:

With this module the interface between the TPS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TPS data.
Within STATE_RBM_TPS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
- Monitor disabled because of system malfunction (bit 1, not valid for TPS)
- Monitor indiv. RBM conditions encountered within this DC (bit 2 not valid for TPS)

Application conditions:

Initialisation :
at LV_DC 0 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_TPS = 0
on failure memory reset :
bit 1 of STATE_RBM_TPS = 0
Recurrence: 1 s
Activation: LV_DC 0 1 transition **and** LV_DC = 1

Formula section:

If bit 0 of STATE_RBM_TPS = 0
Then **If** LV_END_DIAG_MTC_CTL_3 = 1 **and**
LV_END_DIAG_TPS_AD_BOL = 1 **and**
LV_END_DIAG_TPS_AD = 1
Then bit 0 of STATE_RBM_TPS = 1
Endif
Endif
bit 2 of STATE_RBM_TPS = 1 (no individual RBM conditions)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.125 Torque request for safety diagnosis

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CTR_ABC_TQI_REQ_LIM	O/V	0... FFFF H	0... 65535	1	-
counter for torque request for safety is active					
LV_ERR_TQI_LIM	O/V	0... 1H	0 ...1	1	-
Error flag torque request for safety is active					

Input data:

LV_ES {p. 1720}	LV_IGK {p. 906}	LV_MTC_CUR_OFF {p. 6565}	LV_TQ_LIM_INTV {p. 6692}

Calibration data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_TQI_LIM	-	0... FF H	0... 255	1	-
increment counter for torque request for safety					
C_ABC_MAX_TQI_LIM	-	0... FFFF H	0... 65535	1	-
maximum counter for torque request for safety					

FUNCTION DESCRIPTION:

General information:

The objective of this function is to determine the number of intervention actions concerning the torque request for safety and to set the failure table entry depending on LV_ERR_TQI_LIM if the counter exceeds a calibratable threshold.
The monitoring level generates a desired indicated torque TQI_SP_MON. If the actual torque TQI_REF_IGA_LAMB exceeds this value for more than a calibratable threshold a torque demand for the slow and the fast path is generated. The flag LV_TQ_LIM_INTV shows whether this torque intervention is active or not (see chapter D - "Torque request for safety").
LV_ERR_TQI_LIM.

Description:

The counter is initialized with zero for ECU reset, ignition key off, engine starts and engine stops. Otherwize it is incremented, if LV_TQ_LIM_INTV is active.

Application conditions

Activation: LV_IGK = 1 **and** LV_ES = 0 **and** LV_MTC_CUR_OFF = 0

Deactivation: *LV_MTC_CUR_OFF == 1*

Initialization: 0
by: ECU reset
OR LV_IGK == 0
OR LV_ES == 1

Recurrence: 100 ms

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

IF LV_TQ_LIM_INTV == 1
THEN LV_ERR_TQI_LIM = 1 after debounce
ELSE the debounce counter (CTR_ABC_TQI_LIM) is set to 0.
ENDIF

Description:

Error-symptoms are defined to this diagnosis function as following:

```
□□□□
| | | └> -                                      (= SYM_0)

FUNCTION DESCRIPTION:

General information:

This module performs the diagnosis of the clutch switch. This is valid only in case of manual transmission.

The diagnosis is based on the verification of the presence of the expected clutch action to shift the gears necessary to bring the vehicle to a certain speed. It is highly improbable that the vehicle is accelerated several consecutive times to a certain speed with the clutch always depressed or never depressed.

Description:

If there s a a change in LV_IM_CS_PN, the CS is diagnosed as error-free and the diagnosis is switched off if end of diagnosis is reached.
If there s no change in LV_IM_CS_PN then each time the vehicle is stopped, the diagnosis is enabled. Until the vehicle gets to a certain speed, LV_IM_CS_PN is monitored for value change (clutch pedal actuation). If, for several times (Anti bounce is inrementing by one inrement per diagnosis cycle) the vehicle gets to speed and the clutch switch state has never changed (always 0 or 1) then a failure is recognized.
Depending of status LV_IM_CS_PN 0/1 at beginning of monitoring period there is the symtom OL/SCB or SCG.

Application conditions

Initialisation: *according filter type:* **"STD-INI"**, *all other outputs 0 at LV_IGK 0->1* ***or*** *reset* ***or*** *at clearing error memory*

Recurrence: 1s (10 ms for LV_IM_CS_PN detection)
Activation:
If LV_IGK = 0 **or**
LV_ES = 1 **or**
LV_ST = 1 **or**

A.128 Clutch switch diagnosis (Appl. Inc.)

Data definition:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
STATE_RBM_CS	O/V	0... 7H	0 ...7	1	-
Interface of CS monitor with the Rate-Based Monitoring statisticsBit 0: conditions for monitoring are met long enough to detect malfunction (bit 0 = 1)Bit 1: inhibition of the monitor because of system failure(s) (bit 1 = 1)Bit 2: individual RBM condition					

Input data:

CTR_ERR_DYN_NR {p. 5767}	LV_AT {p. 654}	LV_DC {p. 5746}	LV_END_DIAG_CS {p. 5015}
LV_ERR_VS {p. 5021}	LV_VAR_TCT {p. 656}		

Import actions:

ACTION_ERRM_CheckPendingStatus (**IN**<PRM_IDX_DIAG>,**OUT**<PRM_LV_ERR_PND>)

FUNCTION DESCRIPTION:

General information:

With this module the interface between the CS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_CS data.
Within STATE_RBM_CS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for CS diagnosis)

Application conditions:

Initialisation :
at LV_DC 0   1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_CS = 0
on failure memory reset :
bit 1 of STATE_RBM_CS = 0
Recurrence: 1 s
Activation: LV_DC 0   1 transition **and** LV_DC = 1

Formula section:

At LV_DC 0   1 transition
The pending status of the following failures has to be checked only once :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

LV_ERR_VS			

If(1) { CPU optimization at LV_DC 0   1 transition }
CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn t empty }
Then(1)
While bit 1 of STATE_RBM_CS = 0 **do**
with each XX failure of the above list :
ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>, SYNCHRONIZATION<C

If(2) XX has a pending status
Then(2)
bit 1 of STATE_RBM_CS = 1
Endif(2)
Endwhile
Else(1)
{ the dynamic failure memory is empty }
No action
Endif(1)
Every 1 s :
If bit 0 of STATE_RBM_CS = 0
Then **If** LV_END_DIAG_CS = 1 **or**
LV_AT = 1 **or**
LV_VAR_TCT = 1
Then bit 0 of STATE_RBM_CS = 1
Endif
Endif
If bit 1 of STATE_RBM_CS = 0
Then
If LV_ERR_VS = 1
Then bit 1 of STATE_RBM_CS = 1
Endif
Endif
bit 2 of STATE_RBM_CS = 1

General information

A.129.1 Plausibility check of VS signal

General information:

An vehicle speed signal error is detected if at calibratable engine speed-, mass air flow- and time thresholds the vehicle speed signal VS = 0. Depending if the vehicle is MT /AT different calibration data a applied (If LV_AT = 1 then _AT are used, else _MT are used).

If (vehicle speed VS = 0 **or** testbenchdetection with different rotation at the rearwheels) **and** engine speed N >= C_N_VS_MIN_DIAG_AT /_MT **and** (converterclutch is closed **or** manual-gearbox) **and** actual torque TQ_AV >= C_TQ_AV_VS_MIN_DIAG_AT /_MT the time counter T_VS_DIAG is started. The vehicle speed signal error bit LV_ERR_VS_PLAUS is set to 1 **if** T_VS_DIAG >= C_T_VS_MIN_DIAG.

Application conditions:

Initialisation:

```
The configuration is NO_FIL
(=> all 0 at LV_IGK 0->1 or  reset or  clearing error memory)
LV_CDN_DIAG_VS_PLAUS_POW = 0
LV_ERR_SET_VS_PLAUS_POW  = 0
ERR_SYM_VS_PLAUS_POW     = 0
LV_END_DIAG_VS_PLAUS_POW = 0
T_VS_DIAG                = 0
T_VS_END_DIAG            = 0

At reset:
This action erases filter data :
ACTION_ERRM_NoFilterReset( IN<NC_IDX_DIAG_VS_PLAUS_POW >,
OUT< LV_ERR_VS_PLAUS_POW >)
```

Activation:

```
LV_IGK              = 1  and
LV_ERR_VS_PLAUS     = 0  and
CLF_VS_PLAUS_ENA bit 0 = 1
```

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

               LV_ERR_SET_VS_PLAUS_POW  = 1
//Once the LV_ERR_VS_PLAUS_POW is set, should be reset only LV_IGK 0- ->1
          Endif
     Else(2)
          T_VS_DIAG = 0
          ERR_SYM_VS_PLAUS_POW      = NO_SYM
          If  T_VS_END_DIAG < C_T_VS_DIAG
          Then
               LV_CDN_DIAG_VS_PLAUS_POW = 0
               T_VS_END_DIAG++
          Else
               LV_CDN_DIAG_VS_PLAUS_POW = 1
                            LV_ERR_SET_VS_PLAUS_POW  = 0
               LV_END_DIAG_VS_PLAUS_POW = 1
          Endif
     Endif(2)
Else
     LV_CDN_DIAG_VS_PLAUS_POW = 0
     ERR_SYM_VS_PLAUS_POW     = NO_SYM
     T_VS_DIAG                = 0
     T_VS_END_DIAG            = 0
Endif

For error management treatment the following action is called:
ACTION_ERRM_NoFilterSymptom(IN< NC_IDX_DIAG_VS_PLAUS_POW >,
IN<LV_CDN_DIAG_VS_PLAUS_POW >, IN<ERR_SYM_VS_PLAUS_POW >,
IN< LV_ERR_SET_VS_PLAUS_POW >, IN< 0 >, IN<LV_END_DIAG_VS_PLAUS_POW>, OUT<
LV_ERR_VS_PLAUS_POW > )
```

A.129.2 Top limit check of the vehicle speed signal, ’VS_TOL’

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

A range check is carried out to determine if the vehicle speed exceeds the plausible maximum threshold. As such the diagnosis instance VS_TOL contains one error symptom:

- Signal out of range **VS_TOL**

The general error treatment is described in the chapters “ABC algorithm” and “Dynamic Error Management”: environmental data, DTC, error classes (priority assignment, lamp management), communication interface, etc..

Application conditions:

Initialisation: The configuration is MEM
(=> all 0 at LV_IGK 0->1 or reset or clearing error memory)

Activation:
```
LV_IGK              = 1 and
LV_ERR_VS_PLAUS     = 0 and
CLF_VS_PLAUS_ENA bit 1 = 1
```

Deactivation: When activation condition does not met

```
Following should be updated during de-activation
LV_CDN_DIAG_VS_TOL = 0
ERR_SYM_VS_TOL     = NO_SYM
```

Recurrence: 100 ms

Function description:

Formula section:

```
If  VS > 0
Then
    LV_CDN_DIAG_VS_TOL = 1
    If  VS_HIGH_RES > C_VS_TOL_DIAG
    Then
        ERR_SYM_VS_TOL = SYM_0
    Else
        ERR_SYM_VS_TOL = NO_SYM
    Endif
Else
    LV_CDN_DIAG_VS_TOL = 0
Endif
```

For failure and error management treatment the anti-bounce mechanism is called :

```
ACTION_ERRM_FilterSymptom(IN< NC_IDX_DIAG_VS_TOL >,
IN< LV_CDN_DIAG_VS_TOL>, IN< ERR_SYM_VS_TOL >, IN< C_ABC_INC_VS_TOL >, IN<
1 >, IN< C_ABC_MAX_VS_TOL >, OUT< LV_ERR_VS_TOL > )
```

A.129.3 Bottom Limit check of the vehicle speed signal, ’VS_BOL’

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

General information:

A plausibility check is carried out to determine if the observed vehicle speed is plausible for the given engine conditions (PU or PUC mode). In the engine states PU or PUC the vehicle speed may not be below calibratable threshold. As such the diagnosis instance VS_BOL contains one error symptom:

- BOL check in PU/PUC mode fails **VS_BOL**

The general error treatment is described in the chapters “ABC algorithm” and “Dynamic Error Management”: environmental data, DTC, error classes (priority assignment, lamp management), communication interface, etc..

Application conditions:

Initialisation:
```
The configuration is MEM
(=> all 0 at LV_IGK 0->1 or reset or clearing error memory)
Except:  LV_VS_BOL = 1
```

Activation:
```
LV_IGK                  = 1 and
LV_ERR_VS_PLAUS         = 0 and
VS > C_VS_BOL_MIN_DIAG   and
CLF_VS_PLAUS_ENA bit 2 = 1
```

Deactivation:
```
When activation condition does not met

Following should be updated during de-activation

    T_VS_BOL = 0
    LV_VS_BOL = 1
Endif
```

For failure and error management treatment the anti-bounce mechanism is called :

```
ACTION_ERRM_FilterSymptom( IN< NC_IDX_DIAG_VS_BOL >,
IN< LV_CDN_DIAG_VS_BOL >, IN< ERR_SYM_VS_BOL >, IN< C_ABC_INC_VS_BOL >,
IN< 1 >, IN< C_ABC_MAX_VS_BOL >, OUT< LV_ERR_VS_BOL > )
```

A.129.4 Gradient check for vehicle speed signal ’VS_GRD’

General information:

A speed gradient check is carried out, if speed changes for more than C_VS_MAX_GRD within 100ms. It will be calibrated to a value which is physically not possible to reach with the acceleration of the vehicle. So if the value is ever reached, it means we have a problem with the speed signal.

- Unrealistic gradient signal **VS_GRD**

The general error treatment is described in the chapters “ABC algorithm” and “Dynamic Error Management”: environmental data, DTC, error classes (priority assignment, lamp management), communication interface, etc..

Application conditions:

Initialisation: The configuration is **MEM**
(=> all 0 at LV_IGK 0->1 or reset or clearing error memory)

VS_HIGH_RES_TMP = 0

Activation:
LV_IGK = 1 **and**
LV_ERR_VS_PLAUS = 0 **and**
CLF_VS_PLAUS_ENA bit 3 = 1

Deactivation: When activation condition does not met

Following should be updated during de-activation
LV_CDN_DIAG_VS_GRD = 0
ERR_SYM_VS_GRD = NO_SYM

Recurrence: 100 ms

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

IN< C_ABC_MAX_VS_GRD >, OUT< LV_ERR_VS_GRD > )
```

A.129.5 Plausibility check for stuck vehicle speed signal 'VS_PLAUS_STUCK'

General information:

A plausibility check for vehicle speed stuck signal is carried out with reference to engine load change. When there is a significant change of engine load, but vehicle speed signal lies within a small calibratable window for calibratable duration and once the counter elapses without speed change vehicle speed signal will be declared as stuck.

- Vehicle speed stuck signal **VS_PLAUS_STUCK**

The general error treatment is described in the chapters “ABC algorithm” and “Dynamic Error Management”: environmental data, DTC, error classes (priority assignment, lamp management), communication interface, etc..

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

A.129.6 Emission relevant VS error or missing Flexray signal

General information:

LV_ERR_VS is set if no VS signal is available from ECU-PIN (L4-Projects) or flexray (L6-Projects)

Application conditions:

Initialisation: The configuration is **STD_INI**
(=> all 0 at LV_IGK 0->1 ***or*** *reset* ***or*** *clearing error memory)*

Activation: LV_IGK = 1

Deactivation: When activation condition does not met

Following should be updated during de-activation
LV_CDN_DIAG_VS = 0
ERR_SYM_VS   = NO_SYM

Recurrence: 100 ms

Function description:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Formula section:

A.130.1 Interface for Rate - Based - Monitoring

General information:

With this module the interface between the VS_PLAUS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_VS_PLAUS data.
Within STATE_RBM_VS_PLAUS, three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)
  (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for VS_PLAUS diagnosis)

Application conditions:

Initialisation: at LV_DC 0 -> 1 transition :
bit 0, bit 1 and bit 2 of STATE_RBM_VS_PLAUS = 0
on failure memory reset :
bit 1 of STATE_RBM_VS_PLAUS = 0

Activation: LV_DC 0 -> 1 transition and LV_DC = 1

Deactivation: -

Recurrence: 1 s

Function description:

Formula section:

```
If (NC_NR_VS_DIAG == 1   or       // NC for 4DB
    NC_NR_VS_DIAG == 2   or       // NC for 4DS
    NC_NR_VS_DIAG == 3   or       // NC for 4D8
    NC_NR_VS_DIAG == 4   or       // NC for 4D9
    NC_NR_VS_DIAG == 5   or       // NC for 4V6
    NC_NR_VS_DIAG == 6   or       // NC for 4DC

        Then
            bit 0 of STATE_RBM_VS_PLAUS = 1
        Endif
    Endif
    Bit 1:
    At LV_DC 0 ®  1 transition
    The pending status of the respective failures for each project has
    to be checked only once :
    // The failures have been defined in the VS_PLAUS diagnosis
    If { CPU optimization at LV_DC 0 -> 1 transition }
    CTR_ERR_DYN_NR <> 0 { the dynamic failure memory isn't   empty }
    Then
        While  bit 1 of STATE_RBM_VS_PLAUS = 0
        do with each XX failure of the corresponding project :
        ACTION_ERRM_CheckPendingStatus(IN<XX>, OUT<PendingStatus>,
        SYNCHRONIZATION<CALL>)
            If  XX has a pending status
            Then bit 1 of STATE_RBM_VS_PLAUS = 1
            Endif
        Endwhile
    Else    { the dynamic failure memory is empty }
            No action
     Endif
    // The below calculation for bit 1 will happen at each activation
    If  bit 1 of STATE_RBM_VS_PLAUS = 0
    Then
        If  LV_INH_DIAG_VS_PLAUS =1
        Then   bit  1 of  STATE_RBM_VS_PLAUS =1
        Endif
    Endif
    Bit 2:
    bit 2 of STATE_RBM_VS_PLAUS = 1
Endif
```

A.130.2 VS_PLAUS - Diagnosis

General information:

VS_PLAUS-diagnosis is used to detect whether the VS-signal is plausible:
An vehicle speed signal error is detected if at calibratable engine speed-, mass air flow- and time thresholds the vehicle speed signal VS = 0. Depending if the vehicle is MT /AT different calibration data a applied (If LV_AT = 1 then _AT are used, else _MT are used).

Application conditions:

Initialisation: At LV_IGK 0->1 **or** reset **or** clearing error memory:
LV_INH_DIAG_VS_PLAUS = 0

Activation: LV_IGK = 1

Deactivation: -

Recurrence: 100 ms (to be called before VS_PLAUS-diagnosis)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information

Note: In the above Error treatment table the first 4 diagnostic instances (NC_IDX's) are for BN2020 (L6 variant) and the last 4 diagnostic instances (NC_IDX's) are for BN2000 (L4 variant).

For BN2020(L6):
The electrical diagnosis is performed using the STATE_N_WHEEL_XX_YY, which contain, amongst other information, the error status of each individual wheel speed sensor obtained via flexray. For each wheel speed sensor, the 4-bit information contained in STATE_N_WHEEL_XX_YY can be allocated freely to 1 of the 4 error symptoms using the calibratable bitfield CLF_N_WHEEL_DIAG_xxx (e.g:xxx = SCP or SCG, or OC or EL) . Each error symptom can be activated or deactivated using the switches LC_N_WHEEL_xxx. For error healing, one additonal, 4-bit value of STATE_N_WHEEL_XX_YY can be calibrated using CLF_N_WHEEL_DIAG_NO_ERR.

For BN2000(L4):
The electrical diagnosis is performed using the error flags LV_WHEEL_CAN_XX_YY_ERR, which contain the error information of each individual wheel speed sensor obtained via CAN. An error is detected when LV_WHEEL_CAN_XX_YY_ERR = 1 and at the same time the DSC-status STATE_TCS_CAN = 2, meaning DSC has detected an electrical defect

//*For code optimization use FOR loop with common activation conditions for all the four wheel diagnosis and capture different wheel specific information via common variable*//

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Note: The electrical diagnosis strategy for all four individual wheel speed sensors is same and there will be a single algorithm for all the four wheel speed sensors as below with respective wheel information designated by XX_YY.

XX_YY has following diagnostic instances with XX = FN or RE and YY = LE or RI
- FN_LE (Front left wheel speed sensor)
- FN_RI (Front right wheel speed sensor)
- RE_LE (Rear left wheel speed sensor)
- RE_RI (Rear right wheel speed sensor)

Application conditions:

Initialisation: The configuration is STD_INI
(=> all 0 at LV_IGK 0->1 or reset or clearing error memory)

At LV_IGK 0->1 or reset:
T_AST_ENA_N_WHEEL_DIAG = C_T_AST_ENA_N_WHEEL_DIAG_MAX

Activation: LV_IGK = 1

Deactivation: When activation condition does not met

Following should be updated during de-activation
LV_CDN_DIAG_N_WHEEL_XX_YY = 0

Recurrence: 100 ms

Function description:

Formula section:

```
If  LV_ST_END = 1
Then     T_AST_ENA_N_WHEEL_DIAG- -
    //timer T_AST_ENA_N_WHEEL_DIAG decrement to zero
Else
    Do nothing
End

#IF  (USE_L6 == ACTIVE)// Compiler switch for BN2020(Signal from Flexray)
#THEN

FUNCTION DESCRIPTION:

General information:

At implausible DCC messages, e.g. timeout errors, or ECU internal errors a reversible or irreversible error is detected and reflect to the DCC Unit. This should be confirmed by the DCC switch-off flag LV_DCC_OFF_ACK. Only if the switch-off is confirmed by DCC the reversible DCC error is reset. This is necessary for a safety communication between ECU and DCC.

Copyright (C) Continental AG,2007

Description:

The following symptoms can be detected:

```
┌─┬─┬─┬─┐
│ │ │ └─> DCC irreverible off          (= SYM_0)
│ │ └───> DCC reversible off           (= SYM_1)

FUNCTION DESCRIPTION:

General information:

In this function the diagnosis of the relevant signals from the MSW for the cruise control is made. The following error can be distinguished:

- Redundant coding of the signal
- Toggle switch test
- Toggle bit monitoring

Application conditions

Initialisation: *all 0 at LV_IGK 0->1 or reset*

Recurrence: *see diagnosis*

Activation:

```
If            V_IGK  >  C_VB_MIN_MSW_DIAG
 and       Time since  V_IGK > C_VB_MIN_MSW_DIAG  greater
than  C_T_READY_CRU
 and       LV_VAR_MSW = 1
 and       LV_VAR_BN_MSW = 0
```

A.134.1 Determination of STATE_MSW_DATA /LV_MSW_MSG_VLD

Description:

The datas are used for function cruise control.

Formula section:

Calculation of LV_MSW_MSG_VLD:
If a single message is valid (no ERR_SYM_... is active, BIOS_LV_CRU_ERR = 0)
Then LV_MSW_MSG_VLD = 1
Else LV_MSW_MSG_VLD = 0
Endif
Calculation of STATE_MSW_DATA:
STATE_MSW_DATA = (range converted) BIOS_CRU_DATA

A.134.2 Redundant coding check of the signal (LV_ERR_MSW_2)

Application conditions

Recurrence:

```
80ms
 = every four equal messages plus delay time due to different
recurrency
 [ 4 x (15ms + Delay)]
```

Description:

Error-symptoms are defined to this diagnosis function as following :

```
[ | | | ]
 |  |  |  └─> -                    (= SYM_0)
 |  |  └────> -                    (= SYM_1)
 |  └───────> -                    (= SYM_2)
 └──────────> Signal implausible   (= SYM_3)
```

Formula section:

Calculation of diagnosis condition:
If at least one of the bits for WA, S/B or OFF is active in BIOS_CRU_DATA
Then LV_CDN_DIAG_MSW_2 = 1
Error detection and plausibility:
If Redundant coding is infringed (see "Supplementary functions" chapter, CRU)
Then ERR_SYM_MSW_2 = SYM_3
// LV_ERR_MSW_2 = 1 after debounce by error management

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Else ERR_SYM_MSW_2 = NO_SYM
// LV_ERR_MSW_2 = 0 *after rebounce by error management*
Endif
Else LV_CDN_DIAG_MSW_2 = 0
Endif
Calculation end of diagnosis:
LV_END_DIAG_MSW_2 is calculated by error management if diagnosis condition is true.

A.134.3 Toggle switch test (LV_ERR_MSW_3)

Application conditions

Recurrence:
```
80ms
 = every four equal messages plus delay time due to different
recurrency
 [ 4 x (15ms + Delay)]
```

Description:

The toggle switch condition is checked for each new message (BIOS_CRU_DATA) in which S/B or VE are active. If this is infringed, the preceding message remains valid.

Error-symptoms are defined to this diagnosis function as following :

```
□□□□
| | | └─> -                        (= SYM_0)
| | └───> -                        (= SYM_1)
| └─────> -                        (= SYM_2)
└───────> Rocker switch defect     (= SYM_3)
```

Formula section:

Calculation of diagnosis condition:
If S/B or VE is active in BIOS_CRU_DATA
Then LV_CDN_DIAG_MSW_3 = 1
Error detection and plausibility:
If S/B and VE are simultaneously active
Then ERR_SYM_MSW_3 = SYM_3
// LV_ERR_MSW_3 = 1 *after debounce by error management*
Else ERR_SYM_MSW_3 = NO_SYM
// LV_ERR_MSW_3 = 0 *after rebounce by error management*
Endif
Else LV_CDN_DIAG_MSW_3 = 0
Endif
Calculation end of diagnosis:
LV_END_DIAG_MSW_3 is calculated by error management if diagnosis condition is true.

A.134.4 Toggle bit monitoring (LV_ERR_MSW_TOG)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Application conditions

Recurrence: `each change of toggle bit (error free: about 0.5s)`

Description:

The diagnosis condition is set latest if C_T_MAX_MSW_BIT_DIAG is reached, after this the diagnosis condition is on and T_TOG (time between two state changes of the toggle bit BIOS_CRU_TOG) is checked for MIN and MAX time at each new message.

If C_T_MAX_MSW_BIT_DIAG is reached without toggle bit change the error LV_ERR_MSW_TOG is set directly without debounce.

If toggle bit change is faster C_T_MIN_MSW_BIT_DIAG then the error symptom ERR_SYM_MSW_TOG is set and the anti-bounce is inrementing.

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
│ │ │ └─┘
│ │ │  └──> -                                  (= SYM_0)
│ │ └─────> -                                  (= SYM_1)
│ └───────> -                                  (= SYM_2)
└─────────> Toggle-bit period is wrong         (= SYM_3)
```

Formula section:

Error detection and plausibility:
T_TOG is incrementing (10ms steps) and reseted at every toggle bit change

If a full toggle bit cycle is received
Then LV_CDN_DIAG_MSW_TOG = 1
  If T_TOG $\leq$ C_T_MIN_MSW_BIT_DIAG
  Then ERR_SYM_MSW_TOG = SYM_3
    // LV_ERR_MSW_TOG = 1 after debounce by error management
  Else ERR_SYM_MSW_TOG = NO_SYM
    // LV_ERR_MSW_TOG = 0 after rebounce by error management
  Endif
ElseIf T_TOG > C_T_MAX_MSW_BIT_DIAG
  Then LV_CDN_DIAG_MSW_TOG = 1
    ERR_SYM_MSW_TOG = SYM_3
    LV_ERR_MSW_TOG = 1
    //set directly without debounce, Anti-bounce counter is set to max value
  Else no change
  Endif
Endif

Calculation end of diagnosis:
LV_END_DIAG_MSW_TOG is calculated by error management if diagnosis condition is true.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. A.135.1 Summary of all VIM diagnosis

FUNCTION DESCRIPTION:

This function shall summarize all VIM failures in one flag only for each VIM.

Description:

Application conditions

Initialisation: reset **or** FMY reset **or** LV_IGK = 0 -> 1
LV_ERR_VIM_1 = 0
LV_ERR_VIM_2 = 0

Recurrence: 100ms

Activation: every ECU state

Formula section:

If LV_ERR_VIM_1_EL = 1 or LV_ERR_VIMPWM_1_FB = 1
Then LV_ERR_VIM_1 = 1
Else LV_ERR_VIM_1 = 0
Endif

If LV_ERR_VIM_2_EL = 1 or LV_ERR_VIMPWM_2_FB = 1
Then LV_ERR_VIM_2 = 1
Else LV_ERR_VIM_2 = 0
Endif

A.135.2 Diagnostic information from infrastructure

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Description:

The DISA control unit is controlled by a PWM signal line driven by the ATIC 39. The driver can distinguish between three symptoms: 'Short circuit to Vbatt', 'Short circuit to GND' and 'Open Load'.
This function reads the failure information (ERR_DIAG_VIM_1/2) from the infrastructure.

Application conditions

Initialisation: `reset` **or** `reset of failure memory` **or** `LV_IGK = 0 -> 1`
`CDN_DIAG_VIM_1_BAS = 0`
`CDN_DIAG_VIM_2_BAS = 0`
`ERR_DIAG_VIM_1 = 0`
`ERR_DIAG_VIM_2 = 0`

Recurrence: `100ms`

Activation: `every ECU state`

Formula section:

Usage of the diagnosis information (failure symptoms (raw value) ERR_DIAG_VIM_1/2 and diagnosis conditions CDN_DIAG_VIM_1_BAS/2_BAS received from the infrastructure:

Diagnosis conditions are set according infrastructure info.: CDN_DIAG_VIM_1_BAS/2_BAS
Failure symptoms are set according infrastructure info.: ERR_DIAG_VIM_1/2

A.135.3 Failure feedback recognition of VIM

FUNCTION DESCRIPTION:

If a failure is detected from the DISA control unit, a failure feedback is send to the ECU by pulling the signal line (interface ECU to the DISA control unit) to ground in a defined pattern. The time t_{low} is an identification for the failure.

Description:

For the recognition of the failure feedback the information, if a failure "short circuit to ground" is detected on the signal line between ECU and DISA control unit is used.

Application conditions

Initialisation: `at reset` **or** `FMY reset` **or** `LV_IGK = 0 -> 1`
`ERR_VIMPWM_1_FB = FFH`
`ERR_VIMPWM_2_FB = FFH`
`T_VIMPWM_1_FB = 0`
`T_VIMPWM_2_FB = 0`
`LV_VIMPWM_1_FB_VLD = 0`
`LV_VIMPWM_2_FB_VLD = 0`

Recurrence: `100ms`
FB-Diagnosis has to be calculated ***after*** *VIM-Powerstage-Diagnosis*

Activation: `LV_IGK = 1` **and**
`LV_CDN_VB_MIN_DIAG = 1` **and**
$N\_32 \leq C\_N\_MAX\_ERR\_VIM\_FB$ **and**
`LV_ERR_SPI_MPS = 0`

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Deactivation: not activation
at deactivation function is initialized
one time

Formula section:

LV_VIMPWM_1_FB_VLD = 0

If ERR_DIAG_VIM_1 = 2 *(SCG detected by Powerstage-diagnosis)*
Then T_VIMPWM_1_FB = T_VIMPWM_1_FB + 100ms
ERR_VIMPWM_1_FB = FFH *(failure feedback possible)*
If T_VIMPWM_1_FB > C_T_VIMPWM_1_FB_MAX
(T_VIMPWM_1_FB out of range for FB)
Then ERR_VIMPWM_1_FB = 00H
Endif
Else
If C_T_VIMPWM_1_FB_MIN ≤ T_VIMPWM_1_FB ≤ C_T_VIMPWM_1_FB_MAX
Then *failure feedback detected*
ERR_VIMPWM_1_FB = 01H
LV_VIMPWM_1_FB_VLD = 1
Else *no failure feedback possible*
ERR_VIMPWM_1_FB = 00H
Endif
T_VIMPWM_1_FB = 0
Endif

The same calculation is done for all ...VIMPWM_2...-outputs.

A.135.4 Electrical diagnosis of VIM (LV_ERR_VIM_1 /2_EL)

FUNCTION DESCRIPTION:

General information:

The purpose is to diagnose the electrical signal from the two drivers which controls the VIM.

Description:

The driver can distinguish between three symptoms: ‘Short circuit to Vbatt’, ‘Short circuit to GND’ and ‘Open Load’.
The error detection algorithm in this function for “short circuit to GND” is respecting the status of the failure feedback recognition (ERR_VIMPWM_1_FB and ERR_VIMPWM_2_FB). The failure, detected by the HW, is delivered from the infrastructure ERR_DIAG_VIM_1 and ERR_DIAG_VIM_2.

Error-symptoms: are defined to this diagnosis function as following :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The same calculation is done for all ...VIMPWM_2...-outputs.

Failure debouncing and error management treatment:
For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_VIM_1/2_EL and ERR_DIAG_VIM_1/2.

ACTION_ERRM_FilterMulticondition (IN<VIMPWM_1/2_EL>,
IN<CDN_DIAG_VIM_1/2_EL>,
IN<ERR_DIAG_VIM_1/2>,
IN<C_ABC_INC_VIM_1/2_EL>, IN<C_ABC_MAX_VIM_1/2_EL>,
OUT< LV_ERR_VIM_1/2_EL>,
SYNCRONIZATION<CALL>)

This algorithm determines:
ERR_SYM_VIM_1/2_EL (detected error symptom)
LV_ERR_VIM_1/2_EL (Error flag for debounced error)
LV_CDN_DIAG_VIM_1/2_EL (Diagnosis condition information)
LV_END_DIAG_VIM_1/2_EL (End of diagnosis information)

A.135.5 Feedback diagnosis of VIM

FUNCTION DESCRIPTION:

General information:

If a failure is detected by the DISA control unit, a failure feedback is send to the ECU.

Description:

According the possible failure feedback from the DISA control unit (defined by ERR_VIMPWM_1/2_FB and LV_VIMPWM_1/2_FB_VLD), the diagnosis is managing the following failure: LV_ERR_VIMPWM_1/2_FB.

Error-symptoms of failure LV_ERR_VIMPWM_1/2_FB:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.1.1 Global TAM system error (LV_ERR_TAM)

General information:

The global error flag LV_ERR_TAM can be used for inhibition. It is set if a CAN or a plausibility TIA error occure.

Application conditions

Initialisation: *0 at reset*

Recurrence: *100ms*

Activation: *LV_IGK = 1*

Formula section:

If LV_ERR_TAM_CAN = 1 **or** LV_ERR_TAM_PLAUS = 1
Then LV_ERR_TAM = 1
Else LV_ERR_TAM = 0
Endif

B.1.2 CAN based TAM - signal diagnosis (LV_ERR_TAM_CAN)

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The input signals are from CAN.

Description:

Error symptoms are defined for this diagnosis function as:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

            LV_ERR_COM_2_BOFF        = 0
Then      ERR_SYM_TAM_CAN = SYM_2
Endif
```

Calculation of present error and end of diagnosis:
LV_ERR_TAM_CAN and LV_END_DIAG_TAM_CAN are calculated by error management

B.1.3 Ambient temperature sensor plausibility check (LV_ERR_TAM_PLAUS)

FUNCTION DESCRIPTION:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

General information:

This diagnosis is performed in order to detect a stucking or not plausible TAM signal which cannot be detected by electrical range diagnosis.

Description:

Diagnosis condition:
The diagnosis should only be activated:

- after a long engine stop time, e.g. > 10h in order to get similar temperatures of TAM /TIA /TCO_2 or TCO (depending on variant coding LV_VAR_TCO_2)
- if TAM is in a "critical" range e.g. fade out temperature of other OBD2 diagnosis
- just after start to avoid warming-up effects, e.g. within 5 s
- not in cold environment, because it's not requested by law

If these conditions are not fulfilled the diagnosis is switched off if C_T_AST_MAX_TAM_DIAG is elapsed after start.

Error detection
The TAM_PLAUS error is detected if the temperature-difference TAM_DIF_DIAG is over the threshold C_TAM_DIF_MAX_ERR for the anti-bounce time C_T_TAM_DIF_MAX_ERR.

End of diagnosis cycle with positive result
The positive diagnosis result is based on the monitoring of the alteration of TAM at and can be reached even if a error is detected or the validation phase is running.

- Just after start, comparing the start and stop temperature
- During warm up phase

If a alteration is detected the diagnosis is finished.
Error validation
The validation is only performed if all el. diagnosis for TIA /TCO_2 or TCO and finished (LV_DIAG_CDN_TAM_PLAUS = 1) and the vehicle was driven with a certain vehicle speed
(C_VS_MIN_VLD_TAM_ERR for C_T_VS_MIN_VLD_TAM_ERR).
If both conditions are true and a error was detected then the error LV_ERR_TAM_PLAUS is set for this driving cylce and the diagnosis is switched off.

Application conditions

Initialisation: 0 at LV_IGK 0->1 **or** reset **or** at clearing error memory
TAM_DIF_MAX / MIN_DIAG = TAM_ST
at LV_ST_END = 1 **or** reset **or** at clearing error memory

Recurrence: *100ms*

Activation: *LV_ST_END = 1*

Deactivation: LV_END_DIAG_TAM_PLAUS = 1 **or**
LV_INH_DIAG_TAM_PLAUS = 1 **or**
LV_CNL_DIAG_TAM_PLAUS = 1
(set LV_CDN_DIAG_TAM_PLAUS = 0 at deactivation)

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

B.2.1 Interface for Rate - Based - Monitoring

General information:

General information:
With this module the interface between the TAM_PLAUS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TAM_PLAUS data.
Within STATE_RBM_TAM_PLAUS, three different information are defined:
Conditions for monitoring are met long enough to detect malfunction (bit 0)
(no intrusive operation, no short trip)
Monitor disabled because of system malfunction (bit 1)
(depending on failure status: pending)

Application conditions:

Initialisation:	`RST`
Recurrence:	`DCON, FMYCLR, 1S`
Activation:	`always`
Deactivation:	`never`

Function description:

Formula section:

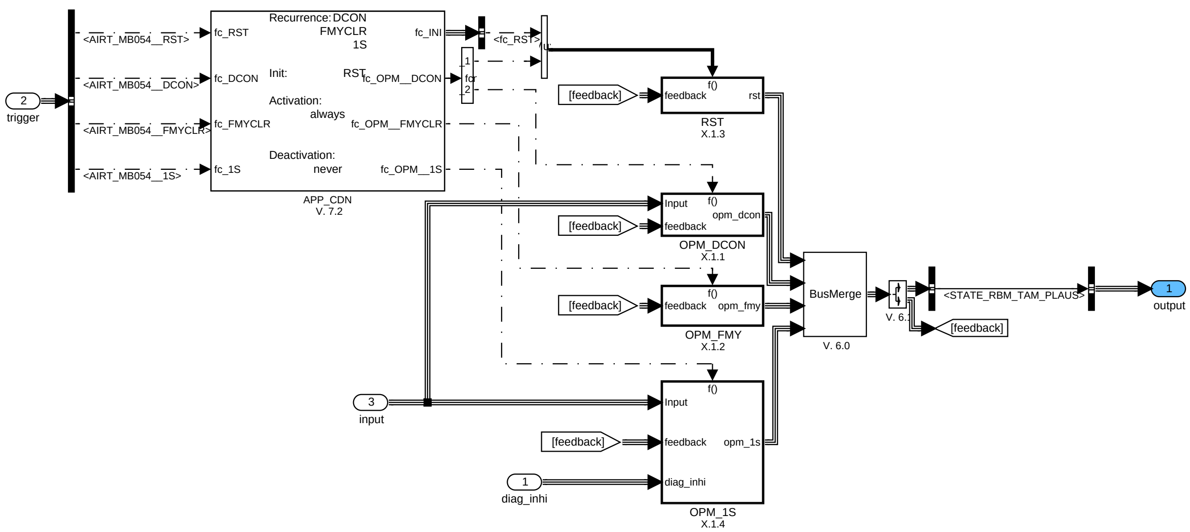

Figure B.2.2: :

B.2.1.1 Formula Section for SYSTEM EVENT DCON

B.2.1.1.1 If_Then

All the calculation within formula section will be done when this block is triggered. The pending status check function will be called if CTR_ERR_DYN_NR is greater than zero.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

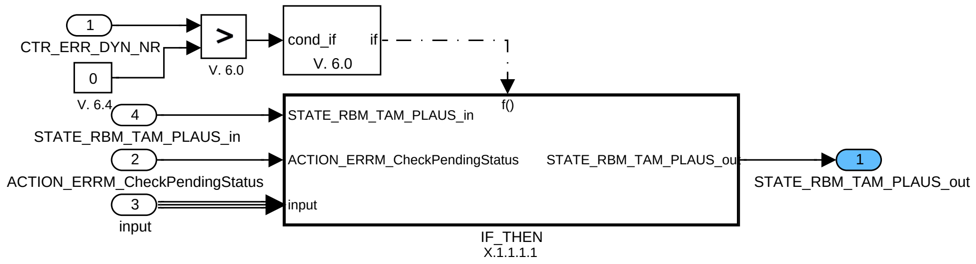

Figure B.2.3: :

B.2.1.1.1.1 IF_THEN/IF_THEN

B.2.1.1.1.1.1 Bit 1_Reset

If the failure is present bit 1 of STATE_RBM_TAM_PLAUS is reset to zero.

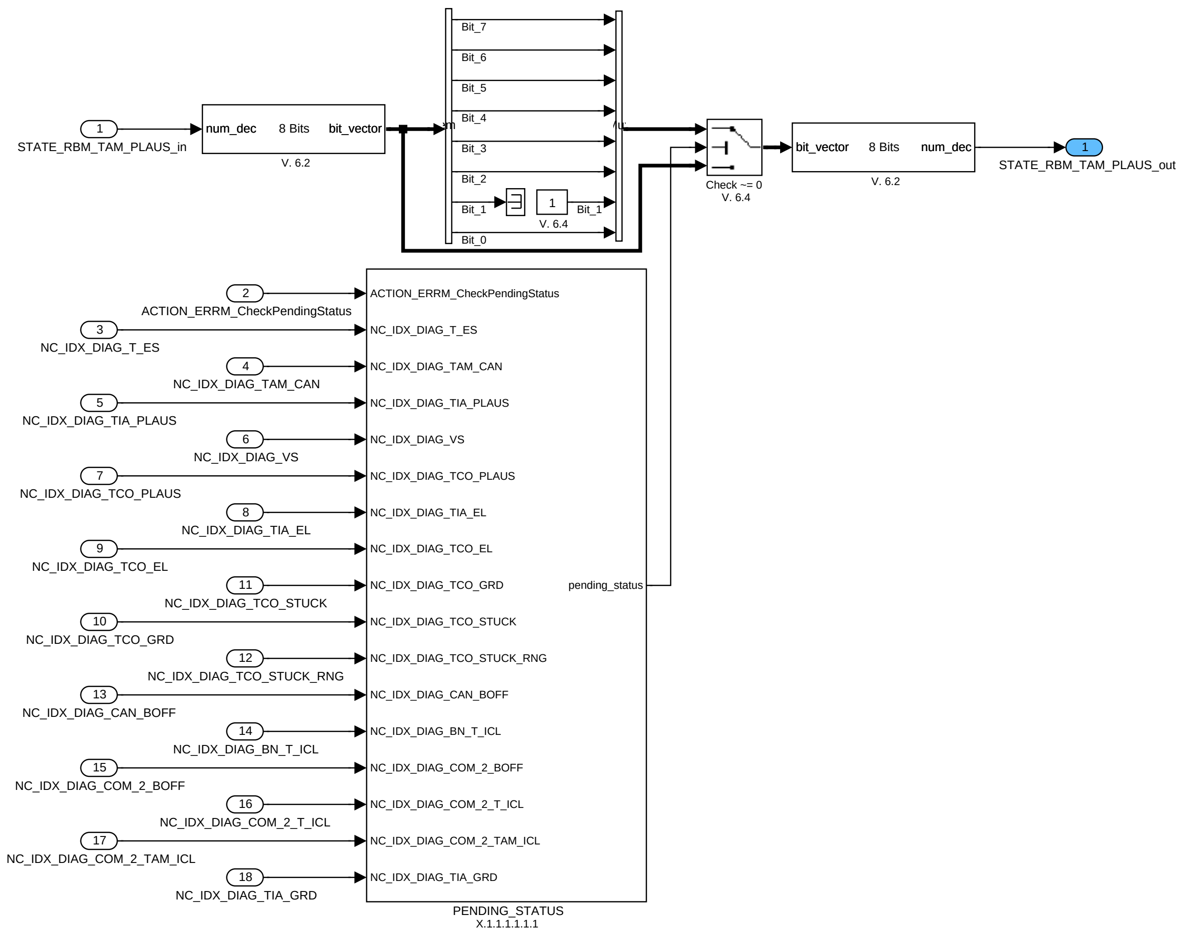

Figure B.2.4: :

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. General information:

General information:
This diagnosis is performed in order to detect a stucking or not plausible TIA_MESsignal which cannot be detected by electrical range diagnosis.
Description:
The diagnosis can be inhibited in cold conditions (If TAM_ST <= C_TAM_MIN_TIA_PLAUS_DIAG).
The error detection is based on two different diagnosis:

Plausible range detection:
The plausible TIA_MESmust be between TCO and TAM. If TIA_MESis outside of the range plus offset the error symptom MAX/MIN is set and the error is debounced.

Stucking signal:
If the vehicle was driven with a certain vehicle speed for a calibratable time (cool down of hot TIA_MES) or vehicle was in IDLE for a calibratable time and cycles (hot up of cold TIA_MES) and the TIA_MESsignal was not moving then a stucking TIA_MESsignal is detected and the error is debounced.

Error symptoms are defined for this diagnosis function as:

Figure B.4.4: :

B.4.2 Interface for Rate - Based - Monitoring

General information:
With this module the interface between the TIA_PLAUS monitor and the RateBased Monitoring statistics is defined with STATE_RBM_TIA_PLAUS data.
Within STATE_RBM_TIA_PLAUS, three different information are defined:
Conditions for monitoring are met long enough to detect malfunction (bit 0)
(no intrusive operation, no short trip)
Monitor disabled because of system malfunction (bit 1)
(depending on failure status: pending)
Monitor individual RBM conditions encountered within this DC (bit 2)
(not valid for TIA_PLAUS diagnosis)

Application Conditions

Initialization: RST, CLRFMY, DCON
Recurrence: 1S
Activation: always
Deactivation: never

Function description

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. FUNCTION DESCRIPTION:

General information:

The objective function of cylinder balancing diagnosis is monitoring the output of cylinder individual lambda control in homogenous engine operation and output of cylinder balancing via engine roughness in stratified or homogenous-stratified engine operation mode. Breaking the diagnosis limits for a long

time, which may have been caused by injector- failures, shall be diagnosed by cylinder balancing diagnosis. The failure allocation is cylinder selective. In case of failure detection for one of the cylinders the failure symptom of remaining cylinders shall be checked. Should the run-off time of any cylinder be over the minimum threshold, the concerned cylinder has to be detected as defect. Should the output of cylinder individual lambda control be concerned, the diagnosis shall be executed for all of the exhaust-bank-related cylinders (1.2, 1.4.1,1.5, 1.6.1,1.7.1.1).
The diagnosis shall be executed for all of the cylinders if the output of cylinder balancing via engine roughness is concerned (1.2, 1.4.2, 1.5, 1.6.2, 1.7.2).

Description of index "[i]" and "[x]":

x: logical cylinder
*use **NC_CYL_NR**: number of engine cylinders - index "[x]"*
*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF**: pattern for allocation of physical cylinders to exhaust bank - index "[i]*

CILC error detected over several driving cycles					

Input data:

LV_ES {p. 1720}	LV_INH_OBD_DIAG_CYL_BAL_LAM [NC_CBK_EX_NR] {p. 5113}	LV_ST_END {p. 1720}	NC_CBK_EX_NR {p. 1829}

FUNCTION DESCRIPTION:

General information:

Variable assignment

Description of index "_i":

*use **NC_LAMB_REF**: pattern for allocation of physical cylinders to exhaust bank - index "_i or [i]"*

Remark:

index "_i" is equivalent to "[i]"

Application conditions

Initialization:
at reset, LV_IGK = 0 1 and clear error memory:

LV_ERR_LAM_CYL_SEL_i = 0

Recurrence:
T_SAMPLE = 100 ms

Activation:
- LV_ST_END = 1

Deactivation:
- LV_ES = 1

Formula section:

LV_ERR_LAM_CYL_SEL_i = LV_INH_OBD_DIAG_CYL_BAL_LAM[i]

FUNCTION DESCRIPTION:

General information:

Copyright (C) Continental AG,2007

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

With level monitoring of the monitor sensor after leaving regeneration phase of NOx trap unplausible voltage values can be detected and a plausibility check of the sensor can be made.

Description:

If the general conditions for activating the diagnostic function are fulfilled and if during a regeneration phase either the state STATE_RGN[i] is set to L_AMPL or LC_STATE_RGN_L_AMPL_DEAC = 1 (withdrawal of monitoring STATE_RGN[i] depending on regeneration strategy) the lambda probe voltage and its previous value shall be stored.

Upon leaving the regeneration phase the previously measured voltage shall be compared to the threshold which, when exceeded, allows to activate the diagnosis as indicated by LV_DIAG_ACT_RGN_NT_LS_DOWN[i] = 1. Additionally the timer T_RGN_NT_END[i] and the mass air flow integral MAF_INT_RGN_NT_END[i] are calculated until the next stratified combustion mode is activated.

Provided that the stratified mode is activated before the timer T_RGN_NT_END[i] or the MAF integral MAF_INT_RGN_NT_END[i] exceed their respective threshold values monitoring the lambda probe voltage after leaving the regeneration phase shall be started and the MAF integral MAF_INT_RGN_NT_S_ACT[i] shall be calculated. After exceeding the MAF integral threshold C_MAF_INT_RGN_NT_S_ACT, i.e. if the stratified mode has been active long enough, the voltage difference between leaving the regeneration phase and exceeding the MAF integral threshold shall be calculated as expressed by VLS_DOWN_RGN_NT_DIF[i].

Comparison of the voltage difference to a threshold value allows to recognize a sensor malfunction. Each time the voltage comparison is made the counter for end of diagnosis recognition shall be increased. Provided that the measured voltage difference does not exceed its respective threshold C_VLS_DOWN_RGN_NT_DIF_THD the symptom counter CTR_SYM_DIAG_RGN_NT_LS_DOWN[i] shall be incremented by the calibratable increment C_CTR_INC_DIAG_RGN_NT_LS_DOWN and decremented otherwise with a decrement of 1.
The final diagnosis result is drawn after the end cycle counter has reached the calibratable minimum number of necessary diagnostic cycles C_CTR_END_DIAG_RGN_NT_LS_DOWN. In this case the end indication flag shall be set and the error indication flag shall be set following an n-out-of-m statistical evaluation for the case that the symptom counter has exceeded the corresponding threshold C_CTR_SYM_MAX_RGN_NT_ LS_DOWN. The result shall not be transmitted to the ERRM directly, since another diagnosis is expected to include it in its error and end state considerations.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Error-symptoms and conditions:

```
□□□□
| | | └─> (not used)                                     (= SYM_0)

```

Copyright (C) Continental AG,2007

Application conditions:

Initialisation:
At reset or the transition of LV_IGK = 0 -> 1 or at clearing the error memory all variables shall be reset to 0, except VLS_DOWN_RGN_NT_MES_SAE[i] and VLS_DOWN_RGN_NT_ MIN_SAE[i].
Initialisation in case of new ECU and NVMY checksum errors:
VLS_DOWN_RGN_NT_MES_SAE[i] = 0V
Initialisation in case of reset:
VLS_DOWN_RGN_NT_MIN_SAE[i] = C_VLS_DOWN_RGN_NT_DIF_THD

Recurrence: 20 ms
Activation: At any engine operating state

Formula section:

FUNCTION DESCRIPTION:

General information:

The monitor sensor diagnosis consists of three separate tests. These tests are carried out at the beginning or at the end of the pull fuel cut-off (PUC) or after switching from stoichiometric to lean combustion. In detail there are the tests monitoring of the rich-lean switching time, monitoring of the signal voltage transition during PUC or after switching to lean combustion and monitoring of the signal voltage motion after PUC, the last one being complemented by an alternative function providing the error flags LV_DIAG_RGN_NT_LS_DOWN_ERR[i] and the completition flags LV_DIAG_RGN_NT_LS_DOWN_END[i]. The purpose of these tests is the recognition of emission relevant sensor errors caused by changes in the sensor behaviour or by electrical errors like open circuits.

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
  i = 1, for exhaust cylinder bank 1
  i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
  i = 1, for single exhaust cylinder bank.

Application conditions:

Initialisation:
If At LV_IGK 0->1 **or** reset **or**at clearing error memory
then reset of all variables and bits to 0
endif

Recurrence: *20 ms*
Activation /Deactivation:

If TCO > C_TCO_MIN_DIAG_MPL_LS_DOWN
and LV_LS_DOWN_READY[i] = 1
(Operating readiness of the monitor sensor must be detected)
and C_VS_MIN_DIAG_MPL_LS_DOWN ≤ VS
≤ C_VS_MAX_DIAG_MPL_LS_DOWN
(Vehicle speed in range)
and TEMP_CAT_DYN_MDL[i] > C_TEMP_CAT_MIN_DIAG_MPL_LS_DOWN
(Catalytic converter at operating temperature)
then
LV_DIAG_MPL_CDN_LS_DOWN[i] = 1
Else
LV_DIAG_MPL_CDN_LS_DOWN[i] = 0
endif

or LV_END_DIAG_SWT_LS_DOWN[i] = 0)
then
LV_DIAG_MPL_CDN_LS_DOWN[i] = 1
else
LV_DIAG_MPL_CDN_LS_DOWN[i] = 0
endif

B.9.1 Monitoring the rich-lean switching times in the trailing throttle fuel cut-off

FUNCTION DESCRIPTION:

General information:

Changes in the dynamic behaviour of the monitor sensor can be detected by the recognition of the rich-lean switching time after fuel cut-off or after changing the combustion mode from homogenous mode to stratified mode.

Description:

After detection of the PUC engine operating state, the rich-lean switching time of the lambda sensor is determined and weighted depending upon the mass air flow in the intake system. The functioning of the sensor is diagnosed by comparison of the mean value of the weighted switching time with a limit. The functioning is guaranteed in this test if the switching time is below the limit.
The switching time diagnosis shall be finished for the current driving cycle, if C_CTR_SWT_DIAG_LS_DOWN valid switching times are calculated or if the alternative function indicates its completition via LV_DIAG_RGN_NT_LS_DOWN_END[i] = 1. Whenever one of the two functions completes, its diagnostic result is used for the current driving cycle and the result of the other function is ignored.
The rich-lean switching time of the sensor is determined in defined ranges of the mass air flow. A prerequisite for performing the diagnosis is that the voltage of the monitor sensor at the time of activating the trailing throttle fuel cut-off VLS_DOWN_TRAN_PUC[i] is above the threshold C_VLS_PUC_MIN_DIAG_SWT_LS_DOWN. The voltage value of the sensor at the time of trailing throttle fuel cut-off VLS_DOWN_TRAN_PUC[i] is required for the calculation of the dynamic limits for switching point determination and must be stored for the diagnostic period.
If the sensor voltage drops below the value C_FAC_VLS_MAX_DIAG_SWT_LS_DOWN * VLS_DOWN_TRAN_PUC[i], the switching time determination starts and the cycle counter CTR_SWT_ACT_LS_DOWN[i] has to be started. The counting process is ended if the limit C_FAC_VLS_MIN_DIAG_SWT_LS_DOWN * VLS_DOWN_TRAN_PUC[i] is exceeded downwards. The value of the cycle counter CTR_SWT_ACT_LS_DOWN[i] is a measure of the rich-lean switching time of the monitor sensor.
If a rich peak which exceeds C_VLS_HYS_DIAG_SWT_LS_DOWN occurs during determination of the switching time, its determination is interrupted and the relevant switching time is no longer further processed. The determination of the sensor switching times must also be interrupted if PUC is left.
Simultaneously to incrementation of CTR_SWT_ACT_LS_DOWN[i] the counter CTR_SWT_ACT_RBM_LS_DOWN[i] shall be incremented until the corresponding ratio CTR_QUO_SWT_RBM_LS_DOWN[i] exceeds the threshold for a defective lambda probe C_CTR_SWT_LS_DOWN. After this condition has been fulfilled the valid cycle counter CTR_SWT_LS_DOWN[i] shall be incremented. This procedure ensures that within each diagnostic cycle and after completion of the required total number of diagnostic cycles a probe malfunction can be detected as is demanded by ARB.
A valid value of the switching times for the monitor sensor must be weighted depending upon the minimum value for the mass flow during the determination of the switching time of the lambda sensor

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

MAF_KGH_MIN_PUC. The weighting factor is determined via the map IP_FAC_CYCNR_MAX_LS_DOWN_ACT.
If for the determined switching time of the monitor sensor doesn't exceed the limit the sensor is diagnosed as functioning, otherwise as malfunctioning. Depending on LC_SWT_LS_DOWN_MV the average value of the switching time determination or the respective minimum value shall be evaluated. The minimum or maximum measured diagnosis values are saved for the scantool SAE 1979 accordingly.

Application conditions:

Initialisation:
If At LV_IGK 0->1 **or** reset **or**at clearing error memory
then reset of all variables and bits to 0, except:
MAF_KGH_MIN_PUC = *"max phys. limit"*
CTR_SAVE_SWT_LS_DOWN[i] which shall be initialized with its saved
Value. Reset only at clearing error memory.
CTR_QUO_SWT_LS_DOWN_MIN[i] which shall be initialized with its maximum value
endif

Recurrence: *20 ms*
Activation /Deactivation:
If ((LV_DIAG_MPL_CDN_LS_DOWN[i] =1
and LV_INH_DIAG_SWT_LS_DOWN[i] = 0)
or LV_DIAG_RGN_NT_LS_DOWN_END[i] = 1)
and LV_END_DIAG_SWT_LS_DOWN[i] = 0
then LV_CDN_DIAG_SWT_LS_DOWN[i] =1
else LV_CDN_DIAG_SWT_LS_DOWN[i] =0
(switching time check disabled)
VLS_DOWN_TRAN_PUC[i] = 0
LV_SWT_DIAG_VLD_LS_DOWN[i] = 0
CTR_SWT_ACT_LS_DOWN[i] = 0
CTR_SWT_ACT_RBM_LS_DOWN[i] = 0
MAF_KGH_MIN_PUC = *"max phys. limit"*
LV_DIAG_SWT_LS_DOWN_S_ENA[i] = 0
endif

Formula section:

% Ensure that either upstream or downstream sensor indicates rich conditions for a minimum contiguous air
% mass integral. After such conditions, leaner conditions are allowed for a limited time. The upstream criterion
% is preferred, because a slow downstream sensor could make it hard to detect short rich phases, thus
% inhibiting its own detection. Fuel cut is a blocking criterion on its own, because lambda setpoint is
% not a reliable indicator in this condition.

Diagnostic Identifier	Symptom Description	Nr	OBD Sym DTC	OBD Global DTC	Filter Type	CARB class
Diagnostic Description						
SWT_LS_DOWN		0			NO	
Oxygen sensor downstream rich lean switch time check		1				
		2				
	SYM_3	3				

General information

B.10.1 Inhibition of diagnosis of the monitor sensors

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then

i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

It must be considered that there is one pump and also one exhaust line pro cylinder bank. Therefore NC_CBK_EX_NR and NC_CBK_HPP_NR can be considered in the code as equivalent.

If one of the below mentioned conditions is not fulfilled, the inhibit bit interrupts the downstream oxygen sensor diagnosis.

Application conditions:

Initialisation:
```
at every transition LV_IGK = 0 -> 1or reset all variables
shall be reset to 0, except STATE_RBM_SWT_LS_DOWN[i] //for
init of this variable see section below

at every transition LV_IGK = 1 -> 0
LV_INH_DIAG_SWT_LS_DOWN[NC_CBK_EX_NR] = 1
```

Activation: `LV_IGK = 1`

Deactivation: `LV_IGK = 0`

Recurrence: `100 ms`

Function description:

B.10.2 RBM – Interface for monitor sensor diagnosis

General information:

With this module the interface between the SWT_LS_DOWN[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_SWT_LS_DOWN[i] data.
Within STATE_RBM_SWT_LS_DOWN[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0)
  (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1)
  (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2)
  (not valid for SWT_LS_DOWN[i] diagnosis)

Application conditions:

Initialisation:
```
at ECU reset all bits of STATE_RBM_SWT_LS_DOWN[i] shall be
initialized with 0
at LV_DC 0 ->1 transition :
   bit 0 and bit 1 of STATE_RBM_SWT_LS_DOWN[i]  = 0
   bit 2 of STATE_RBM_SWT_LS_DOWN[i]  = 1
on failure memory reset :
   bit 1 of STATE_RBM_SWT_LS_DOWN[i] = 0
```

Activation: LV_DC 0 -> 1 transition **and** LV_DC = 1

Deactivation: –

Recurrence: 1 s

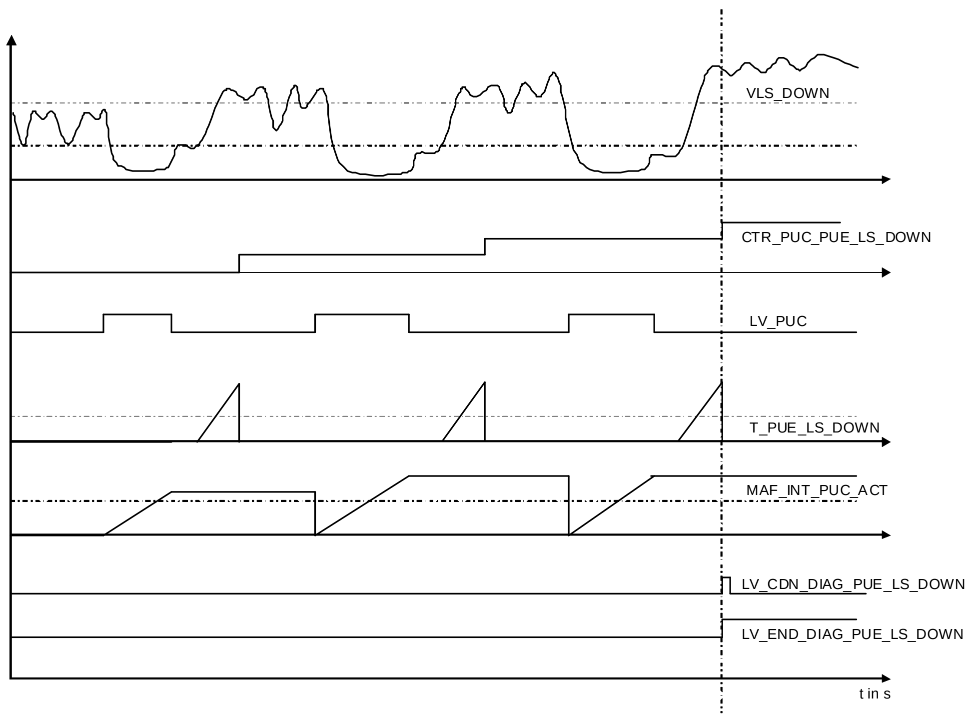
General Information

The downstream oxygen sensor is used for several tasks where signal dynamics is critical, e.g. trim control, catalyst purge, or monitoring of the catalyst performance. If the sensor response to a lean to rich transition is slow, these functions may not operate properly and diagnoses may produce wrong results. Therefore the sensor signal is monitored for sufficient dynamics.



Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

FUNCTION DESCRIPTION:

Copyright (C) Continental AG,2007

The diagnosis runs once per driving cycle (adjustable by LC) and monitors the gradient of the downstream oxygen sensor voltage (VLS_DOWN). For the diagnosis to run, the sensor must be ready, no inhibitions must be indicated and the sensor voltage must be in a plausible range.

The function tests if the sensor signal changes fast enough by evaluating the gradient after removal of high-frequency noise. To ensure that a result is produced only if enough signal dynamics can be expected, a certain number of suitable fuel cut phases must occur before the diagnosis finishes. A "suitable fuel cut phase" is long enough to ensure a lean catalyst, and enough gas has passed afterwards to purge the catalyst. Both criteria can be calibrated in terms of air mass integrals and a timer.
The overall maximum and/or minimum of the signal gradient is calculated until the condition of the diagnosis has been determined. At that moment, the value is compared against a threshold, and if it is high enough, the sensor passes diagnosis, otherwise it fails. At the same time the relevant gradient and the thresholds are stored for mode06 output.

The following Flowchart is a short overview of the characteristic of the diagnosis.

Activation: always
Deactivation: never

Function description

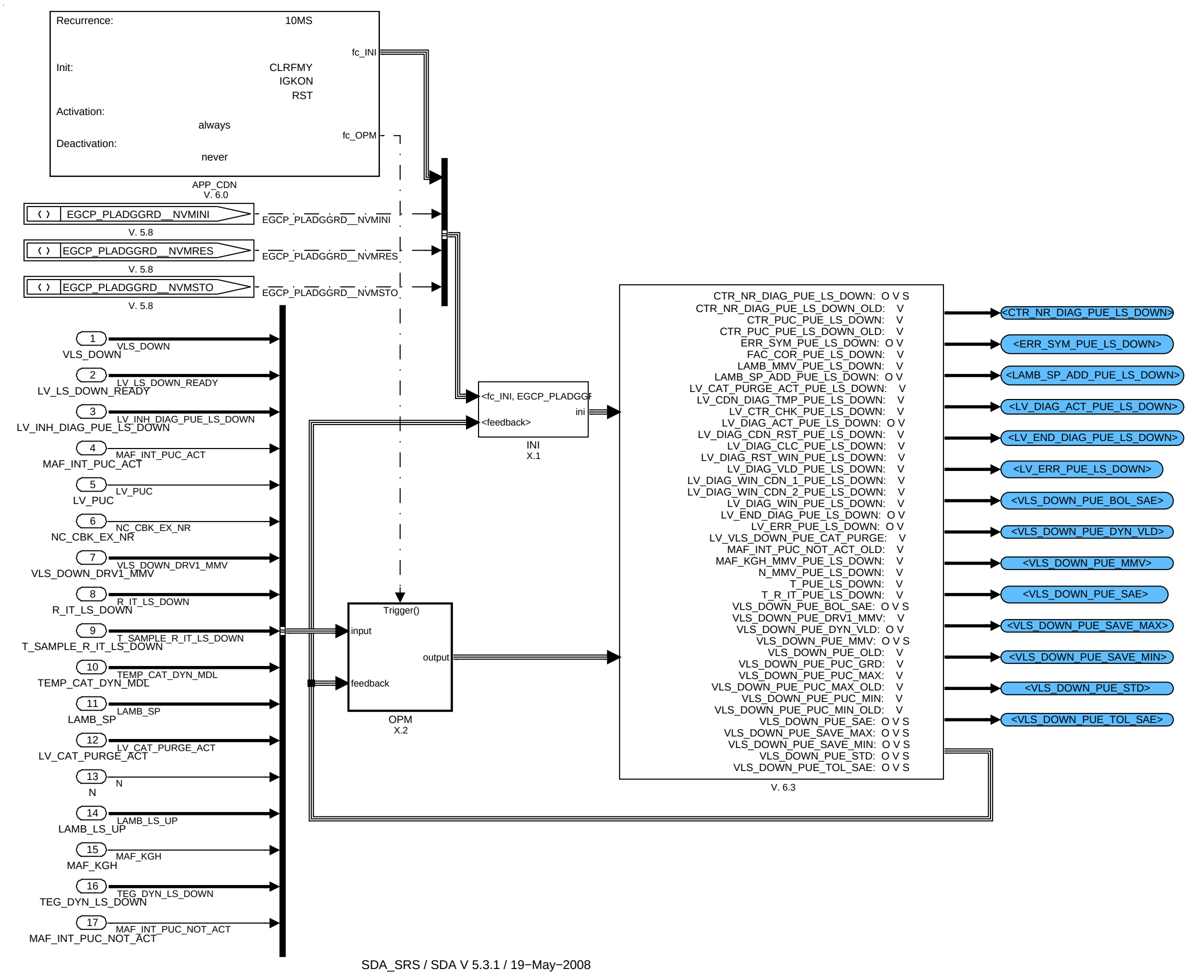

Figure B.11.1: :

B.11.1 Initialization

Initialization of (normal) variables, non-volatile memory variables and variables that are directly linked to error manager is described.
Initialization of variables takes place at ignition key on and reset.
The variables saved in the non-volatile memory are reset in case the error memory is cleared and by initializing the NVMY.
Variables that are directly linked with the error manager are initialized according to related error manager routines (ACTION_ERRM).

B.11.1.1 Synchronization with ERRM at clear failure memory and reset of Mode06 Label

Synchronisation between LV_ERR_PUE_LS_DOWN, LV_END_DIAG_PUE_LS_DOWN and ERR_SYM_PUE_LS_DOWN and its result from ERRM is done using action ACTION_ERRM_GetLvErr(),ACTION_ERRM_GetLvEnd() and ACTION_ERRM_GetErrSym() at clear failure memory.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

ACTION_ERRM_GetLvErr(IN <IDX_DIAG>, OUT <LV_ERR>)
Action that returns the status of the debounced failure
ACTION_ERRM_GetErrSym(IN <IDX_DIAG>, OUT <ERR_SYM>)
Action that returns the symptom of the failure
ACTION_ERRM_GetLvEndDiag(IN <IDX_DIAG>, OUT <LV_END_DIAG>)
Action that returns the status of the failure availability

B.11.1.2 Initialization at reset, ignition key on and clear failure memory

ACTION_ERRM_NoFilterReset(IN <IDX_DIAG>, OUT <LV_ERR>)
This action resets data filter in case of no filter usage
ACTION_ERRM_GetErrSym(IN <IDX_DIAG>, OUT <ERR_SYM>)
Action that returns the symptom of the failure
ACTION_ERRM_GetLvEndDiag(IN <IDX_DIAG>, OUT <LV_END_DIAG>)
Action that returns the status of the failure availability

General information

B.12.1 Inhibition of oxygen sensor downstream gradient monitoring

General information:

The calculation shall be done for all exhaust cylinder banks.
For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then

i = 1, for exhaust cylinder bank 1

i = 2, for exhaust cylinder bank 2

otherwise (NC_CBK_EX_NR = 1)

i = 1, for single exhaust cylinder bank.

This function shall evaluate the application conditions applicable to the oxygen sensor gradient monitoring lean to rich and provide the result in a single boolean flag. This flag shall represent the interface to the main diagnosis function. Additionally the inhibition bit for Rate Based Monitoring is evaluated.

Description:
The oxygen sensor gradient monitoring lean to rich shall be ihibited if one of the following listed errors was recognized:

- LV_ERR_LS_DOWN (LV_ERR_SCG_LS_DOWN, LV_ERR_SCP_LS_DOWN, LV_ERR_OC_LS_DOWN, LV_ERR_CHK_LS_DOWN, LV_ERR_PUC_LS_DOWN, LV_ERR_LSH_DOWN , LV_ERR_OBD_LSH_DOWN, LV_ERR_CHG_LS_DOWN) is a system error flag and has influence on the oxygen sensor downstream readiness.
- LV_ERR_LS_UP is a system error flag of the oxygen sensor upstream. The upstream sensor produce the LAMB_LS_UP which shall be in the correct range to activate the gradient monitoring diagnosis.

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Application conditions:

Initialisation: The following variables shall be initialised at reset and at the ignition key transition on (i.e. LV_IGK = 0 → 1):
LV_INH_DIAG_PUE_LS_DOWN[i] = 0
LV_INH_DIAG_RBM_PUE_LS_DOWN[i] = 0

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0

Recurrence: The function shall be carried out once every 10 ms

General information:

With this module the interface between the PUE_LS_DOWN[i] monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_PUE_LS_DOWN[i] data.
Within STATE_RBM_PUE_LS_DOWN[i], three different information are defined:

- Conditions for monitoring are met long enough to detect malfunction (bit 0) (no intrusive operation, no short trip)
- Monitor disabled because of system malfunction (bit 1) (depending on failure status: pending)
- Monitor individual RBM conditions encountered within this DC (bit 2)

Application conditions:

Initialisation:

```
at ECU reset :
        bit 0, bit 1 and bit 2 of STATE_RBM_PUE_LS_DOWN[i]
= 0
at LV_DC 0 → 1 transition :
        bit 0 and bit 1 of STATE_RBM_PUE_LS_DOWN[i] = 0
on failure memory reset :
        bit 1 of STATE_RBM_PUE_LS_DOWN[i]= 0
```

Activation: `LV_DC = 1`

Deactivation: -

Recurrence: `1 s`

Function description:

Formula section:

At LV_DC 0 →1 transition

`bit 2 of STATE_RBM_PUE_LS_DOWN[i] = 1`

The pending status of the following failures has to be checked only once:

Dependence	Error			
	LV_ERR_AMP	LV_ERR_AMP_PLAUS	LV_ERR_CHG_LS_DOWN	LV_ERR_CHG_LS_UP
	LV_ERR_CRK_PLAUS	LV_ERR_CRK_SYN	LV_ERR_CRK_TOOTH	LV_ERR_CRK_TOOTH_ PER

FUNCTION DESCRIPTION:

General information:

The calculation shall be done for all exhaust cylinder banks.

For instance, if two separate catalyst systems are concerned (NC_CBK_EX_NR = 2) then
i = 1, for exhaust cylinder bank 1
i = 2, for exhaust cylinder bank 2
otherwise (NC_CBK_EX_NR = 1)
i = 1, for single exhaust cylinder bank.

Description:

The downstream oxygen sensor heater circuit shall detect any loss in heater power that would cause a drop in the sensor operating temperature, thereby possibly causing exhaust gas emissions to rise above the applicable standards or prevent the sensor signal from being used as a diagnostic system monitoring device.
Losses in heater power may occur due to, for example, ageing of the heater element, defective wiring, increased heater cct. connector contact resistance, defective heater driver etc.
The hereafter mentioned diagnosis strategy is based on the comparison of the oxygen sensor internal resistance to an absolute threshold during operating conditions where the exhaust gas temperature has been determined to be sufficiently low as to cause the sensor ceramic temperature to fall outside normal operating levels, in cases where a power is insufficient.

Copyright (C) Continental AG,2007

The functionality of the diagnosis may be described in further detail below:
The initial diagnosis application condition; LV_ST_END shall ensure that the engine is running and has left the start phase but not yet entered the engine stop phase, LV_INH_DIAG_OBD_LSH_DOWN[i] shall ensure that the project specific application conditions (Application Incidences) have been met and LV_END_DIAG_OBD_LSH_DOWN[i] shall ensure that the diagnosis only be carried out once per driving cycle.
In order to ensure that the sensor has reached its normal operating temperature, the heater management state STATE_LSH_DOWN[i] shall be determined to be in the open loop control state LSH_POW_CTL, the sensor shall be determined to be in a state of operative readiness via LV_LS_DOWN_READY[i], the battery voltage VB shall be in a range determined to be fit for carrying out OBD2 diagnosis shown by LV_VB_CDN_OBD_2 and the heater duty-cycle LSHPWM_DOWN[i] shall be determined to be within calibrateable range C_LSHPWM_MIN_LSH_DOWN & C_LSHPWM_MAX_LSH_DOWN.
Should the above initial and operative conditions have been determined to be met, a timer, denoted herein as *TIMER_1*, shall be started. The timer shall run until the threshold T_DLY_OBD_LSH_DOWN_TMP is equalled or exceeded. Once this delay has passed, the status of the OBDI error bits LV_ERR_EL_LS_DOWN[i] & LV_ERR_LSH_DOWN[i] shall be read to ensure that no signal electrical or plausibility faults and no heater electrical faults are present in the sensor cct. under test. The delay shall ensure that sufficient time passes to permit completion of the OBDI monitoring prior to the start of OBDII monitoring.
Should no OBDI faults be present, the modelled exhaust gas temperature TEG_DYN_LS_DOWN[i] shall be compared to a calibrateable threshold C_TEG_DYN_MAX_OBD_LSH_DOWN. Due tolerances in the determination of the sensor internal resistance and in the case of a functional heater, the maximum resistance value may be given by a minimum tolerance sensor at a much lower temperature than for a maximum tolerance sensor at a higher temperature. Therefore, in the case of diagnosis based on an absolute internal resistance threshold, a certain temperature tolerance exists. The above mentioned temperature threshold shall lie below the minimum temperature determined from analysis of the internal resistance tolerances and be sufficient to cool the sensor ceramic element to below normal operating conditions, in the case of a heater fault.
Should the exhaust gas temperature be determined to equal or fall below the threshold, the monitoring strategy shall ensure that the sensor be cooled sufficiently long by the exhaust gas to enable differentiation between a functional and non-functional heater cct. (The time required is dependent on the thermal capacity of the system at the sensor location and the forced convection cooling of the sensor location). This shall be achieved by integrating the heat flux of the forced convection thermal transfer between sensor and exhaust gas, this being a measure for the cooling energy of the exhaust gas. The heat flux shall be calculated by determining the difference between the typical set sensor operating temperature C_TEMP_SP_OBD_LSH_DOWN and the modelled exhaust gas temperature TEG_DYN_LS_DOWN[i] and multiplying the result by the factor IP_FAC_MAF_OBD_LSH_DOWN representing the heat transfer coefficient and surface area concerned in the thermal transfer. As the heat transfer coefficient is a function of the velocity of the exhaust gas, the factor shall be mapped and dependent on the current mass airflow MAF_KGH.
The resultant integral POW_INT_OBD_LSH_DOWN[i] shall be compared to the threshold POW_INT_MIN_OBD_LSH_DOWN_TMP. Each time that the threshold be exceeded for the first time, e.g. first time after engine start or after the power integral has been reset, the CTR_CYCNR_R_IT_OBD_LS_DOWN[i] shall be updated once only with the value CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. This shall ensure that only new internal resistance values be used for diagnosis purposes that have been determined since all the activation conditions have been met.
It shall be determined whether a new internal resistance has been determined by comparing the contents of counter CTR_CYCNR_R_IT_OBD_LS_DOWN[i] with that of CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. Should the counters be unequal, then a new value is available and CTR_CYCNR_R_IT_OBD_LS_DOWN[i] shall be updated with CTR_CYCNR_R_IT_LS_DOWN_VLD[i]. If this conditions and all the above conditions be met, LV_CDN_DIAG_OBD_LSH_DOWN[i] shall be set and the diagnosis shall be considered to be active and the current monitoring cycle valid.
Once the current monitoring cycle has been determined to be valid, a counter TCC_VLD_OBD_LSH_DOWN[i] shall be incremented, denoting the number of valid monitoring cycles carried out to date. The internal resistance R_IT_LS_DOWN[i] shall be compared to a calibrateable threshold IP_R_IT_THD_OBD_LSH_DOWN according to modelled tip temperature of a new sensor (including safety margin).

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

Copyright (C) Continental AG,2007

Should the resistance equal or exceed the threshold, a heater fault shall be determined to be present in the current cycle and a counter TCC_ERR_OBD_LSH_DOWN[i] shall be incremented, denoting the number of heater faults within the valid monitoring cycles carried out to date.

In order to comply with OBDII requirements, the current R_IT_LS_DOWN[i] value used shall be made available to an external tester. This information is Mode 6 information. Hence once the comparison to the threshold has been carried out, the latest measured internal resistance and threshold values (R_IT_L_MES_OBD_LSH_DOWN[i] and R_IT_L_REF_OBD_LSH_DOWN[i]) shall be copied to the respective Mode 6 interface variables R_IT_OBD_LS_DOWN[i] and R_IT_THD_OBD_LSH_DOWN[i] for the no error case. In the error case the variables R_IT_H_MES_OBD_LSH_DOWN[i] and R_IT_H_REF_OBD_LSH_DOWN[i] shall be handed out.

Once the number of valid monitoring cycles TCC_THD_OBD_LSH_DOWN_TMP has been determined to have been carried out, the diagnosis shall carry out a n-out-of-m statistical evaluation of the results. Should the number of determined heater faults exceed the threshold TCC_THD_ERR_OBD_LSH_DOWN_TMP, the oxygen sensor heater under test shall be considered to be faulty for the current driving cycle and flag LV_ERR_OBD_LSH_DOWN[i] shall be set.

If the number of faults does not exceed the threshold, LV_ERR_OBD_LSH_DOWN[i] shall be reset.

Once the statistical evaluation has been carried out, no further monitoring cycles shall be executed in the remaining driving cycle. This is achieved by setting LV_END_DIAG_OBD_LSH_DOWN[i].

Should, according to project philosophy, the diagnosis be activated for an end of line (EOL) test, specific threshold conditions for the diagnosis delay timer, the power integral, the required number of test and error indicating cycles may be chosen to shorten the time until recognition of diagnosis end.

NOTES:

1. The integral POW_INT_OBD_LSH_DOWN[i] shall be reset to 0 should the exhaust gas temperature exceed the applicable threshold. This would cause the sensor to be re-heated from the exhaust gas once again and a certain delay would be required prior to the sensor being cooled long enough to permit valid diagnosis to occur.
2. The timer *TIMER_1* and integral POW_INT_OBD_LSH_DOWN[i] shall be reset should any of the initial entry or operative readiness conditions no longer be met or an OBDI fault be detected in the sensor under test. This may cause the sensor to leave its normal operating conditions and the OBDII diagnosis shall be required to start from the beginning as the sensor operating conditions would require time to stabilise should the conditions be met again.
3. The statistic counters TCC_VLD_OBD_LSH_DOWN[i] and TCC_ERR_OBD_LSH_DOWN[i] shall not be reset by changing conditions and therefore shall only increment or remain frozen during any given monitoring cycle. The counters shall only be reset at the beginning of a new driving cycle.
4. Projects that provide for an internal statistical error management shall use their internal error management and apply this wherever reference to TCC_VLD_OBD_LSH_DOWN[i], TCC_ERR_OBD_LSH_DOWN[i], TCC_THD_OBD_LSH_DOWN_TMP & TCC_THD_ERR_OBD_LSH_DOWN_TMP is made.
5. The variable STATE_OBD_LSH_DOWN[i] shall indicate, at the end of the each monitoring cycle, the status of the diagnosis within that cycle. The following correlation of variable content to description shall apply:

0:	DIAG_OFF	Initialisation state; no conditions met
1:	DIAG_INIT	Initial conditions & application incidences met only
2:	LS_READY	Sensor operatively ready conditions met + 1,
3:	OBD1_DLY	OBDI monitoring completion delay exceeded + 1 & 2
4:	OBD1_CHK	No OBDI faults present +1, 2 & 3
5:	TEG_THD	Exhaust gas below threshold + 1, 2, 3 & 4
6:	POW_INT	Power integral exceeded + 1,2,3,4 & 5
7:	DIAG_ACT	***Diagnosis detection active***
8:	DIAG_END	***Diagnosis detection complete***

Application conditions

Initialisation:

Transmittal, reproduction, dissemination and/or editing of this document as well as utilisation of its contents and communication thereof to others without expressed authorisation are prohibited. Offenders will be held liable for payment of damages. All rights created by patent grant or registration of a utility model or design patent are reserved.

The following variables shall be initialised at reset, at the transition ignition key on (i.e. LV_IGK = 0 -> 1) and at clearing the error memory:

LV_CDN_DIAG_OBD_LSH_DOWN[i] = 0
ERR_SYM_OBD_LSH_DOWN[i] = 0
LV_ERR_OBD_LSH_DOWN[i] = 0
LV_END_DIAG_OBD_LSH_DOWN[i] = 0
STATE_OBD_LSH_DOWN[i] = 0
TEMP_DIF_OBD_LSH_DOWN[i] = 0
POW_INT_OBD_LSH_DOWN[i] = 0
TCC_VLD_OBD_LSH_DOWN[i] = 0
TCC_ERR_OBD_LSH_DOWN[i] = 0
CTR_CYCNR_R_IT_OBD_LS_DOWN[i] = 0
R_IT_L_MES_OBD_LSH_DOWN[i] = 0
R_IT_L_REF_OBD_LSH_DOWN[i] = 0
R_IT_H_MES_OBD_LSH_DOWN[i] = 0
R_IT_H_REF_OBD_LSH_DOWN[i] = 0

Reset *TIMER_1*

R_IT_OBD_LSH_DOWN[i] and R_IT_THD_OBD_LSH_DOWN[i] shall be initialised with the last value from the previous driving cycle stored in non-volatile memory after RESET.

NOTE: TIMER_1 refers to a program specific timer and is not intended to represent a variable name!

Recurrence:

The OBDII oxygen sensor heater diagnosis shall be carried out once per driving cycle. The diagnosis shall require a number of monitoring cycles to be carried out to permit statistical evaluation of the results. These monitoring cycles shall occur every 1 s, until a calibrateable number of valid diagnosis cycles has been exceeded.

Once this threshold has been completed, the OBDII oxygen sensor heater diagnosis shall no longer be carried out until a new driving cycle is initiated.

Should an OBDII heater fault be detected, the application assistances (Functions that are defined to be affected by the state of the oxygen sensor signal) shall remain active for the remainder of the driving cycle. The restarting of the affected functions during the next driving cycle shall be carried out according to the project philosophy.
