1.1 AIRT – Requirements to infrastructure interface

Input data:

LV_VAR_TCHA			

Export actions:

ACTION_INFR_GetVpTia (OUT <Vp_tia_sens**>)**
This action provides the digitized voltage value of the available intake air temperature sensors in a single value.
ACTION_INFR_GetVpTiaTcha (OUT <Vp_tia_tcha_sens**>)**
This action provides the digitized voltage value of the available temperatur up turbocharger sensor in a single value.

Description for actions:

ACTION_INFR_GetVpTia (Vp_tia_sens**)**					
This action provides the digitized voltage value of the available intake air temperature sensors in a single value delivered from the infrastructure. The AD conversion is performed autonomously by the infrastructure. When the action is called the gathered information will be provided to the application software level. Port-Channel: if LV_VAR_TCHA = 0 (N53) PIN 5_28 if LV_VAR_TCHA = 1 (N54) PIN 5_17					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
Vp_tia_sens	OUT	0...7FFFH	0...4.999847412	1.5258E-04	V
Intake air temperature sensor voltage value					

ACTION_INFR_GetVpTiaTcha (Vp_tia_tcha_sens**)**					
This action provides the digitized voltage value of the available temperatur sensor up turbocharger in a single value delivered from the infrastructure. The AD conversion is performed autonomously by the infrastructure. When the action is called the gathered information will be provided to the application software level. Port-Channel: if LV_VAR_TCHA = 0 (N53) PIN 5_17 if LV_VAR_TCHA = 1 (N54) PIN 5_28					
Parameter	**Type**	**Hex. Limits**	**Phys. Limits**	**Resol.**	**Unit**
Vp_tia_tcha_sens	OUT	0...7FFFH	0...4.999847412	1.5258E-04	V
Voltage for temperatur sensor up turbocharger					

FUNCTION DESCRIPTION:

General information:

The following action is used for the acquisition of the digitized voltage value of the adressed intake air temperature sensor and the "up turbocharger" air temperature sensor in two single values. The action delivers the intake air temperature sensor and the "up turbocharger" air temperature sensor voltage values to the application software level from the standard AD converter queue.

- The AD conversion is performed autonomously by the infrastructure, the returned value is not older than 1000 ms (in case of TIA sensor).

- The voltage values are gathered in the infrastructure until the application reads out the information by calling the action, old values are replaced by new values.

Requirements for ACTION_INFR_GetVpTia:

Data acquisition					
Parameter	**Absolute precision**	**Relative precision**	**Resolution**	**Coincidence with parameter**	**Comment**
Vp_tia_sens			10 Bit		No comment

Diagnosis: no electrical diagnosis done here

Coincidence requirements: When calling this action, all returned voltages must be within the last 100 ms. Port-Channel:

```
If          LV_VAR_TCHA = 0
      then  Port-Channel: PIN_5_28 (N53)
      else  Port-Channel: PIN_5_17 (N54)
endif
```

Requirements for ACTION_INFR_GetVpTiaTcha:

Data acquisition					
Parameter	**Absolute precision**	**Relative precision**	**Resolution**	**Coincidence with parameter**	**Comment**
Vp_tia_tach_sens			10 Bit		No comment

Diagnosis: no electrical diagnosis done here

Coincidence requirements: When calling this action, all returned voltages must be within the last 100 ms. Port-Channel:

```
If          LV_VAR_TCHA = 0
      then  Port-Channel: PIN_5_17 (N53)
      else  Port-Channel: PIN_5_28 (N54)
endif
```

1.2 AGGR AIRT adaptation

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_TIA_IM	O/V	0...1H	0...1	1	-
Boolean for error currently present which might affect temperature TIA_IM (after debounce)					
LV_ERR_TIA_THR	O/V	0...1H	0...1	1	-
Boolean for error currently present which might affect temperature TIA_THR (after debounce)					
TIA_IM	O/V	0...FEH	-48...142.5	0.75	°C
Air temperature in the intake manifold					
TIA_THR	O/V	0...FEH	-48...142.5	0.75	°C
Air temperature at the throttle body					
TIA_THR_ST	O/V	0...FEH	-48...142.5	0.75	°C
Air temperature at the throttle body at start					

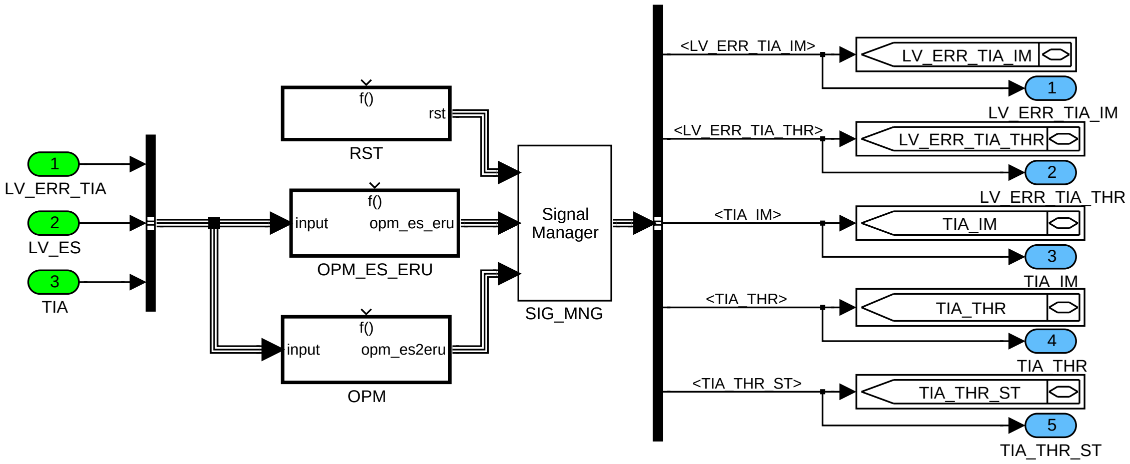
Input data:

LV_ERR_TIA	LV_ES	TIA	

1.2.1 Function Description

Adaptation of AIRT variables to MSV70 environment.

Function Description



SDA_SRS / SDA 4.0 29−Jul−2005

Figure 1 AIRT_M300B

1.2.1.1 Calculation at reset

Initialization at reset

TIA_THR_ST is initialised at engine start.

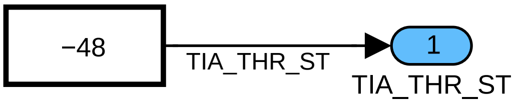


Figure 2 AIRT_M300B/ RST/ INI

1.2.1.2 Calculations at Engine stop to engine run

Initialization

TIA is assigned to output variable TIA_THR_ST

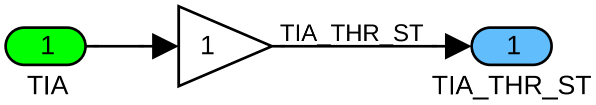

Figure 3 AIRT_M300B/ OPM_ES_ERU/ INI

1.2.1.3 Formula section

Calculation of outputs

Output variables TIA_IM, TIA_THR, LV_ERR_TIA_IM and LV_ERR_TIA_THR are calculated here. TIA is assigned to TIA_IM and TIA_THR , LV_ERR_TIA is assigned to LV_ERR_TIA_THR and LV_ERR_TIA_IM.

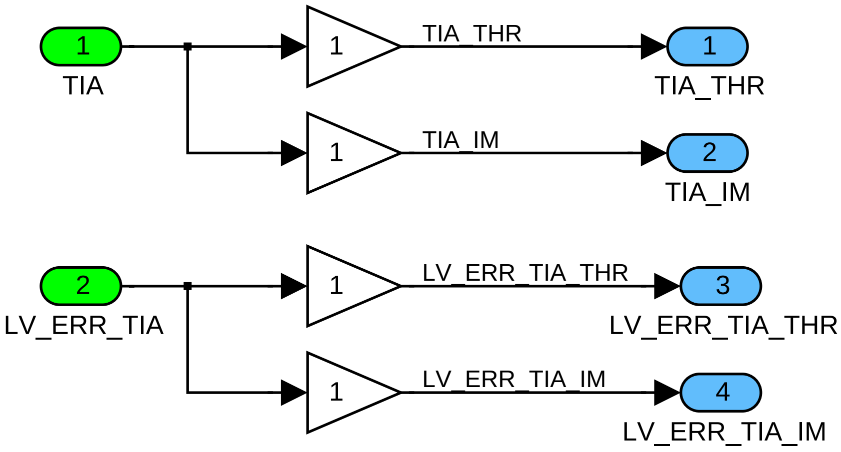

Figure 4 AIRT_M300B/ OPM/ SUB_CLC

1.3 Ambient Air Temperature TAM

Overview

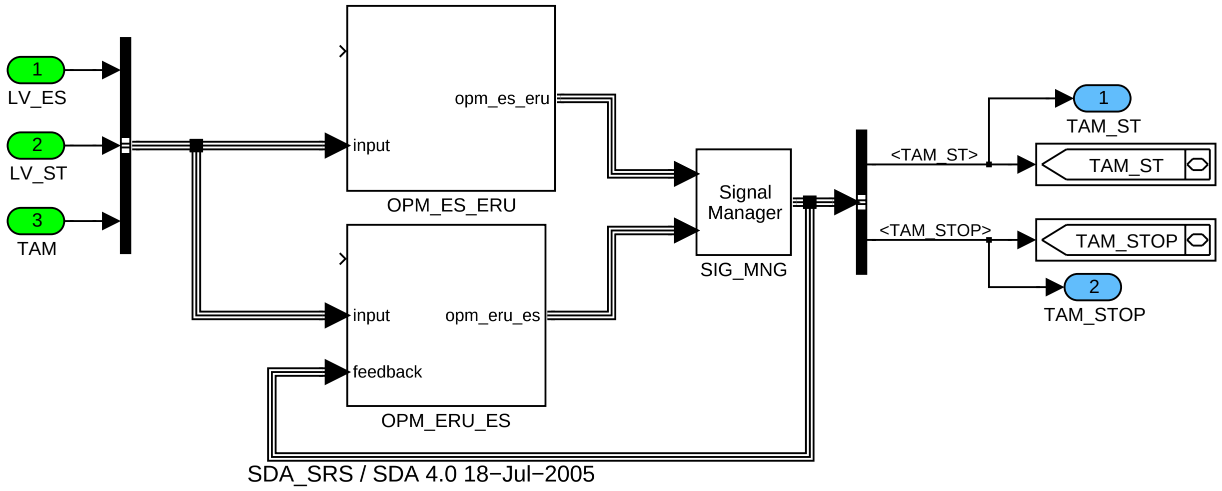

Figure 5 AIRT_M4024

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
TAM_ST	O/V	0...FEH	-48...142.5	0.75	°C
Ambient air temperature at Start					
TAM_STOP	O/V/S	0...FEH	-48...142.5	0.75	°C
Ambient air temperature at engine stop					

Input data:

LV_ES	LV_ST	TAM	

1.3.1 Calculation of ambient temperature at start(ES to ERU)

General information:

TAM is received via CAN (see chapter CAN-messages).

TAM_ST is determined at each transition from ES to ST.

Function Description

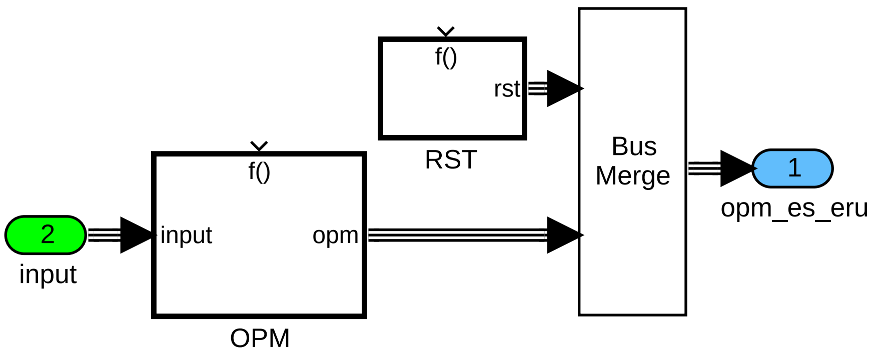

Figure 6 AIRT_M4024/ OPM_ES_ERU

1.3.1.1 Initialisation at reset

Initialisation of TAM_ST to 0 at reset

1.4 Intake air temperature TIA

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
TIA	O/V	0...FEH	-48...142.5	0.75	°C
Intake air temperature					
TIA_MES	O/V	0...FEH	-48...142.5	0.75	°C
Intake air temperature raw value					
TIA_ST	O/V	0...FEH	-48...142.5	0.75	°C
Intake air temperature at ST					
TIA_SUB	O/V	0...FEH	-48...142.5	0.75	°C
Substitute value intake air temperature					
TIA_TCHA	O/V	0...FEH	-48...142.5	0.75	°C
Air temperature up turbo charger					
VP_TIA	O/V	0...7FFFH	0...4.99984741	1.52588E-4	V
Voltage value of the intake air temperature sensor					
VP_TIA_TCHA	O/V	0...7FFFH	0...4.99984741	1.52588E-4	V
Voltage for temperatur sensor up turbocharger					

Input data:

C_VP_TIA_MAX_DIAG	C_VP_TIA_MIN_DIAG	LV_ERR_TCO	LV_ERR_TIA
LV_ERR_TIA_TCHA_UP	LV_ST	NC_CYL_NR	TCO
LV_VAR_TCHA			

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_TCO_DIAG	1	0...FEH	-48...142.5	0.75	°C
TCO threshold for switching TIA substitute					
C_TIA_GRD_MAX_DIAG	1	0...FEH	0...190.5	0.75	°C/500ms
Maximum permissible gradient for TIA					
C_TIA_SUB_BOL	1	0...FEH	-48...142.5	0.75	°C
Lower TIA substitute value					
C_TIA_SUB_TOL	1	0...FEH	-48...142.5	0.75	°C
Upper TIA substitute value					
IP_TIA_TCHA__VP_TIA_TCHA	16	0...FEH	-48...142.5	0.75	°C
LDP_VP_TIA_TCHA	16	0...7FFFH	0...4.99984741	1.52588E-4	V
NTC characteristic up turbo charger					
IP_TIA__VP_TIA	16	0...FEH	-48...142.5	0.75	°C
LDP_VP_TIA_TIA	16	0...7FFFH	0...4.99984741	1.52588E-4	V
NTC characteristic					

Import actions:

ACTION_INFR_GetVpTia(OUT <VP_TIA>)

This action provides the digitized voltage value of the available intake air temperature sensors in a single value.

ACTION_INFR_GetVpTiaTcha(OUT <VP_TIA_TCHA>)

This action provides the digitized voltage values of the available temperature of turbocharger sensor in a single value.

1.4.1 Function description

Function Description

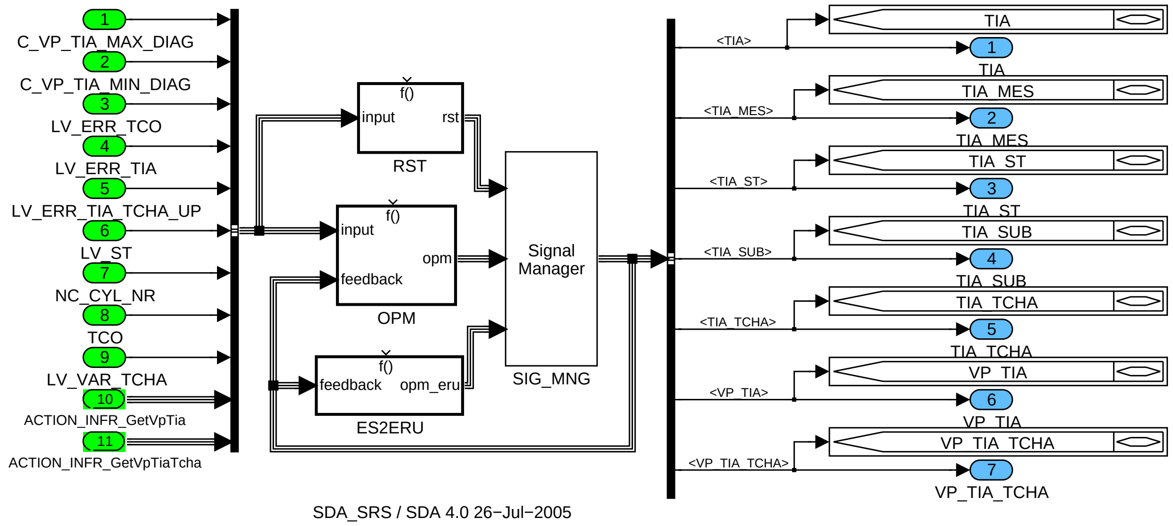

Figure 13 AIRT_M4007

1.4.1.1 Temperature determination

General information:

The air temperatures are measured through an A/D converter.

The conversion into physical values is made through the non-linear characteristic IP_TIA__VP_TIA and IP_TIA__V_TANS_TCHA. In case of a present fault of the TIA-sensor a substitute value will be used.

Calculation at reset

Calculation of TIA, TIA_MES, VP_TIA and VP_TIA_TCHA at reset

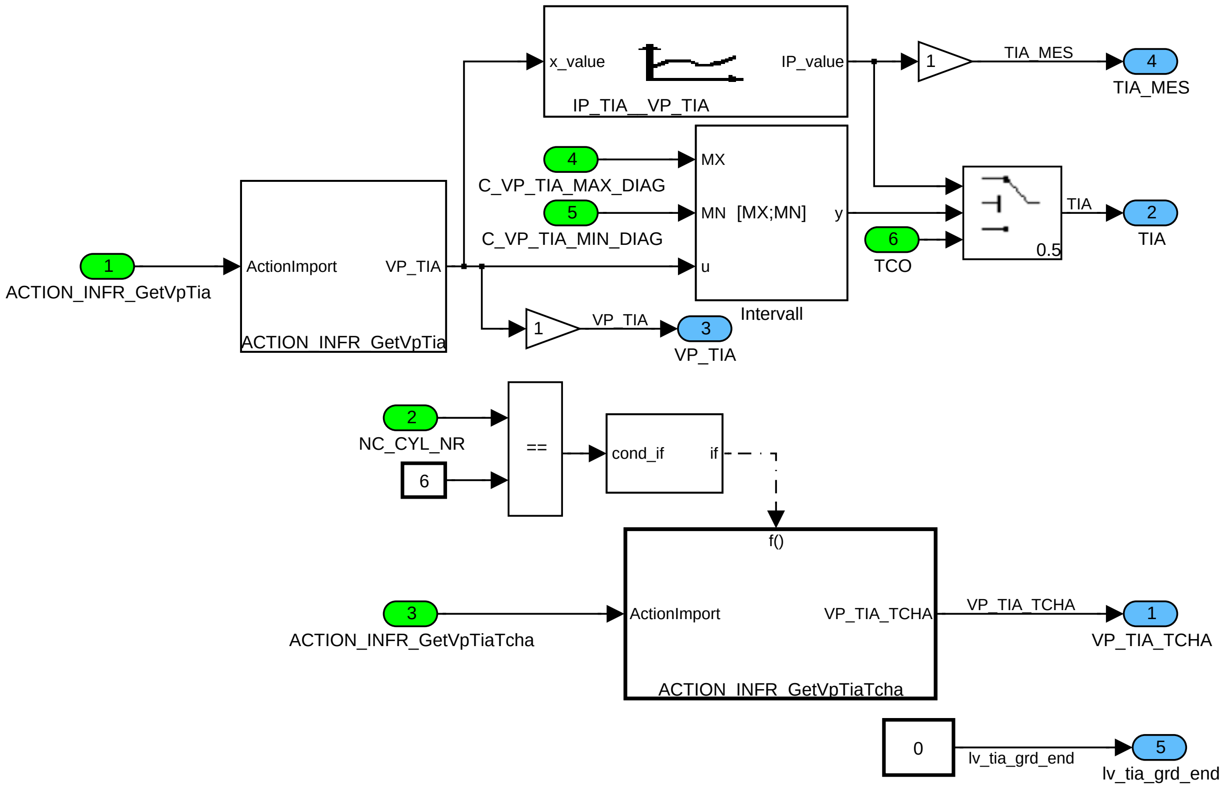

Figure 14 AIRT_M4007/ RST/ CLC

1.4.1.2 Formula section

Calculation at 100ms recurrence

Calculation of TIA, TIA_MES, TIA_SUB, VP_TIA and VP_TIA_TCHA

Action infrastructure outputs

The outputs of the air temperature sensor (VP_TIA and VP_TIA_TCHA) are calculated here using action infrastructure.

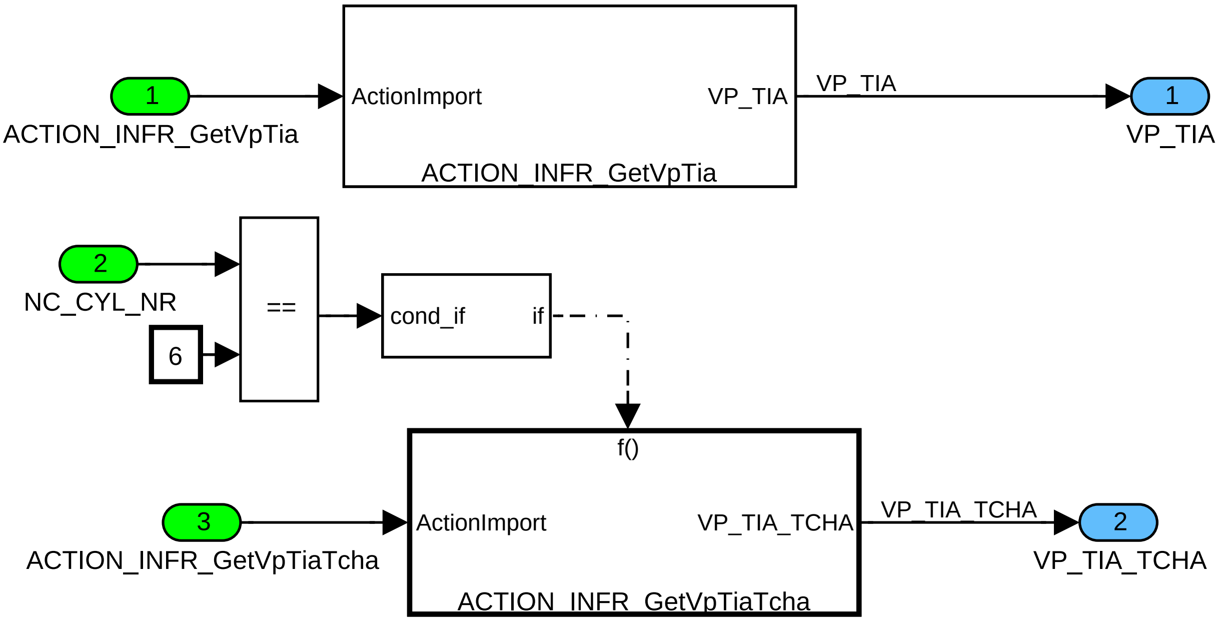

Figure 15 AIRT_M4007/ OPM/ CLC/ CLC_1_VP_TIA

Determination of TIA , TIA_TCHA, TIA_MES and TIA_SUB

Calculation of TIA is done using TIA_SUB, Output from temperature gradient monitoring scheme and old value of TIA .TIA_TCHA is calculated using TIA and IP MAP.TIA_MES is calculated from the IP table.

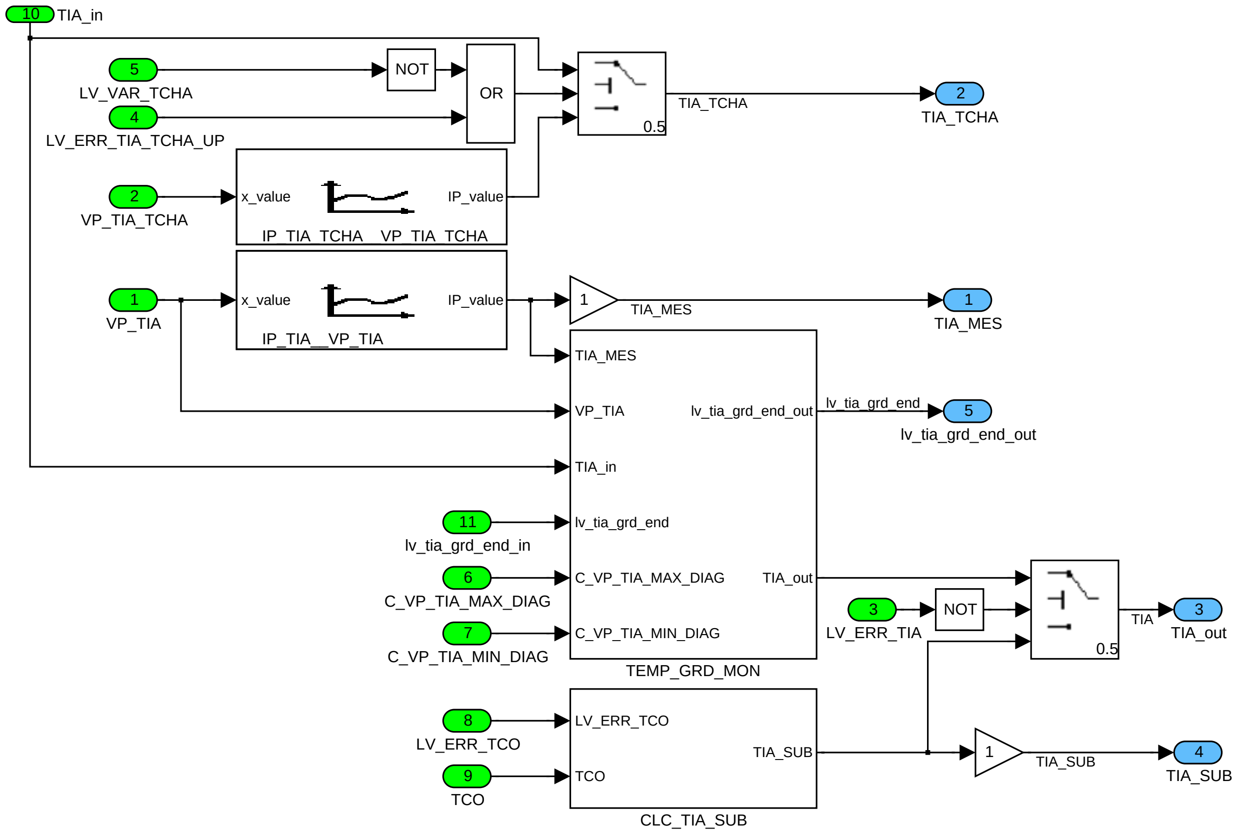

Figure 16 AIRT_M4007/ OPM/ CLC/ CLC_2_TIA_ERR

Determination TIA_SUB

TIA_SUB is determined from lower TIA substitute value (C_TIA_SUB_BOL) and upper TIA substitute value (C_TIA_SUB_TOL).

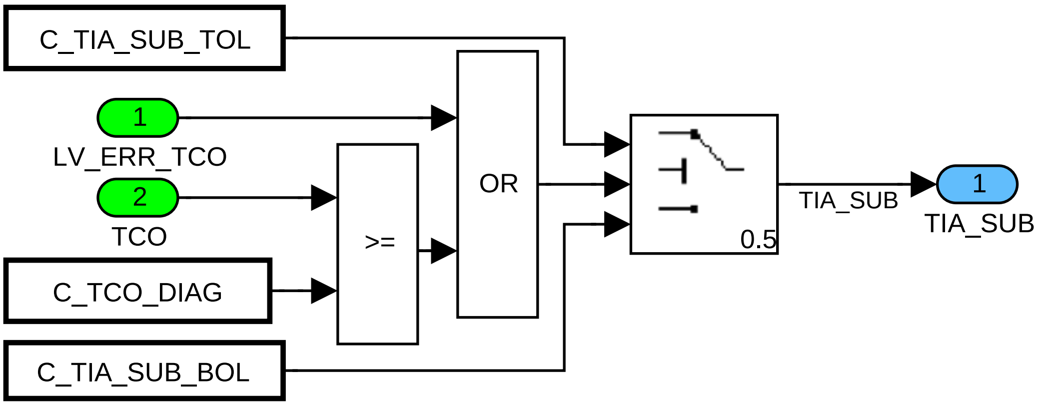

Figure 17 AIRT_M4007/ OPM/ CLC/ CLC_2_TIA_ERR/ CLC_TIA_SUB

Temperature gradient monitoring

General information:

The temperature TIA is monitored for unplausible gradients. Previously there is a check that the measured value is within the permissible value range (see chapter Diagnosis). If yes, a check is made that the difference between the old and the new measured value exceeds the permissible gradient

C_TIA_GRD_MAX_DIAG for TIA.

If this is the case, then the old measured value remains unchanged. If it is determined once again at the next measurement that the maximum gradient was exceeded, then the new measured value is taken over into the working memory. A measured value can therefore only be masked out if the gradient was exceeded for the first time.

Gradient monitoring does not lead to any error storage, but serves only for masking out not plausible measured values (disturbances).

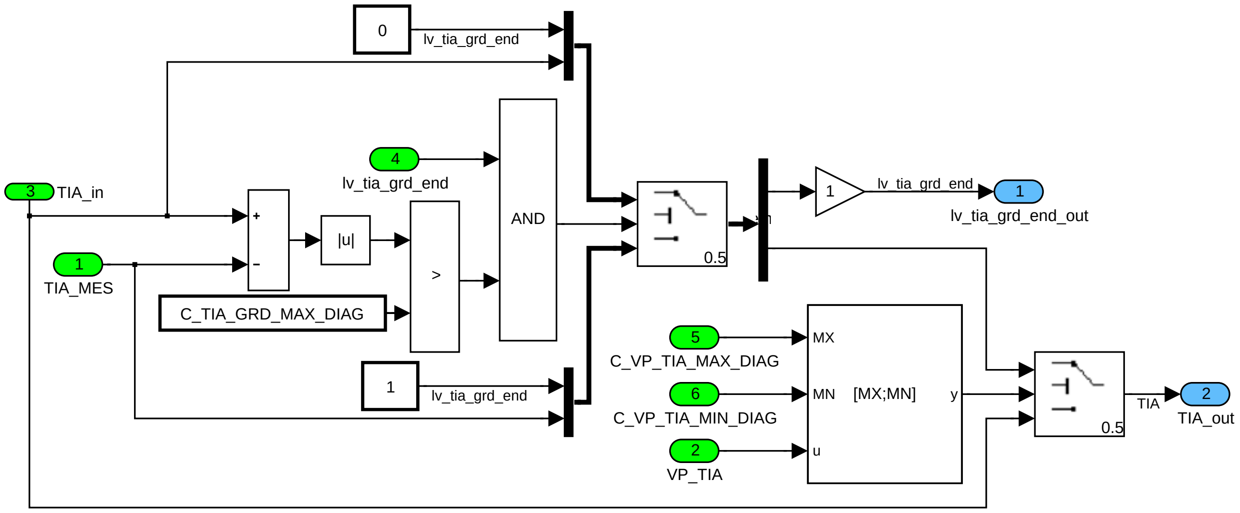

Figure 18 AIRT_M4007/ OPM/ CLC/ CLC_2_TIA_ERR/ TEMP_GRD_MON

1.4.1.3 Calculation at Engine stall to engine run event

Assignment of TIA to TIA_ST

TIA is assigned to TIA_ST

Import actions:

ACTION_ERRM_FilterSymptom(IN <IDX_DIAG>, IN <LV_CDN_DIAG>, IN <ERR_SYM>, IN <ABC_INC>, IN <ABC_DEC>, IN <ABC_MAX>, OUT <LV_ERR>)
This action computes the elementary anti-bounce filter
ACTION_ERRM_GetLvEndDiag(IN <IDX_DIAG>, OUT <LV_END_DIAG>)
Action that returns the status of the failure availability
ACTION_ERRM_GetLvErr(IN <IDX_DIAG>, OUT <LV_ERR>)
Action that returns the status of the debounced failure

1.5.1 Function description

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The input signal is analog from a NTC.

Description:

Error symptoms are defined for this diagnosis function as:

```
┌──┬──┬──┬──┐
└──┴──┴──┴──┘

│ │ │ └─> Short circuit to Vbatt or open load        (= SYM_0)
│ │ └───> Short circuit to GND                       (= SYM_1)
│ └─────> -                                    (= SYM_2)
└───────> -                                    (= SYM_3)
```

Intake air temperature signal gradient diagnosis

The purpose of the signal gradient diagnosis is to detect a not plausible gradient on the intake air temperature signal. The monitoring is based on a comparison between the actual and the last intake air temperature value. The symptom of the error code is handled by anti-bouncing.

Error-symptoms are defined to this diagnosis function as following:

```
┌──┬──┬──┬──┐
└──┴──┴──┴──┘
 | | | └─>                                              (= SYM_0)
 | | └───>                                              (= SYM_1)
 | └──────> -Intake air temperature range check error   (= SYM_2)
 └────────> -Intake air temperature signal gradient error     (= SYM_3)
```

Import actions:

ACTION_ERRM_GetLvErr(IN <IDX_DIAG>, OUT <LV_ERR>)
Action that returns the status of the debounced failure
ACTION_ERRM_FilterSymptom(IN <IDX_DIAG>, IN <LV_CDN_DIAG>, IN <ERR_SYM>, IN <ABC_INC>, IN <ABC_DEC>, IN <ABC_MAX>, OUT <LV_ERR>)
This action computes the elementary anti-bounce filter
ACTION_ERRM_GetLvEndDiag(IN <IDX_DIAG>, OUT <LV_END_DIAG>)
Action that returns the status of the failure availability

1.8.1 Function Description

General information:

This diagnosis is performed in order to detect a stucking or not plausible TIA signal which cannot be detected by electrical range diagnosis.

Description:

The diagnosis can be inhibited in cold conditions (If TAM_ST <= C_TAM_MIN_TIA_PLAUS_DIAG).

The error detection is based on two different diagnosis:

Plausible range detection:

The plausible TIA must be between TCO and TAM. If TIA is outside of the range plus offset the error symptom MAX/MIN is set and the error is debounced.

Stucking signal:

If the vehicle was driven with a certain vehicle speed for a calibratable time (cool down of hot TIA) or vehicle was in IDLE for a calibratable time and cycles (hot up of cold TIA) and the TIA signal was not moving then a stucking TIA signal is detected and the error is debounced.

Error symptoms are defined for this diagnosis function as:

```
┌──┬──┬──┬──┐
└──┴──┴──┴──┘
 |  |  |  └─> Signal to high          (= SYM_0)
 |  |  └────> Signal to low           (= SYM_1)
 |  └───────> -                       (= SYM_2)
 └──────────> Signal is not plausible (= SYM_3)
```

Calculation of TIA_DIF_DIAG

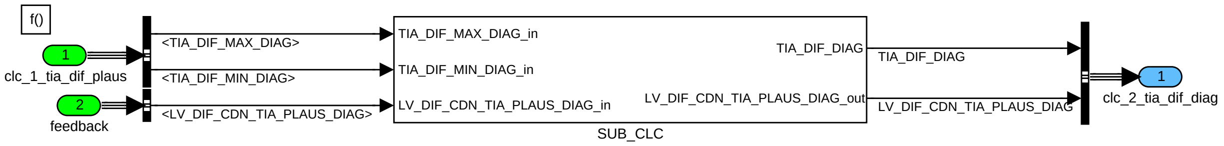

Figure 60 AIRT_MB051/ OPM/ CLC_2_TIA_DIF_DIAG

Calculation of the TIA_DIF_DIAG for stucking detection

Calculation of the TIA_DIF_DIAG for stucking detection. If TIA_DIF_DIAG is greater than C_TIA_DIF_DIAG (*e.g. 3°C*) LV_DIF_CDN_TIA_PLAUS_DIAG is set to 1 (set irreversible)

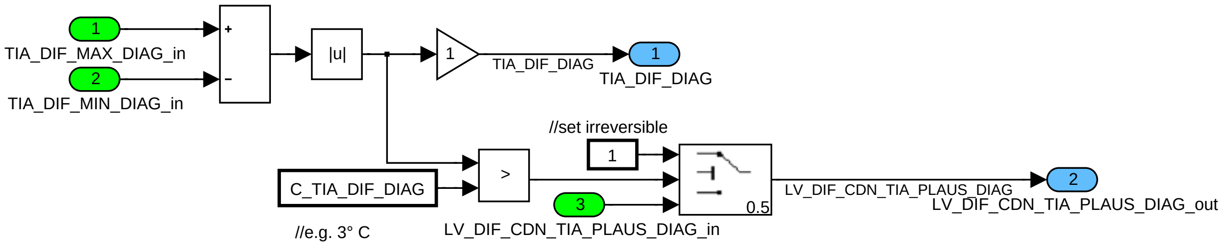

Figure 61 AIRT_MB051/ OPM/ CLC_2_TIA_DIF_DIAG/ SUB_CLC

Calculation at vehicle speed (VS)

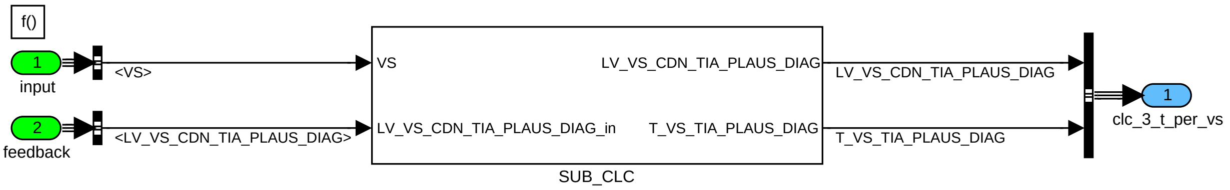

Figure 62 AIRT_MB051/ OPM/ CLC_3_T_PER_VS

Calculation of time period when vehicle is moving(Vehicle with speed)

When VS is greater then C_VS_MIN_TIA_PLAUS_DIAG (e.g. 40km/h) then timer (T_VS_TIA_PLAUS_DIAG) starts incrementing and if T_VS_CDN_TIA_PLAUS_DIAG is greater than threshold for load timer ,C_T_VS_MIN_TIA_PLAUS_DIAG (e.g. 180 s) then LV_VS_CDN_TIA_PLAUS_DIAG is set to 1(set irreversible). If VS is less than minimum VS then timer is reset.

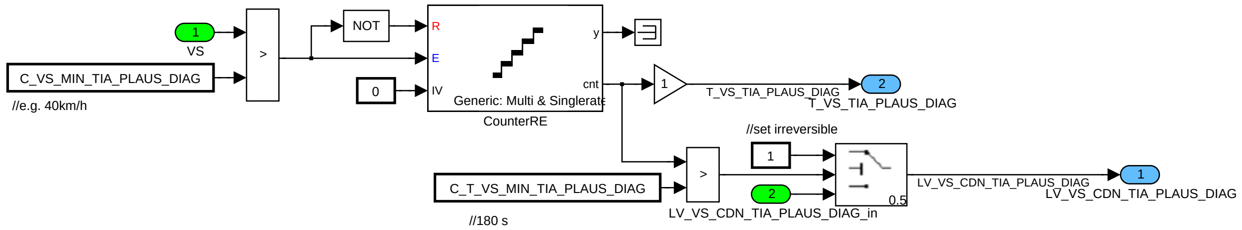

Figure 63 AIRT_MB051/ OPM/ CLC_3_T_PER_VS/ SUB_CLC

Calculation at idle speed condition

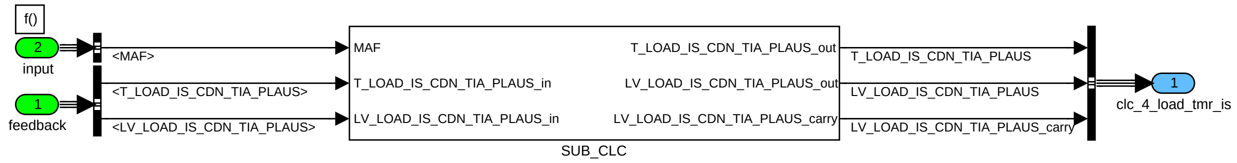

Figure 64 AIRT_MB051/ OPM/ CLC_4_LOAD_TMR_IS

Calculation of load timer to enter in idle speed condition

If MAF is greater than C_MAF_MIN_INT_CDN_TIA_PLAUS (e.g. 200 mg/stk), time period of the vehicle driven with high load (T_LOAD_IS_CDN_TIA_PLAUS) and flag indication that vehicle was driven with high load to enter in idle condition (LV_LOAD_IS_CDN_TIA_PLAUS) is calculated.

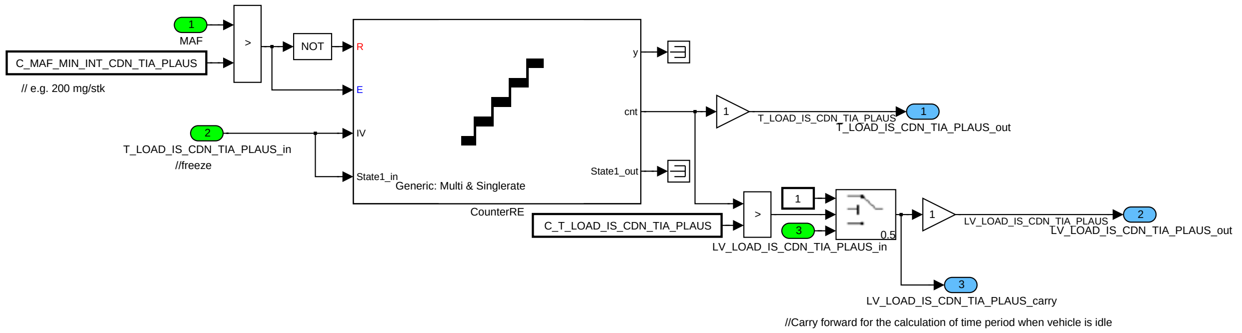

Figure 65 AIRT_MB051/ OPM/ CLC_4_LOAD_TMR_IS/ SUB_CLC

Calculation at vehicle idle

Ireversible inhibition of diagnosis. LV_INH_DIAG_TIA_PLAUS bit is set to 1, if any one of the inputs is 1.

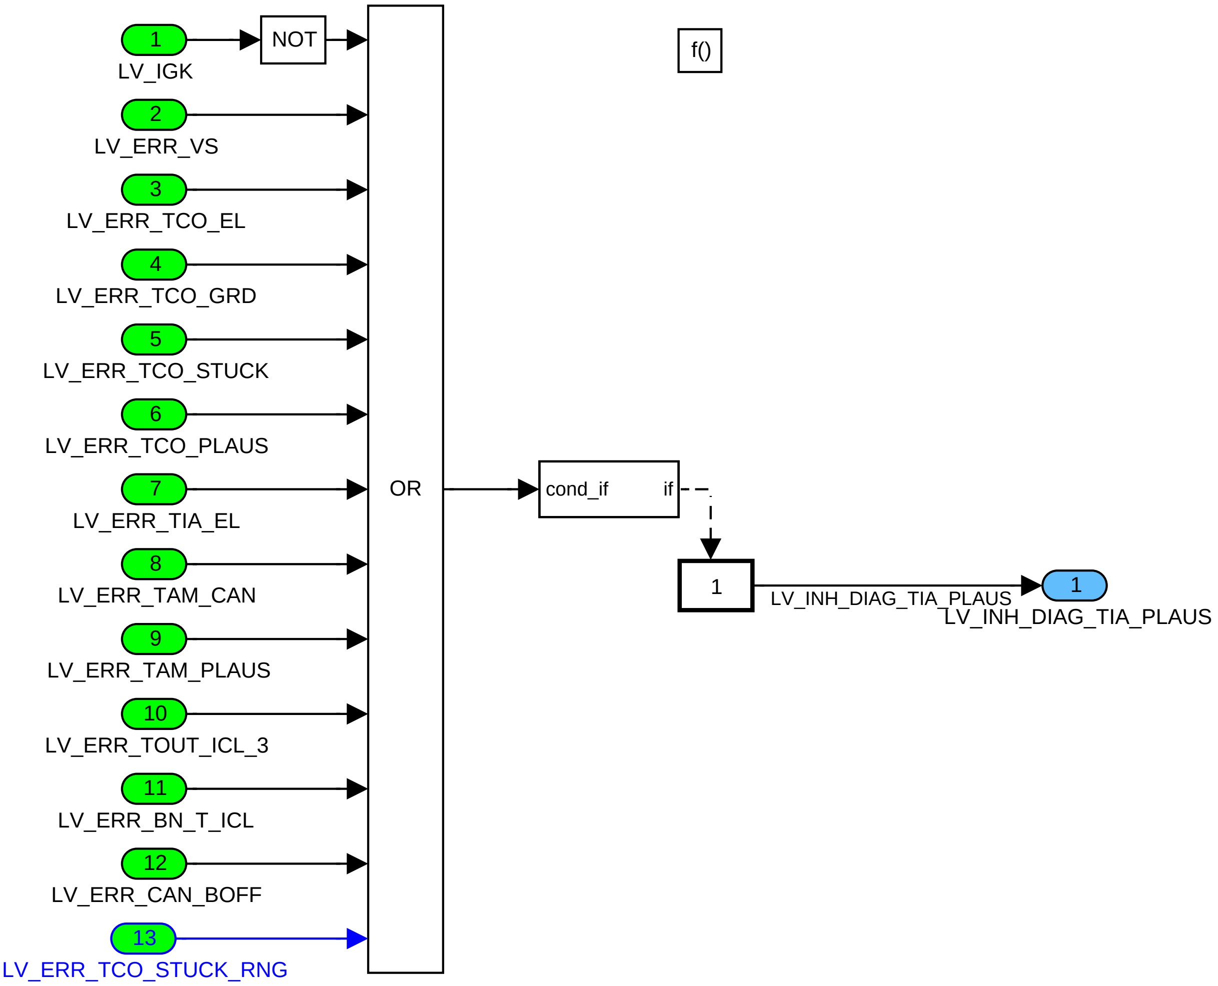

Figure 79 AIRT_MB053/ INH_TIA_PLAUS_DIAG/ OPM

1.9.2 Interface for Rate – Based – Monitoring

General information:

With this module the interface between the TIA_PLAUS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TIA_PLAUS data.

Within STATE_RBM_TIA_PLAUS, three different information are defined:

Conditions for monitoring are met long enough to detect malfunction (bit 0)

(no intrusive operation, no short trip)

Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

Monitor individual RBM conditions encountered within this DC (bit 2)

(not valid for TIA_PLAUS diagnosis)

Application Condition

1.10.1 Global TAM system error (LV_ERR_TAM)

General information:

The global error flag LV_ERR_TAM can be used for inhibition. It is set if a CAN or a plausibility TIA error occure.

Application conditions:

Initialisation: 0 at reset

Recurrence: 100ms

Activation: LV_IGK = 1

Formula section:

```
If      LV_ERR_TAM_CAN = 1 or LV_ERR_TAM_PLAUS = 1
Then    LV_ERR_TAM = 1
Else    LV_ERR_TAM = 0
Endif
```

1.10.2 CAN based TAM – signal diagnosis (LV_ERR_TAM_CAN)

General information:

The purpose of the diagnosis shall be to detect electrical faults as defined by OBD I requirements. The input signals are from CAN.

Description:

Error symptoms are defined for this diagnosis function as:

```
┌─┬─┬─┬─┐
│ │ │ └─> short circuit to vbatt or open line      (= SYM_0)
│ │ └───> short circuit to ground                  (= SYM_1)
│ └─────> signal error                             (= SYM_2)
└───────> -                                        (= SYM_3)
```

Application conditions:

Initialization: according ABC configuration **STD_INI**
(ABC datas are initialized at transition LV_IGK 0->1)

Recurrence: 100 ms

Activation: LV_IGK = 1

Formula section:

```
LV_CDN_DIAG_TAM_CAN = 1
ERR_SYM_TAM_CAN = NO_SYM
If      LV_ERR_CAN_BOFF         = 0   and

Endif
```

Calculation of present error and end of diagnosis:

LV_ERR_TAM_CAN and LV_END_DIAG_TAM_CAN are calculated by error management

1.10.3 Ambient temperature sensor plausibility check (LV_ERR_TAM_PLAUS)

FUNCTION DESCRIPTION:

General information:

This diagnosis is performed in order to detect a stucking or not plausible TAM signal which cannot be detected by electrical range diagnosis.

Description:

Diagnosis condition:

The diagnosis should only be activated:

- after a long engine stop time, e.g. > 10h in order to get similar temperatures of TAM / TIA / TCO_2 or TCO (depending on variant coding LV_VAR_TCO_2)
- if TAM is in a "critical" range e.g. fade out temperature of other OBD2 diagnosis
- just after start to avoid warming-up effects, e.g. within 5 s
- not in cold environment, because it's not requested by law

If these conditions are not fulfilled the diagnosis is switched off if C_T_AST_MAX_TAM_DIAG is elapsed after start.

Error detection

The TAM_PLAUS error is detected if the temperature-difference TAM_DIF_DIAG is over the threshold C_TAM_DIF_MAX_ERR for the anti-bounce time C_T_TAM_DIF_MAX_ERR.

End of diagnosis cycle with positive result

The positive diagnosis result is based on the monitoring of the alteration of TAM at and can be reached even if a error is detected or the validation phase is running.

- Just after start, comparing the start and stop temperature
- During warm up phase

If a alteration is detected the diagnosis is finished.

Error validation

The validation is only performed if all el. diagnosis for TIA / TCO_2 or TCO and finished (LV_DIAG_CDN_TAM_PLAUS = 1) and the vehicle was driven with a certain vehicle speed (C_VS_MIN_VLD_TAM_ERR for C_T_VS_MIN_VLD_TAM_ERR).

If both conditions are true and a error was detected then the error LV_ERR_TAM_PLAUS is set for this driving cylce and the diagnosis is switched off.

Application conditions:

Initialisation: 0 at LV_IGK 0->1 **or** reset **or** at clearing error memory
TAM_DIF_MAX / MIN_DIAG = TAM_ST
at LV_ST_END = 1 **or** reset **or** at clearing error memory

Recurrence: 100ms

Activation: LV_ST_END = 1

Deactivation: LV_END_DIAG_TAM_PLAUS = 1 **or**
LV_INH_DIAG_TAM_PLAUS = 1 **or**
LV_CNL_DIAG_TAM_PLAUS = 1
(set LV_CDN_DIAG_TAM_PLAUS = 0 at deactivation)

Formula section:

Calculation of TAM_DIF_PLAUS to end the diagnosis

```
TAM_DIF_MAX_DIAG = MAX [ TAM, TAM_DIF_MAX_DIAG(n-1)]
TAM_DIF_MIN_DIAG = MIN [ TAM, TAM_DIF_MIN_DIAG(n-1)]
TAM_DIF_PLAUS = ABS (TAM_DIF_MAX_DIAG - TAM_DIF_MIN_DIAG)
If      TAM_DIF_PLAUS > C_TAM_DIF_PLAUS_MIN     or      //e.g. 3°C
        ABS ( TAM_STOP – TAM_ST ) > C_TAM_DIF_ST_END    //e.g. 5°C
Then    LV_CDN_DIAG_TAM_PLAUS = 1
        LV_END_DIAG_TAM_PLAUS = 1
Endif
```

Calculation of diagnosis condition / error detection

```
If(1) T_AST < C_T_AST_MAX_TAM_DIAG        and     //e.g. 5s
    LV_DET_ERR_TAM_PLAUS = 0
Then(1)
    If(2) T_ES_CUS > C_T_ES_MIN_TAM_DIAG        and     //e.g. >10h
       [ TAM  >  C_TAM_MAX_TAM_DIAG             or      //e.g.  >35°C or  < -10°C
       TAM  <  C_TAM_MIN_TAM_DIAG ]
   Then(2)          // conditions to calculate TAM_DIF_DIAG fulfilled

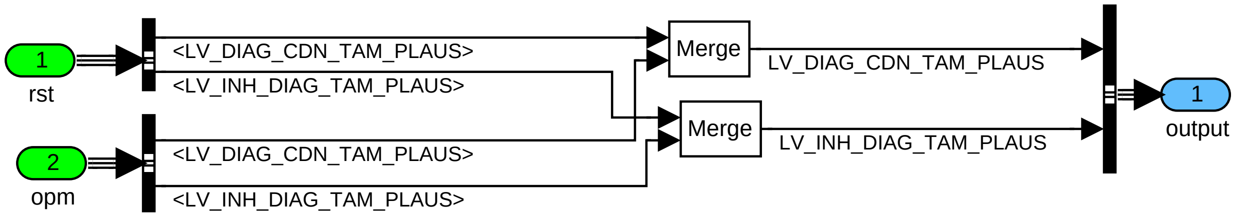

Figure 100 AIRT_MB054/ DIAG_INH/ SIG_MNG

1.11.2 Interface for Rate – Based – Monitoring

General information:

With this module the interface between the TAM_PLAUS monitor and the Rate-Based Monitoring statistics is defined with STATE_RBM_TAM_PLAUS data.

Within STATE_RBM_TAM_PLAUS, three different information are defined:

Conditions for monitoring are met long enough to detect malfunction (bit 0)

(no intrusive operation, no short trip)

Monitor disabled because of system malfunction (bit 1)

(depending on failure status: pending)

Application Condition

Lambda setpoint for stratified mode					

Input data:

MAF_SP_S	MFF_CP	N_32	
LV_S_CLC	MFF_SP_S	LAMB_SP_S_EXT	

FUNCTION DESCRIPTION:

General information:

The lambda LAMB_SP_S in stratified has to be limited to a minimum lambda value. If the lambda setpoint LAMB_SP_S is below the minimum threshold LAMB_MIN_S then the stratified combustion is not authorized.

Description:

Application conditions:

Activation: LV_S_CLC = 1

Deactivation: LV_S_CLC = 0

Initialization: at reset:

LAMB_SP_S(n-1) = C_LAMB_SP_S_INI

at the transition of LV_S_CLC from 0 to 1:

LAMB_SP_S_RAW has to be calculated for the initialization.

LAMB_SP_S(n-1) = LAMB_SP_S_RAW.

Update rate: 10 ms

Formula section:

```
IF      LC_LAMB_SP_S_RAW_EXT = 0
Then    LAMB_SP_S_RAW   =
                     MAF_SP_S / (C_FAC_LAMB_AFS * (MFF_SP_S + MFF_CP))
ELSE    LAMB_SP_S_RAW   = LAMB_SP_S_EXT ("from Layer")
endif
LAMB_SP_S(n) =
C_CRLC_LAMB_SP_S * (LAMB_SP_S_RAW – LAMB_SP_S(n-1)) + LAMB_SP_S(n-1)
```

Calibration data:

2.2 Combustion State Manager (Appl. Incidences)

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_INH_S	V/O	0...1	0...1	1	-
Inhibit of stratified mode due to project specific requests.					
LV_INH_AFL	V/O	0...1	0...1	1	-
Inhibit of AFL mode due to project specific requests.					
LV_S_CLC	V/O	0...1	0...1	1	-
Logical variable for the deactivation of all straified mode relevant modules.					
LV_AFL_CLC	V/O	0...1	0...1	1	-
Logical variable for the deactivation of all AFL- mode relevant modules.					

Input data:

LV_INH_S_MAN	LV_BRAKE_REQ	LV_ERR_EGR	LV_TEMP_BOL
STATE_CMB_CTL	N_32	LV_MIS_STATE_A	LV_MIS_STATE_B
LV_SAWUP	LV_ERR_PORT	LV_ERR_FPS	
LV_ERR_NOX_SENS_CAN_BOFF	LV_FPAPWM_DIAG_AFS_REQ		

FUNCTION DESCRIPTION:

There are several project specific requests to inhibit the stratified and AFL mode. Within this function all these requests lead to the bits LV_INH_S and LV_INH_AFL to simpify the combustion manager.

To reduce the processor load all stratified mode related modules shall no longer be calculated, if LV_S_CLC = 0. All AFL-mode relevant modules including the combustion manager shall no longer be calculated, if LV_AFL_CLC = 0.

Application conditions:

Initialisation: at reset: LV_INH_S = 1
LV_INH_AFL = 1
LV_S_CLC = 1
LV_AFL_CLC = 1

Recurrence: 10 ms

Activation: every engine state

Deactivation: -

Formula section:

Input data:

LV_CDN_VB_OBD1	LV_IGK	WGPWM[NC_CBK_EX_NR]	LV_VAR_TCHA
LV_ERR_SPI_MPS			

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults in the waste gate. There are one for each exhaust bank (x = 1 or 2). All calibration data will be copyed into SW internal CBK spezific calibration data. Example:

C_ABC_INC_WG_DR = C_ABC_INC_WG_1_DR = C_ABC_INC_WG_2_DR

The input signal is a modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.
The diagnosis condition calculation is done according **“Open range”** duty cycle, thus a definition of the PWM diagnosis windows is neccessary (see calibration data).

Error-symptoms are defined to this diagnosis function as following :

```
┌──┬──┬──┬──┐
└──┴──┴──┴──┘
 |  |  |  └─> Short circuit to VBatt          (= SYM_0)
 |  |  └────> Short circuit to GND            (= SYM_1)
 |  └───────> Open load                       (= SYM_2)
 └──────────> -                               (= SYM_3)
```

Application conditions:

Initialisation: according Filter-type **MPL_STD_INI**
(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 100ms

Activation: LV_VAR_TCHA =1 at every engine operating state

```
Deactivation:    If      LV_VAR_TCHA =0
                 Then    LV_END_DIAG_WG_X_DR = 1
                 Endif
```

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_WG_X_DR = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_WG_X_DR.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_WG_X_DR.

Failure debouncing and error management treatment:

For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_WG_X_DR and ERR_DIAG_WG_X_DR.

This algorithm determines:

ERR_SYM_WG_X_DR	(detected error symptom)
LV_ERR_WG_X_DR	(Error flag for debounced error)

CDN_DIAG_WG_X_DR (Diagnosis condition information)

LV_END_DIAG_WG_X_DR (End of diagnosis information)

Diagnosis inhibition:

```
IF      LV_IGK = 1              AND
        LV_CDN_VB_OBD1 = 1      AND
        LV_ERR_SPI_MPS = 0
THEN    LV_INH_DIAG_WG_X_DR = 0
ELSE    LV_INH_DIAG_WG_X_DR = 1
ENDIF
```

Raw value of error symptom for RFP_DR(only parameter)					

Input data:

LV_CDN_VB_OBD1	LV_IGK	RFPPWM	LV_VAR_TCHA
LV_ERR_SPI_MPS			

FUNCTION DESCRIPTION:

General information:

The purpose of the diagnosis is to detect electrical faults in the recirculation flap.

The input signal is a modulated control pulse (PWM).

Description:

For error detection algorithm see “Electrical diagnosis of powerstage outputs ATIC39”.
The diagnosis condition calculation is done according **“Open range”** duty cycle, thus a definition of the PWM diagnosis windows is neccessary (see calibration data).

Error-symptoms are defined to this diagnosis function as following :

```
 ┌─┬─┬─┬─┐
 └─┴─┴─┴─┘
  │  │  │  └─> Short circuit to VBatt          (= SYM_0)
  │  │  └────> Short circuit to GND            (= SYM_1)
  │  └───────> Open load                       (= SYM_2)
  └──────────> -                               (= SYM_3)
```

Application conditions:

Initialisation: according Filter-type **MPL_STD_INI**

(reset of variables at LV_IGK 0 -> 1 or ECU reset)

Recurrence: 100ms

```
Activation:          LV_VAR_TCHA = 1
Deactivation:  If    LV_VAR_TCHA = 0
               Then  LV_END_DIAG_RFP_DR = 1
               Endif
```

Formula section:

If diagnosis is not inhibited (LV_INH_DIAG_RFP_DR = 0) the diagnosis conditions are set according infrastructure information: CDN_DIAG_RFP_DR.
Failure symptoms (raw value) are set according infrastructure information: ERR_DIAG_RFP_DR.

Failure debouncing and error management treatment:

For failure and error management treatment the anti-bounce mechanism is called with the parameters CDN_DIAG_RFP_DR and ERR_DIAG_RFP_DR.

This algorithm determines:

ERR_SYM_RFP_DR	(detected error symptom)
LV_ERR_RFP_DR	(Error flag for debounced error)

3.5 Customer adaptation module: AGGR CHRG

3.5.1 Outputs for SV Aggregates

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
WGPWM[NC_CBK_EX_NR]	V/O	0...FFFFH	0...99.99847	1.5259e-3	[%]
PWM output wastegate[NC_CBK_EX_NR]					
RFPPWM	V/O	0...FFFFH	0...99.99847	1.5259e-3	[%]
PWM output recirculation flap					

Input data:

Tvwg	Tvwg2	Tvulv	LV_WGPWM_EXT_ADJ[NC_CBK_EX_NR]
WGPWM_EXT_ADJ[NC_CBK_EX_NR]	LV_ERR_WG_DR[NC_CBK_EX_NR]		

FUNCTION DESCRIPTION:

Adaptation to BMW environment.

Application conditions:

Initialisation: 0 at reset

Recurrence: all 10 ms

Activation: every engine state

In power latch phase:
WGPWM[NC_CBK_EX_NR] = 0
RFPPWM = *last calcuclated value*

Formula section:

```
If      LV_WGPWM_EXT_ADJ[1] = 0
Then
        IF      LV_ERR_WG_DR[1]  =  0
        Then    WGPWM[1]   = Tvwg
        Else    WGPWM[1]   = C_WGPWM _SUB_DIAG
Else
                WGPWM[1]   =  WGPWM_EXT_ADJ[1]
Endif
```

```
If          LV_WGPWM_EXT_ADJ[2] = 0
Then
        IF      LV_ERR_WG_DR[2]  =  0
        Then    WGPWM[2]    = Tvwg2
        Else    WGPWM[2]    = C_WGPWM _SUB_DIAG
Else
                WGPWM[2]    =  WGPWM_EXT_ADJ[2]
Endif
------

RFPPWM           =        Tvulv
```

Calibration data:

DESCRIPTION:

General information:

```
if(1) two separate cylinder banks are concerned
then
    i = 1, for cylinder bank 1 ( x = 0, 2, 4, ... )
    i = 2, for cylinder bank 2 ( x = 1, 3, 5, ... )
else(1)
    i = 1 ( x = 0 ... 3 or 4 )
endif(1)
```

Description of index "[i]" and "[x]":

x: logical cylinder
*use **NC_CYL_NR** : number of engine cylinders – index "[x]"*
*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF**: pattern for allocation of physical cylinders to exhaust bank – index "[i]"*

The purpose of this function is detection and control the cylinder to cylinder air-fuel ratio deviation in an internal combustion engine using an observer to estimate the deviation of each cylinder that is not measurable and a controller for each cylinder separately. In this connection the periodic signal of the WRAF sensor is reconstructed using a sensor model and adapted to the measured value. The estimated state describes the deviation in percentage for each cylinder. The mentioned value is an input to a control system that balances the air- /fuel ratio in each cylinder separately (Figure 1).

Formula section:

4.1.6 Signal evaluation (segment synchronous)

The aim of signal evaluation with a low sampling rate is the precise dividing of the lambda sensor output signal into the identified cylinder. Therefore, the sampling moment shall be computed, depending on the engine operating state, precisely. The Sampling moment is influenced by phase displacement predetermined by IP_CRK_SYN[i]. The value of the phase shift is given in °CRK.

4.1.6.1 Calculation of the segment period

Depending on the engine speed the segment period is simply computed by

```
if(1) two separate exhaust banks are concerned, then
        $TA = 2 * \frac{2 * 60}{N * NC\_CYL\_NR}$
                                                        (4.1.6.1.1)
else(1)
        $TA = \frac{2 * 60}{N * NC\_CYL\_NR}$
                                                        (4.1.6.1.2)
endif(1)
```

4.1.6.2 Calculation of the phase displacement

The phase shift - caused by system delayed response - is computed once per combustion cycle using the map IP_CRK_SYN[i], adjusted by C_CRK_CYL_LAM[x], PHA_SHIFT_CAM_EX[i] and DELTA_CRK_CYL_LAM[i]. It shall be determined at the beginning of the combustion cycle (SEG_NR = 0). That applies to the first and ensuing segments.

```
if(1) SEG_NR = 0
then
    CRK_CYL_LAM[x] = IP_CRK_SYN[i] + C_CRK_CYL_LAM[x] +
                        PHA_SHIFT_CAM_EX[i] + DELTA_CRK_CYL_LAM[i] +
                        IP_CRK_DELTA_AMP_CYL_LAM   (4.1.6.2.1)

    if(2)   CRK_CYL_LAM[x] > $\alpha$*720 °CRK
    then
            CRK_CYL_LAM[x] = CRK_CYL_LAM[x] – $\alpha$*720 °CRK
                                                        (4.1.6.2.2)
    endif(2)
endif(1)
```

Remark:

$\alpha = 1, 2, ...$

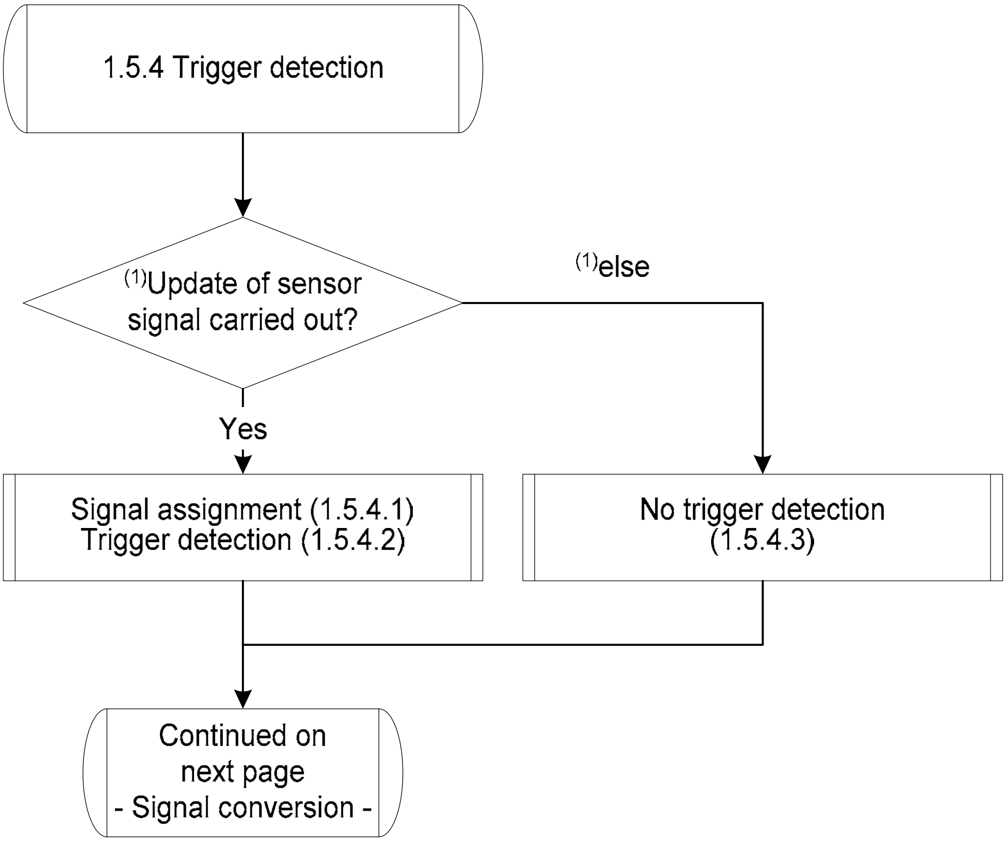
            if(3)   CTR_LAM_CYL_SEL_REF_CLL[i] =
                                        C_CTR_LAM_CYL_SEL_REF_CLL_THD
            then
                    STATE_LAM_CYL_SEL[i] = 3 [CLL]
                                                                  (4.1.6.3.4)
                    LV_LAM_CYL_SEL_SEG_REF_CLL[i] = 0
                                                                  (4.1.6.3.5)
                    CTR_LAM_CYL_SEL_REF_CLL[i] = 0
                                                                  (4.1.6.3.6)
            endif(3)
    endif(2)
endif(1)
```

4.1.6.4 Trigger detection

The trigger for the corresponding segment is created if the state of the variable VLS_CYL_TRIG[x] changes. At the same time the value of VLS_CYL[x] shall be transferred to VLS_CYL_SEL[x].



```
if(1) $VLS\_CYL\_TRIG[x] \neq VLS\_CYL\_TRIG[x]_{k-1}$
then
    VLS_CYL_SEL[x] = VLS_CYL[x]                    (4.1.6.4.1)
    LV_TRIG[x] = 1                                 (4.1.6.4.2)
else(1)
    LV_TRIG[x] = 0                                 (4.1.6.4.3)
endif(1)
```

4.1.7 Signal conversion

The voltage value of VLS_CYL_SEL[x] shall be converted to Lambda using the characteristic curve IP_LAMB_CYL$_x$[1] and has to be shifted by its mean value. The resulting value represents the global AFR deviation. Calculation and shifting the mean value shall be carried out in segment step.

if$^{(1)}$ LV_TRIG[x] =1

then

LAMB_CYL_SEL[x] = IP_LAMB_CYL (VLS_CYL_SEL[x])

(4.1.7.1)

$$\text{DELTA\_LAMB\_AV[i]} = \text{LAMB\_CYL\_SEL[x]} - \frac{1}{\alpha}\sum_{k=1}^{\alpha}\text{LAMB\_CYL\_SEL[x]};$$

α :number of cylinders per bank

(4.1.7.2)

4.1.8 Calculation of time lag of the lambda-sensor model

T1_LAMB_CYL_SEL[i] = IP_T1_LAMB_CYL_SEL[i]

(4.1.8.1)

4.1.9 Calculation of the estimation-error

Estimation error represents the difference between the measured value, DELTA_LAMB_AV[i], and the estimated value, DELTA_LAMB_MDL[i].

DELTA_LAMB_ERR_RAW[i] = DELTA_LAMB_AV[i] –
DELTA_LAMB_MDL[i][x(n-1)] **(4.1.9.1)**

Remark: Software shall guarantee a segment synchronous comparison, i.e. the value of DELTA_LAMB_AV[i] at the segment-time x shall be compared with that DELTA_LAMB_MDL[i] which was calculated in segment x during the last combustion cycle [x(n-1)].

4.1.10 Weighting the estimation-error

Depending on T1_LAMB_CYL_SEL[i], the error shall be weighted. This is carried out by means of a characteristic curve. A non-linear dependent weighting function might be considered for late come out.

DELTA_LAMB_ERR[i] = DELTA_LAMB_ERR_RAW[i] * IP_FAC_ERR_LAM_SEL

(4.1.10.1)

---

[1] x...actual cylinder

4.1.11 Signal splitting / Calculation of the cylinder selective AFR / Signal merge

Splitting procedure shall be implemented in order the weighted error signal to be allocated to an internal state, which describes the current estimated value of air -/fuel ratio in each cylinder respectively (Figure 2).

$$\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x] = \text{DELTA\_LAMB\_ERR}[i]$$

(4.1.11.1)

An adaptation mechanism, including an integral-action element for each cylinder – corrected by exhaust-manifold-port factor C_CRLC_EXV_FAC[x], adjusts the estimated value to the actual one. The adjusted value of the cylinder individual deviation is calculated by the equation

$$\text{DELTA\_LAMB\_CYL}[x]_k = (\text{DELTA\_LAMB\_CYL}[x]_{k-1} + \text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k * \text{TA}) * \text{C\_CRLC\_EXV\_FAC}[x]$$

(4.1.11.2)

In order to avoid rounding error that leads to zero-readout of the gradient term in aforementioned equation, following scan shall be made:

```
if$^{(2)}$ $(\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k * \text{TA} = 0$ and $\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k > 0)$
then
    increment $(\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k * \text{TA})$
                                                            (4.1.11.3)
else$^{(2)}$
    if$^{(3)}$ $(\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k * \text{TA} = 0$ and $\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k < 0)$
    then
        decrement $(\text{DELTA\_LAMB\_ERR\_CYL\_SEL}[x]_k * \text{TA})$
                                                            (4.1.11.4)
    endif$^{(3)}$
endif$^{(2)}$
```

In accordance with the ignition sequence signal-reassembling procedure shall be carried out in order to get the divided signals together. DELTA_LAMB_CYL_SEL[i] is input of the sensor model for the current segment.

$$\text{DELTA\_LAMB\_CYL\_SEL}[i]_k = \text{DELTA\_LAMB\_CYL}[x]_k$$

4.1.12 Sensor model

The dynamic behaviour of WRAF sensor is described by a sensor model, first order low-pass-filter. This is characterised by a time lag, T1_LAMB_CYL_SEL[i]. Furthermore, the effect of the delay is considered by choice of an adequate sampling time relevant to crankshaft angle. This is depicted in 0 ... 720 ° CRK range.
The approximated model is theoretically defined in time range as

$$y(t) = 1 - e^{-t/T}$$

and described in frequency range as continuous-time model

$$G(s) = \frac{1}{1 + sT}$$

with T = T1_LAMB_CYL_SEL[i]

Conversion of continuous-time model to discrete-time model with sample time TA can be made using either 'zoh'- or 'foh'-method.

if(2)  LC_LAMB_DELTA_MDL_HLD = 0
then
        $\mathrm{DELTA\_LAMB\_MDL[i]}_k = \mathrm{IP\_EXP\_LAMB\_MDL[i]} * \mathrm{DELTA\_LAMB\_MDL[i]}_{k-1} + \mathrm{IP\_N1\_FAC\_LAMB\_MDL[i]} * \mathrm{DELTA\_LAMB\_CYL\_SEL[i]}_k$
                                                                    (4.1.12.2.1)
else(2)
        $\mathrm{DELTA\_LAMB\_MDL[i]}_k = \mathrm{IP\_EXP\_LAMB\_MDL[i]} * \mathrm{DELTA\_LAMB\_MDL[i]}_{k-1} + \mathrm{IP\_N1\_FAC\_LAMB\_MDL[i]} * \mathrm{DELTA\_LAMB\_CYL\_SEL[i]}_k + \mathrm{IP\_N2\_FAC\_LAMB\_MDL[i]} * \mathrm{DELTA\_LAMB\_CYL\_SEL[i]}_{k-1}$
                                                                    (4.1.12.2.2)
endif(2)
```

Attention:

Precise allocation required. For segment x, $\mathrm{DELTA\_LAMB\_MDL[i]}_{k-1}$ and $\mathrm{DELTA\_LAMB\_CYL\_SEL[i]}_{k-1}$ are buffered variables that were calculated in the segment x -1 for one bank system and x - 2 for two bank system.

4.1.13 Control system

A cylinder individual AFR regulation is carried out (Figure 3).

4.1.13.1 Control deviation

The tracking error for corresponding cylinder is defined as DELTA_LAMB_DIF_CYL[x].

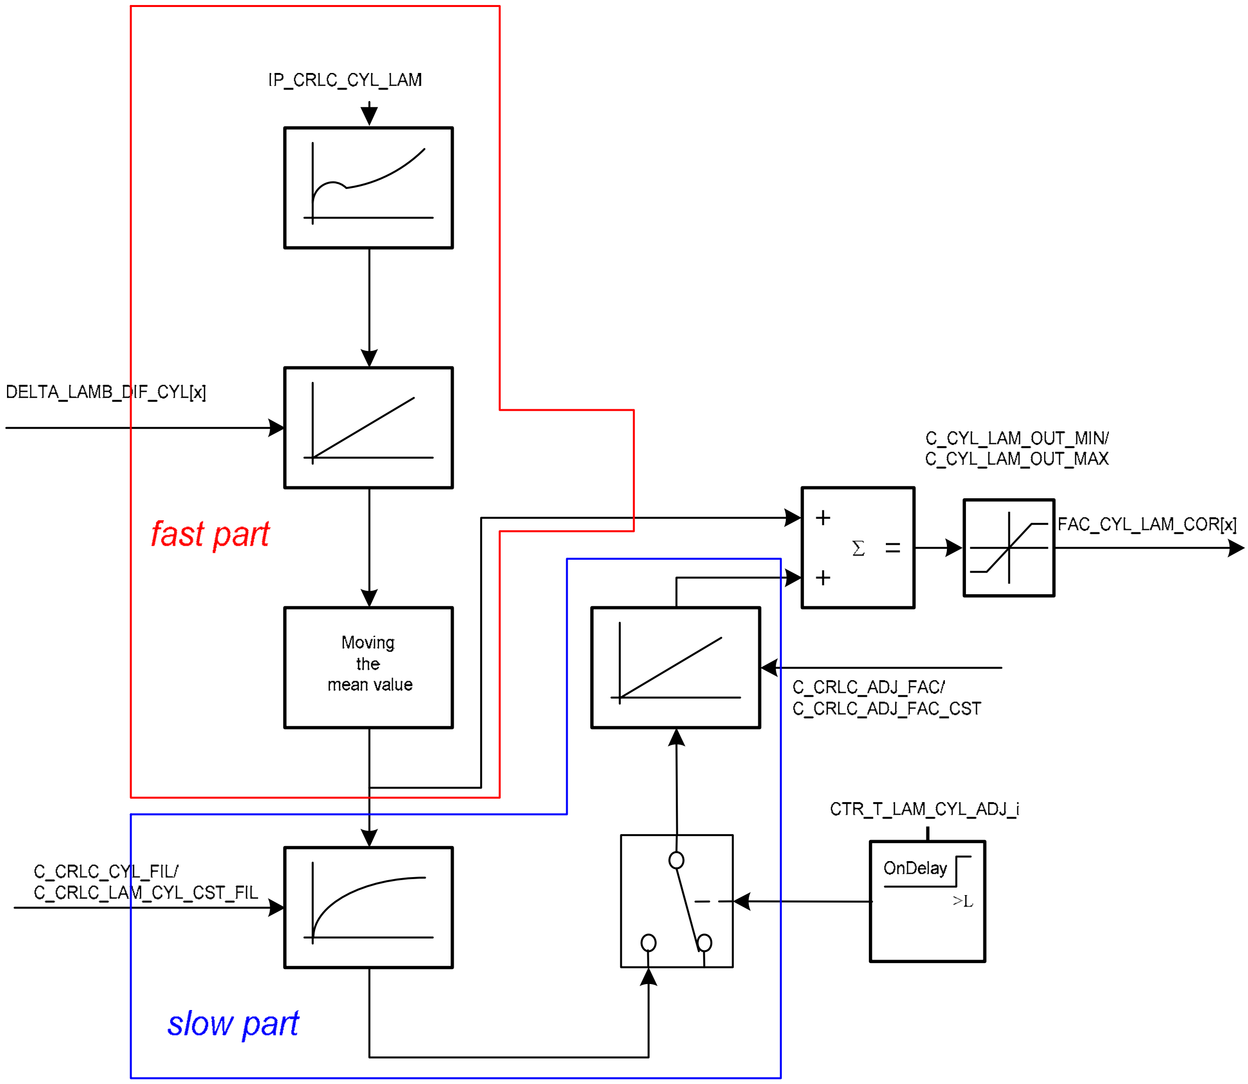

Figure 3: Control system including the adaptation mechanism

Calculate the I-component - nominal parameter - (1.12.3.2)
Continued on next page (Rounding error check)

```
if(2)   STATE_LAM_CYL_SEL[i] = 3 [CLL]
then
        DELTA_LAMB_DIF_CYL[x] = DELTA_LAMB_CYL[x]
                                    – C_DELTA_LAMB_CYL_SP (4.1.13.1.1)
```

4.1.13.2 Calculation of proportional-action controller (P-Component)

The P-Component can be switched off using an on-off switch

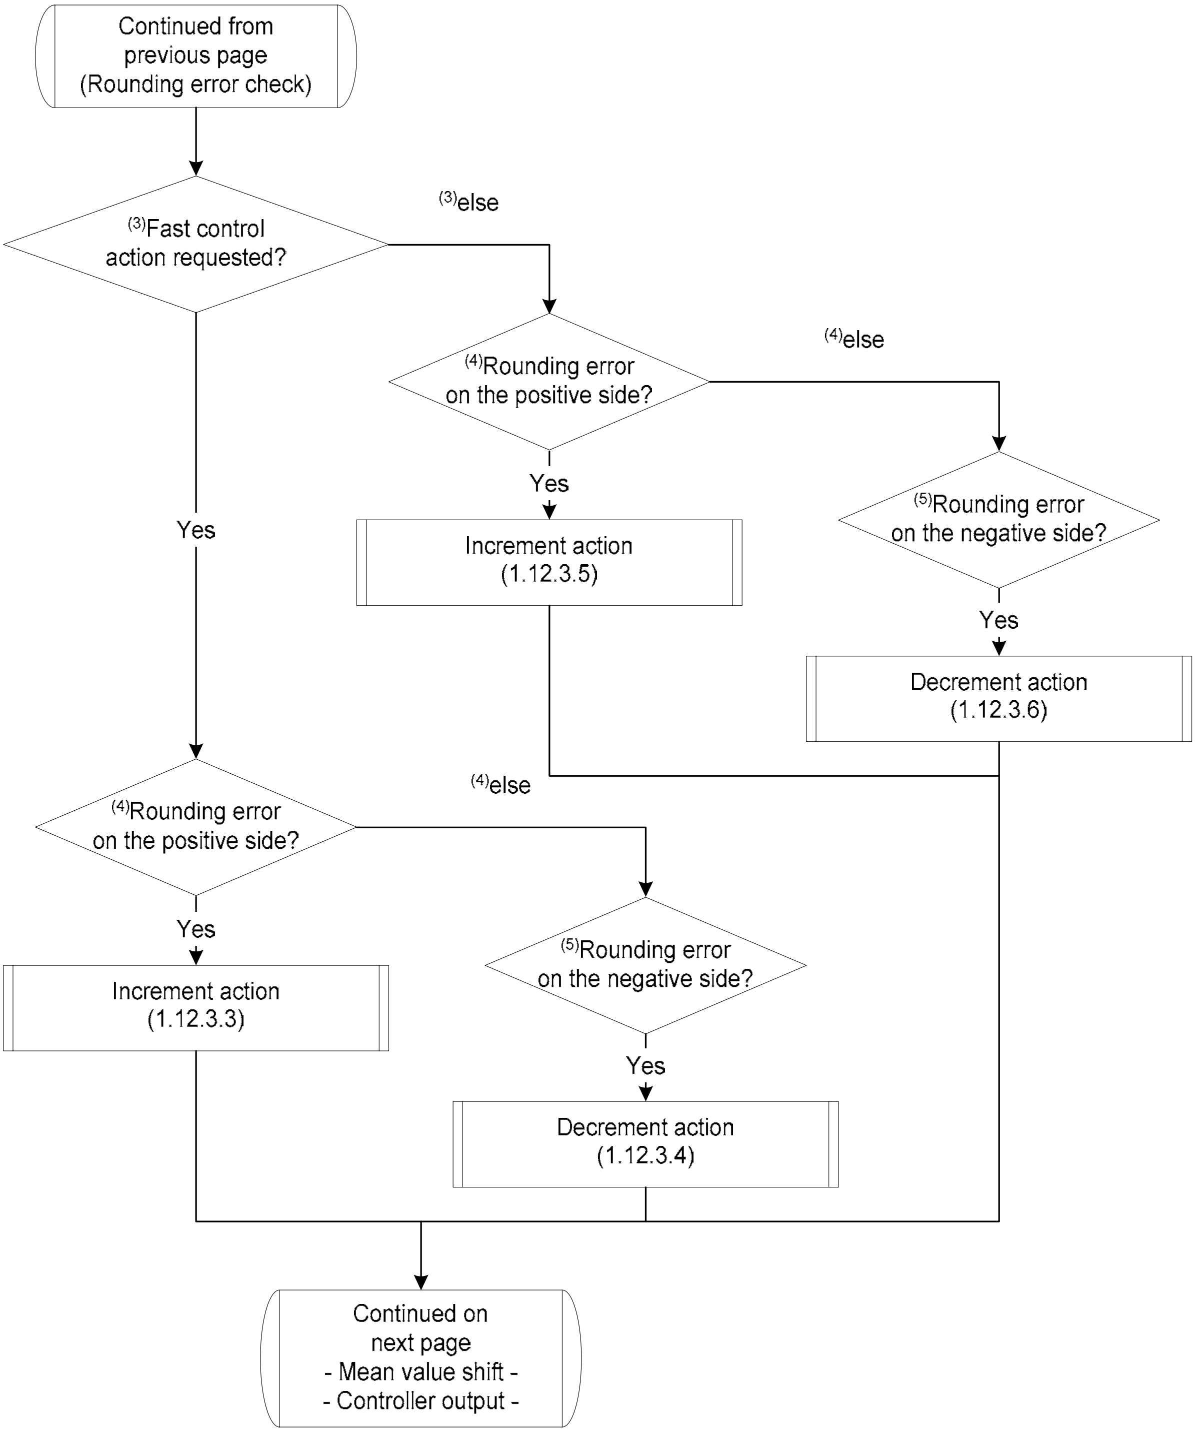
```
if(3)   LC_FAC_CYL_LAM_P_SWI = 1
then
        FAC_CYL_LAM_P[x] =  IP_FAC_GAIN_P_LAM_CYL_SEL*
                DELTA_LAMB_DIF_CYL[x]*IP_CRLC_P_NEUT_RNG (4.1.13.2.1)
else(3)
        FAC_CYL_LAM_P[x] =  0
                                                         (4.1.13.2.2)
endif(3)
```

4.1.13.3 Calculation of integral-action controller (I-Component)

Tracking step disturbances with zero steady state error requires integration of the tracking error. Integral action can be incorporated by defining an internal state FAC_CYL_LAM_INT[x] that represents the integrated tracking error. This state is governed by FAC_CYL_LAM_INT[x]. For the injection systems being not adapted the integral action can be switched to the fast control parameter. The action is then triggered by LV_LAM_CYL_SEL_CTL_FAST_REQ.

```
if(3)   LV_LAM_CYL_SEL_CTL_FAST_REQ = 1
then
        FAC_CYL_LAM_INT[x]$_k$ =  FAC_CYL_LAM_INT[x]$_{k-1}$ +
              IP_CRLC_INT_FAST_CYL_LAM*DELTA_LAMB_DIF_CYL[x]$_k$*
                                      IP_CRLC_I_NEUT_RNG (4.1.13.3.1)
else(3)
        FAC_CYL_LAM_INT[x]$_k$ =  FAC_CYL_LAM_INT[x]$_{k-1}$ +
                   IP_CRLC_CYL_LAM*DELTA_LAMB_DIF_CYL[x]$_k$*
                                      IP_CRLC_I_NEUT_RNG (4.1.13.3.2)
endif(3)
```

In order to avoid rounding error that leads to zero-readout of the gradient term in aforementioned equation, following scan shall be made:



```
if$^{(3)}$ LV_LAM_CYL_SEL_CTL_FAST_REQ = 1
then
    if$^{(4)}$ (IP_CRLC_INT_FAST_CYL_LAM*DELTA_LAMB_DIF_CYL[x]$_k$*
                IP_CRLC_I_NEUT_RNG = 0 and
                IP_CRLC_INT_FAST_CYL_LAM > 0 and
                IP_CRLC_I_NEUT_RNG > 0 and
                DELTA_LAMB_DIF_CYL[x]$_k$ > 0)
    then
        increment (IP_CRLC_INT_FAST_CYL_LAM*
                   DELTA_LAMB_DIF_CYL[x]$_k$*
                   IP_CRLC_I_NEUT_RNG) (4.1.13.3.3)
    else$^{(4)}$
        if$^{(5)}$ (IP_CRLC_INT_FAST_CYL_LAM*

Allocation of shifted I-part to the integrator- initial value (1.12.4.4)
(3)Is calculation of P-component released?
(3)else
Yes
Calculate the controller output (1.12.5.1)
Calculate the controller output (1.12.5.2)
End
Control system

$$\mathrm{FAC\_CYL\_LAM\_I\_MV\_SHIFT}[x]_k = \mathrm{FAC\_CYL\_LAM\_INT}[x]_k - \frac{1}{\alpha} * \sum_{x=1}^{\alpha} \mathrm{FAC\_CYL\_LAM\_INT}[x]$$

(4.1.13.4.1)

```
if^(3)  LC_FAC_CYL_LAM_P_SWI = 1
then
        $\mathrm{FAC\_CYL\_LAM\_P\_MV\_SHIFT}[x]_k = \mathrm{FAC\_CYL\_LAM\_P}[x]_k - \frac{1}{\alpha} * \sum_{x=1}^{\alpha} \mathrm{FAC\_CYL\_LAM\_P}[x]$
        α : number of cylinders per bank
                                                                        (4.1.13.4.2)
else^(3)
        FAC_CYL_LAM_P_MV_SHIFT[x] = 0
                                                                        (4.1.13.4.3)
endif^(3)
```

The value of FAC_CYL_LAM_I_MV_SHIFT[x] shall be allocated to the initial value of the integrator:

$$\mathrm{FAC\_CYL\_LAM\_INT}[x]_k = \mathrm{FAC\_CYL\_LAM\_I\_MV\_SHIFT}[x]_k$$

(4.1.13.4.4)

4.1.13.5 Calculation of the controller output

```
if^(3)  LC_FAC_CYL_LAM_P_SWI = 1
then
        $\mathrm{FAC\_CYL\_LAM}[x]_k = \mathrm{FAC\_CYL\_LAM\_P\_MV\_SHIFT}[x]_k + \mathrm{FAC\_CYL\_LAM\_I\_MV\_SHIFT}[x]_k$   (4.1.13.5.1)
else^(3)
        $\mathrm{FAC\_CYL\_LAM}[x]_k = \mathrm{FAC\_CYL\_LAM\_I\_MV\_SHIFT}[x]_k$
                                                                        (4.1.13.5.2)
endif^(3)
```

4.1.13.6 Limitation of the controller output

If the cylinder individual controller output falls into the defined lower/upper limit, the corresponding flag has to be set and the involved controller output shall be limited to the minimum or maximum value.

```
if^(3)  $\mathrm{FAC\_CYL\_LAM}[x]_k \le \mathrm{C\_FAC\_CYL\_LAM\_MIN}$
then
        $\mathrm{FAC\_CYL\_LAM}[x]_k = \mathrm{C\_FAC\_CYL\_LAM\_MIN}$
                                                                        (4.1.13.6.1)
        LV_FAC_CYL_LAM_LIM_MIN[x] = 1
```

```
                                                              (4.1.13.6.2)
        LV_FAC_CYL_LAM_LIM_MAX[x] = 0
                                                              (4.1.13.6.3)

else$^{(3)}$
        if$^{(4)}$   $FAC\_CYL\_LAM[x]_k \geq C\_FAC\_CYL\_LAM\_MAX$
        then
                $FAC\_CYL\_LAM[x]_k = C\_FAC\_CYL\_LAM\_MAX$
                                                              (4.1.13.6.4)
                LV_FAC_CYL_LAM_LIM_MAX[x] = 1
                                                              (4.1.13.6.5)
                LV_FAC_CYL_LAM_LIM_MIN[x] = 0
                                                              (4.1.13.6.6)
        else$^{(4)}$
                LV_FAC_CYL_LAM_LIM_MIN[x] = 0
                                                              (4.1.13.6.7)
                LV_FAC_CYL_LAM_LIM_MAX[x] = 0
                                                              (4.1.13.6.8)
        endif$^{(4)}$
endif$^{(4)}$
```

4.1.13.7 Anti-Wind-Up

As anti wind up measure for the integral-action element, FAC_CYL_LAM_INT[x], following calculations shall be carried out if the controller output is limited.

```
if$^{(3)}$   LV_FAC_CYL_LAM_LIM_MIN[x] = 1
then
        $FAC\_CYL\_LAM\_INT[x]_k =$
            $\frac{\alpha}{\alpha - 1} * C\_FAC\_CYL\_LAM\_MIN + \frac{1}{\alpha - 1} * \sum_{j=x+1}^{x-1} FAC\_CYL\_LAM\_INT[j]_k$
                                                              (4.1.13.7.1)
endif$^{(3)}$

if$^{(3)}$   LV_FAC_CYL_LAM_LIM_MAX[x] = 1
then
        $FAC\_CYL\_LAM\_INT[x]_k =$
            $\frac{\alpha}{\alpha - 1} * C\_FAC\_CYL\_LAM\_MAX + \frac{1}{\alpha - 1} * \sum_{j=x+1}^{x-1} FAC\_CYL\_LAM\_INT[j]_k$
                                                              (4.1.13.7.2)
endif$^{(3)}$
```

4.1.13.9 Update of cylinder individual lambda adaptation values

The computation of the cylinder individual lambda adaptation shall be updated in the time-cycle C_T_LAM_CYL_ADJ_CST/C_T_LAM_CYL_ADJ. When the computation was carried out, then the initial value of cylinder individual lambda-controller, FAC_CYL_LAM_INT[x], and low pass filter,
FAC_LAM_CYL_SEL_ADJ_FIL[x]/FAC_LAM_CYL_SEL_ADJ_CST_FIL[x] shall be shifted.
On the deactivation condition all cylinder individual filter outputs,
FAC_LAM_CYL_SEL_ADJ_FIL[x] and the timer CTR_T_LAM_CYL_ADJ[i] shall be set to zero.

4.1.15 Calculation of the characteristic value of the state variables – control action result

In order to evaluate the control-action result the absolute value of mean value-deviation of the state variables shall be averaged over the whole combustion cycle.
In order to evaluate the adaptation result the sum of the absolute cylinder individual controller outputs is calculated (FAC_CYL_LAM_ABSV_SUM[i]).
Convergence of FAC_CYL_LAM_ABSV_SUM[i] is an indication of a well-running adaptation process.
In case of separate exhaust banks existing, the calculation shall be carried out for both exhaust banks at the beginning of the combustion cycle (SEG_NR = 0).

4.1.16 Detection of observer divergence

In order to detect the observer divergence in closed-loop operation and stop the adaptation process consequently, virtual limitation (C_FAC_CYL_LAM_VIRT_MIN/MAX) is defined. As soon as the single controller output (FAC_CYL_LAM[x]) passes the virtual limit over, the value of CILC- Characteristic Quantity (CQ- value as a measure for the observer behaviour) for the concerned exhaust bank is stored. Should one of the concerned exhaust-bank members (cylinders) reach the actual limit (LV_FAC_CYL_LAM_LIM_MIN/MAX[x] = 1) the current CQ- value has to be compared with the stored value at virtual limit transition. A positive ascent of characteristic value (CQ- value) in current activation cycle (STATE_LAMB_CYL_SEL_CQ_SLOP[i] = 2) is interpreted as for unstable behaviour of CILC and shall involve inhibition of adaptation process.

```
if(3) (STATE_LAMB_CYL_SEL_CQ_SLOP[i] = 0 or
                                  STATE_LAMB_CYL_SEL_CQ_SLOP[i] = 1)
then
    if(4) (FAC_CYL_LAM[x]$_k$ < C_FAC_CYL_LAM_VIRT_MIN or

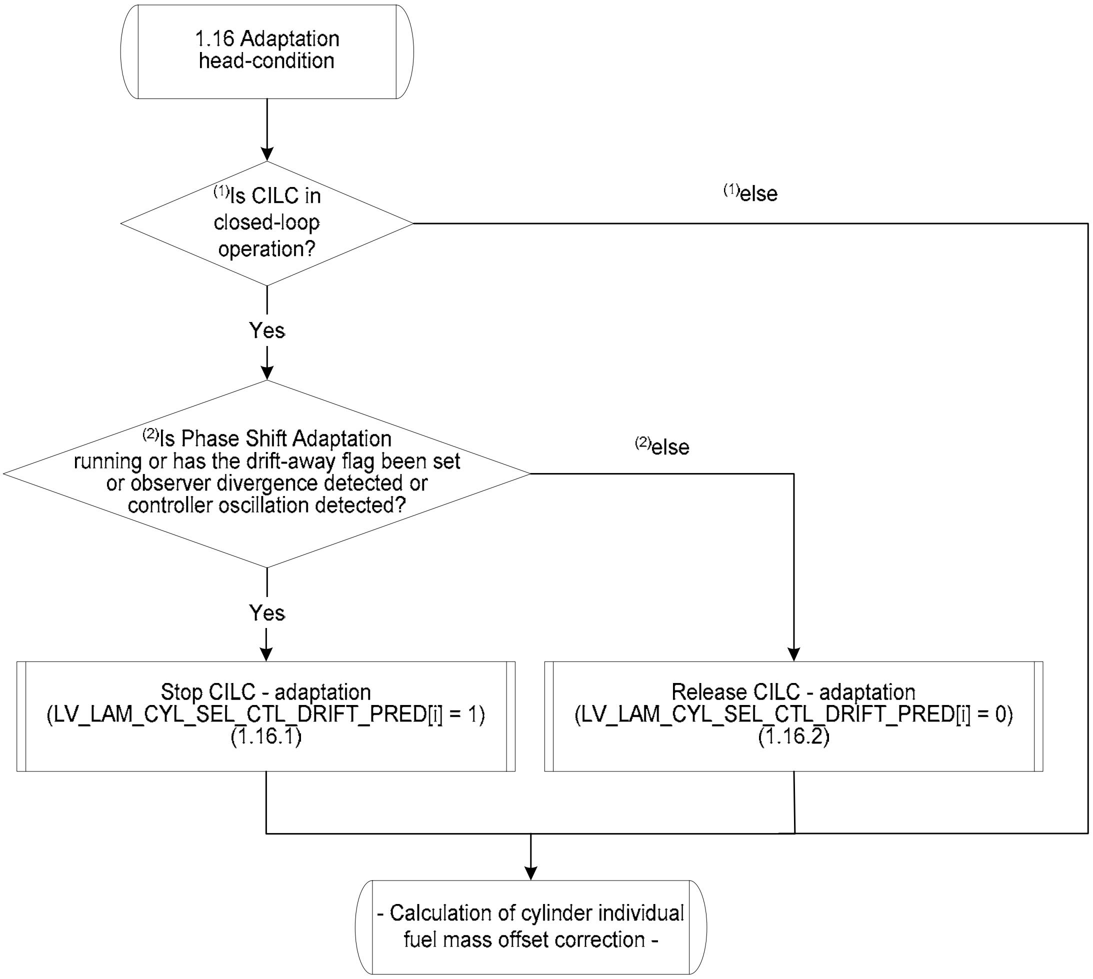
End of detection of observer divergence

4.1.17 Adaptation head-condition

In order to stop the long-term adaptation in case of controller outputs drift away, controller behaviour shall be predicted using following auxiliary variables:



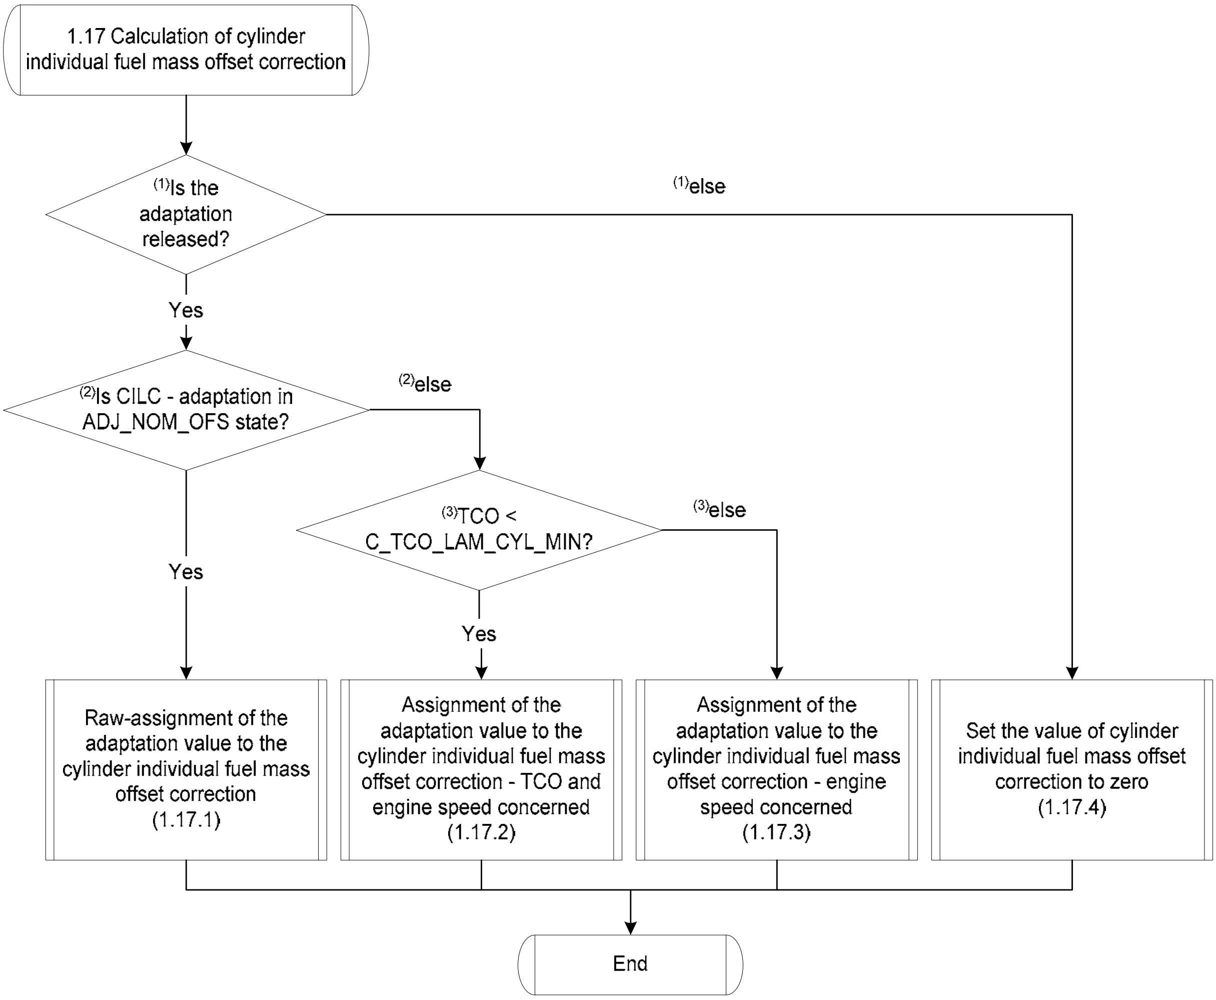
```
if(1) STATE_LAM_CYL_SEL[i] = 3 [calculation is exhaust bank selective]
then
    if(2)   (STATE_DELTA_CRK_CYL_LAM[i] = 3 'AD_INI' or
                    STATE_DELTA_CRK_CYL_LAM[i] = 4 'AD_DEC' or
                    STATE_DELTA_CRK_CYL_LAM[i] = 5 'AD_INC' or
                    LV_LAMB_CYL_SEL_CQ_DRIFT[i] = 1 or
                    STATE_LAMB_CYL_SEL_CQ_SLOP[i] ≠ 0 or
                    LV_FAC_CYL_LAM_COR_OSC[i] = 1)
    then
            LV_LAM_CYL_SEL_CTL_DRIFT_PRED[i] = 1
                                                        (4.1.17.1)
    else(2)
            LV_LAM_CYL_SEL_CTL_DRIFT_PRED[i] = 0
```

(4.1.17.2)

```
        endif(2)
    endif(1)
```

4.1.18 Calculation of cylinder individual fuel mass offset correction – weighted output

The value of cylinder individual fuel mass offset correction should be weighted versus engine speed, and temperature up to engine runs to the nominal temperature for activation of cylinder individual lambda control. The calculation shall be carried out independently of the activation condition for all of the cylinders.



```
if(1) LC_ADAPT_COR_OUT = 1
then
    if(2)   STATE_LAM_CYL_SEL_ADJ[i] = 6 [ADJ_NOM_OFS]
    then

FUNCTION DESCRIPTION:

General information:

This module enables an adaptation of phase shift, which might be influenced by ageing effect of wide range A/F sensor or even calibration-error for instance.

```
if(1) two separate exhaust banks are concerned
then
    i = 1, for cylinder bank 1 ( x = 0, 2, 4, ... )
    i = 2, for cylinder bank 2 ( x = 1, 3, 5, ... )
else(1)
    i = 1 ( x = 0 ... 3 or 4 )
endif(1)
```

Description of index "[i]" and "[x]":

x: logical cylinder
*use **NC_CYL_NR** : number of engine cylinders – index "[x]"*
*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF**: pattern for allocation of physical cylinders to exhaust bank – index "[i]"*

Time recurrence: every TDC

Application conditions:

4.2.1 Initialization (at reset)

The following initialization shall be carried out after a RESET and upon leaving the engine state Engine Stop (LV_ES).

STATE_DELTA_CRK_CYL_LAM[i] = 0 'AD_PAS'

(4.2.1.1)

FAC_CYL_LAM_SAVE[x] = 0

(4.2.1.2)

LV_FAC_CYL_LAM_COR_OSC[i] = 0

(4.2.1.3)

LV_FAC_CYL_LAM_COR_LIM_OSC[i] = 0

(4.2.1.4)

LV_FAC_CYL_LAM_OSC_MAX_THD[x] = 0

(4.2.1.5)

LV_FAC_CYL_LAM_OSC_MIN_THD[x] = 0

(4.2.1.6)

LV_STATE_DELTA_CRK_WAIT[i] = 0

(4.2.1.7)

CTR_SUM_FAC_CYL_LAM_COR_OSC[x] = 0

(4.2.1.8)

CTR_CQ_MON_PHA_SHIFT_AD[i] = 0

(4.2.1.9)

CTR_ER_MON_PHA_SHIFT_AD[i] = 0

(4.2.1.10)

CTR_CQ_MAX_OSC[i] = 0

(4.2.1.11)

CTR_RESP_LAM_CYL_SEL[i] = 0

(4.2.1.12)

CTR_RESP_CYC_LAM_CYL_SEL[i] = 0

(4.2.1.13)

CTR_FAC_CYL_LAM_COR_DIF_ABSV[i] = 0

(4.2.1.14)

CTR_CQ_FIL_FALL[i] = 0

(4.2.1.15)

CRK_CHG_FAC_PHA_SHIFT_AD[i] = 1

(4.2.1.16)

LV_DELTA_CRK_CYL_LAM_ERR[i] = 0

(4.2.1.17)

LV_ER_ABSV_SUM_GRD_RISE[i] = 0

(4.2.1.18)

ER_STND_MMV_DIF_BAL_ABSV_SUM[i] = 0

(4.2.1.19)

ER_STND_MMV_DIF_ABSV_SUM_PRE[i] = 0

(4.2.1.20)

ER_STND_MMV_DIF_ABSV_SUM_GRD[i] = 0

(4.2.1.21)

FAC_CYL_LAM_ABSV_SUM_PRE[i] = 0

(4.2.1.22)

FAC_CYL_LAM_ABSV_SUM_GRD[i] = 0

(4.2.1.23)

CRK_CYL_LAM_INT[i] = DELTA_CRK_CYL_LAM[i]

(4.2.1.24)

```
if(1)  DELTA_CRK_CYL_LAM[i] = 0
then
    CRK_CYL_LAM_DELTA_INI[i] = C_CRK_CYL_LAM_DELTA_INI
                                                        (4.2.1.25)
endif(1)
```

4.2.2 Reset at E²PROM – failure

At E²PROM – failure:

DELTA_CRK_CYL_LAM[i] = 0

(4.2.2.1)

CRK_CYL_LAM_DELTA_INI[i] = 0

(4.2.2.2)

CTR_PHA_SHIFT_AD_TRIG[i] = 0

(4.2.2.3)

4.2.3 Adaptation reset by external tool intervention

Following calculation shall be carried out independently of the activation condition (time recurrence: 100 ms):

```
if(1)  LV_CRK_CYL_LAM_DELTA_RST_LS_EXT[i] = 1
then

FUNCTION DESCRIPTION:

General information:

The module serves as a check box for application conditions of the function “cylinder individual lambda control”. If several conditions are fulfilled the flag LV_LAM_CYL_ENA is set to 1. This flag is an input to the cylinder individual lambda control.

Description of index "[i]" and "[x]":

x: logical cylinder
*use **NC_CYL_NR**: number of engine cylinders – index "[x]"*
*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF**: pattern for allocation of physical cylinders to exhaust bank – index "[i]"*

Application conditions:

Initialisation (at reset):

```

MAF_CYL	LV_ST_END	LV_ES
FAC_LAM_MV_DELTA_LDC[NC_CBK_EX_NR]	LF_LS_CBK_EX_LAM_CYL_SEL_CONF	

FUNCTION DESCRIPTION:

General information:

if(1) two separate exhaust banks are concerned (NC_CBK_EX_NR = 2)
then
i = 1, for exhaust bank 1
i = 2, for exhaust bank 2

else(1)

i = 1 (NC_CBK_EX_NR = 1)

endif(1)

*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF** to distinguish between single and 2-exhaust-bank configuration – index "[i]"*

Description:

The condition limited dynamics LV_LAM_CYL_SEL_LDC[i] for cylinder individual lambda control is detected if the engine speed, mass air flow and the mean value of lambda controller output are within the corresponding dynamic window. Once all of the conditions are fulfilled, the integral of the mass air flow is calculated. The limited dynamics is then detected (LV_LAM_CYL_SEL_LDC[i] = 1) if the value of mass air flow integral reaches the calibrated threshold.

Application conditions:

Initialisation:

at reset, LV_IGK = 0 → 1 and clear error memory:
LV_LAM_CYL_SEL_LDC[i] = 0
MAF_INT_LDC_LAM_CYL_SEL[i] = 0
FAC_LAM_MV_OFS_LDC_LAM_CYL_SEL[i] = 0
MAF_OFS_LDC_LAM_CYL_SEL = 0
N_OFS_LDC_LAM_CYL_SEL = 0

Recurrence:

T_SAMPLE = 20 ms

Activation:

LV_ST_END = 1

Deactivation:

LV_ES = 1

Formula section:

4.4.1 Evaluation of the dynamic window for the engine speed

```
if$^{(1)}$ abs(N_DELTA_LDC) > C_N_DYW_LDC_LAM_CYL_SEL

FUNCTION DESCRIPTION:

General information:

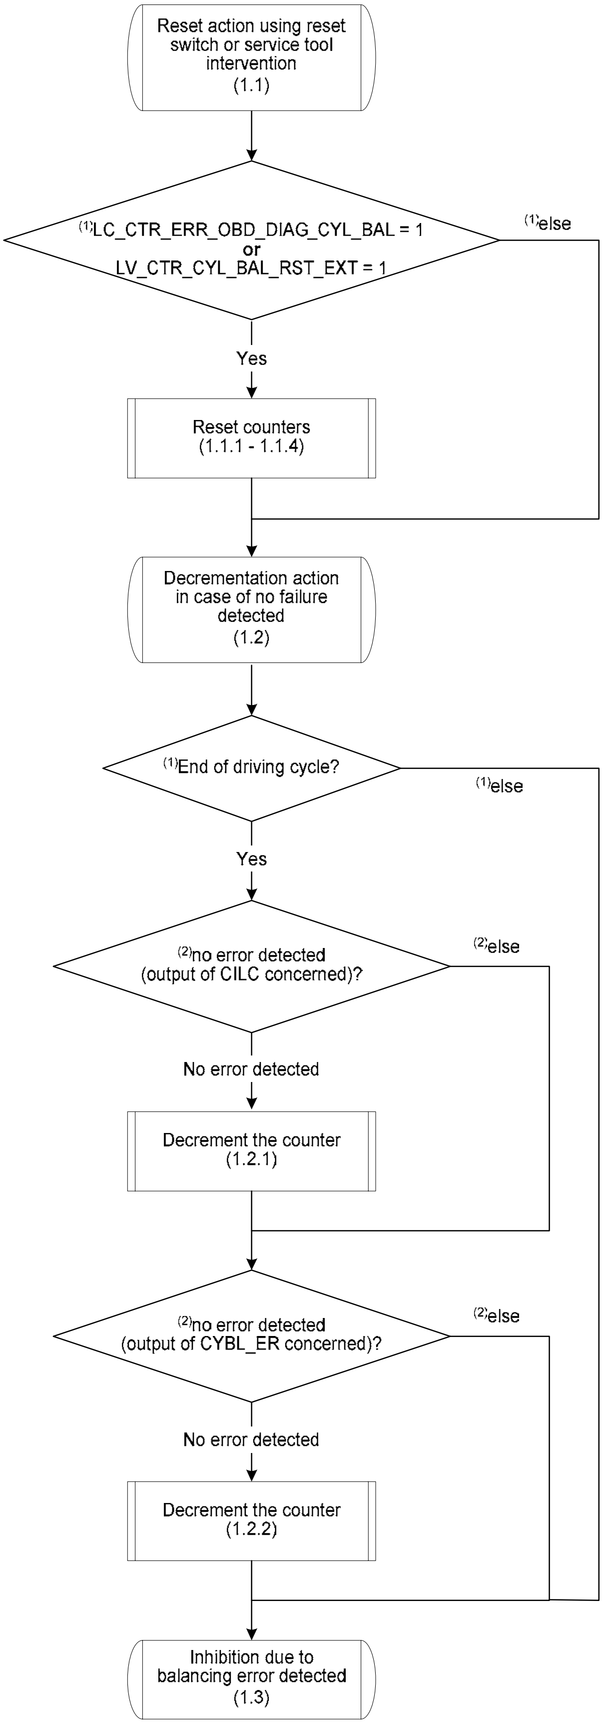
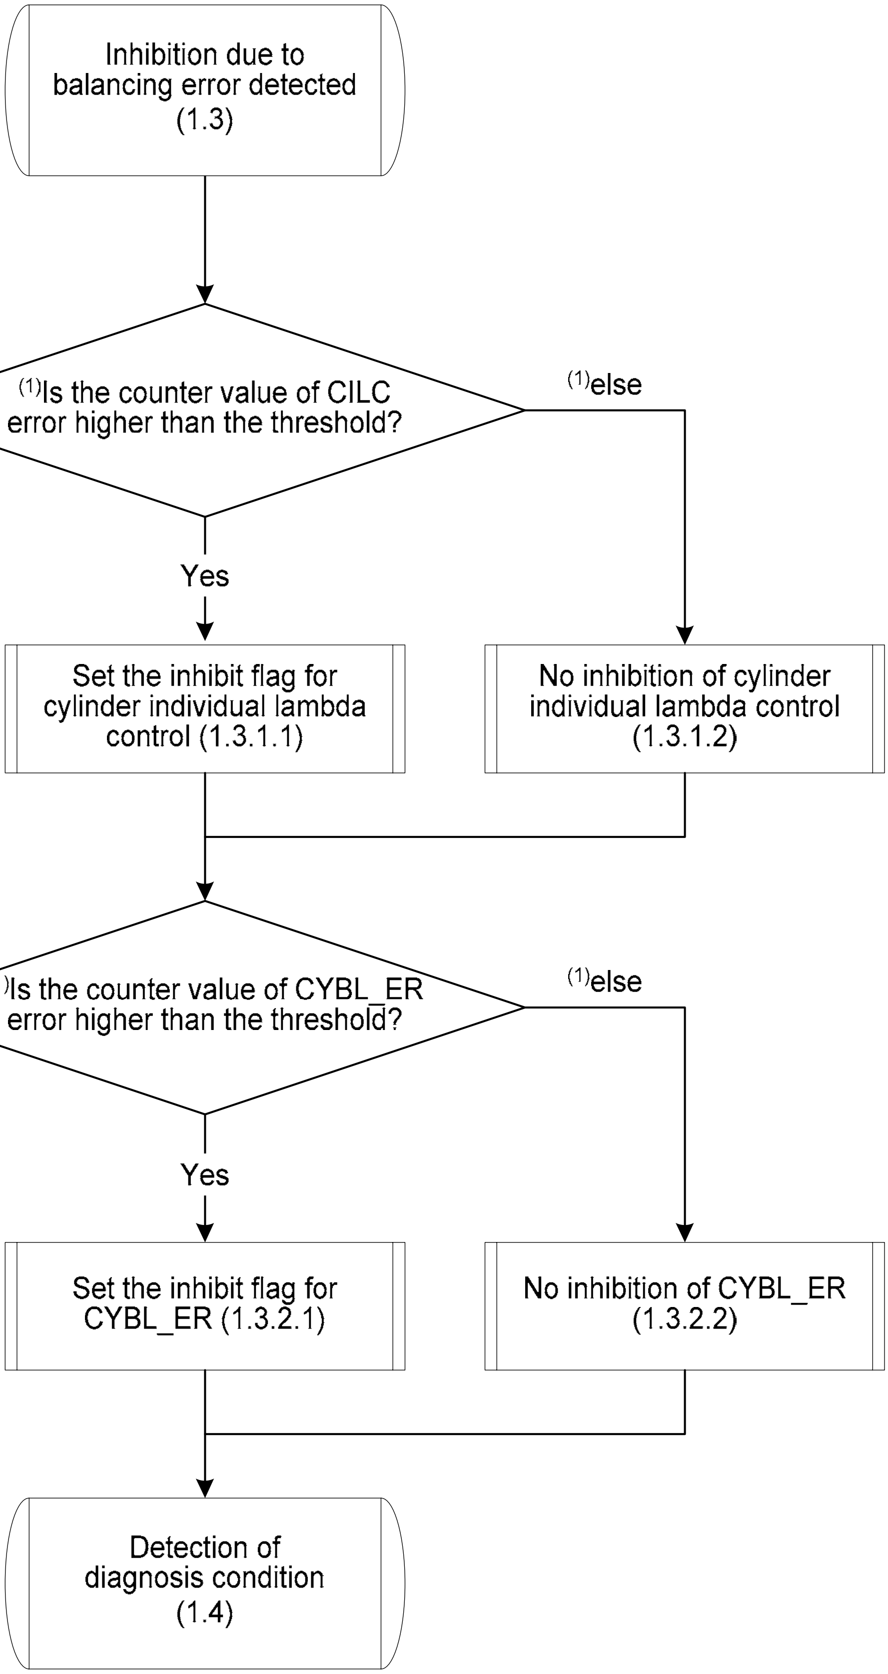
The objective function of cylinder balancing diagnosis is monitoring the output of cylinder individual lambda control in homogenous engine operation and output of cylinder balancing via engine roughness in stratified or homogenous-stratified engine operation mode. Breaking the diagnosis limits for a long time, which may have been caused by injector- failures, shall be diagnosed by cylinder balancing diagnosis. The failure allocation is cylinder selective. In case of failure detection for one of the cylinders the failure symptom of remaining cylinders shall be checked. Should the run-off time of any cylinder be over the minimum threshold, the concerned cylinder has to be detected as defect. Should the output of cylinder individual lambda control be concerned, the diagnosis shall be executed for all of the exhaust-bank-related cylinders (4.6.2, 4.6.4.1, 4.6.5, 4.6.6.1, 4.6.7.1.1).
The diagnosis shall be executed for all of the cylinders if the output of cylinder balancing via engine roughness is concerned (4.6.2, 4.6.4.2, 4.6.5, 4.6.6.2, 4.6.7.2).

Description of index "[i]" and "[x]":

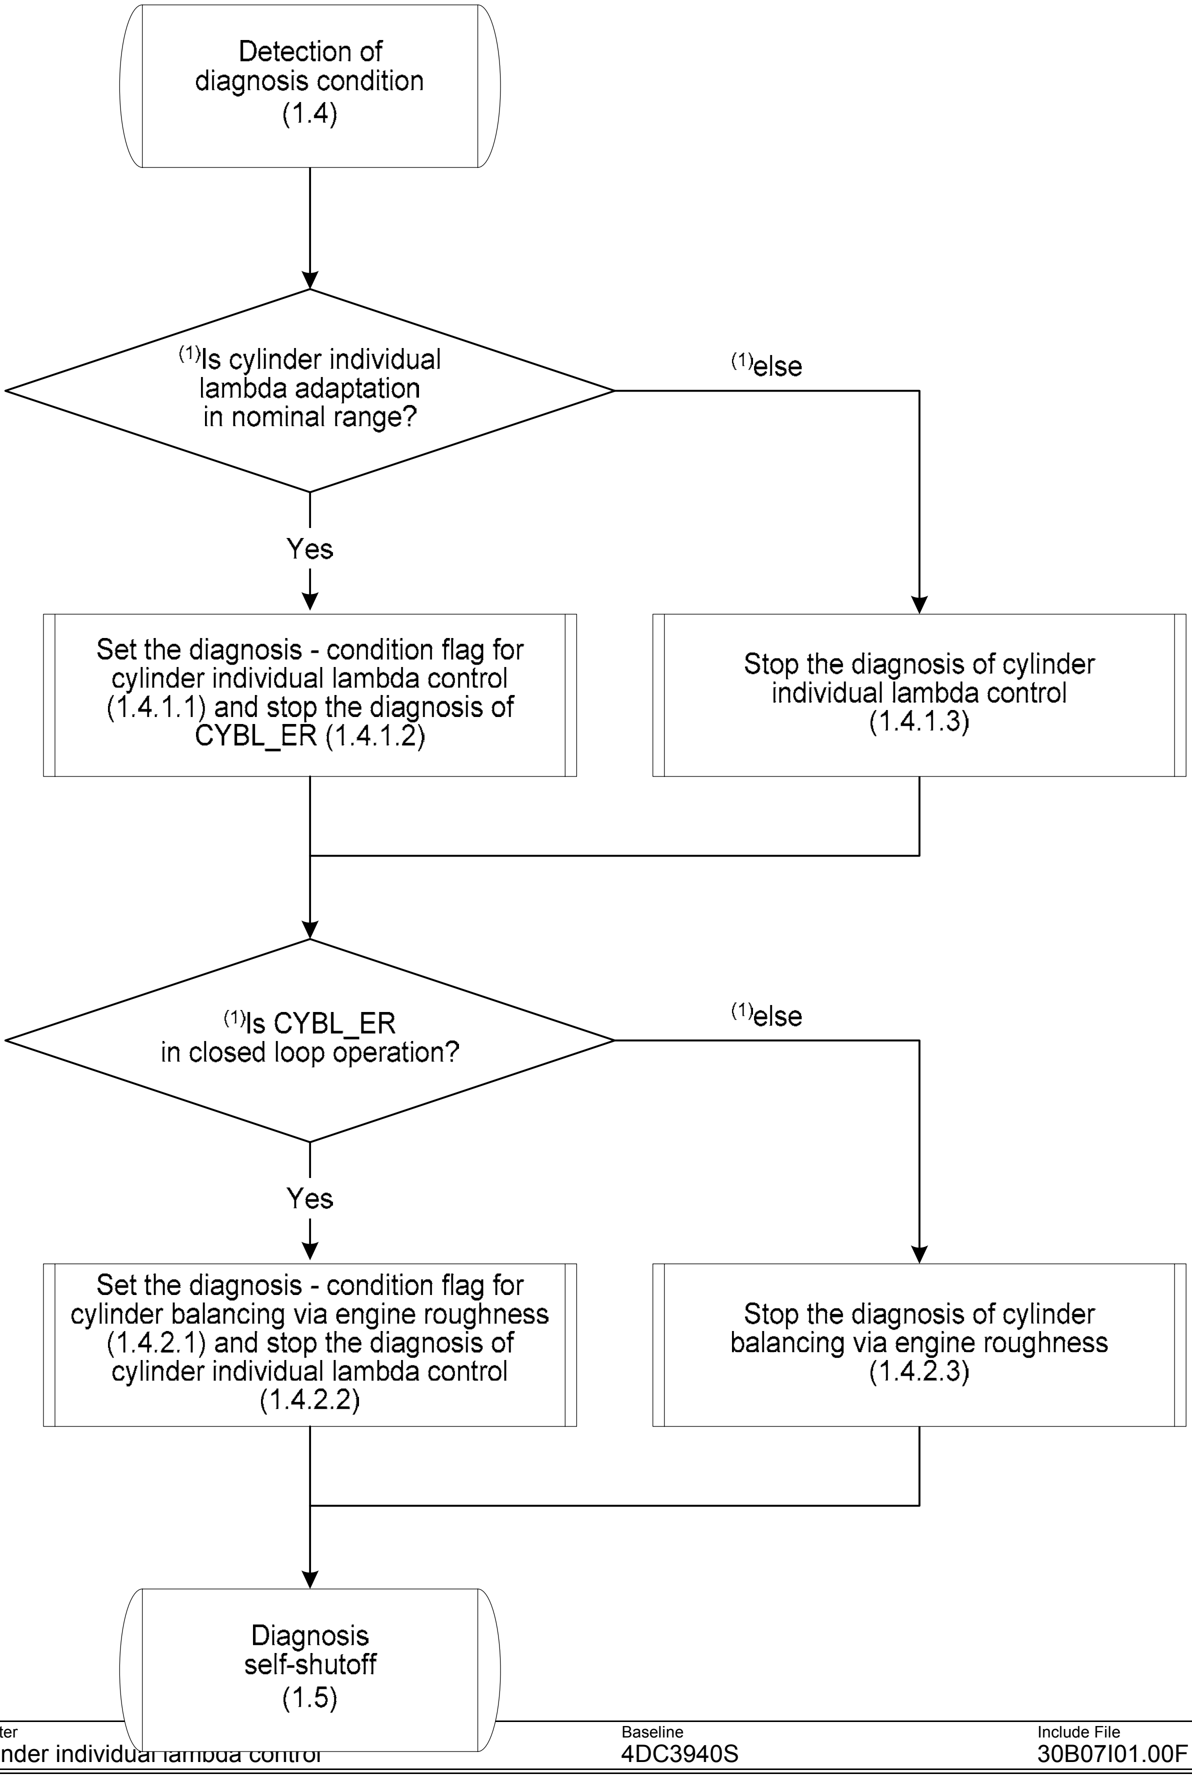
x: logical cylinder
*use **NC_CYL_NR**: number of engine cylinders – index "[x]"*
*use **LF_LS_CBK_EX_LAM_CYL_SEL_CONF**: pattern for allocation of physical cylinders to exhaust bank - index "[i]*

Signal flow diagram:

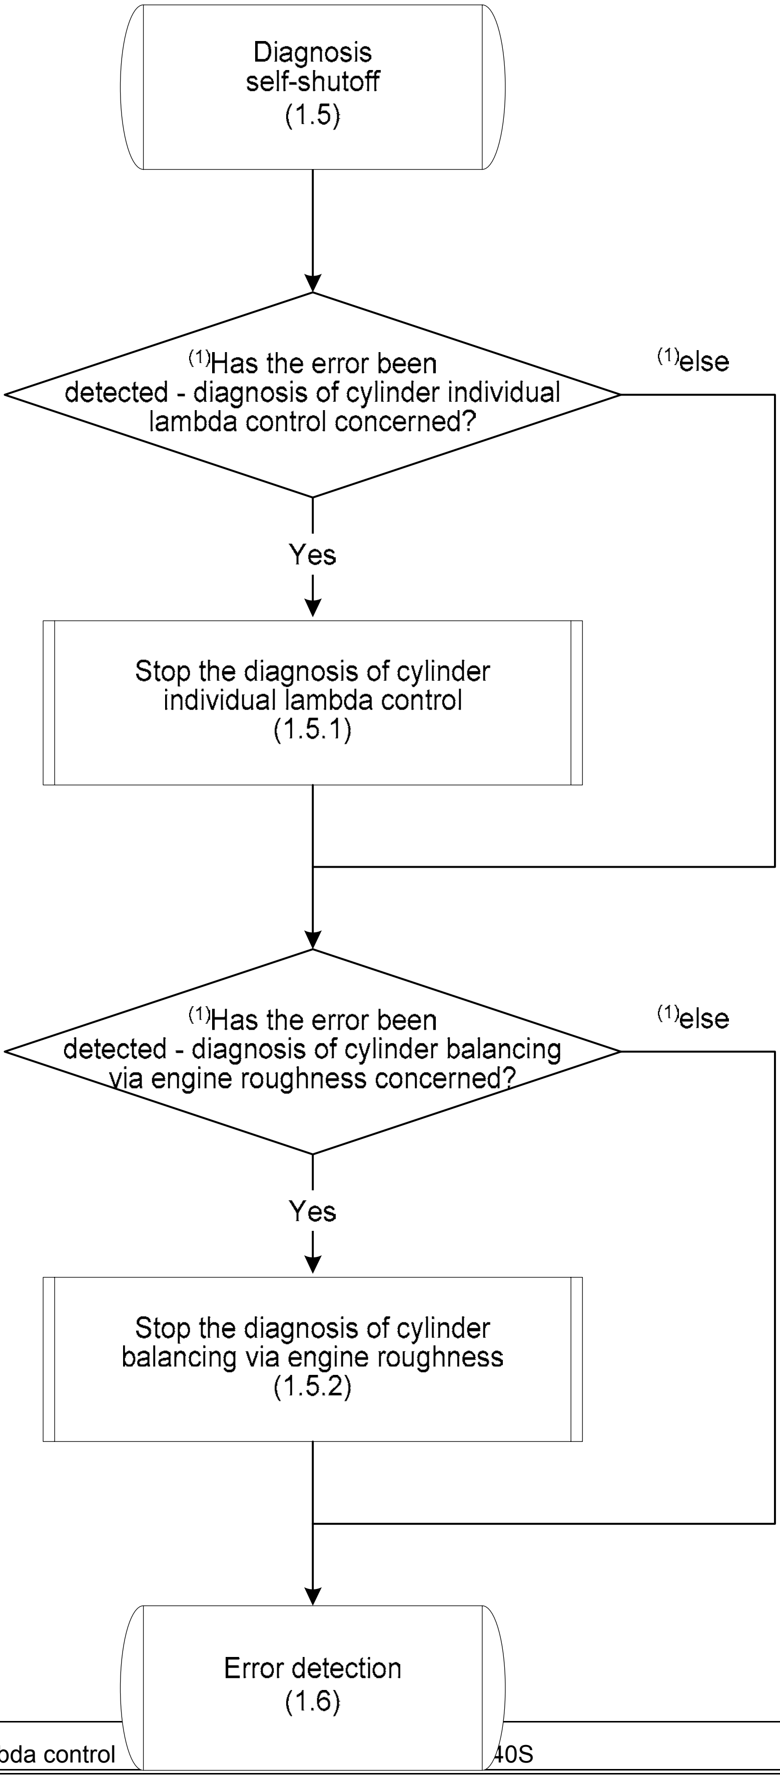




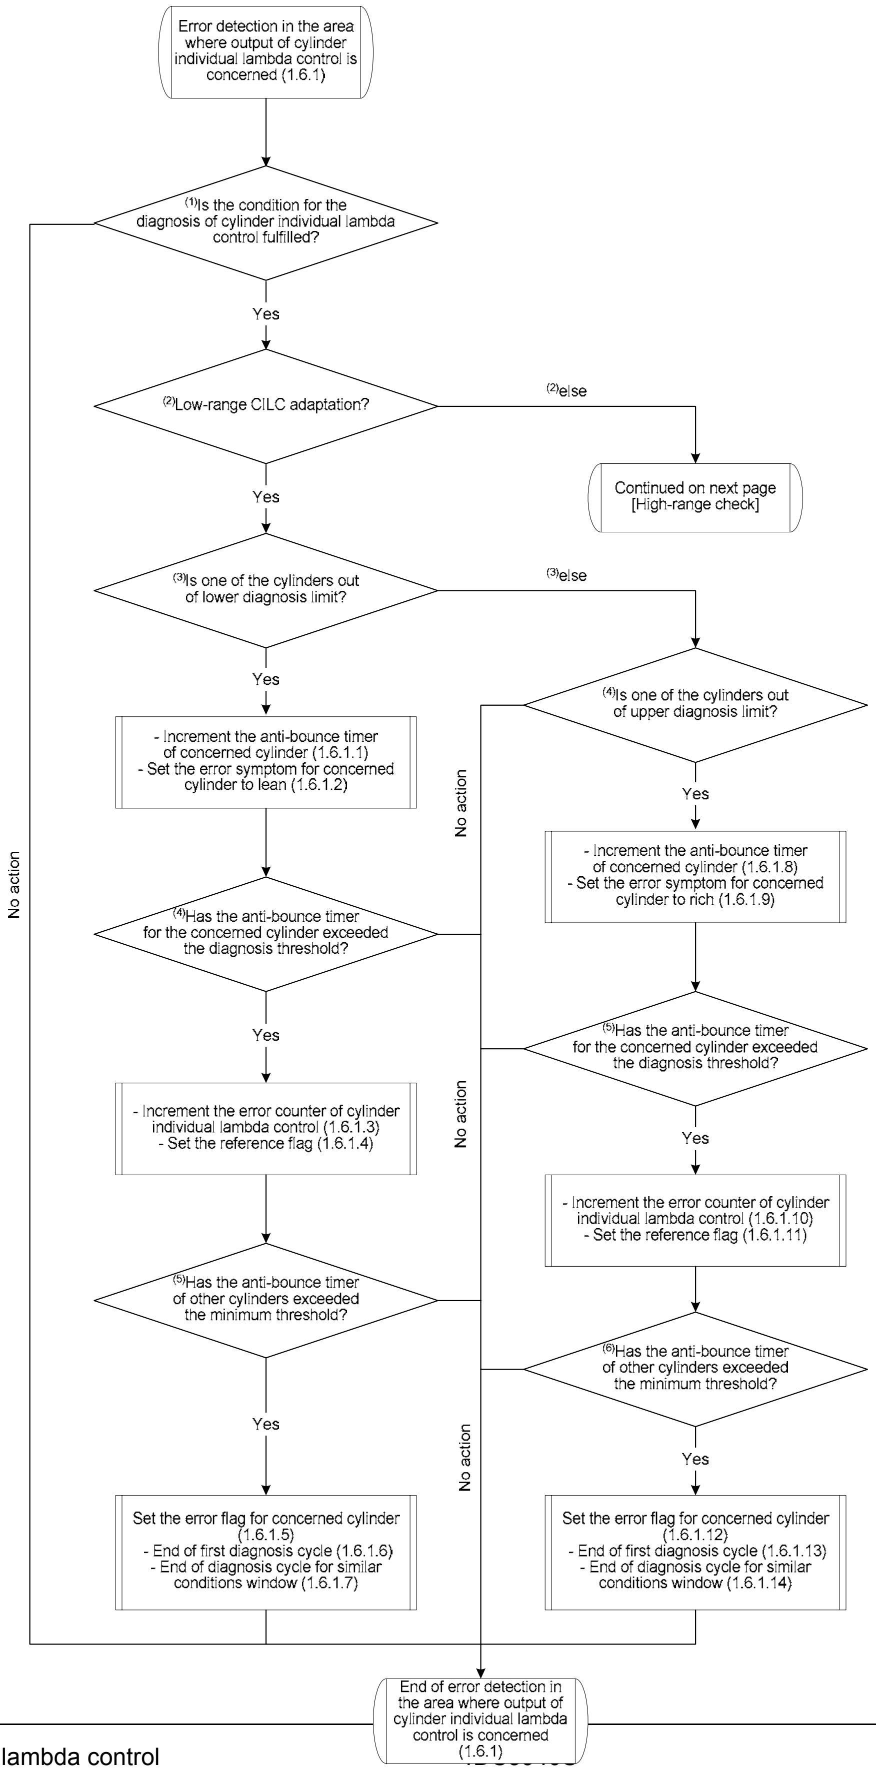
Inhibition due to balancing error detected (1.3)
(1)Is the counter value of CILC error higher than the threshold?
(1)else
Yes
Set the inhibit flag for cylinder individual lambda control (1.3.1.1)
No inhibition of cylinder individual lambda control (1.3.1.2)
(1)Is the counter value of CYBL_ER error higher than the threshold?
(1)else
Yes
Set the inhibit flag for CYBL_ER (1.3.2.1)
No inhibition of CYBL_ER (1.3.2.2)
Detection of diagnosis condition (1.4)



Detection of diagnosis condition (1.4)
(1)Is cylinder individual lambda adaptation in nominal range?
(1)else
Yes
Set the diagnosis - condition flag for cylinder individual lambda control (1.4.1.1) and stop the diagnosis of CYBL_ER (1.4.1.2)
Stop the diagnosis of cylinder individual lambda control (1.4.1.3)
(1)Is CYBL_ER in closed loop operation?
(1)else
Yes
Set the diagnosis - condition flag for cylinder balancing via engine roughness (1.4.2.1) and stop the diagnosis of cylinder individual lambda control (1.4.2.2)
Stop the diagnosis of cylinder balancing via engine roughness (1.4.2.3)
Diagnosis self-shutoff (1.5)



Diagnosis
self-shutoff
(1.5)
(1)Has the error been detected - diagnosis of cylinder individual lambda control concerned?
(1)else
Yes
Stop the diagnosis of cylinder individual lambda control
(1.5.1)
(1)Has the error been detected - diagnosis of cylinder balancing via engine roughness concerned?
(1)else
Yes
Stop the diagnosis of cylinder balancing via engine roughness
(1.5.2)
Error detection
(1.6)



Error detection in the area where output of cylinder individual lambda control is concerned (1.6.1)
(1)Is the condition for the diagnosis of cylinder individual lambda control fulfilled?
No action
Yes
(2)Low-range CILC adaptation?
(2)else

5.1 E-box cooling fan

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_EBOX_CFA	V/O	0...1H	0...1	1	[-]
Control bit EBOX cooling fan					

Input data:

TECU	TIA	LV_VAR_EBOX_CFA	LV_ERR_EBOX_CFA
LV_EBOX_CFA_EXT_ADJ	LV_ACT_EBOX_CFA_EXT_ADJ	LV_END_DIAG_EBOX_CFA	N
LV_IGK			

General information:

The function should prevent a overheating of the ECUs in the EBOX. For that, a cooling fan is controlled in dependency of the ECU temperature and the intake air temperature.

Application conditions:

Initialisation: LV_EBOX_CFA = 0 ,

T_MAX_EBOX_CFA_ACT = 0 at transition LV_IGK 0 -->1

LV_EBOX_CFA_ACT_TEST_END = 0 at transition LV_IGK 0 -->1

Recurrence: 1000 ms

Activation: at every engine operating states and

LV_VAR_EBOX_CFA = 1

FUNCTION DESCRIPTION:

Description:

There are two operating states for the activation of the Ebox-cooling-fan:
1) for power stage diagnosis:
the Ebox-cooling-fan has to be briefly activated at every transition LV_IGK 0 --> 1 in order to be able to perform a complete diagnosis cycle. After LV_IGK 0 --> 1 and the exceeding of a calibratable N-threshold the Ebox-CFA is activated either until LV_END_DIAG_EBOX_CFA is set to 1 (diagnosis completed) or the maximum time C_T_MAX_EBOX_CFA_ACT has been reached.
2) normal operation:
activation via external adjustment or due to cooling request because of high TIA or TECU

Formula section:

```
// Activation of Ebox-cooling-fan - for diagnosis (at every transition LV  IGK 0 --> 1):
If (1)      (LV_IGK = 0 --> 1 or  LV_IGK = 1)  and
            N > C_N_THD_EBOX_CFA_ACT    and
            LV_EBOX_CFA_ACT_TEST_END = 0
then (1)    if (2)        (T_MAX_EBOX_CFA_ACT < C_T_MAX_EBOX_CFA_ACT)  and

6.2.1 General information:

Attention - This specification version (402U01) is only valid for software variants which are providing the input variables ER and DRV1_ER as 16 bit values.

The engine roughness signal ER as well as the dynamic part of the engine roughness signal DRV1_ER are used as basis for the calculation of the input signal for the cylinder balancing control functions. The calculations are kept cylinder individual corresponding on the actual segment number SEG_NR_ER.

The module "Engine roughness signal preparation for cylinder balancing" is divided in two separate chapters. Within the first part the calculation of the input signals for the cylinder balancing controller is done, while the second part is providing fade out conditions while cylinder balancing has to be interrupted.

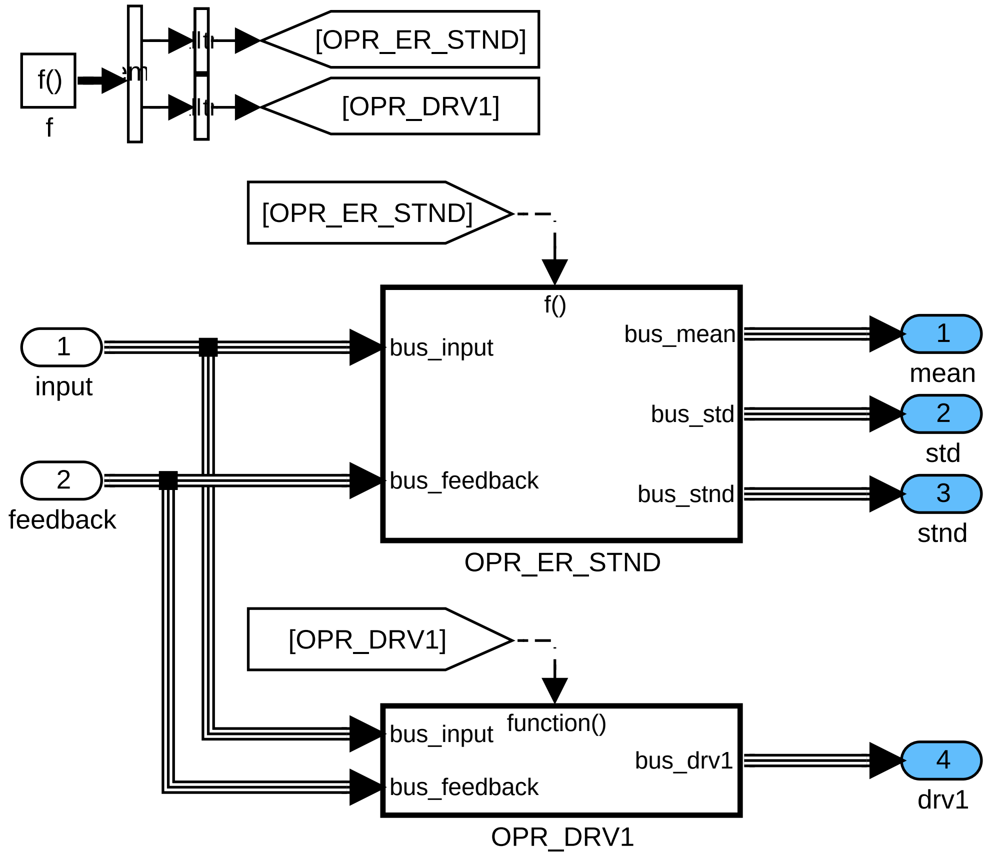

Figure 8 CYBL_SIGNAL/ OPM

<u>Input signals for cylinder balancing adaptation functions</u>

The ER values are used to calculate normalized cylinder selective engine roughness values ER_STND_BAL. After normalization (multiplication by N_32^3), the cylinder selective values are filtered by a Median Filter and a PT1-Filter.

In addition, moving mean values are built (ER_STND_MMV_STD_BAL[SEG_NR_ER]) for the calculation of cylinder specific standard deviations (ER_STD_BAL[SEG_NR_ER]).

The standard deviation ER_STD_DIF_BAL is calculated by subtracting the moving mean values ER_STND_MMV_STD_BAL[SEG_NR_ER] from the ER_STND_BAL values.

The resulting difference ER_STD_DIF_BAL is multiplied with a weighting factor for negative and positive values (C_FAC_ER_STD_NEG/POS_BAL). Afterwards a moving mean value is calculated based on this weighted signal.

To allow a cylinder specific adaptation via the engine roughness, a specific signal has to be created for each cylinder. Therefore, from the variable ER_STND_MMV_BAL[SEG_NR_ER] the value ER_STND_MMV_MV_BAL (average value of all cylinder specific moving mean values) is subtracted.

The values ER_STD_MMV_BAL[SEG_NR_ER], ER_STND_MMV_BAL[SEG_NR_ER] and ER_STND_MMV_STD_BAL[SEG_NR_ER] are stored in the non-volatile memory (NVMY) and used for initialization issues at next engine run.

Calculation of cylinder balancing acceleration fade out conditions

Multiplying the dynamic component (DRV1_ER) part of the engine roughness calculation with the engine speed by the power of three normalizes the signal. The defined signal is reproducing the engine acceleration in numbers. If the acceleration is quite high or low, in case of speeding up or down, the cylinder balancing adaptation is stopped for a certain number of segments. The number of segments are stored in a counter, which is counting back to zero in certain steps as mentioned in the signal flow diagram.

6.3.1 General information

This module coordinates the adaptation and application of the correction factors calculated by the functions "Cylinder Balancing via ER" and "Cylinder Balancing via Lambda Sensor".

The module "Cylinder Balancing via Lambda Sensor" calculates the adaptation values only in homogenous modes (lean or stochiometric), while the module "Cylinder Balancing via ER" calculates the adaptation values only in stratified mode. it is possible to apply manually the calculated adaptation values either in homogeneous or stratified or in both combustion modes with a calibration constant.

With use of a calibration constant a manual adjustment of the used injector energy level calculation is possible. The complete energy level calculation is disabled and the corresponding output values for the injection path are set to zero if the switch is set to "Disable".

Two different algorithms are existing for the injection valve energy level calculation. While the manual switch is set to "Adjustment", the calculation is based on a step by step approximation until a stable energy level is reached. In case the manual switch is set to "Control", the energy level is calculated by a converter.

Both calculation routines can be activated in parallel while the manual switch is set to "AJD/CTL". The common energy level then is a summary of the adjustment value with the controller value.

Manual Reset of cylinder balancing correction values

In case of a manual reset it is possible to adjust the output data to neutral values to make the function test and handling more easier. While the manual function reset is activated, all following subchapters within the module "Coordination of the Injection Time Correction Factors for CYBL" are deactivated during the period.

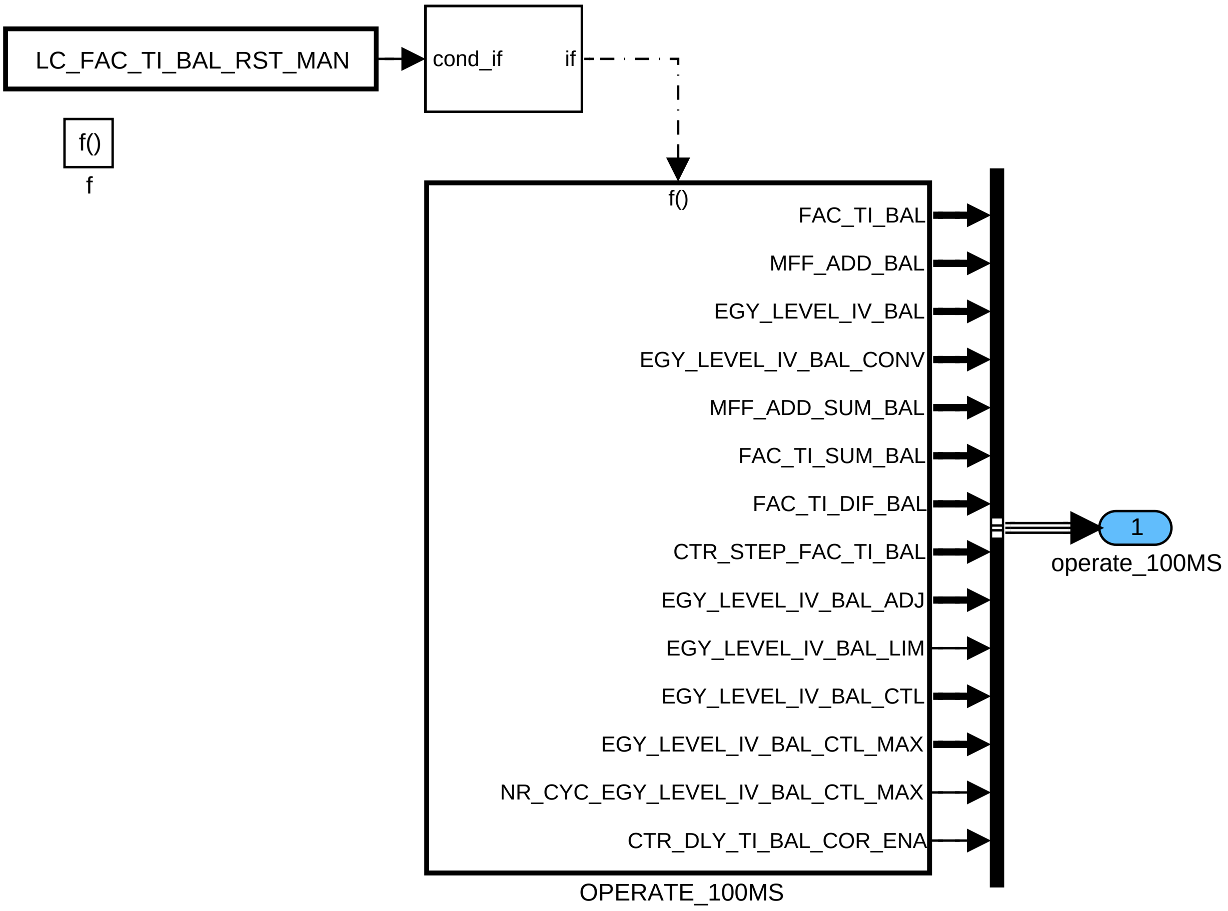

Figure 24 CYBL_M30704P01/ OPM/ OPERATE_100MS

Manual Reset of cylinder balancing correction values OPERATE_100MS

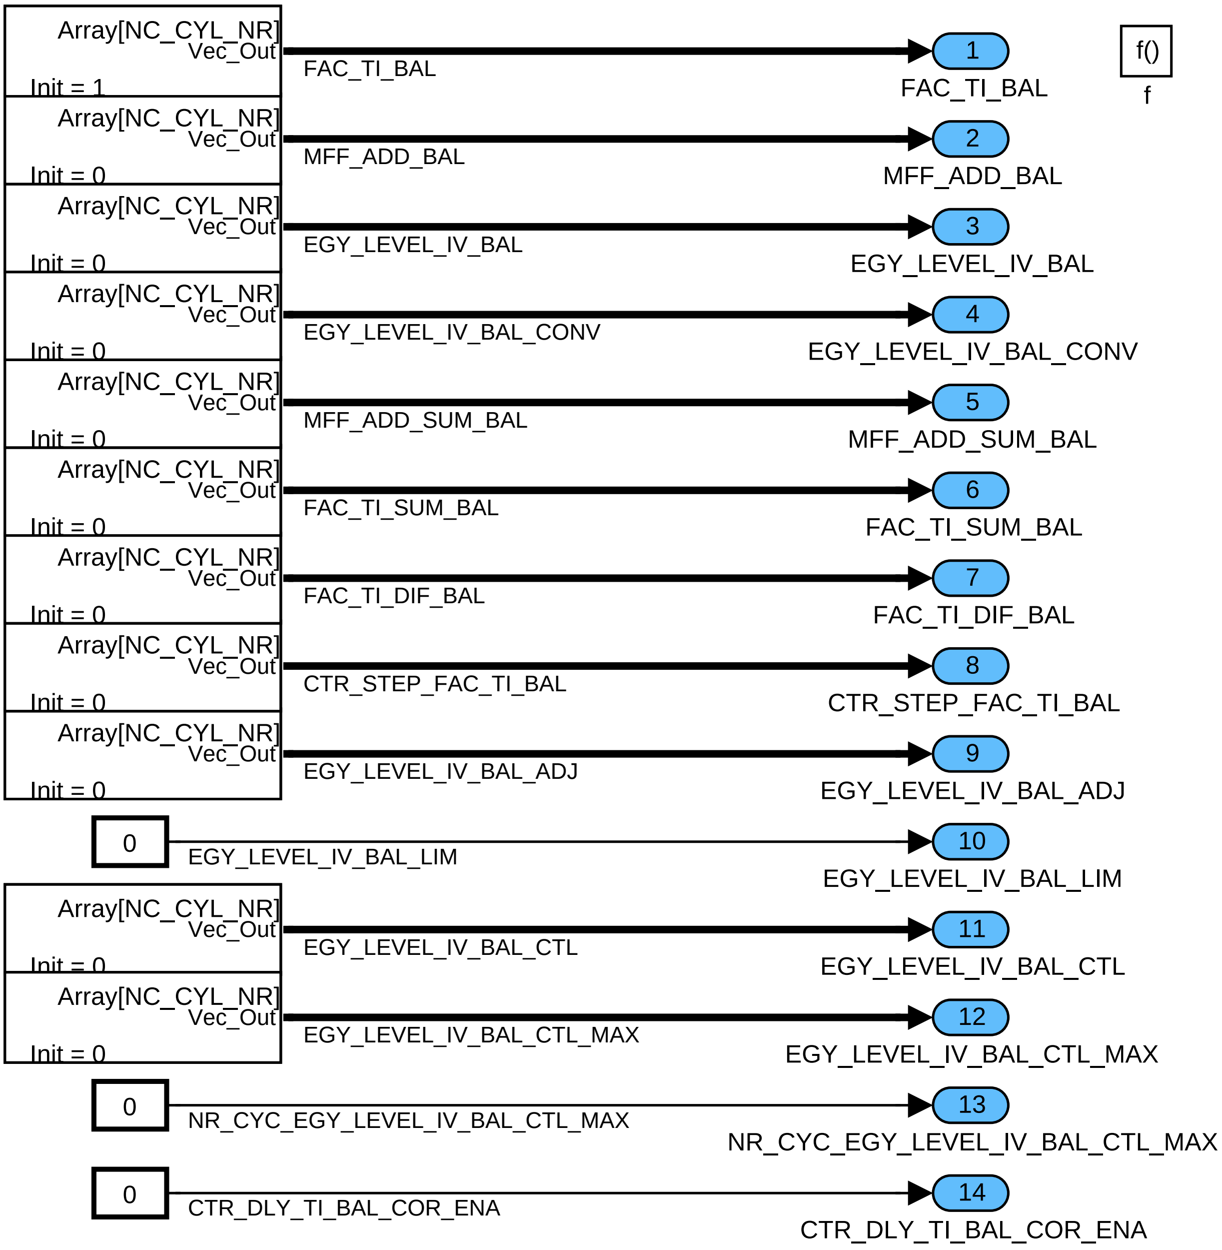

Figure 25 CYBL_M30704P01/ OPM/ OPERATE_100MS/ OPERATE_100MS

Calculation of overall correction factors for cylinder balancing at engine stop

The formula section is only activated if the switch for a manual reset is set to "0". In case of a manual reset (refer:" Manual Reset of cylinder balancing correction values"), the calculations are stopped at once.

The calculation of the total cylinder balancing correction output values takes place at engine stop and engine start in fixed time steps. The output values are used to adjust the wanted cylinder individual corrections. All total cylinder correction values (for every cylinder) are calculated within one time step during this period.

General information for OPERATE_SEG

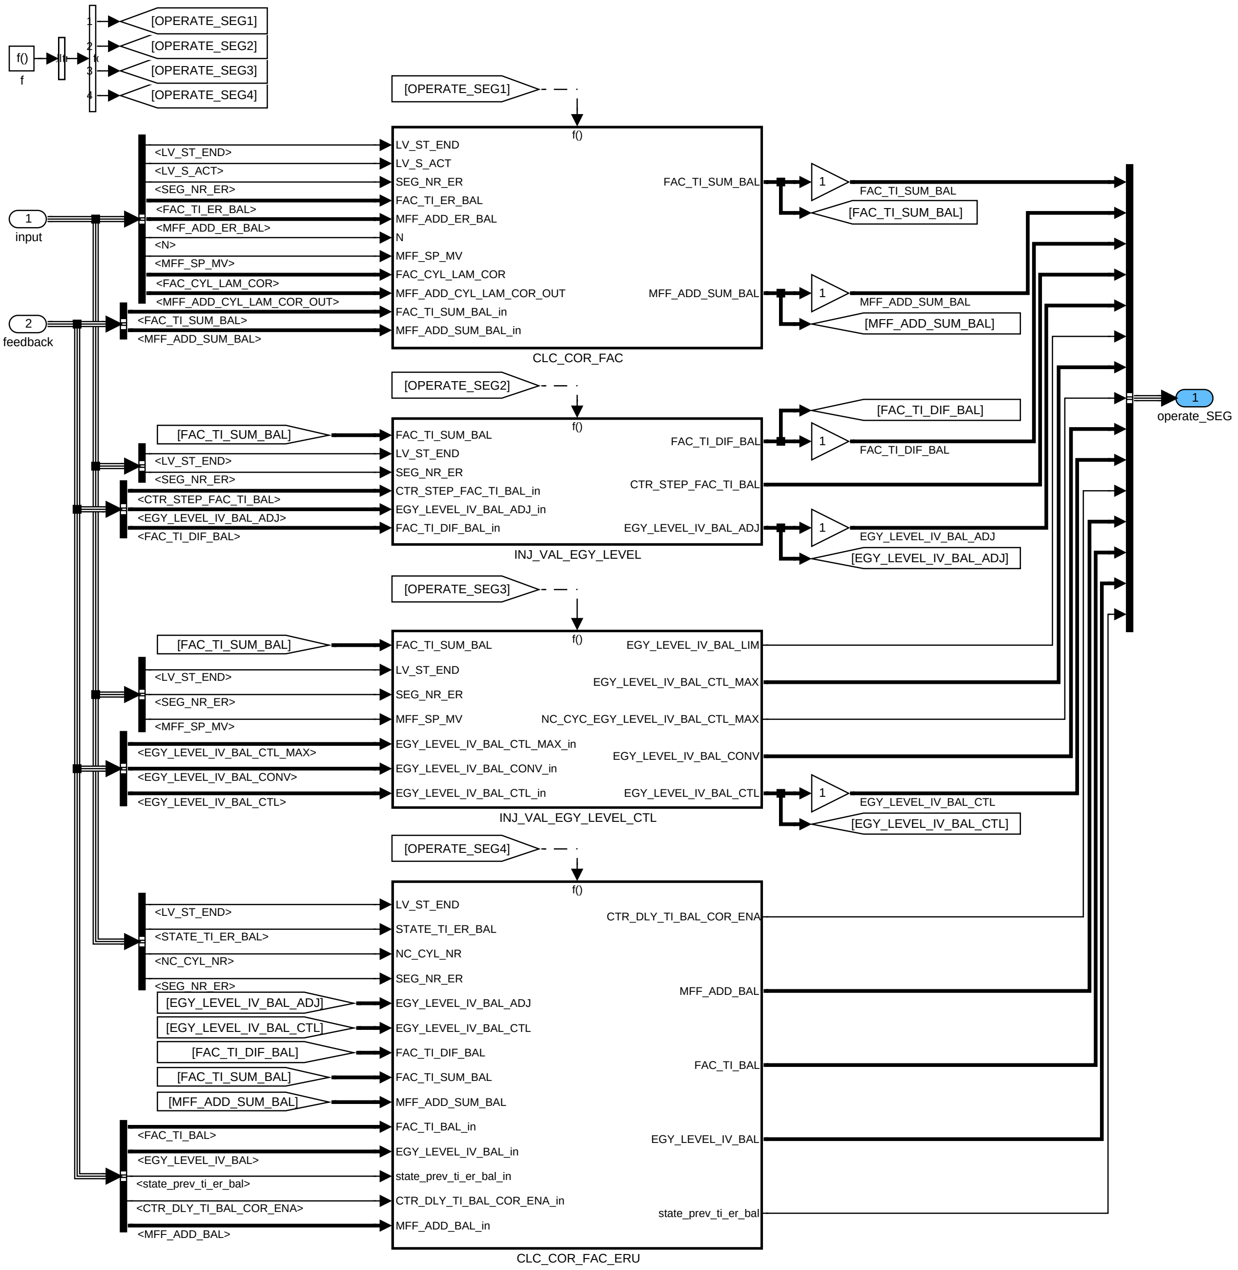

Figure 31 CYBL_M30704P01/ OPM/ OPERATE_SEG

Calculation of correction factors for cylinder balancing

The formula section is only activated if the switch for a manual reset is set to "0". In case of a manual reset (refer: "Manual Reset of cylinder balancing correction values"), the calculations are stopped at once.

The cylinder balancing correction factors for homogenous- and stratified combustion mode are built from the input values of the different cylinder balancing adaptation functions. With a manual calibration constant it is possible to adjust the adaptation values at different combustion modes.

Short description of possible settings:

Constant setting:		**CYBL via LAM sensor applied at combustion mode:**	**CYBL via ER applied at combustion mode:**
"NORM"	(**0**H)	HOM	STR
"LAM"	(**1**H)	HOM & STR	STR
"ER"	(**2**H)	HOM	STR & HOM

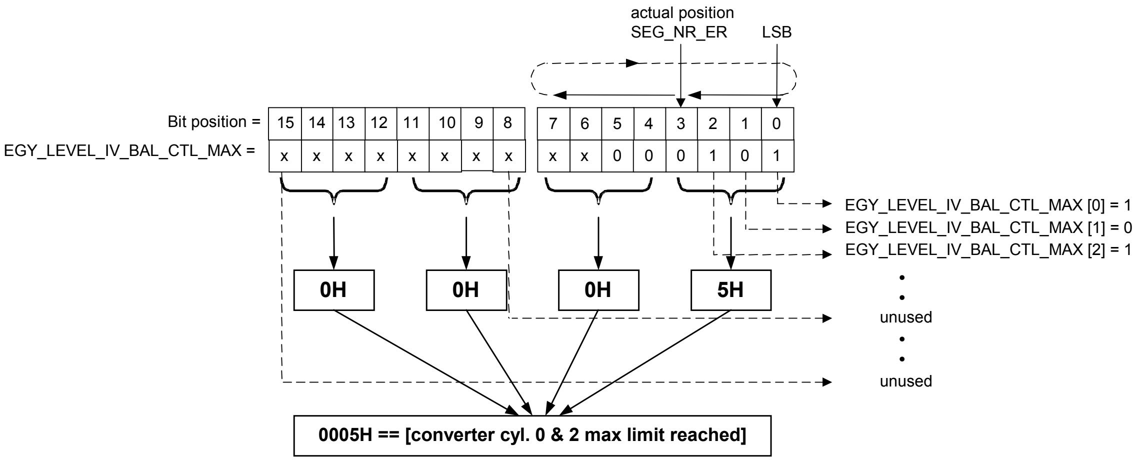
Cylinder balancing injection valve energy level control

The formula section is only activated if the switch for a manual reset is set to "0". In case of a manual reset (refer: "Manual Reset of cylinder balancing correction values"), the calculations are stopped at once.

The energy level conversion is only enabled while the manual switch for injection valve energy level calculation is set to "Control" or "ADJ&CTL".

Signalization of converter maximum output value reached



Note: always the complete WORD (16BIT) is displayed as visible value

As soon as an energy level conversion of one cylinder is reaching its maximum, a corresponding value is set to "1" to indicate the related cylinder. To save memory resources, the information for all cylinders is located within one output date (WORD). Each BIT information within the WORD is used to indicate one cylinder. It is possible to handle up to 16 cylinders with this method.

For a description more in detail please have a look to the signal flow diagram above. As example, a six-cylinder engine with two converters, which have reached the limits is shown.

("Calculation of the converter part enabled")

Task of this section is to convert the multiple correction factor provided by the cylinder balancing functions into a corresponding energy level value. The energy level signal is used to adjust the injector needle lift.

The outputs of the converter are limited to a calibrateable threshold. If one converter output has reached the limit a flag is set to one and the corresponding segment number is displayed.

The final converter outputs are corrected with a multiple factor out of an interpolation table to compensate different conversion rates for the energy levels at all engine operating areas.

Calculation of overall correction factors for cylinder balancing at engine run

The formula section is only activated if the switch for a manual reset is set to "0". In case of a manual reset (: "Manual Reset of cylinder balancing correction values"), the calculations are stopped at once.

Finally, the calculation of the total cylinder balancing correction output values takes place. The output values are used to adjust the wanted cylinder individual corrections. All injection valve correction values are calculated at any engine operating area depending of the chosen control strategy.

To avoid high cylinder to cylinder torque differences, especially at first activation after engine start and at cylinder balancing via ER activation, all total cylinder correction values are calculated within one segment. Later on, only the correction values of the current valid segment is calculated. The control is realized by a calibrateable for-loop with adjustable "start" and "stop" parameters.

6.4.1 General information

This application incidence module is used as interface module between the project specific key word protocol (KWP) and the generic cylinder balancing functionality. The KWP provides for every piezo injector and absolute MFF value, which is determined at end of injector production line and imported to the ECU at vehicle production.

To take the aging of each injector into consideration, the distance since the last injector change is calculated. The determined distance is basic for an additive MFF offset value out of an interpolation table.

It is possible to adjust default values provided by a constant array instead of the input values from the key word protocol (KWP). For this purpose a separate switch (logical constant) is existing to manage the absolute MFF setpoint values. In serial production, always the KWP values have to be used.

Adjustment of interface parameter for cylinder balancing

Goal of this chapter is to adjust interface parameter from other aggregates to cylinder balancing issues. Due to this modification it is possible to use one cylinder balancing version for all projects.

6.5.1 General information

The calculation of the additive correction- or adaptation values is performed, depending on the settings of the corresponding logical activation variable. LV_MFF_ADD_ER_BAL_ENA is used to enable the correction path, while LV_MFF_ADD_AD_ER_BAL_ENA enables the adaptation path. As soon as the corresponding logical value is set to “1” in combination with additional activation conditions, the calculation is started.

The calculated additive adaptation value MFF_ADD_AD_ER_BAL[NC_CYL_NR] for each cylinder is stored in the non-volatile memory to be available for initialization issues at next engine run.

With use of the manual reset it is possible to initialize the additive correction- or adaptation values with zero at any time. In this case, the flags which indicate the exceeding of a controller output limitation are set to zero as well (refer: “Initialization at Manual Reset”)

<u>External adjustment of additive correction values</u>

In case of an external adjustment (request from key word protocol) the additive adaptation values for all cylinders are set to zero. While the external adjustment is activated, all following subchapters within the module "Cylinder balancing via additive MFF intervention" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during this period.

Manual reset of additive correction values

In case of a manual reset it is possible to adjust the exported output data to a wanted value to make the function test and handling more easier. While the manual function reset is activated, all following subchapters within the module "Cylinder balancing via additive MFF intervention" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during this period.

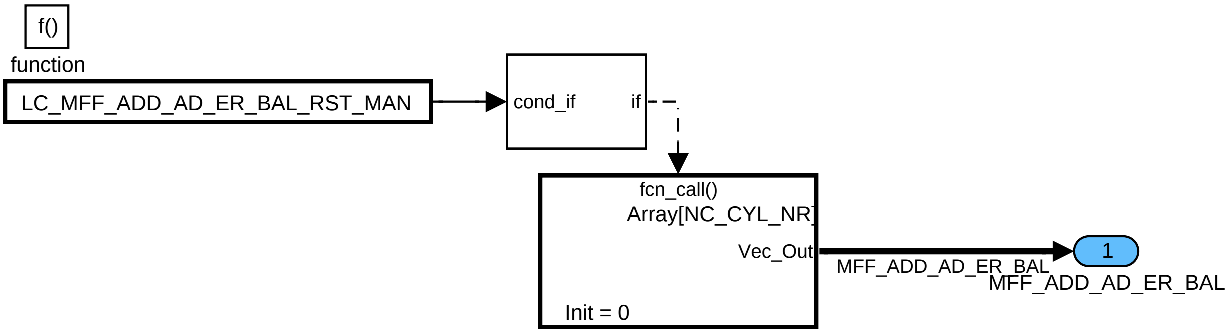

Figure 99 CYBL_M30708501/ OPM/ operate_SEG/ CLC_OPERATE_SEG/ MAN_RST_ADD_COR_VALUE/ MAN_RST_ADD_MFF

Calculation of the additive injection time correction values

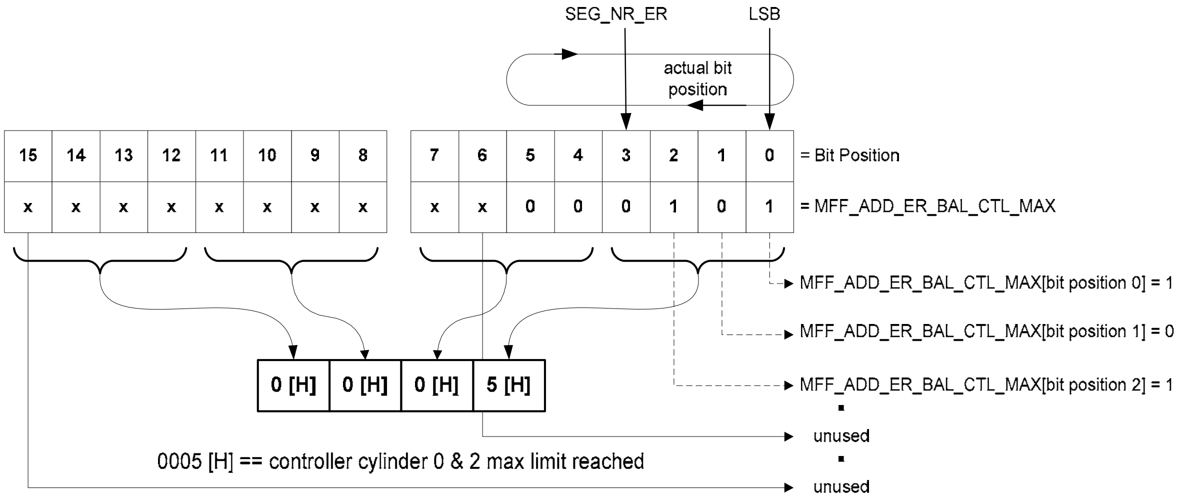
The calculation of the additive injection time correction values are only performed if the corresponding enable bit LV_MFF_ADD_ER_BAL_ENA is set to logical “1” in combination with additional activation conditions. In this case, a separate correction value for each cylinder is determined with use of a PI-controller.

As soon as a PI-controller of one cylinder is reaching its maximum, a corresponding value is set to “1” to indicate the related cylinder. To save memory resources, the information for all cylinders is located within one output data (WORD). Each BIT information within the WORD is used to indicate one cylinder. It is possible to handle up to 16 cylinders with this method.

For a description more in detail please have a look to the signal flow diagram below. As example, a six-cylinder engine with two PI-controllers, which have reached the limits is shown.

Signal flow diagram:

- Signalization of controller max. output value reached for additive path



Note: always the complete WORD (16 BIT) is displayed as visible value

- Calculation of the additive injection time correction / adaptation values in general

Controller Equataions

For the additive correction mode, a separate set of NC_CYL_NR controllers exists operating in parallel (one controller for each cylinder).

The computation of the output values is carried out every C_CYCNR_MFF_ADD_ER_BAL engine cycles (= calibrateable number of engine cycles).

Only in case of C_CYCNR_MFF_ADD_ER_BAL = 1, the calculation of the additive path is done without interruption. At every segment the corresponding cylinder specific correction value is built.

If the computation is not done at every engine cycle (C_CYCNR_MFF_ADD_ER_BAL > 1), the trigger of the controller output calculation is always related to SEG_NR_ER = 0.

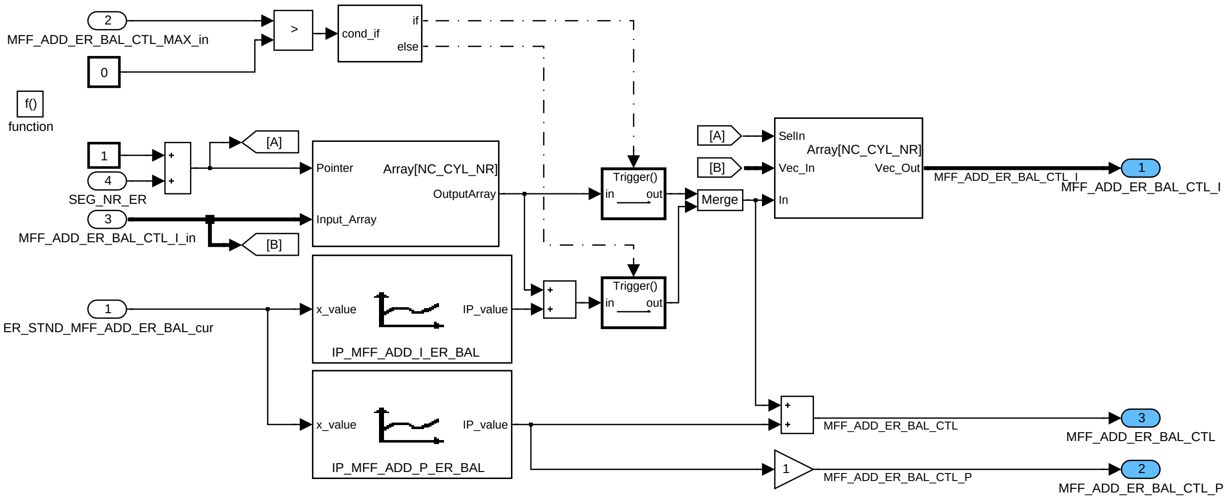

Figure 108 CYBL_M30708501/ OPM/ operate_SEG/ CLC_OPERATE_SEG/ CLC_ADD_INJ_T_COR_VALUE/ CTL_EQUATIONS

Limitation of the Controller output

The outputs of the controllers are limited to a calibrateable threshold. If one controller output has reached the limit, a flag is set at one and the corresponding segment number is displayed.

Observation of corrected controller output values for OBD issues

The additive correction values out of the correction path are observed for OBD purposes. As soon as the minimum or maximum diagnosis threshold is exceeded, a corresponding flag for the related cylinder is set. In this case the OBD system is indicated to handle the further failure treatment. The diagnosis thresholds have always to be less or equal to the absolute minimum or maximum controller output limits.

Calculation of the additive injection time adaptation values

The corrected NC_CYL_NR controller output values are adjusted dependent on the corresponding segment number SEG_NR_ER. During the function is activated, at every new segment the corresponding MFF_ADD_ER_BAL value is updated. Due to this correction the sum of all adaptation output values remains zero to guarantee that the overall injection spreading stays unchanged.

6.6.1 General information:

The calculation of the multiple correction- or adaptation values is performed, depending on the settings of the corresponding logical activation variable. LV_FAC_TI_ER_BAL_ENA is used to enable the correction path, while LV_FAC_TI_AD_ER_BAL_ENA enables the adaptation path. As soon as the corresponding logical value is set to "1" in combination with additional activation conditions, the calculation is started.

The calculated additive adaptation value FAC_TI_AD_ER_BAL[NC_CYL_NR] for each cylinder is stored in the non-volatile memory to be available for initialization issues at next engine run.

With use of the manual reset it is possible to initialize the multiple correction- or adaptation values with zero at any time. In this case, the flags which indicate the exceeding of a controller output limitation are set to zero as well (refer: "Initialization at Manual Reset")

Structure of the multiple injection time correction values

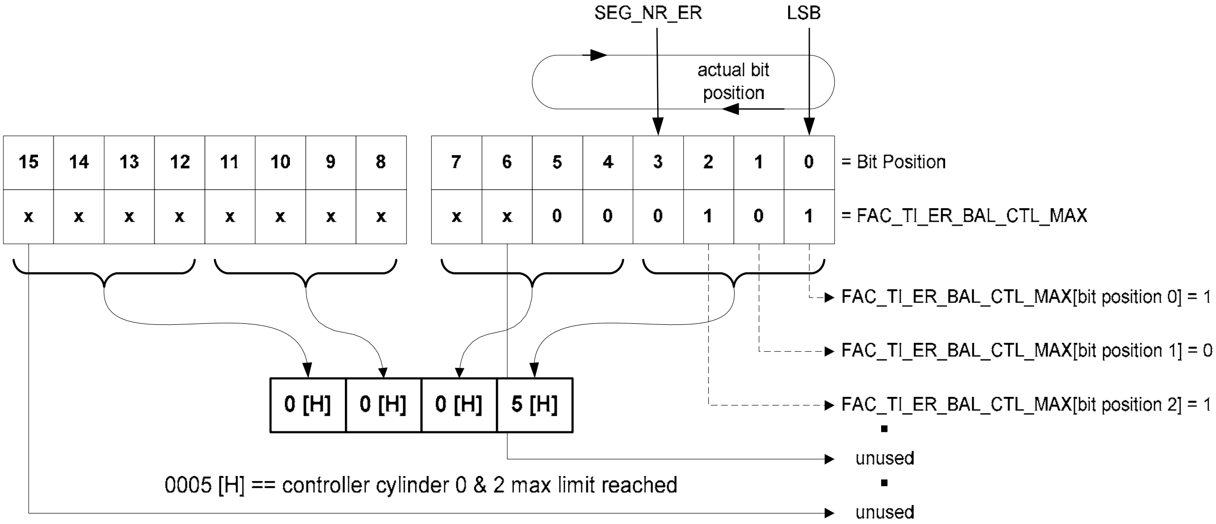
The calculation of the multiple injection time correction values are only performed if the corresponding enable bit LV_FAC_TI_ER_BAL_ENA is set to logical "1" in combination with additional activation conditions. In this case, a separate correction value for each cylinder is determined with use of a PI-controller.

As soon as a PI-controller of one cylinder is reaching its maximum, a corresponding value is set to "1" to indicate the related cylinder. To save memory resources, the information for all cylinders is located within one output data (WORD) is used to indicate one cylinder. It is possible to handle up to 16 cylinders with this method.

For a description more in detail please have a look to the signal flow diagram below. As example, a six-cylinder engine with two PI-controllers, which have reached the limits, is shown.

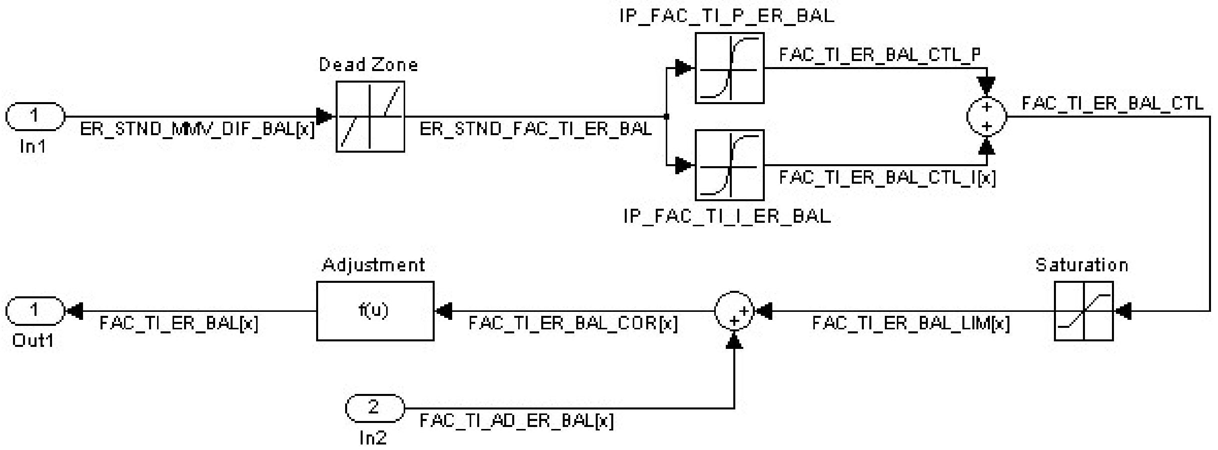
Signal flow diagram:

-Signalization of controller max. output value reached for multiple path



Note: always the complete WORD (16 BIT) is displayed as visible value

- Calculation of the multiple injection time correction / adaptation values in general



Note: [_x] is representing [SEG_NR_ER] in the signal flow diagram above

Controller Equations

For the multiple correction mode, a separate set of NC_CYL_NR controllers exists operating in parallel (one controller for each cylinder).

The computation of the output values is carried out every C_CYCNR_FAC_TI_ER_BAL engine cycles (= calibrateable number of engine cycles).

Only in case of C_CYCNR_FAC_TI_ER_BAL = 1, the calculation of the additive path is done without interruption. At every segment the corresponding cylinder correction value is built.

If the computation is not done at every engine cycle (C_CYCNR_FAC_TI_ER_BAL > 1), the trigger of the controller output calculation is always related to SEG_NR_ER = 0.

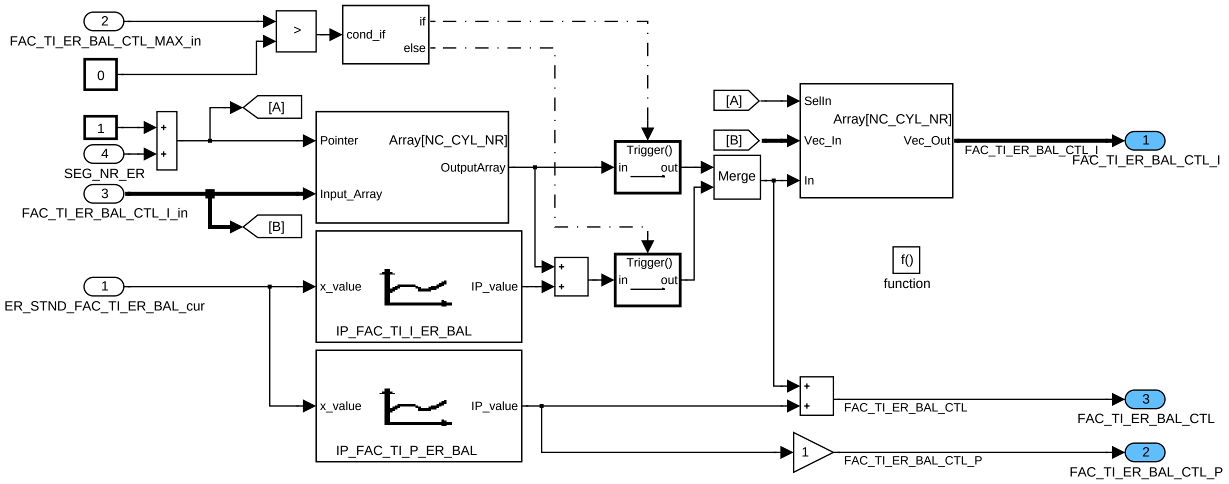

Figure 143 CYBL_M30707Q01/ OPM/ operate_SEG/ CLC_OPERATE_SEG/ CLC_MPL_TI_COR_VALUE/ CTL_EQUATIONS

Limitation of the Controller Output

The outputs of the controllers are limited to calibrateable threshold. If one controller output has reached the limit, a flag is set at one and the corresponding segment number is displayed.

6.7.1 General information:

Cylinder balancing via TI intervention means a correction of the cylinder individual injection time values to achieve a balancing of the indicated torque between the single cylinders based on engine roughness calculation. Target is to achieve a smooth engine running.

The "Balancing Manager" is realized with a state machine. Different states with a defined setting of corresponding output variables are existing as well as clear conditions to change from one state to another. The calculation of adaptation values is controlled by the states of the state machine.

By means of the logical constant LC_MFF_ADD_ER_BAL_ENA it is possible to enable (LC_MFF_ADD_ER_BAL_ENA = 1) or disable (LC_MFF_ADD_ER_BAL_ENA = 0) the additive adaptation in part load. At idle speed the additive adaptation is always enabled.

In order to compensate torque differences, e.g. caused by manufacturing tolerances of the injection valves, either an additive or a multiple adaptation correction of the injection times is carried out at state "Cylinder Balancing" depending on the current mass fuel flow setpoint.

The additive adaptation value, which influences the offset of the injection valve characteristic line is learned at low mass fuel flow values. The multiple adaptation factor however, which influences the slop of the injector characteristic line, is learned at higher mass fuel flow values (refer: figure).

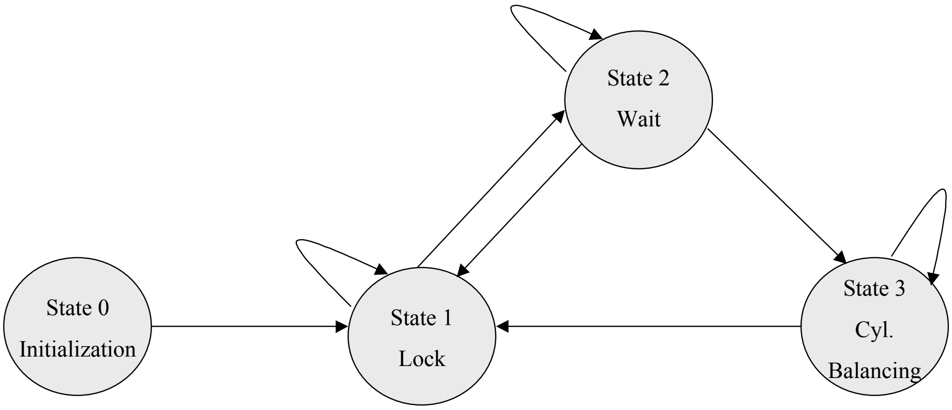
Description of the Cylinder Balancing Manager

State diagram:



Cylinder Balancing Manager: State 0H – "Initialization"

At reset the state of cylinder balancing changes at once to state "Initialization". The state "Initialization" is active for one recurrence (first segment after reset). As soon as the next segment (second segment after reset) is valid, the state changes immediately to state "Lock".

Cylinder Balancing Manager: State 1[H] – "Lock"

The algorithm stays in this state until the flags LV_TI_ER_BAL_ENA is set to "1". This flag is set when certain conditions for controlling and adaptation are fulfilled.

Cylinder Balancing Manager: State 2[H] – "Wait"

The counter CTR_TI_ER_BAL_ENA starts to run. It counts down from its calibrate able initial value IP_CTR_TI_ER_BAL_ENA_INI to zero (decrease of "1" every engine cycle).

Furthermore the input values ER_STND_MMV_BAL[SEG_NR_ER] and ER_STD_MMV_BAL[SEG_NR_ER] have to below a certain limit:

Cylinder Balancing Manager: State [3] – Cylinder Balancing

The input values ER_STND_MMV_BAL[SEG_NR_ER] and ER_STD_MMV_BAL[SEG_NR_ER] have to below a certain limit (analogue to state 2).

6.8.1 General information

The Appl. Inc. module is used to keep the cylinder balancing functions modular. Therefore the activation conditions for the signal preparation functions, the balancing manager and the cylinder balancing adaptation functions are set within this module. The cylinder balancing functions are activated as soon as the corresponding activation condition is enabled (=1).

With the logical variable LV_MFF_COR_ER_BAL_ENA_EXT it is possible to adapt the main enable condition (to start cylinder balancing via TI intervention) with additional external requirements. The flag is used as input signal for the cylinder balancing manager.

With the logical variable LV_MFF_ADD_AD_ER_BAL_ENA_EXT it is possible to adapt the main adaptation condition (to start cylinder balancing additive adaptation) with additional external requirements. The flag is used as input signal for the cylinder balancing manager.

A logical calibration constant is available to stop all cylinder balancing interventions at once. In case of LC_TI_ER_BAL_STOP_MAN = 1, several activation conditions for the cylinder balancing functions are disabled (=0). If the logical constant is enabled (=1), a re-initialisation ("0"[hex]) of all output values occurs.

FUNCTION DESCRIPTION:

General information:

This manager specifies the sequencing of all CYBL tasks.

Description:

Within the cylinder balancing package (CYBL), all functions for Cylinder balancing via engine roughness" (CYBL_ER) are included. This scheduler has to manage the coordination of all involved parts.

Application conditions:

Recurrence: see formula section below

Activation: at every engine operating state

Deactivation: -

Formula section:

6.9.1 Non volatile memory tasks (CYBL_ER):

FUNCTION DESCRIPTION:

General information:

Task of the cylinder balancing coordination is to observe the balancing adaptation functions at end of line test and to set a readiness information as soon as a defined adaptation limit for each adaptation has been reached.

Application conditions:

Initialization at first Engine run or NVMY-error:

LV_CYL_BAL_LAM_AD_EOL = 0 *(first initialization)*

LV_CYL_BAL_LAM_SEL_AD_COLD_EOL = 0 *(first initialization)*

LV_CYL_BAL_LAM_SEL_AD_HOT_EOL = 0 *(first initialization)*

```
    LV_CYL_BAL_ER_AD_FAC_EOL = 0                                    (first initialization)
    LV_CYL_BAL_ER_AD_ADD_EOL = 0                                    (first initialization)
    FOR m = 0 to NC_CBK_EX_NR – 1
        LV_CYL_BAL_LAM_SEL_AD_COLD[m] = 0                           (first initialization)
        LV_CYL_BAL_LAM_SEL_AD_RNG_L[m] = 0                          (first initialization)
        LV_CYL_BAL_LAM_SEL_AD_RNG_H[m] = 0                          (first initialization)
        LV_CYL_BAL_LAM_AD_FAC[m] = 0                                (first initialization)
        LV_CYL_BAL_LAM_AD_ADD[m] = 0                                (first initialization)
    END FOR
```

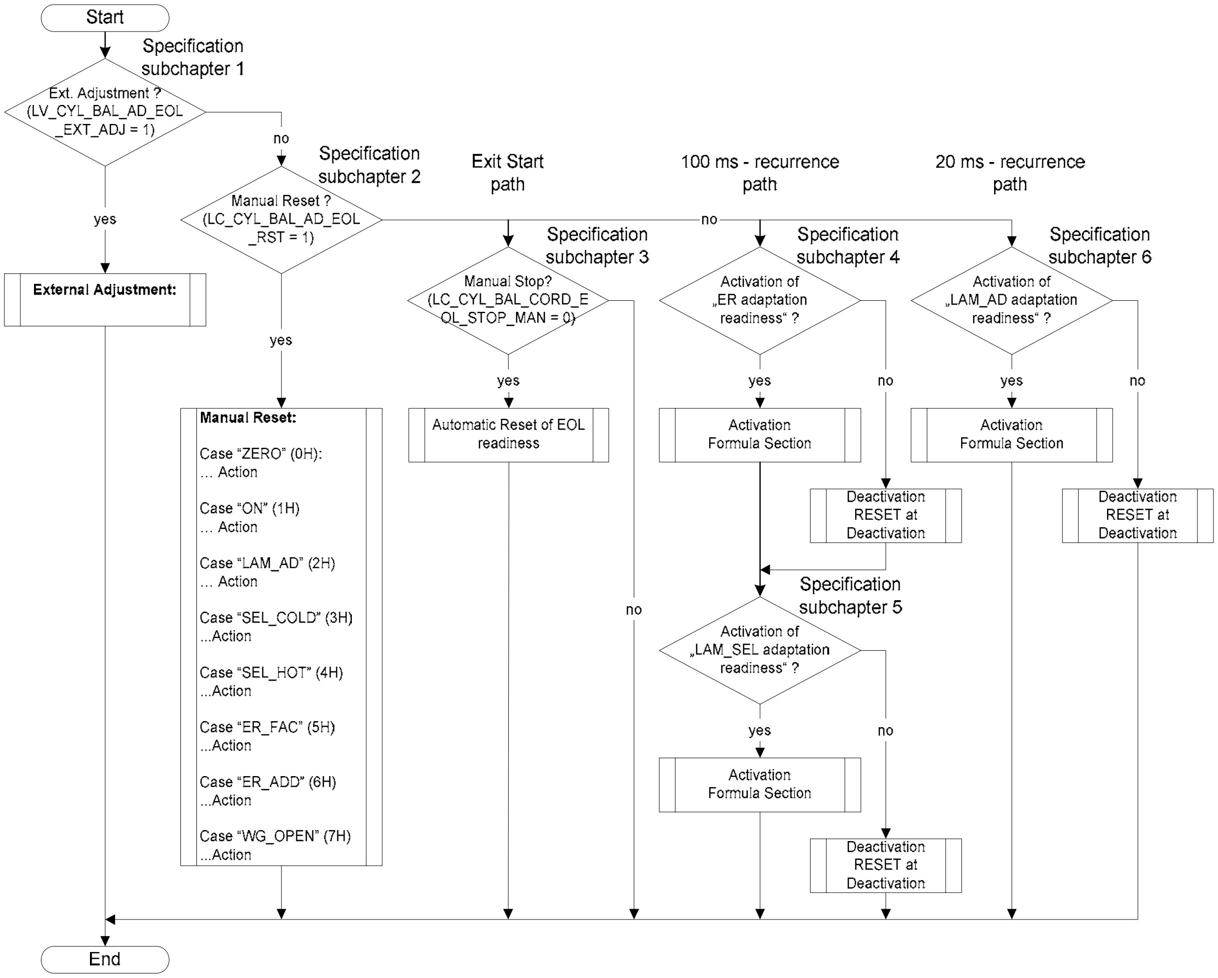
Initialization at Reset:

```
LV_CYL_BAL_LAM_AD_EOL = LV_CYL_BAL_LAM_AD_EOL                                         (NVMY)
LV_CYL_BAL_ER_AD_FAC_EOL = LV_CYL_BAL_ER_AD_FAC_EOL                                   (NVMY)
LV_CYL_BAL_ER_AD_ADD_EOL = LV_CYL_BAL_ER_AD_ADD_EOL                                   (NVMY)
LV_CYL_BAL_LAM_SEL_AD_COLD_EOL = LV_CYL_BAL_LAM_SEL_AD_COLD_EOL                       (NVMY)
LV_CYL_BAL_LAM_SEL_AD_HOT_EOL = LV_CYL_BAL_LAM_SEL_AD_HOT_EOL                         (NVMY)
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_SEL_AD_COLD[m] = LV_CYL_BAL_LAM_SEL_AD_COLD[m]                     (NVMY)
    LV_CYL_BAL_LAM_SEL_AD_RNG_L[m] = LV_CYL_BAL_LAM_SEL_AD_RNG_L[m]                   (NVMY)
    LV_CYL_BAL_LAM_SEL_AD_RNG_H[m] = LV_CYL_BAL_LAM_SEL_AD_RNG_H[m]                   (NVMY)
    LV_CYL_BAL_LAM_AD_FAC[m] = LV_CYL_BAL_LAM_AD_FAC[m]                               (NVMY)
    LV_CYL_BAL_LAM_AD_ADD[m] = LV_CYL_BAL_LAM_AD_ADD[m]                               (NVMY)
END FOR
```

(NVMY: values stored in the non-volatile memory)

Recurrence:	See separate chapters
Activation:	See separate chapters
Deactivation:	See separate chapters

Signal flow diagram:



6.10.1 External adjustment of cylinder balancing readiness at end of line (EOL):

FUNCTION DESCRIPTION:

General information:

In case of an external adjustment (request from key word protocoll) the readiness bits for all cylinder balancing adaptation functions at EOL are set to zero. While the external adjustment is activated, all following subchapters within the module "Cylinder balancing coordination at EOL" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during the period.

Application conditions:

Recurrence: 100 ms

Activation: LV_CYL_BAL_AD_EOL_EXT_ADJ = 1

Deactivation: LV_CYL_BAL_AD_EOL_EXT_ADJ = 0

Formula section:

```
LV_CYL_BAL_LAM_AD_EOL = 0
LV_CYL_BAL_LAM_SEL_AD_COLD_EOL = 0
LV_CYL_BAL_LAM_SEL_AD_HOT_EOL = 0
LV_CYL_BAL_ER_AD_FAC_EOL = 0
LV_CYL_BAL_ER_AD_ADD_EOL = 0
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_SEL_AD_COLD[m] = 0
    LV_CYL_BAL_LAM_SEL_AD_RNG_L[m] = 0
    LV_CYL_BAL_LAM_SEL_AD_RNG_H[m] = 0
    LV_CYL_BAL_LAM_AD_FAC[m] = 0
    LV_CYL_BAL_LAM_AD_ADD[m] = 0
END FOR
```

6.10.2 Manual reset of cylinder balancing readiness at end of line (EOL):

FUNCTION DESCRIPTION:

General information:

In case of a manual reset it is possible to adjust the exported output data to a wanted value to make the function test and handling more easier. While the manual function reset is activated, all following subchapters within the module "Cylinder balancing coordination at EOL" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during the period.

Application conditions:

Recurrence: 100 ms

Activation: LV_CYL_BAL_AD_EOL_EXT_ADJ = 0 **and**
LC_CYL_BAL_AD_EOL_RST = 1

Deactivation: LV_CYL_BAL_AD_EOL_EXT_ADJ = 0 **and**
[LC_CYL_BAL_AD_EOL_RST = 0 **]**

Formula section:

```

6.10.3 Automatic reset of cylinder balancing end of line (EOL) readiness:

FUNCTION DESCRIPTION:

General information:

In case of lost adaptation values due to a manual reset at the garage or faulty non-volatile memory entries, the system detects the changes and the corresponding end of line readiness is reset automatically.

Application conditions:

Initialization at exit start (EXIT_ST):

```
IF          LC_CYL_BAL_CORD_EOL_STOP_MAN = 0          and
            LC_CYL_BAL_AD_EOL_RST = 0                 and
            LV_CYL_BAL_AD_EOL_EXT_ADJ = 0
THEN
            Reset of cylinder balancing global lambda adaptation readiness:
            IF (1)      LV_CYL_BAL_LAM_AD_EOL = 1
            THEN (1)
                    IF (2)    ( C_CYL_BAL_LAM_AD_EOL_CONF = “FAC_L” (2H)   or
                                C_CYL_BAL_LAM_AD_EOL_CONF = “ADD_FAC_L” (3H) )   and
                              $\sum_{m=0}^{m=NC\_CBK\_EX\_NR-1} |\mathrm{FAC\_L\_RNG\_LAM\_AD[m]}| = 0$
                    THEN  (2)     LV_CYL_BAL_LAM_AD_EOL = 0
                              FOR m = 0 to NC_CBK_EX_NR – 1

    ENDIF (2)
ENDIF (1)
ENDIF
```

6.10.4 Calculation of cylinder balancing engine roughness adaptation readiness (EOL):

FUNCTION DESCRIPTION:

General information:

After activation of the corresponding adaptation function (multiple or additive) at stratified combustion mode, a timer is started to observe the filtered engine roughness values used as input for the adaptation controllers. As soon as all controller input values are within a defined range for a specific time interval, readiness is indicated. The function is controlled by a state machine.

Application conditions:

6.10.6 Calculation of cylinder balancing lambda adaptation readiness (EOL):

FUNCTION DESCRIPTION:

General information:

After activation of the corresponding adaptation function at homogenous combustion mode, a timer is started to observe the deviation between the actual and the last learned lambda deviation value. As soon as the deviation values are within a defined range for a specific time interval, readiness is indicated. The function is controlled by a state machine.

Application conditions:

*Initialization at Reset **or** Deactivation*

```
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_STATE_CYL_BAL_LAM_CHG_WAIT[m] = 0
    CTR_CYL_BAL_LAM_CBK_AD[m] = 0
END FOR
T_CYL_BAL_LAM_AD = 0.00[s]
LV_STATE_CYL_BAL_LAM_CHG_AD = 0
STATE_CYL_BAL_LAM_AD_EOL = "Ready" (0[H])
```

Recurrence: 20 ms

Activation:

```
LC_CYL_BAL_AD_EOL_RST = 0                  and
LV_CYL_BAL_AD_EOL_EXT_ADJ = 0              and
LC_CYL_BAL_CORD_EOL_STOP_MAN = 0           and
LV_CYL_BAL_LAM_AD_EOL = 0
```

Deactivation:

```
LC_CYL_BAL_AD_EOL_RST = 0                  and
LV_CYL_BAL_AD_EOL_EXT_ADJ = 0              and
[   LC_CYL_BAL_CORD_EOL_STOP_MAN = 1   or
    LV_CYL_BAL_LAM_AD_EOL = 1          ]
```

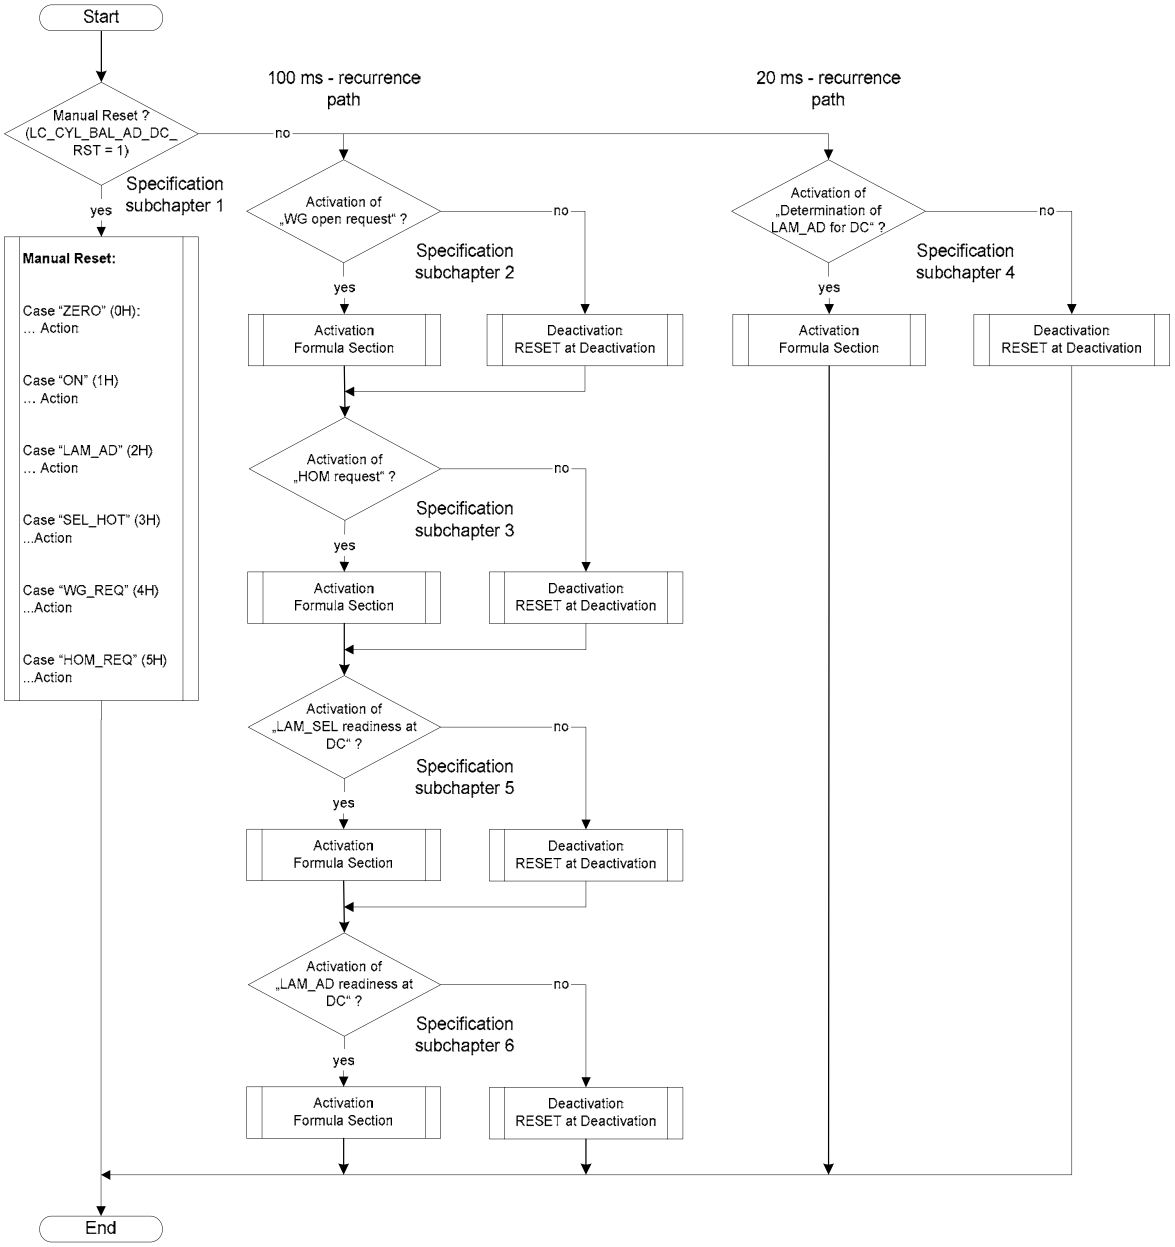
FUNCTION DESCRIPTION:

Task of the cylinder balancing coordination at DC is to control the adaptation functions during the current driving cycle.

Signal flow diagram:



Application conditions:

Initialisation: See separate chapters

Recurrence: See separate chapters

Activation: See separate chapters

Deactivation: See separate chapters

6.11.1 Manual reset of cylinder balancing readiness at active drving cycle (DC):

FUNCTION DESCRIPTION:

General information:

In case of a manual reset it is possible to adjust the exported output data to a wanted value to make the function test and handling more easier. While the manual function reset is activated, all following subchapters within the module "cylinder balancing coordination at DC" are deactivated and the corresponding "Initialization at Deactivation" process for this chapters is blocked during this period.

Application conditions:

Recurrence: 100 ms

Activation: LC_CYL_BAL_AD_DC_RST = 1

Deactivation: LC_CYL_BAL_AD_DC_RST = 0

Formula section:

```
IF        C_CYL_BAL_AD_DC_RST = “ZERO” (0H)
THEN      LV_CYL_BAL_LAM_AD_DC = 0
          LV_CYL_BAL_LAM_SEL_AD_HOT_DC = 0
          LV_CYL_BAL_LAM_SEL_AD_COLD_DC = 0
          LV_CYL_BAL_AD_HOM_REQ_DC = 0
          FOR m = 0 to NC_CBK_EX_NR – 1
                LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 0
          END FOR

ELSEIF    C_CYL_BAL_AD_DC_RST = “ON” (1H)
THEN      LV_CYL_BAL_LAM_AD_DC = 1
          LV_CYL_BAL_LAM_SEL_AD_HOT_DC = 1
          LV_CYL_BAL_LAM_SEL_AD_COLD_DC = 1
          LV_CYL_BAL_AD_HOM_REQ_DC = 1
          FOR m = 0 to NC_CBK_EX_NR – 1
                LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 1
          END FOR
```

```
ELSEIF    C_CYL_BAL_AD_DC_RST = “LAM_AD” (2H)
THEN      LV_CYL_BAL_LAM_AD_DC = 1

ELSEIF    C_CYL_BAL_AD_DC_RST = “SEL_COLD” (6H)
THEN      LV_CYL_BAL_LAM_SEL_AD_COLD_DC = 1
ENDIF
```

6.11.2 Waste gate open request for cylinder balancing adaptation:

FUNCTION DESCRIPTION:

General information:

For a turbo engine, the cylinder individual lambda control is only possible while the waste gate is sufficient opened to identify the exhaust package for each cylinder. In case of a planned adaptation, a request to open the waste gate is carried out for each turbine before.

Application conditions:

*Initialization at Reset **or** Deactivation:*

```
FOR m = 0 to NC_CBK_EX_NR – 1
      LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 0
END FOR
```

Recurrence: 100 ms

Activation:

```
LC_CYL_BAL_AD_DC_RST = 0                      and
LC_TCHA_CONF = 1                              and
( LC_CYL_BAL_CORD_DC_STOP_MAN = 0          or
  LC_CYL_BAL_CORD_EOL_STOP_MAN = 0 )
```

```
Deactivation:   LC_CYL_BAL_AD_DC_RST = 0                                  and
                [     LC_TCHA_CONF = 0                              or
                      ( LC_CYL_BAL_CORD_DC_STOP_MAN = 1 and
                        LC_CYL_BAL_CORD_EOL_STOP_MAN = 1 )          ]
```

Formula section:

```
FOR m = 0 to NC_CBK_EX_NR – 1
    IF       LV_CYL_BAL_AD_WG_OPEN_REQ_EOL[m] = 1     or
             LV_CYL_BAL_AD_WG_OPEN_REQ_DC[m] = 1
    THEN     LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 1
    ELSE     LV_CYL_BAL_AD_WG_OPEN_REQ[m] = 0
    ENDIF
END FOR
```

6.11.3 Homogenous combustion mode request for cylinder balancing adaptation:

FUNCTION DESCRIPTION:

General information:

For a stratified combustion engine, the cylinder individual lambda control as well as the global lambda adaptation are only possible while the engine is running in homogenous combustion mode with activated lambda control. In case of a planned adaptation, a request to switch to homogenous combustion is carried out before.

Application conditions:

Initialization at Reset ***or*** *Deactivation:*

```
    LV_CYL_BAL_AD_HOM_REQ_DC = 0

Recurrence:     100 ms

Activation:     LC_CYL_BAL_AD_DC_RST = 0                           and
                LC_TCHA_CONF = 0                                   and
                LC_CYL_BAL_CORD_DC_STOP_MAN = 0

Deactivation:   LC_CYL_BAL_AD_DC_RST = 0                           and
                [     LC_TCHA_CONF = 1                       or
                      LC_CYL_BAL_CORD_DC_STOP_MAN = 1        ]
```

```

6.11.4 Determination of lambda adaptation cycle for cylinder balancing at DC

FUNCTION DESCRIPTION:

General information:

Because the lambda adaptation function is running with a higher recurrence in comparison to cylinder balancing coordination at DC, the determination of a finished lambda adaptation cycle has to be carried out faster to avoid signal under-sampling.

Application conditions:

*Initialization at Reset **or** Deactivation:*

```
    FOR m = 0 to NC_CBK_EX_NR – 1
        LV_CYL_BAL_LAM_AD_END[m] = 0
        STATE_CYL_BAL_LAM_AD[m] = "INIT" (0[H])
    END FOR
```

Recurrence: 20 ms

```

6.11.5 Calculation of cylinder balancing selective lambda adaptation readiness (DC):

FUNCTION DESCRIPTION:

General information:

A periodic request for homogenous combustion mode is carried out in defined time intervals to allow the start of the cylinder selective adaptation functions, which are only activated in homogenous combustion mode. In case of a turbo engine, a periodic request to open the waste gate is carried out.

Application conditions:

Initialization at first Engine run or NVMY-error:

```
T_CYL_BAL_LAM_SEL_DC = 0.0[s]                         (first initialization)
LV_CYL_BAL_LAM_SEL_AD_HOT_DC = 0                      (first initialization)
LV_CYL_BAL_LAM_SEL_AD_COLD_DC = 0                     (first initialization)
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_SEL_AD_RNG_L_DC[m] = 0             (first initialization)
    LV_CYL_BAL_LAM_SEL_AD_RNG_H_DC[m] = 0             (first initialization)
    LV_CYL_BAL_LAM_SEL_RNG_COLD_DC[m] = 0             (first initialization)
END FOR
```

Initialization at Reset:

T_CYL_BAL_LAM_SEL_DC = T_CYL_BAL_LAM_SEL_DC *(NVMY)*

LV_CYL_BAL_LAM_SEL_AD_HOT_DC = LV_CYL_BAL_LAM_SEL_AD_HOT_DC *(NVMY)*

```
LV_CYL_BAL_LAM_SEL_AD_COLD_DC = LV_CYL_BAL_LAM_SEL_AD_COLD_DC (NVMY)
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_SEL_AD_RNG_L_DC[m] =

6.11.6 Calculation of cylinder balancing lambda adaptation readiness (DC):

FUNCTION DESCRIPTION:

General information:

A periodic request for homogenous combustion mode is carried out in defined time intervals to allow the start of the lambda adaptation functions, which are only activated in homogenous combustion mode.

Application conditions:

Initialization at first Engine run or NVMY-error:

```
T_CYL_BAL_LAM_AD_DC = 0.0[s]                        (first initialization)
LV_CYL_BAL_LAM_AD_DC = 0                            (first initialization)
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_AD_ADD_DC[m] = 0                 (first initialization)
    LV_CYL_BAL_LAM_AD_FAC_L_DC[m] = 0               (first initialization)
    LV_CYL_BAL_LAM_AD_FAC_H_DC[m] = 0               (first initialization)
END FOR
```

Initialization at Reset:

```
T_CYL_BAL_LAM_AD_DC = T_CYL_BAL_LAM_AD_DC (NVMY)
LV_CYL_BAL_LAM_AD_DC = LV_CYL_BAL_LAM_AD_DC (NVMY)
FOR m = 0 to NC_CBK_EX_NR – 1
    LV_CYL_BAL_LAM_AD_ADD_DC[m] = LV_CYL_BAL_LAM_AD_ADD_DC[m] (NVMY)
    LV_CYL_BAL_LAM_AD_FAC_L_DC[m] = LV_CYL_BAL_LAM_AD_FAC_L_DC[m] (NVMY)
    LV_CYL_BAL_LAM_AD_FAC_H_DC[m] = LV_CYL_BAL_LAM_AD_FAC_H_DC[m] (NVMY)
END FOR
```

(NVMY: values stored in the non-volatile memory)

```
FOR m = 0 to NC_CBK_EX_NR – 1
    IF          C_CYL_BAL_LAM_AD_DC_CONF = “ADD” (0H)

General information:

This specification is based on the on actual program version of Basic-Software.
All project specific implemented services and parameter of diagnostic communication protocol are listed below.

In the attached chapters, the displayed telegram structure is without the header for e.g. KWP2000, KWP2000* or BMW-FAST Protocol.
The structure from the service ID is the same in all cases.

Below the differences between KWP2000, KWP2000* and BMW-FAST Protocol are described.

KWP2000:

Baudrate: 10 400
Header:

Data Byte	*Byte #*	*Parameter Name*	*CVT*	*Value*	*Mnemonic*
	#1d	**Format byte**	**M**	**#AALLLLLLb**	**FMT**
	#2d	**Target address byte**	**C**	**#12h/#EAh/#EDh/#EFh /#33h**	**TGT**
	#3d	**Source address byte**	**C**	**#F1h**	**SRC**
	#4d	**Additional length byte**	**C**	**#01h-#FFh**	**LEN**
#1d	#5d	Service ID Byte	M	#XXh	SID
•	#6d	Data Byte #02h	C	#XXh	DATA
•	•	•	•	•	
•	•	•	•	•	
•	•	•	•	•	
#255d	#259d	Data Byte #255d	C	#XXh	
	#260d	addition Checksum	M	#00h-#FFh	CS

KWP2000*:

Baudrate: 9 600
Header:

Data Byte	*Byte #*	*Parameter Name*	*CVT*	*Value*	*Mnemonic*
	#1d	**Format byte**	**M**	**#B8h**	**FMT**
	#2d	**Target address byte**	**C**	**#12h**	**TGT**

	#3d	**Source address byte**	**C**	**#F1h**	**SRC**
	#4d	**length byte calculated by the tool**	**C**	**#01h-#FFh**	**LEN**
#1d	#5d	Service ID Byte	M	#XXh	SID
•	#6d	Data Byte #02h	C	#XXh	DATA
•	•	•	•	•	
•	•	•	•	•	
•	•	•	•	•	
#255d	#259d	Data Byte #255d	C	#XXh	
	#260d	exor Checksum	M	#00h-#FFh	CS

BMW-FAST:
Baudrate: 115 200
Header:

Data Byte	*Byte #*	*Parameter Name*	*CVT*	*Value*	*Mnemonic*
	#1d	**Format byte**	**M**	**#AALLLLLLb**	**FMT**
	#2d	**Target address byte**	**C**	**#12h/#EAh/#EDh/#EFh /#33h**	**TGT**
	#3d	**Source address byte**	**C**	**#F1h**	**SRC**
	#4d	**Additional length byte**	**C**	**#01h-#FFh**	**LEN**
#1d	#5d	Service ID Byte	M	#XXh	SID
•	#6d	Data Byte #02h	C	#XXh	DATA
•	•	•	•	•	
•	•	•	•	•	
•	•	•	•	•	
#255d	#259d	Data Byte #255d	C	#XXh	
	#260d	addition Checksum	M	#00h-#FFh	CS

BMW-FAST is identical to KWP2000 except baudrate.

7.2.1 Normative reference

This implementation and the description of diagnostic communication protocol KWP2000 is based on the following standards:

ISO /FDIS 14229: 1996	Road Vehicles-Diagnostic systems - DiagnosticServices Specification
ISO /FDIS 14230-1:1996	Road Vehicles - Diagnostic systems -Keyword Protocol 2000 - Part 1: Physical Layer
ISO/FDIS 14230-2:1996	Road Vehicles - Diagnostic systems-Keyword Protocol 2000 - Part 2: Data Link Layer
ISO /FDIS 14230-3:1996	Road Vehicles - Diagnostic systems -Keyword Protocol 2000 - Part 3: Implementation
ISO/DIS 14230-4	Road Vehicles - Diagnostic Systems Keyword Protocol 2000 - Part 4 KWP 2000 Requirements for emission-related systems

VDA / WD 14230-2: 1997 Keyword Protocol 2000 - Part 2 Data Link Layer
VDA - Recommended Practice

VDA / WD 14230-3: 1997 Keyword Protocol 2000 - Part 3 Implementation
VDA - Recommended Practice

Diagnosekommunikation mit KWP 2000(*) in Motorsteuerungen Revision 1.2
Ident.Nummer **1 430 227 Index d NÄL.-Nr.: E2263.N**

7.2.2 Convention

☐ M:	Mandatory
☐ C:	Conditional; the presence of the parameter depend on other parameters within the service
☐ CVT:	Conventions
☐ #XXh:	hexadecimal number
☐ #XXd:	decimal number
☐ #XXb:	binary number

These values are necessary for the services - read failure memory extra long (21_0A and 17h) and DDLI and for the freeze frame.

When system values (Word) are used for DDLI output as a Byte, then the lowbyte is cut off, so only the high byte is the output. In this case a selection for the environmental value (FMY) is necessary, only the high Byte from the Word is the output.

When system values (Byte) are used for DDLI output as a Word, the Byte is shifted to the high Byte and the low Byte is filled with 00h.

Analog values e.g. 0…3FFh = 0…5V, are shifted 4 Bits to FFC0h.

When these analog values (FFC0h) are used for DDLI output as a Byte, then the lowbyte is cut off, so only the high byte is the output. In this case a selection for the environmental value (FMY) is necessary, only the high Byte from the Word is the output.

List for selection of the environmental datas for each failure also for DDLI service 2C

cross out ist not supportet yet!

7.2.3 Actuator Diagnosis - Timeouts

7.2.3.1 Diagnostic Timeout

The standard timeout of KWP2000 is defined by P3 max.

In KWP2000(*) is no timeout requested.

	P3 max
Default	5000ms infinity for KWP*

Extended	250ms
Programming	16s
Periodic transmission	250ms

After a diagnostic timeout occurs all actual actuator services are stopped.

7.2.3.2 TIMEOUT_TIME_XX_KWP

This timeout is sent by the protocoll from the tester to the ECU. It can be different for each actuator service.

After the timeout TIMEOUT_TIME_XX_KWP occurs the corresponding actuator services is stopped.

If TIMEOUT_TIME_XX_KWP is greater than the diagnostic timeout, the tester has to take special care to sent “tester present” service.

7.2.4 Definitions for EOL Tests

The status STATE_EOL_KWP_xxx should be defined with the single Bits from the table below. Only supported (necessary) states can be described as followed:

Definitions for EOL Tests: see BMW LH 7 507 660	**values of the status if the function supported the singel one**	
SIEMENSVDO_ SW_NAME	**remark**	**hex value**
EOL_TEST_ACT	test currently running -function active	00h **(other)** 05H **(MSD8x)**
EOL_TEST_ST_INH	start of test not allowed – start-/control - conditions not correct	01h
EOL_TEST_PAR_NOT_PLAUS	hand over parameter not plausible- parameter not correct	02h
EOL_TEST_WAIT_REL	function waiting for release	03h
not used	not used	04h
EOL_TEST_NOT ST	test not yet started (default state) – function not started yet	00h (**MSD8x)** 05h **(other)**
EOL_TEST_END_WOUT_RESULT	function finished - without failures otherwise see 08h or 09h	06h
EOL_TEST_ABORTED	test aborted – function stopped	07h
EOL_TEST_END_WOUT_ERR	test finished without errors - function complete, no errors	08h
EOL_TEST_ END_WITH_ERR	test finished with errors – function complete, with errors	09h

Example (this is not a output section!):

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
STATE_EOL_KWP_XXX	O/V	0H 1H 2H 3H 4H 5H 6H 7H 8H 9H	**MSD8x**: EOL_TEST_NOT_ST Other : EOL_TEST_ACT EOL_TEST_ST_INH EOL_TEST_PAR_NOT_PLAUS EOL_TEST_WAIT_REL not used **MSD8x**: EOL_TEST_ACT Other : EOL_TEST_NOT_ST EOL_TEST_END_WOUT_RESULT EOL_TEST_ABORTED EOL_TEST_END_WOUT_ERR EOL_TEST_END_WITH_ERR	1	-
State variable for end of line test XXX					

7.2.5 Variable conversion for KWP2000 / KWP2000(*)

Description of Basic Equations for conversion:

The general equation for conversion from Siemens internal Range to Customer Range is

General Equation:

$$Var_{cus\text{-}hex} = m(Var_{int\text{-}hex} - C) \qquad \text{--------------------------}(1)$$

Calculation of m and C:

$$m = \frac{\text{resolution of Customer}}{\text{resolution of Siemens}} \qquad \text{---------------------------}(2)$$

$$C = 0_{int\text{-}hex} - 0_{cus\text{-}hex}/m \qquad \text{----------------------------}(3)$$

$Var_{int\text{-}hex}$ = the hex value of the variable in Siemens internal Range
$Var_{cus\text{-}hex}$ = the hex value of the variable in customer Range

m = the slope of conversion from $Var_{int\text{-}hex}$ to $Var_{cus\text{-}hex.}$
C = the offset of conversion from $Var_{int\text{-}hex}$ to $Var_{cus\text{-}hex.}$

$0_{int\text{-}hex}$ = the hex. value for a phys. value 0 in Siemens Range.
$0_{cus\text{-}hex}$ = the hex. value for a phys. value 0 in Customer Range.

Derivation of Equations

To derive the above equations, consider two instances(a1 and a2) of the equation(1),

$a1_{cus\text{-}hex} = m(a1_{int\text{-}hex} - C)$ ----------------(4)
$a2_{cus\text{-}hex} = m(a2_{int\text{-}hex} - C)$ ----------------(5)

Subtracting (4) from (5) and rearranging, we get

$$m = \frac{(a1_{cus\text{-}hex} - a2_{cus\text{-}hex})}{(a1_{int\text{-}hex} - a2_{int\text{-}hex})}$$

$$= \frac{(a1_{cus\text{-}hex} - a2_{cus\text{-}hex}) / (a1_{phy} - a2_{phy})}{(a1_{int\text{-}hex} - a2_{int\text{-}hex}) / (a1_{phy} - a2_{phy})}$$

$$= \frac{\text{resolution of Customer}}{\text{resolution of Siemens}}, \text{ Hence (2) is proved.}$$

From (4), we get

$C \quad = \quad a1_{int\text{-}hex} - a1_{cus\text{-}hex} / m$

The equation (3) is obtained when a1=0. Hence (3) is proved.

where

$a1_{int\text{-}hex}$ = the hex. value of the instance *'a1'* in Siemens Range.
$a1_{cus\text{-}hex}$ = the hex. value of the instance *'a1'* in Customer Range.
$a2_{int\text{-}hex}$ = the hex. value of the instance *'a2'* in Siemens Range.
$a2_{cus\text{-}hex}$ = the hex. value of the instance *'a2'* in Customer Range.
$a1_{phy}$ = the phys. value of the instance *'a1'*.
$a2_{phy}$ = the phys. value of the instance *'a2'*.

7.3 DDLI- List for environmental data and ERRM

!!! Attention !!!
!!! The output variables above are only calculated at tester request. They are present in the a2l- file and visible in INCA, but no reasonable values will be displayed. !!!

7.3.1 DDLI basic List

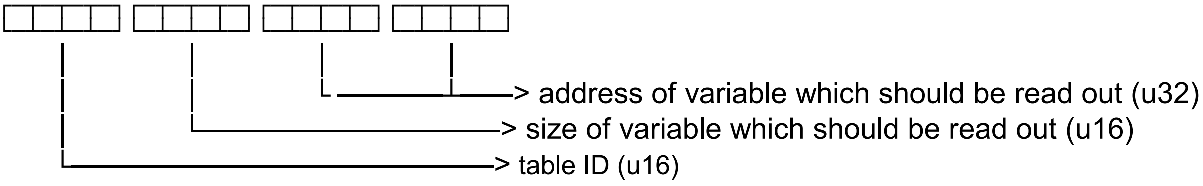
7.3.3 Further manual definable DDLI- List (not for ERRM)

In the dataset one more DDLI- list is implemented. In this list further variables for DDLI- read can be inserted without a software change. The insertion must be done with help of a hex editior. It is necessary to get the start address of the table DDLI_table_cal from the map- file, open the dataset (*.s19- file) and edit it from the start address on. In the hex- file is always the same character string behind the table identifier. It contains the following information:



On third position (byte 5 - 8) you have to insert the address of the wanted variable. The address can be taken from the map- file of the corresponding software and must be changed at every software change, too. On second position the correct size of the variable has to be inserted (e.g. 8 for a byte- variable).

7.4 Message structure

7.4.1 Request Message with Conditional Target, Source Address and length information

The following table shows a general service table structure and its syntax.

Data Byte	*Byte #*	*Parameter Name*	*CVT*	*Value*	*Mnemonic*
	#1d	**Format byte**	**M**	**#AALLLLLLb**	**FMT**
	#2d	**Target address byte**	**C**	**#12h/#EAh/#EDh/ #EFh/ #33h**	**TGT**
	#3d	**Source address byte**	**C**	**#F1h**	**SRC**
	#4d	**Additional length byte**	**C**	**#01h-#FFh**	**LEN**
#1d	#5d	Service ID Byte	M		SID
•	#6d	Data Byte #02h	C	#XXh	DATA
•	•	•	•	•	
•	•	•	•	•	
•	•	•	•	•	
#255d	#259d	Data Byte #255d	C	#XXh	
	#260d	Checksum	M	#00h-#FFh	CS

❑ The input/output buffer of *BSW-KWP* is limited to 255 (#FFH) ***Bytes*** (SID included).

❑ In the following description the table begins with the first data byte (see shaded part of the table above).The headers of the message-flow are always the same construction and therefore in all following diagnostic service descriptions unnecessary.

Header				*Data bytes*					*Checksum*
Fmt	**Tgt**	**Src**	**Len**	**SID**	**Data**	●	●	●	**CS**
max 4 byte				max. 255 byte					1 byte

7.4.2 Method of addressing

❑ The BSW-KWP supports the physical Addressing with the Keybytes #8FEFh (startCommunicationPositive Response; Keybyte1 = #EFh, Keybyte2 = #8Fh), header with conditional target and source address information, with length information in the formatbyte or additional length byte, depending on the response length.

❑ The ECU-address for **physical** adressing is #12h.

❑ The ECU-address for **functional** adressing is #EFh.

❑ The ECU-address for **functional** adressing powertrain CAN is #EAh actual not supported

❑ The ECU-address for **functional** adressing BOS-CAN is #EDh actual not supported

❑ The ECU-address for **OBD services** is #33h (functional).

7.4.3 Length byte

❑ The ECU sends the response with an additional length byte, if the lenght is longer than 64 byte.

❑ The ECU accepts the length information of the request in an additional length byte or in the formatbyte.

7.4.4 Header with or without Length ,Target and Source Address Information

The following two different types of headers are supported the *BSW-KWP* depending of the two high bits in the Format Byte:

				⇦ *Length* ⇨				
Fmt	Tgt	Src	**Len**	SId	Data			CS
⇦ used for *Checksum* calculation ⇨								

Header with address information, with additional length byte

Possible Format Bytes:

Physical Addressing	A1=1	A0=0	L5=X	L4=X	L3=X	L2=X	L1=X	L0=X
Functional Addressing	A1=1	A0=1	L5=X	L4=X	L3=X	L2=X	L1=X	L0=X

		⇦ *Length* ⇨				
Fmt	**Len**	SId	Data			CS
⇦ used for *Checksum* calculation ⇨						

Header without address information, with optional additional length byte

Possible Format Byte:

Physical Addressing without Address Information	A1=0	A0=0	L5=X	L4=X	L3=X	L2=X	L1=X	L0=X

7.4.5 Checksum byte

☐ The checksum is the sum of all bytes in the message (except the checksumbyte itself) modulo 256 (i.e. 1 byte long):

(Checksum = Format + Target + Source + Length + ΣData[SID + DATA1 + … + DATAn])

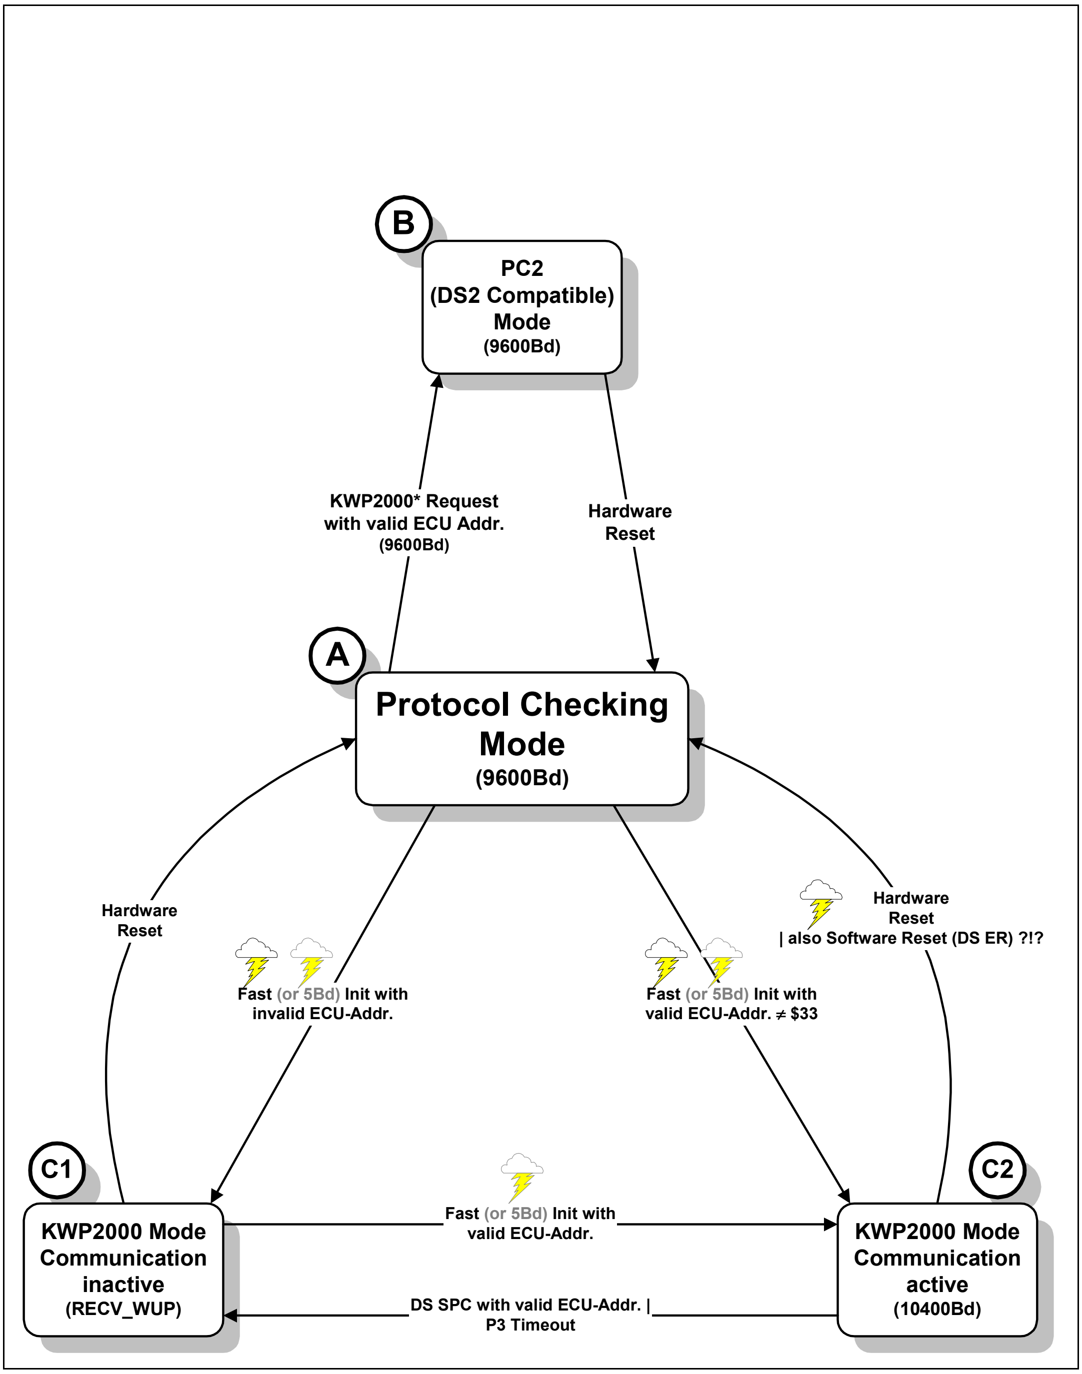
or (Checksum = Format + Target + Source + ΣData[SID + DATA1 + … + DATAn])

or (Checksum = Format + Length + ΣData[SID + DATA1 + … + DATAn])

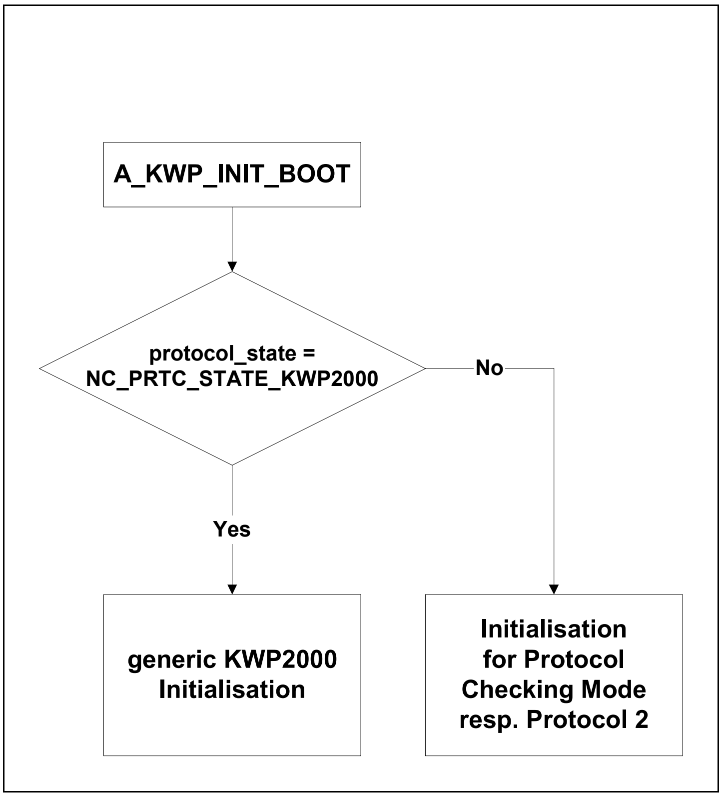
or (Checksum = Format + ΣData[SID + DATA1 + … + DATAn])

7.5 Initialisation and Timing

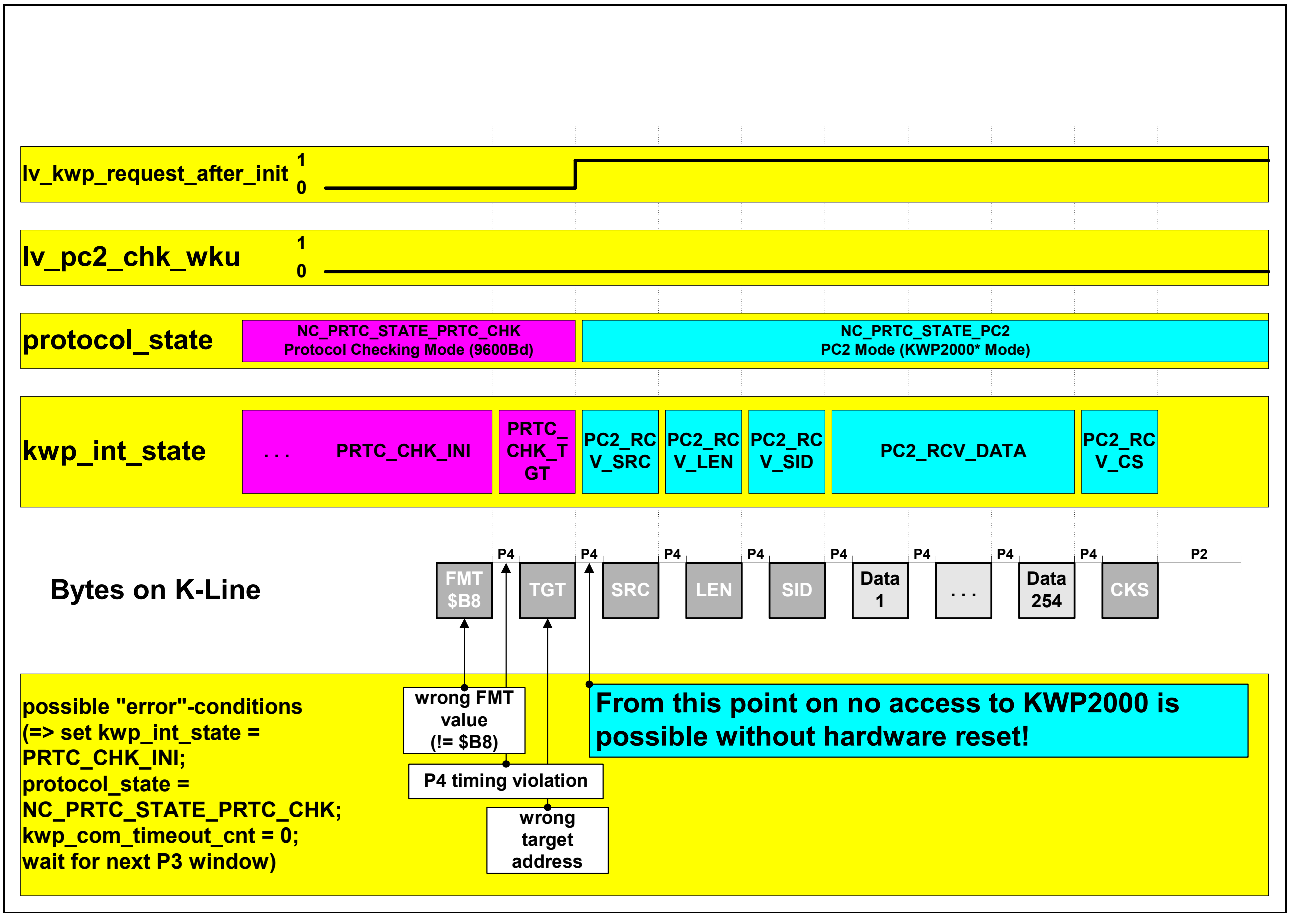
7.5.1 Protocol Switching



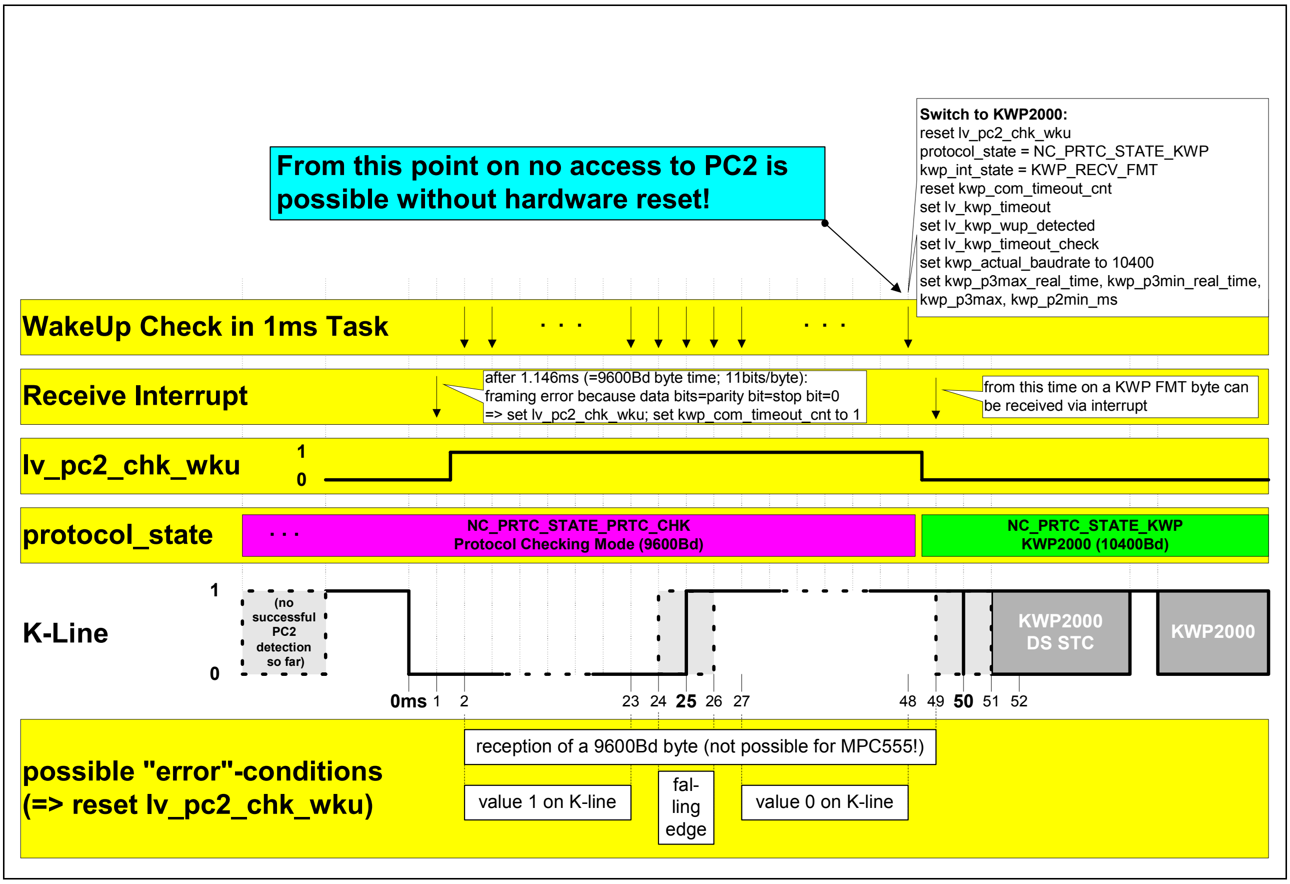
7.5.2 Initialisation of different protocols



7.5.3 KWP* Detection



7.5.4 WUP Detection for KWP



Switch to KWP2000:
reset lv_pc2_chk_wku
protocol_state = NC_PRTC_STATE_KWP
kwp_int_state = KWP_RECV_FMT
reset kwp_com_timeout_cnt
set lv_kwp_timeout
set lv_kwp_wup_detected
set lv_kwp_timeout_check
set kwp_actual_baudrate to 10400
set kwp_p3max_real_time, kwp_p3min_real_time, kwp_p3max, kwp_p2min_ms

after 1.146ms (=9600Bd byte time; 11bits/byte):
framing error because data bits=parity bit=stop bit=0
=> set lv_pc2_chk_wku; set kwp_com_timeout_cnt to 1

from this time on a KWP FMT byte can be received via interrupt

Table Fast Initialization

- The tester may use a baudrate of 10400 baud for initializatian (stc) and communication. For KWP2000* the baudrate is 9600 baud.
- It is possible to change the baudrate with the service **s**tart**D**iagnostic**S**ession.

7.5.5 Timing

Timing	*lower limit values / ms*			*upper limit values / ms*		
Parameter	***min.***	***default***	***Resolution***	***default***	***max.***	***Resolution***
P1	0	0	-	20	20	-
P2	0	25	0,5	50 200ms for KWP*	6375	#25d; #FFh=6375ms
P3	0	55 25ms for KWP*	0.5	5000 infinity for KWP*	63750	#250d; #FFh=63750ms
P4	0	5	0.5	20	20	-
T_{WuP}	49	50	-	-	51	-
T_{inL}	24	25	-	-	26	-
T_{Idle}	-	300	-	-	-	-

Table - Normal Timing Parameter Set (for functional and physical addressing)

Value	*Description*
P1	Inter byte time for ECU response
P2	Time between tester request and ECU response
P3	Time between end of ECU responses and start of new tester request
P4	Inter byte time for tester request
TWuP	High Low sequenz of the Wake-Up-Pattern
TiniL	Low sequenz of the Wake-Up-Pattern
Tidle (W5)	Idle Time

7.6 Error handling

7.6.1 Error handling during physical/functional Fast Initialization

7.6.1.1 Client(tester) Error handling during physical/functional Fast Initialization

Client(tester) detects an...	***Action***
... error in T_{idle} (W5 or P3min)	The client(tester) is responsible to keep to the idle time The server(ECU) is responsible to keep to the time P1min. In case of an error the client(tester) must wait for T_{idle} again.
... error in P1min	No observation necessary. P1min is always 0 ms.
... error in P1max (P1max timeout)	The client(tester) shall ignore the response and shall open a new timing window P2 to receive a directly repeated response from the same server(ECU) or a response from another server(ECU). If the server(ECU) doesn´t repeat the response, the client(tester) shall wait for P3max timeout and afterwards the client(tester) may start a new Initialization beginning with a wake-up-pattern (T_{idle}= 0 ms).
... error in P2min	No observation necessary. P2min is always 0 ms during Initialization.
... error in P2max (no valid response from any server (ECU))	If the client(tester) doesn´t receive any response, the client(tester) shall wait for P3max timeout and afterwards may start a new Initialization beginning with a wake-up-pattern (T_{idle}= 0 ms).
... error in StartCommunication Positive Response (Byte collision) (Response contents) (Response checksum)	The client(tester) shall ignore the response and shall open a new timing window P2 to receive a directly repeated response from the same server(ECU) or a response from another server(ECU). If the server(ECU) doesn´t repeat the response, the client(tester) shall wait for P3max timeout and afterwards the client(tester) may start a new Initialization beginning with a wake-up-pattern (T_{idle}= 0 ms).

Client(tester) Error Handling during physical/functional Fast Initialization

7.6.1.2 Server(ECU) Error Handling during physical/functional Fast Initialization (normal timing only)

Server(ECU) detects an ...	***Action***
... error in T_{idle} (W5 or P3min)	No observation necessary. The client(tester) is responsible to keep to the idle time T_{idle}.
... error in wake-up-pattern	The server(ECU) shall not respond and shall be able to detect immediately a new wake-up-pattern sequence.
... error in P4min	No observation necessary. The client(tester) is responsible to keep to the time P4min
... error in P4max (P4max timeout)	The server(ECU) shall not respond and shall be able to detect immediately a new wake-up-pattern sequence.
... error in StartCommunication Request (checksum) (contents)	The server(ECU) shall not respond and shall be able to detect immediately a new wake-up-pattern sequence.
... error in StartCommunication Positive Response (Byte collision)	The server (ECU) shall repeat the response within a new timing window P2 considering arbitration.
... unknown tester(client) target address or server(ECU) source address	The server(ECU) shall not respond and shall be able to detect immediately a new wake-up-pattern sequence.

Server(ECU) Error Handling during physical/functional Initialization

7.6.2 Error handling after physical/functional Initialization

7.6.2.1 Client(tester) Error handling after physical/functional Initialization

Client(tester) detects an ...	*Action*
... error in P1min	No observation necessary P1min is always 0 ms.
... error in P1max (P1max timeout)	The client(tester) shall ignore the response and shall open a new timing window P2 to receive a directly repeated response from the same server(ECU) or a response from another server(ECU). If the server(ECU) doesn´t repeat the response, the client(tester) may repeat the same request in a new timing window P3.
... error in P2min	No observation necessary. The server(ECU) is responsible to keep to the time P2min.
... error in P2max (no valid response from any server (ECU) or missing responses)	The client(tester) may repeat the last request twice, each within in a new timing window P3. (i.e. three transmission total) any following appropriate action is client(tester) dependent if the client(tester) doesn´t receive a response.
... error in server(ECU) Response (checksum) (contents)	The client(tester) may repeat the last request twice, each within in a new timing window P3. (i.e. three transmission total) any following appropriate action is client(tester) dependent if the client(tester) doesn´t receive a response.

Client(tester) communication Error Handling after physical/functional Initialization

7.6.2.2 Server(ECU) Error Handling after physical/functional Initialization

Server(ECU) detects an ...	*Action*
... error in P3min	No observation necessary. The client(tester) is responsible to keep to the time P3min.
... error in P3max (P3max timeout)	The server(ECU) shall reset communication and shall be able to detect immediately a new wake-up-pattern sequence.
... error in P4min	No observation necessary. The client(tester) is responsible to keep to the time P4min.
... error in P4max (P4max timeout)	The server(ECU) shall ignore the request and shall open a new timing window P3 to receive a new request from the client(tester).
... error in client(tester) request (contents) (checksum)	The server(ECU) shall ignore the request and shall open a new timing window P3 to receive a new request from the client(tester).
... unknown source or target address	The server(ECU) shall ignore the request and shall open a new timing window P3 to receive a new request from the client(tester).
... error in its own Response (byte collision)	If the server(ECU) detects a byte collision within its own response, it must repeat the response within a new timing window P2 considering the arbitration.

Server(ECU) Error Handling after physical/functional Initialization

7.7 Error-Codes

Hex Value	***Response Code***	***Mnemonic***
10	generalReject	GR
11	serviceNotSupported	SNS
12	subFunctionNotSupported-invalidFormat	SFNS_IF
21	busy-repeatRequest	B_RR

78	requestCorrectlyReceived-ResponsePending	RCRRP
79	incorrectByteCountDuringBlockTransfer	IBCDBT
80	serviceNotSupportedInActiveDiagnosticMode	SNSIADM

7.7.1 General negative Responses

NegativeResponseCode	***Cause of Occurrence***
generalReject	selected diagnosticService is longer than the current receive buffer
serviceNotSupported	selected diagnosticService is not supported by the ECU
serviceNotSupportedInActiveDiagnosticMode	selected diagnosticService is not supported in the current diagnostic mode
securityAccessDenied/Required	selected diagnosticService is not supported in the current securityLevel
incorrectByteCountDuringBlockTransfer	Number of bytes of the telegram does not match to the given length
requestCorrectlyReceived-ResponsePending	the action to be performed by the selected diagnosticService may not be completed yet

- ☐ These negative response codes are possible for all diagnostic services. The occurrence is depending on the system configuration.

7.9 SID 10h: startDiagnosticSession Service

Input data:

LV_IGK			

General information:

This function is the first function when a diagnostic session starts.
Changing the diagnostic mode or switch over to another baudrate is possible after the command "stop" or "reset" KWP2000 inactive mode is set.

StartDiagnosticSession Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**startDiagnosticSessionRequest Service Id**	**M**	**#10h**	**STDS**
#2d	diagnosticMode= [Stdandard Diag.Mode Periodic Transmission Mode ECU Programming Mode Development Mode safty mode]	M	#XXh= [#81h #82h #85h #86h #89h]	DCM
#3d	baudrateIdentifier (#XXh) = [9600 Baud 19200 Baud 38400 Baud 57600 Baud 115200 Baud (113636 Baud) (*) by tester]	C	#XXh= [#01h #02h #03h #04h #05h #06h]	BI
#4d	Baud rate high byte (if baudrateidentifier = 6)	C	#XXh	#XX
#5d	Baud rate middle byte (if baudrateidentifier = 6)	C	#XXh	#XX
#6d	Baud rate low byte (if baudrateidentifier = 6)	C	#XXh	#XX

Table startDiagnosticSession Request Message

(*) : With the MPC555 controller and a frequency of 40 MHz it is not possible to generate 115200baud with the desired tolerance range of -+1%.
The baudrate, which can be generated exactely by MPC555 and 40MHz, is 113636Baud.

☐ Is the current DiagnosticSession different from StandardDiagnosticSession, it is not possible to get a positive response with the request stopCommunication. To stop the communication the ECU has to be turned back in the StandardDiagnosticSession with stopDiagnosticSession (SPDS) or the startDiagnosticSession (STDS [DCM #81h]) request.

☐ Is the startDiagnosticSession request used without a baudrateMode or is the current request answered by negative response, the last selected baudrate and mode are still active.

StartDiagnosticSession positive Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**startDiagnosticSession Positive response**	**M**	**#50h**	**STDSPR**
#2d	diagnosticMode= [Std.Diagnostic Mode Periodic Transmission Mode ECU Programming Mode Development mode safty mode]	M	#XXh= [#81h #82h #85h #86h #89h]	DCM
#3d	BaudrateIdentifier (#XXh) = [f_{CPU} =16MHz f_{CPU} =20 MHz f_{CPU} =24 MHz 9600 Baud + 0,2% + 0,2% + 0,2% 19200 Baud + 0,2% + 1,7% + 0,2% 38400 Baud + 0,2% + 1,7% + 2,8% 57600 Baud + 8,5% + 8,5% + 0,2% 115200 Baud + 8,5% + 8,5% + 8,5% by tester]	C	#XXh= [#01h #02h #03h #04h #05h #06h]	BI
#4d	Baud rate high byte	C	#XXh	#XX
#5d	Baud rate middle byte	C	#XXh	#XX
#6d	Baud rate low byte	C	#XXh	#XX

Table startDiagnosticSession Positive Response Message

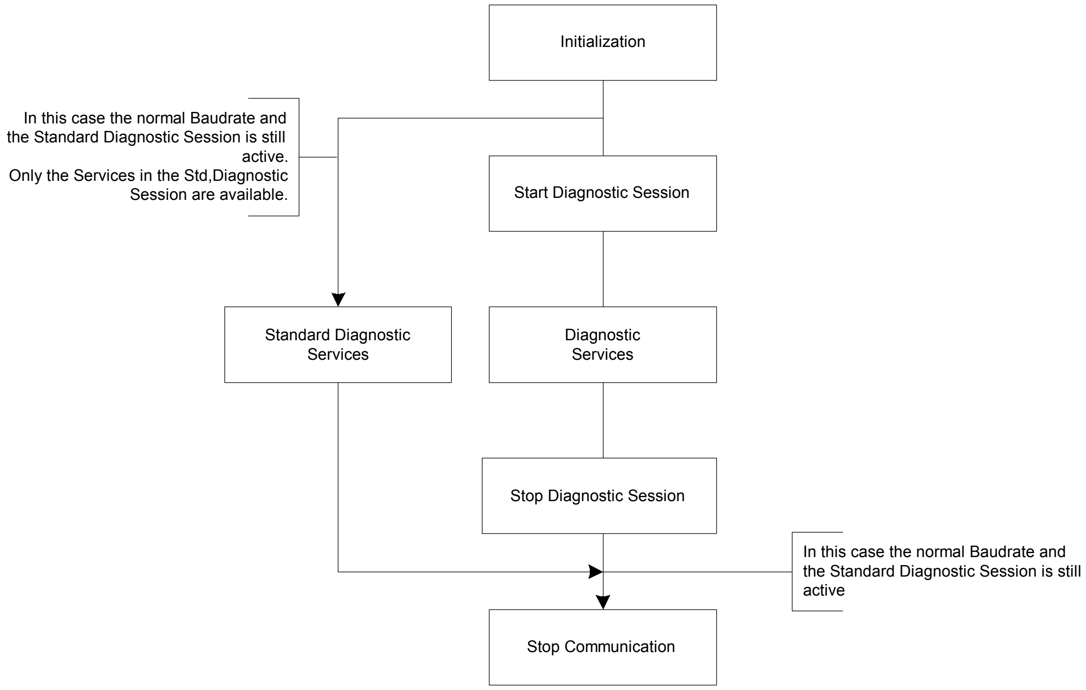
StartDiagnosticSession negative Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**negativeResponse Service Id**	**M**	**#7Fh**	**NR**
#2d	startDiagnosticSessionRequest Service Id	M	#10h	STDS
#3d	responseCode= [conditionsNotCorrect, requestOutOfRange, wrong baud rate]	M	#XXh= [#22h, #31h,]	RC

Table startDiagnosticSession Negative Response Message

NegativeResponseCode	*Cause of Occurrence*
conditionsNotCorrect	selected diagnosticMode is not supported
requestOutOfRange	selected baudrate is not supported

Message flow Diagnostic Session



StartDiagnosticSession (Periodic Transmission mode #82h)

Is only supported for KWP

KWP2000 Periodic Transmission Mode Message Flow

This section specifies the conditions to enable the ***Periodic Transmission*** mode ($82) in the client (tester) and the server (ECU).
It also specifies the use of the service ***accessTimingParameter*** within this mode to modify the ***PeriodicTransmission mode*** default timing.

Possible Periodic Transmission Services

Possible services in the Periodic Transmission mode	*Mnemonic*	*SID*	*Description*
ReadDataByLocalIdentifier	RDBLI	#21h	Read of previous defined „dynamically defined local id“ (#F0h) or snapshot information.
ReadMemoryByAdress	RMBA	#23h	Read of memory contents
ReadStatusOfDiagnosticTroubleCodes	RSODTC	#17h	Read all Diagnostic Trounble Codes
ReadDiagnosticTroubleCodesByStatus	RDTCBS	#18h	Read one Diagnostic Trounble Codes with System Supplier Data
TesterPresent	TP	#3Eh	Tester Present without contents

NOTE➲: In case the Tester has defined a DynamicallyDefinedLocal ID (#F0h) all other services in the periodic transmission mode are blocked except the ReadDataByLocalID (#F0). With the service DDLI (sub identifier „clear DDLI“) in the Standart Diagnostic Mode the Tester can release all other services for the periodic transmission mode again.

Periodic Transmission Message Flow Examples

NOTE➲: In the column „Activity“ markes with the black row the Tester request messages and with the shaded row the ECU responses.

7.10 KWP2000 - SID 20h: stopDiagnosticSession

General information:

This function is for ending a diagnostic session.

stopDiagnostic Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**stopDiagnosticSessionRequest Service Id**	**M**	**#20h**	**SPDS**

Table stopDiagnostic Request Message

StopDiagnosticSession positive Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	stopDiagnosticSession Positive response	M	#60h	SPDSPR

Table ecuReset Positive Response Message

☐ After positive response, the Standard Diagnostic Session, the default timing and baudrate(10400 baud for KWP and 9600baud for KWP*) are active !

StopDiagnosticSession negative Response

☐ A negative response after StopDiagnosticSession is not possible!

7.11 SID 3Eh: testerPresent Service

Input data:

LV_IGK			

General information:

This funktion is for keeping KWP2000 communication alive.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: Boot-/ ECU-SW

7.12 SID 28h: disableNormalMmessageTransmission Services

7.12.1 28h - DisableNormalMessageTransmission service

Input data:

LV_IGK			

General information:

This command is used to inhibit J1850 normal message transmission from PCM (intersystem) while still performing other functions normally. That means, that PCM should still receive all its J1850 messages and process them as required.

Description:

The parameter ***responseRequired*** is used in the DisableNormalMessageTransmission request message. It indicates to the server(s) whether a positive response message is required or not.
A negative response shall even be sent if responseRequired is set to “no”

If the “responseRequired” parameter in the DisableNormalMessageTransmission request message is missing, the server(s) shall sent a response message.

The DisableNormalMessageTransmission service shall be used by a client to stop the normal (non diagnostic) and network management message transmission from the vehicle server(s).

Fault detection and storage is also disabled by this service.

The DisableNormalMessageTransmission request messagecan be used with both physical and functional addressing to stop the message transmission from an individual server or a group of servers. The server(s) being addresed shall respond with a DisableNormalMessageTransmission positive response massage if the response option is set so or, if unable to stop the message transmission, respond with a DisableNormalMessageTransmission negative response message.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see "list of implemented diagnostic services"

#3d	responseCode=only general response code	M	#XXh	

Table: ReadDataByCommonIdentifier Negative Response Message

7.13 SID 29h: enableNormalMmessageTransmission Services

7.13.1 29h - EnableNormalMessageTransmission service

Input data:

LV_IGK			

General information:

This command is used to cancel a mode 28h DisableNormalMessageTransmission request.

The parameter responseRequired is used in the EnableNormalMessageTransmission request message. It Indicates to the server(s) whether a positive response message is required or not. IA negative response shall even be sent if responseRequired is set to no.

Description:

The EnableNormalMessageTransmission request message shall be used to indicate to the server that normal transmission shall be resumed. The service is used in combination with the DisableNormalMessageTransmission service to once again start the normal and network management message transmission from the server.

Fault detection and storage is also Enabled by this service.

The EnableNormalMessageTransmission request message can be used with both physical and functional addressing to resume normal messages transmission friom an individual server or a group of servers.

The server(s) being addresed shall respond with a EnableNormalMessageTransmission negative response message.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see "list of implemented diagnostic services"

Table: ReadDataByCommonIdentifier Negative Response Message

7.14 SID 11h: ecuReset Service

Input data:

LV_IGK	LV_LOCK_IMOB		

General information:

This function is for reset the ECU during a diagnostic session. Before the ECU is reset, the service writes down the EWS starting value to the E2PROM and once this is finished, the EWS starting value will be copied to flash memory. This happens only if no first code is detected in the flash memory and LV_LOCK_IMOB = 0 after service 31_83_00 has come up with response 00.
This function works only by engine speed=0rpm.

ecuReset Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**ecuReset Request Service Id**	**M**	**#11h**	**ER**
#2d	resetMode=[powerOn]	M	#01h	RM

Table ecuReset Request Message

☐ Attention, after the positive response the Communication is lost. A new Initialization is possible after the time W5(300ms).

☐ This service is only possible in the reprogramming session. Only a session change to the ECU programmingMode is not sufficient to execute this service!!!

EcuReset positive Response

Table ClearDiagnosticInformation Negative Response Message

7.16 SID 18h: readDTCByStatus Service

7.16.1 18h - read failure memory short - ReadDiagnosticTroubleCodesByStatus service

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
CTR_ERR_DYN_NR_OBD	V	0...FFH	0...255	1	[-]
Number of failures stored in dynamic memory (2 nd layer) with error class >=10h					

Input data:

ERR_TYPE_BYTE[NC_NR_ERR_DYN]	CTR_ERR_DYN_NR	ERR_DTC[NC_NR_ERR_DYN]	LV_IGK
C_ERR_CLAS_XX	NC_NR_ERR_DYN		

General information:

This function is to read out the numbers of faults in the error memory and the status of CDK (see also “Fault-type-byte and fault-type extension byte” (chapter OBDII functions)). Only failures with error class of **>= 10h** are considered.

Application conditions:

Initialisation:	at reset
Activation:	LV_IGK = 1
Deactivation:	LV_IGK = 0 Diagnostic timeout
Service location:	see "list of implemented diagnostic services"

Formula section:

CTR_ERR_DYN_NR_OBD = CTR_ERR_DYN_NR - ∑ errors with C_ERR_CLAS_XX < 10h

Example:

CTR_ERR_DYN_NR = 3

1) DIAG_INST[0] = TCO_EL   C_ERR_CLAS_TCO_EL   = 11H

2) DIAG_INST[1] = VS   C_ERR_CLAS_VS   = 5H

3) DIAG_INST[2] = CAT_DIAG_1   C_ERR_CLAS_CAT_DIAG_1   = 33H

=> CTR_ERR_DYN_NR_OBD = 3 – 1 = 2

If C_ERR_CLAS_XX from error [NC_NR_ERR_DYN] is calibrated with **>= 10h**

Then error is considered for SID18

Else error is not considered for SID18

Endif

7.19 SID 21h: readDataByLocalIdentifier Service

General information:

All implemented SID 21h services are described below.

Formula section:

7.19.1 Global negative Responses

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**negativeResponse Service Id**	**M**	**#7Fh**	**NR**
#2d	readDataByLocalIdentifier Request Service Id	M	#21h	RDBLID
#3d	responseCode=only general response code	M	#XXh	RC

Table: readDataByLocalIdentifier Negative Response Message

Remark:
The detailed message of the negative response code is described in chapter "Introduction".

7.19.2 21_01 - read system specific adress - ReadDataByLocalIdentifier service

General information:

This function allows to read out the system specific adresses. They are necessary e.g. reprogramming the ECU with the NPS.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

ReadDataByLocalIdentifier negative Response

Global Negative Responses

7.19.4 21_03 - read engine overspeed detection - ReadDataByLocalIdentifier service

Input data:

N_MAX	TRT_N_MAX	CTR_N_MAX	CTR_KM_N_MAX
N_GRD_N_MAX	VS_N_MAX	PV_AV_N_MAX	GEAR_EF_N_MAX
LV_CS_N_MAX	T_SUM_N_MAX	T_N_MAX	NR_PAT_SCC_N_MAX

General information:

Exact description of the Function see file 14A06301.

Detection of an overreving event and non-volatile storage of:

An overreving event starts at exceeding the engine speed C_N_LIM_MIN and active engine speed limitation (LV_N_MAX = 1).

At each overreving event, the event frequency counter is incremented by 1. The highest engine speed reached N_MAX and the associated total running time in case of highest engine speed reached TRT_N_MAX is only overwritten if a higher engine speed was reached.

Application conditions:

Initialisation: at reset the values from the NVMY

Activation: Kl.15 on

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.19.5 21_05 - read readiness flags - ReadDataByLocalIdentifier service

Input data:

LV_IGK	C_STATE_READY_OBD_2		

Import actions:

ACTION_ERRM_ReadReadinessCode

General information:

With this comand the readiness flags described in the chapter “Readiness codes” are shown.

The flags (bit) are default 1 and when the diagnosis is done well, the flag is switched to 0.

Description:

For reading readiness code see chapter “OBD Error management – Communication interface”.

Application conditions:

Initialisation: at reset with 00h

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off) or
Diagnostic timeout

Service location: ECU-SW

Formula section:

```
IF          service 21_05 is received.....
THEN
ACTION_ERRM_ReadReadinessCode(STATE_READY_OBD_1, STATE_READY_OBD_2)
The values
STATE_READY_OBD_1          XXh
STATE_READY_OBD_2          XXh
will be sent from the ECU to the tester
ENDIF
```

ReadDataByLocalIdentifier negative Response

Global Negative Responses

7.19.6 21_06 - receiving status of immobilizer - ReadDataByLocalIdentifier service

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
STATE_IMOB	V/O	0...FFH	0...255	1	[-]
State of the immobilizer - only updated when service ist requested					

General information:

This function gives the actual status of the immobilizer back. The ecu reports to the tester whether the new start value is accepted or if the actual saved start value is identical with the one from the immobilizer. If there is a problem, the error information during synchronisation is also reported to the tester.

The ecu answers the question as long with the respective status until for the first time the answer is 01 or 02. When this answer is received, the ecu can activate this answer again after a Kl.15 change and the ecu power latch is over.

Parameter 04 “process is running” in the positive response switch after timeout occur to 03” Interface failure D_EWS: frame or parity or no signal (timeout)”

In case of an destroyed IMOB CODE STATUS the positive response should be 21h, the same as for -2-out-of-3 start values in the flash memory not OK;

Application conditions:

Initialisation: at reset

Activation: Kl.15 on

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.19.8 21_08 - release of multiple start value programming - ReadDataByLocalIdentifier service

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
RLS_MPL_VALUE_PROG	V/O	0...5H	0...5	1	[-]
release of multiple start value programming - only updated when service ist requested					

Input data:

LV_IGK	TRT		

General information:

This function gives the actual status of release of multiple start value programming.
This service should give always a response as well if the total running time t>90min!

If the response is sent to the ECU by TRT>90 minutes then a negative response “7F_21_22-conditions not correct” occur.

Meaning of RLS_MPL_VALUE_PROG:

RLS_MPL_VALUE_PROG=00h – release of multiple start value programming available
RLS_MPL_VALUE_PROG=01h – release of multiple start value programming not available
RLS_MPL_VALUE_PROG=04h – relase process for start value programming is going on
RLS_MPL_VALUE_PROG=05h – no release process for start value programming done in this cycle

Application conditions:

Initialisation: RLS_MPL_VALUE_PROG=00h at reset

Activation: LV_IGK=1 (Kl.15 on) and

Authenticity check and
TRT<90min

***Deactivation**:* LV_IGK=0 (Kl.15 off) or
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

CTR_ERR_DYN_NR			

General information:

This function is created to read out the failure memory with all the errors including the freeze frame data. The index of the environment values allows a classification to the list of the environment values from BMW.

Record Common Identifier table usage and reading:

- RCI usage as BYTE Values (Freeze Frame, Umweltbedingung, DDLI etc.) should support the full range 0x00 to 0xFF as VALID. A value that is not supported will be transmitted as 0xFF

- RCI usage as WORD Values (DDLI etc.) should support the range 0x0000 to 0xFFFE as VALID. Invalid is shown with 0xFFFF.

This should enable the full range of internal Byte values to be used with no compromise, but still allow the diagnostic equipment to recognise if a value is available or not.

Application conditions:

Initialisation: at reset with 00h

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off) **or**
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Formula section:

IF ERR_DTC[x] = 0000h **or**

ERR_DTC[x] = FFFFh

THEN RESPONSE=NEGATIVE RESPONSE

ELSE RESPONSE=POSITIVE RESPONSE

#7d	MemorySize	M	#1h...#FEh	MS

Table ReadMemoryByAddress Request Message (4-byte addressing)

Remark:

For 3-byte addressing **independent from delivery of a MemoryTypeIdentifier (byte 5) by the tester´s request, the ECU automatically adds an offset to the requested memory address.**
If no MemoryTypeIdentifier is delivered, the same offset as for MemoryTypeIdentifier 00h (linear addressing) is used.
This base memory offset must be subtracted from any memory address taken from the MAP- / A2L- file if 3-byte addressing is not sufficient for the address range!

For 4-byte addressing **a MemoryTypeIdentifier (byte 6) must be delivered by the tester´s request.**
Though it is not evaluated or used within the ECU for this absolute addressing mode, it is necessary to decide between 3- / 4-byte addressing mode.
In this 4-byte mode the absolute address delivered by the tester is used by the ECU without any memory offset.

For MSx80 (TriCore) the base memory offsets for 3-byte addressing **are:**

MemoryTypeIdentifier:	Memory offset:		
none	**(linear)**		**C000 0000h**
00h	**(linear)**		**C000 0000h**
02h	**(ext. FLASH)**		**8000 0000h (the same as for int. FLASH)**
05h	**(ext. RAM)**	**D000 0000h**	
06h	**(int. FLASH)**	**8000 0000h**	
07h	**(UIF)**		**8000 xxxxh not fixed yet, address might still change !!!**

Boot Software Active			***ECU Software Active***		
Memory ID	***Range (absolute addr.)***	***Security Level***	***Memory ID***	***Range (absolute addr.)***	***Security Level***
00h (linear)	C000 0000h ...C000 FFFFh C03F C000h…C03F FFFFh	None	00h (linear)	C000 0000h ...C000 FFFFh C03F C000h…C03F FFFFh	None

3d	responseCode= only general response code	M	XXh	RC

The detailed message of the negative response code is described in chapter "Error-Codes".

7.22.2 Flag for disable adaptions while external adjust with SID 30_xx_07h services

General information:

The flag LV_AD_DIS_EXT_ADJ is set when an external adustment is done. The flag is set back to zero at ECU reset.

Application conditions:

Initialisation: 0 at reset

Activation: if a SID 30,xx,07 job is received

Formula section:

LV_AD_DIS_EXT_ADJ = 1 *// if a SID 30,xx,07 job is received*

7.22.3 Activation conditions for SID 30_xx_07h services

General information:

All SID 30_xx_07 services (external adjust of actuators) are only allowed if several activation conditions are fulfilled. The activation condition(s), which has/have to be fulfilled, can be chosen for every adjustment service via a calibratable bitmask in the table ID_IDX_ACT_DS_CONF. In this table one axis is the identifier of the service. On the other axis on position 0 a word can be calibrated for every service (positions 1...3 in the table are reserved for maximal 3 variables from the DDLI- lists for the read- services, see chapter "actuator diagnosis read value " below). The activation- condition- word must be calibrated in the following way: In the bitmask every activation condition, which has to be checked, must be set to "1". The possible conditions with their positions are listed in the table below. The combination of the conditions gives the hex- value of the word, which has to be written to ID_IDX_ACT_DS_CONF (on position 0 and position with service identifier).

Example: On Position (A1;0) in the table ID_IDX_ACT_DS_CONF 1h (= 0000 0000 0000 0001 bin) is calibrated. So the service 30_A1_07 is only activated if LV_IGK = 1.

If position (A1;0) is calibrated with 81h (0000 0000 1000 0001 bin), service 30_A1_07 is only activated if LV_IGK = 1 and VB > C_VB_MIN_KWP.

Formula section:

Condition name	BitValue	Conditions that have to be fullfilled
Diagnosis (always checked)	00 00	N < C_N_MAX_KWP
Kl15 ON	00 01	LV_IGK = 1
N = 0	00 02	LV_ES = 1
Idle speed	00 04	LV_IS = 1
N > N_MIN	00 08	N > C_N_MIN_KWP
v = 0	00 10	VS < C_VS_MAX_KWP
Engine warm	00 20	TCO > C_TCO_MIN_KWP
Engine temperature normal	00 40	TCO < C_TCO_MAX_KWP
Batt normal	00 80	VB > C_VB_MIN_KWP
NEUTRAL	01 00	

```

7.22.4 30_xx_01h - actuator diagnosis read value -

General information:

With this service actual actuator values can be read. The variable(s), which has to be read, can be choosen out of several tables in software (DDLI- lists) via a calibratable identifier. The DDLI- lists are described in the chapter "Introduction." The identifier is a word value which represents the place in the DDLI- list. The calibration can be done within the table ID_IDX_ACT_DS_CONF. In this table one axis is the identifier of the service. On the other axis on positions 1...3 maximal 3 variables from the DDLI- lists can be chosen via the DDLI-identifier. (Position 0 in the table is reserved for activation conditions of adjustment jobs 30_xx_07; see chapter "activation conditions" above.)

The telegram length is variable and depends on the number and length (byte, word) of the chosen variable(s). If an illegal identifier is calibrated on position 1...3 in the table ID_IDX_ACT_DS_CONF (e.g. not defined identifiers) the service does not give back an error message! Instead of this the next valid calibrated variable is given on the next position in telegram.

Example: If the first variable is calibrated valid, it becomes the first position in the telegram (depending on the length of the variable (byte or word) this can be the first one or the first two data bytes of the telegramm.) The second position is not calibrated valid, but the third is. So the variable, calibrated on third position is given back on second position in telegram.

Application conditions:

Initialisation: 0 at reset

Activation: LV_IGK =1

Deactivation: not activation

Service location: see list of "implemented diagnostic services"

InputOutputControlByLocalIdentifier negative Response

Global Negative Responses

7.22.5 30_xx_00h - stop actuator diagnosis -

General information:

When this service is received, the actuator diagnosis function stops and control is given back to the ECU control.

xx in the headline represents the identifier (00 ... FFh) of the actuator diagnosis service.

Application conditions:

***Initialisation**:* 0 at reset

***Activation**:* LV_IGK =1

Deactivation: not activation

Service location: see list of “implemented diagnostic services”

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**InputOutputControlByLocalIdentifier Response SId**	**M**	**70h**	**IOCBLIDPR**
2	InputOutputLocalIdentifier	M	85h	IOLI_DKP2
3	InputOutputControlParameter	M	07h	IOCP_STA

7.22.15 30_8607 – (second) HPD5-Mengensteuerventil steuern

Second HPD5-Menegensteuerventil for MSD85 only:

InputOutputControlByLocalIdentifier Request

Data Byte	**Parameter Name**	**Cvt**	**Hex Value**	**Mnemonic**
1	inputOutputControlByLocalIdentifier Request SId	M	30h	IOCBLI
2	inputOutputLocalID	M	85h	IOLI_MSV2
3	inputOutputControlParameter	M	07	IOCP_STA
4	InputOutputControlParameter – not used	M	FFh	CS_PD_MSV2
5	InputOutputControlParameter – arqtmsv_w_rb[2] (high byte)	M	xxh	CS_
6	InputOutputControlParameter – arqtmsv_w_rb[2] (low byte)	M	xxh	
7	InputOutputControlParameter –TIMEOUT_TIME_86_KWP	M	xxh	CS_TO_MSV2

Hint: activation with B_rqtmsv_rb[2]

InputOutputControlByLocalIdentifier Positive Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**InputOutputControlByLocalIdentifier Response SId**	**M**	**70h**	**IOCBLIDPR**
2	InputOutputLocalIdentifier	M	86h	IOLI_MSV2
3	InputOutputControlParameter	M	07h	IOCP_STA

HPD5-Mengensteuerventil for MSD80 4cyl only:

InputOutputControlByLocalIdentifier Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	inputOutputControlByLocalIdentifier Request SId	M	30h	IOCBLI
2	inputOutputLocalID	M	85h	IOLI_MSV2
3	inputOutputControlParameter	M	07	IOCP_STA
4	InputOutputControlParameter – not used	M	FFh	CS_PD_MSV2
5	InputOutputControlParameter – arqtmsv_w_rb (high byte)	M	xxh	CS_
6	InputOutputControlParameter – arqtmsv_w_rb (low byte)	M	xxh	
7	InputOutputControlParameter –TIMEOUT_TIME_86_KWP	M	xxh	CS_TO_MSV2

Hint: activation with B_rqtmsv_rb

InputOutputControlByLocalIdentifier Positive Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	InputOutputControlByLocalIdentifier Response SId	M	70h	IOCBLIDPR
2	InputOutputLocalIdentifier	M	86h	IOLI_MSV2
3	InputOutputControlParameter	M	07h	IOCP_STA

7.22.16 30_8707 – Abgasklappe 2 steuern

InputOutputControlByLocalIdentifier Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	inputOutputControlByLocalIdentifier Request SId	M	30h	IOCBLI
2	inputOutputLocalID	M	87	IOLI_AGK2
3	inputOutputControlParameter	M	07	IOCP_STA
4	InputOutputControlParameter – not used	M	FFh	CS_PD_AGK2

Table StartRoutineByLocalIdentifier Negative Response Message

Remark:
The detailed message of the negative response code is described in chapter "Introduction".

7.23.3 31_01 ask checksums after reprogramming

General information:

This function is created to report the checksums after a reprogramming session in order to write the security keys
A negativ response is only possible by a wrong parameter.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

#11d	RoutineLocalIdentifier = MemorySize (Low Byte)	U	#XXh	RELI_

Table StartRoutineByLocalIdentifier Request Message

Remark:

For 3-byte addressing **independent from delivery of a MemoryTypeIdentifier (byte 6) by the tester´s request, the ECU automatically adds an offset to the requested memory address.**
If no MemoryTypeIdentifier is delivered, the same offset as for MemoryTypeIdentifier 02h (external FLASH) or 06h (internal FLASH) is used. For compatibility reasons both MemoryTypeIdentifiers are supported.
This base memory offset must be subtracted from any memory address taken from the MAP- / A2L- file if 3-byte addressing is used!

For 4-byte addressing **a MemoryTypeIdentifier (byte 7) must be delivered by the tester´s request.**
Though it is not evaluated or used within the ECU for this absolute addressing mode, it is necessary to decide between 3- / 4-byte addressing mode.
In this 4-byte mode the absolute address delivered by the tester is used by the ECU without any memory offset.

For MSx80 (TriCore) the base memory offset for 3-byte addressing **mode of this service is independent from MemoryTypeIdentifier :**

MemoryTypeIdentifier:		Memory offset:
none	**(short)**	**8000 0000h**
02h	**(ext. FLASH)**	**8000 0000h**

7.23.12 31_0C energy spare mode

FUNCTION DESCRIPTION:

This module handles the activation of the energy spare mode "FeTraWe". The mode is controlled by external tester and combined with an engine speed limit. The mode is regarded in dynamic error management.

With the received command an engine speed setpoint can be activated. The general function is described in the chapter “engine speed limit coordination”. The set energy spare mode includes either the activated "Fertigungs- / Transport- or Werkstattmode".

The mode is kept in ECU after disconnection of the tester. The same is applied in case of lost power supply.

Application conditions:

Initialisation: at reset and LV_IGK = 1: read non-volatile memory

Activation: LV_IGK=1 (Kl.15 on) **and** LC_EGY_MIN_KWP = 1

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Formula section:

```
IF          activation identifier of service $31_0C_01 is received ***FeTraWe***
THEN        STATE_EGY_MIN_KWP = 1h
            send positive response

ELSEIF      activation identifier of service $31_0C_02 is received ***FeTraWe***
THEN        STATE_EGY_MIN_KWP = 2h
            send positive response

ELSEIF      activation identifier of service $31_0C_04 is received ***FeTraWe***
THEN        STATE_EGY_MIN_KWP = 3h
            send positive response

ELSEIF      deactivation identifier of service $31_0C_00 is received
THEN        STATE_EGY_MIN_KWP = 0h
            send positive response

       Save STATE_EGY_MIN_KWP     in non-volatile memory

ELSE   remains unchanged send negative response

7.23.18 31_25 switch off Injection valves

General information:

With this command the Injection valves can be switched off. The general function is described in the chapter “Injection - Cylinder shut off”.

Application conditions:

Initialisation: at reset with 00h

Activation:

LV_IGK=1 (Kl.15 on) and
STATE_ENG=02h or 03h (IS or PL) and
N<C_N_MAX_KWP

Deactivation:

LV_IGK=0 (Kl.15 off) or
STATE_ENG<>02h or 03h (IS or PL) or
N>=C_N_MAX_KWP or
Diagnostic timeout
set INH_IV_KWP=00h

Service location: see list of “implemented diagnostic services”

Formula section:

```
IF      activation conditions are fullfilled        and
        service 31_25 is received

THEN    INH_IV_KWP =  sent to the module “Cylinder shut off “
        send positive response

ELSE    INH_IV_KWP=00h
        send negative response

ENDIF
```

7.23.22 31_30 delete selective adaption values

General information:

With this comand the adaption values described in the chapter “basic sw general operation - initialize non volatile datas” are deleted.

All adaption values are initialized with their default values (compare detailed specifications), single adaption values according to the bit position.

If bit #4 within byte 4d ist masked (set to 1) by the tester, bit LV_POW_MNG_BAT_CHG is set to 1; after 5s LV_POW_MNG_BAT_CHG is automatically reset by the ECU to 0 again.

Within the telegram some macros are called (named with small letter below). This macros call functions over BMW- layer (see also layer- specification).

Application conditions:

Initialisation:	at reset init with 0	
Activation:	LV_IGK = 1 (Kl.15 on)	**and**
	LV_ES = 1	
Deactivation:	LV_IGK= 0 (Kl.15 off)	**and**
	LV_ES = 0	
	Diagnostic timeout	

Service location: see list of “implemented diagnostic services”

Formula section:

setting of LV_POW_MNG_BAT_CHG:

```
IF      bit position #4 in byte #4d set to 1 within tester´s request
THEN    set LV_POW_MNG_BAT_CHG to 1 and start timer
ELSE    do nothing
ENDIF

IF      LV_POW_MNG_BAT_CHG is set to 1 and timer >= 5s
THEN    reset LV_POW_MNG_BAT_CHG to 0
ELSE    do nothing
ENDIF
```

only **MSD80/MSD81:** setting/resetting LV_CYL_BAL_.../ LV_MFF_._/ LV_HPP_CTL_AD_CLR_EXT_REQ:

```
IF      bit position is set to 1 with tester´s request
THEN    set request bit
ELSE    do nothing
```

IF request bit is 1 and init of corresponding values is done

THEN reset request bit 100..200ms later

ELSE do nothing

7.23.24 31_D9 switch off Lambda controller (not MSD80/MSD81)

General information:

With this command the Lambda Controler (bench 1 and 2) can be switched off. The general function is described in the chapter “Injection - Lambda Control”. The command is available for binary and linear lambda sensor systems.

Application conditions:

***Initialisation**:* at reset with 00h

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout
set LV_INH_LAM_KWP=00h

Service location: see list of “implemented diagnostic services”

Formula section:

```
IF      activation conditions are fullfilled        and
        service 31_D9 is received

THEN    LV_INH_LAM_KWP =  sent to the module “Lambda Control “
        send positive response

ELSE    LV_INH_LAM_KWP remains unchanged
        send negative response

ENDIF
```

7.23.32 31_F0 Calculate checksum for IncaPC

General information:

This function starts the checksum calculation of the calibration data especially for IncaPC.

Therefore IncaPC gives the starting and ending addresses for the checksum calculation and also the desired checksum (calculated by IncaPC before).

The starting and ending addresses must be within the area for calibration data. Also startind address must be smaller than the ending address.

The ECU calculates afterwads an “add” checksum of the given area.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.23.41 31_FE Message using CAN message

FUNCTION DESCRIPTION:

General information:

This service is used to enable the CAN communication to a external CAN device. The aim is to activate the CAN channel (for test purpose only) in order to influence internal values (e.g. setpoint). During ECU reset the flag LV_CAN_TEST_OPM_ENA_VVL is checked wether the CAN channel is enabled to be active (LC_STATE_TEST_OPM_CAN_ENA_VVL = 1) or passive (LC_STATE_TEST_OPM_CAN_ENA_VVL = 0). Nevertheless even if the switch is set to 'passive' at ECU reset, the CAN channel can be enabled by the KWP service during engine running.

Description:

This function activates or deactivates the receiving of the CAN setpoint message.

Application conditions:

Initialisation:

LV_CAN_TEST_OPM_ENA_VVL = LC_STATE_TEST_OPM_CAN_ENA_VVL

Recurrence: depending on the user diagnose protocol

Activation: via diagnostic command

Deactivation: -

Service location: see list of “implemented diagnostic services”

Formula section:

// The receiving of the CAN message will be activated, when the VVL_CAN_INI is set to 0x01 //and deactivated, when the value of the VVL_CAN_INI !=0x01

LV_CAN_TEST_OPM_ENA_VVL= (VVL_CAN_INI ==0x01)

Send positive response

7.24 SID 34h: RequestDownload service

Input data:

LV_IGK			

General information:

This function is used for reprogramming the ECU.
Flash reprogramming is done with the following procedure:
RequestDownload, TransferData, …, RequestTransferExit, RequestDownload, TansferData, …, RequestTransferExit.
This means at memory address gaps during the programming session the transfer data service is finished with RequestTransferExit service. Resumption is done with a new RequestDownload-Service.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see "list of implemented diagnostic services"

7.24.1 RequestDownload Request (3-byte addressing)

#11d	UncompressedMemorySize [Low Byte]	M	#00h...#FFh	UCMS

Table RequestDownload Request Message

Remark:

For 3-byte addressing **independent from delivery of a MemoryTypeIdentifier (byte 5) by the tester´s request, the ECU automatically adds an offset to the requested memory address.**
If no MemoryTypeIdentifier is delivered, the same offset as for MemoryTypeIdentifier 00h (linear addressing) is used. Currently a download to this memory area is not allowed, it will be supported later on for SV-Revival download within a restricted memory area and additional security check.
For compatibility reasons both MemoryTypeIdentifiers (02h ext. FLASH / 06h int. FLASH) are supported and add the same memory offset.
This base memory offset must be subtracted from any memory address taken from the MAP- / A2L- file if 3-byte addressing is used!

For 4-byte addressing **a MemoryTypeIdentifier (byte 6) must be delivered by the tester´s request.**
Though it is not evaluated or used within the ECU for this absolute addressing mode, it is necessary to decide between 3- / 4-byte addressing mode.
In this 4-byte mode the absolute address delivered by the tester is used by the ECU without any memory offset.

For MSx80 (TriCore) the base memory offsets for 3-byte addressing **mode of this service are:**

MemoryTypeIdentifier:		Memory offset:
none	**(linear)**	**C000 0000h supported for SV-Revival download later on**
02h	**(ext. FLASH)**	**8000 0000h**
06h	**(int. FLASH)**	**8000 0000h**

7.25.2 RequestUpload Request (4-byte addressing)

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**RequestUpload Request Service Id**	**M**	**#35h**	**RU**
#2d	MemoryAddress (High Byte)	M	#XXh	MA_HB
#3d	MemoryAddress (MiddleHigh Byte)	M	#XXh	MA_MHB
#4d	MemoryAddress (MiddleLow Byte)	M	#XXh	MA_MLB
#5d	MemoryAddress (Low Byte)	M	#XXh	MA_LB
#6d	MemoryTypeIdentifier **(mandatory, but not evaluated)** [00h … FFh]	M	#XXh [#XXh]	MTI
#7d	DataFormatIdentifier (only uncompressed memory supported)	M	#00h	DFI

#8d	UncompressedMemorySize [High Byte]	M	#00h...#FFh	UCMS
#9d	UncompressedMemorySize [MiddleHigh Byte]	M	#00h...#FFh	UCMS
#10d	UncompressedMemorySize [MiddleLow Byte]	M	#00h...#FFh	UCMS
#11d	UncompressedMemorySize [Low Byte]	M	#00h...#FFh	UCMS

Table RequestUpload Request Message

Remark:

For 3-byte addressing **independent from delivery of a MemoryTypeIdentifier (byte 5) by the tester´s request, the ECU automatically adds an offset to the requested memory address.**
If no MemoryTypeIdentifier is delivered, the same offset as for MemoryTypeIdentifier 00h (linear addressing) is used.
This base memory offset must be subtracted from any memory address taken from the MAP- / A2L- file if 3-byte addressing is not sufficient for the address range!

For 4-byte addressing **a MemoryTypeIdentifier (byte 6) must be delivered by the tester´s request.**
Though it is not evaluated or used within the ECU for this absolute addressing mode, it is necessary to decide between 3- / 4-byte addressing mode.
In this 4-byte mode the absolute address delivered by the tester is used by the ECU without any memory offset.

For MSx80 (TriCore) the base memory offsets for 3-byte addressing **are:**

MemoryTypeIdentifier:		Memory offset:
none	**(linear)**	**C000 0000h**
00h	**(linear)**	**C000 0000h**
02h	**(ext. FLASH)**	**8000 0000h (the same as for int. FLASH)**
05h	**(ext. RAM)**	**D000 0000h**
06h	**(int. FLASH)**	**8000 0000h**
07h	**(UIF)**	**8000 xxxxh not fixed yet, address might still change !!!**

The supported address ranges are identical to the areas defined for the service ReadMemoryByAddress.

7.26 SID 37h: RequestTransferExit service

Input data:

LV_IGK			

General information:

This function is necessary to stop the RequestDownload / RequestUpload process.
Remark: Ending a reprogramming session. There are no new informations since the last transfer data available, therefore it is not necessary to transmit a verify byte.

Application conditions:

Initialisation:	at reset
Activation:	Kl.15 on
Deactivation:	Kl.15 off Diagnostic timeout
Service location:	see "list of implemented diagnostic services"

7.26.1 RequestTransferExit Request (short form)

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**RequestTransferExit**	**M**	**#37h**	**RTE**

Table RequestTransferExit Request Message

7.26.2 RequestTransferExit Request (3-byte addressing)

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*

#11d	UncompressedMemorySize [Low Byte] **(not evaluated)**	U	#00h...#FFh	UCMS

Table RequestTransferExit Request Message

Remark:

No additional formal parameters are evaluated. The only criteria checked is the request length.
Accepted request lengths and telegram formats are:

1 byte:	**SID**
8 bytes:	**SID, Addr3, Addr2, Addr1, DFI, Size3, Size2, Size1**
9 bytes:	**SID, Addr3, Addr2, Addr1, MTI, DFI, Size3, Size2, Size1**
11 bytes	**SID, Addr4, Addr3, Addr2, Addr1, MTI, DFI, Size4, Size3, Size2, Size1**

This service is only accepted after all previously defined data transfer (by RequestDownload / RequestUpload) is done, i.e. no more data is left from TransferData service.

7.28 SID 2Ch: DynamicallyDefineLocalIdentifier service

Output data:

see introduction

Input data:

see introduction

General information:

This function is used to define / clear single or multiple data that can be read as one complete block by ReadDataByLocalId service 21_F0 after block definition.
Data definition can be made either directly by address or by common identifier RCI from DDLI table (see specification 17I00101, "Introduction") defined inside ECU-SW.

Application conditions:

Initialisation: at reset

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0
Diagnostic timeout

Service location: see "list of implemented diagnostic services"

7.28.1 DynamicallyDefineLocalIdentifier Request - DefineByCommonIdentifier - 2C_02

Table DynamicallyDefineLocalIdentifier Request Message - 2C_03 (4-byte addressing)

Remark:

For 3-byte addressing **independent from delivery of a MemoryTypeIdentifier (byte 9) by the tester´s request, the ECU automatically adds an offset to the requested memory address.**
If no MemoryTypeIdentifier is delivered, the same offset as for MemoryTypeIdentifier 00h (linear addressing) is used.
This base memory offset must be subtracted from any memory address taken from the MAP- / A2L- file if 3-byte addressing is not sufficient for the address range!

For 4-byte addressing **a MemoryTypeIdentifier (byte 10) must be delivered by the tester´s request. Though it is not evaluated or used within the ECU for this absolute addressing mode, it is necessary to decide between 3- / 4-byte addressing mode.**
In this 4-byte mode the absolute address delivered by the tester is used by the ECU without any memory offset.

For MSx80 (TriCore) the base memory offsets for 3-byte addressing **are:**

MemoryTypeIdentifier:		Memory offset:	
none	**(linear)**		**C000 0000h**
00h	**(linear)**		**C000 0000h**
02h	**(ext. FLASH)**		**8000 0000h (the same as for int. FLASH)**
05h	**(ext. RAM)**	**D000 0000h**	
06h	**(int. FLASH)**	**8000 0000h**	
07h	**(UIF)**		**8000 xxxxh not fixed yet, address might still change !!!**

The DDLI Service with the definitionMode "defineByMemoryAddress“ can only read memory areas, which are also readable by RMBA-service (for details about allowed memory areas see specification 17I00J02, "SID23h: ReadMemoryByAddress").

7.28.4 DynamicallyDefineLocalIdentifier Request - ClearDDLI - 2C_04

Data Byte	***Parameter Name***	***Cvt***	***Hex Value***	***Mnemonic***
#1d	**DynamicallyDefineLocalIdentifier Request Service Id**	**M**	**#2Ch**	**DDLI**
#2d	DynamicallyDefinedLocalIdentifier	M	#F0h	DDDLI
#3d	DefinitionMode=XX [ClearDynamicallyDefinedLocalIdentifier]	M	#XXh= [#04h]	DNM CDDDLI

Table DynamicallyDefineLocalIdentifier Request Message – 2C_04

7.28.5 DynamicallyDefineLocalIdentifier positive Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**DynamicallyDefineLocalIdentifier Positive Response Id**	**M**	**#6Ch**	**DDLIPR**
#2d	DynamicallyDefinedLocalIdentifier	M	#F0h	DDDLI

Table DynamicallyDefineLocalIdentifier Positive Response Message

7.28.6 DynamicallyDefineLocalIdentifier negative Response

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**negativeResponse Service Id**	**M**	**#7Fh**	**NR**
#2d	DynamicallyDefineLocalIdentifier Request Service Id	M	#2Ch	DDLI
#3d	responseCode= [subFunctionNotSupported-invalidFormat, conditionNotCorrect, requestOutOfRange, uploadNotAccepted, can'tUploadNumberOfBytesRequested, general response codes]	M	#XXh= [#12h, #22h, #31h, #50h, #53h, #XXh]	RC

Table DynamicallyDefineLocalIdentifier Negative Response Message

NegativeResponseCode	*Cause of Occurrence*
SubFunctionNotSupported-invalidFormat	- selected RCI is not supported - selected DDDLI is not supported
ConditionNotCorrect	selected DNM is not supported
RequestOutOfRange	selected PIRCI does not exist
UploadNotAccepted	error in PIDDDLI information (outside DDLI area)
can'tUploadNumberOfBytesRequested	the requested information is bigger than the reserved buffer

7.29.2 Global Application conditions (default)

If no Application conditions block is specified, use default

Application conditions:

Initialisation:	at reset
Activation:	Kl.15 on
Deactivation:	Kl.15 off Diagnostic timeout
Service location:	see list of “implemented diagnostic services”

7.29.3 Global negative Responses (default)

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**negativeResponse Service ID**	**M**	**7Fh**	**NR**
2	Request Service ID	M	22h	requestServiceID
3	responseCode (12h - subfunction not suppoerted, 22h – conditionsNotCorrectOr RequestSequenceError)	M	XXh [#12h, #22h]	responseCode

Remark:
If no negative response is specified, send Global negative Responses
The detailed message of the negative response code is described in chapter "Error Codes".

7.29.4 22_1000 - Read check stamp

General information:

With this comand the 3 bytes of the check stamp was read out to the ecu. Those are actually in the volatile memory. In the latch off phase (n = 0 rpm and Kl.15 off) this values are written down into the non volatile memory. If the battery voltage is removed from the ECU, bevor the power latch phase ends, so the storage of the check stamp was cancelled and the value up to now was keept.
The writing of the check stamp was reserved for the customers production, that means that the check stamp can´t be read by the ECU production factory.

The service only accept ram-reading.

Formula section:

```
If(1)     service 22_16_05..FF is received
Then(1)   send negative Response "Request out of range" ( 31h)
Endif(1)
```

7.29.13 22_2000 - Read failure memory short

General information:

This function is to read out the numbers of faults in the error memory and the status of CDK (see also “Fault-type-byte and fault-type extension byte” (chapter OBDII functions)).

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*

7.29.14 22_2100 - Read History Memory

General information:

This function is created to read out the history memory with all the errors (max. 10, see also “History memory” (chapter OBDII functions)).. The checksum calculation for each error is a simple XOR of all the bytes belonging to that error.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*

7.29.15 22_2500 - Programm Reference Backup

General information:

This function is for reading the Programmreference backup from the logistic data of the ecu.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on
engine speed=0rpm

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	25h	RCI_

4+ 3*(12+6)	recordValue1 backup of programm reference system - cif_backup	M	XXh	RV_

7.29.16 22_2501 - Erasing time

General information:

This function ist for reading the erasing time of the flash memory of the ecu.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on
engine speed=0rpm

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*

7	recordValue1 max. time for authentification kwp_autht	M	XXh	RV_

7.29.17 22_2502 - Hardware reference

General information:

This function ist for reading the hardware reference of the ecu.

Application conditions:

Initialisation: at reset

Activation: Kl.15 on
engine speed=0rpm

Deactivation: Kl.15 off
Diagnostic timeout
Service location: see list of “implemented diagnostic services”

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic

7.29.19 22_2504 - Data reference

General information:

This function ist for reading the data reference of the ecu.

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	25h	RCI_
3	RecordCommonIdentifier Low Byte	M	04h	RCI_

Table Request Message

Positive Response on service

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**

2	RecordCommonIdentifier High Byte	M	25h	RCI_TSP
3	RecordCommonIdentifier Low Byte	M	04h	RCI_TSP
4 6+3*17	RecordValue1 cal_ref_nr	M	XXh	RV_

7.29.20 22_2506 - Maximum of block length

General information:

This function is for reading the maximum of block length, witch is possible for the ecu.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	25h	RCI_
3	RecordCommonIdentifier Low Byte	M	06h	RCI_

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	25h	RCI_TSP
3	RecordCommonIdentifier Low Byte	M	06h	RCI_TSP
4	RecordValue1 high byte = kwp_max_tel_len maximun block length	M	XXh	RV_
5	RecordValue1 low byte = kwp_max_tel_len maximun block length	M	XXh	RV_

7.29.21 22_3000 - RCI_MIL_lesen

General information:

MIL Codierung lesen

This function is created to read out the selected value of MIL (malfunction indication lamp) variant code.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	30h	RCI_MIL_lesen
3	RecordCommonIdentifier Low Byte	M	00h	RCI_MIL_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	30h	RCI_MIL_lesen
3	RecordCommonIdentifier Low Byte	M	00h	RCI_MIL_lesen
4	recordValue = STATE_MIL_ON_DIS_EXT_REQ	M	XXh	RV_STATE_MIL_ON_DIS_EXT_REQ

7.29.22 22_3001 - RCI_KAT_lesen

General information:

Kat Codierung lesen
This function is created to read out the selected value of catalyst variant code.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	30h	RCI_KAT_lesen
3	RecordCommonIdentifier Low Byte	M	01h	RCI_KAT_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	30h	RCI_KAT_lesen
3	RecordCommonIdentifier Low Byte	M	01h	RCI_KAT_lesen
4	recordValue 1= LV_CAT_CONF_DIS_EXT_REQ	M	XXh	RV_LV_CAT_CONF_DIS_EXT_REQ

7.29.23 22_3010 - RCI_VMAX_lesen

General information:

VMAX-Codierdaten lesen
This function is created to read out the selected value for maximum vehicle speed. The values 0 ... 3 represent one of four possible values for maximum vehicle speed.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	30h	RCI_VMAX_lesen
3	RecordCommonIdentifier Low Byte	M	10h	RCI_VMAX_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	30h	RCI_VMAX_lesen
3	RecordCommonIdentifier Low Byte	M	10h	RCI_VMAX_lesen
4	recordValue 1 = VS_MAX_SEL_EXT_REQ	M	XXh	RV_VS_MAX_SEL_EXT_REQ

7.29.24 22_3020 - RCI_CLS_lesen

General information:

STATUS_CODIERUNG_LEISTUNGSSTUFE
This function is created to read out the coding of power stage (Leistungsstufe)

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	30h	RCI_CLS_lesen
3	RecordCommonIdentifier Low Byte	M	20h	RCI_CLS_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	30h	RCI_CLS_lesen
3	RecordCommonIdentifier Low Byte	M	20h	RCI_CLS_lesen
4	recordValue 1 = POW_CONF_IDX_EXT_REQ	M	XXh	RV_POW_CONF_IDX_EXT_REQ

7.29.25 22_3030 - Status Codierung Protokoll lesen

General information:

This function is created to read out the active communication protocol (14230 <-> 15765-4).

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	30h	RCI_CDSP
3	RecordCommonIdentifier Low Byte	M	30h	RCI_CDSP

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	30h	RCI_CDSP
3	RecordCommonIdentifier Low Byte	M	30h	RCI_CDSP
4	recordValue = PROT_CONF_IDX_EXT_REQ	M	XXh	RV_CDSP

7.29.26 22_3200 – RCI_OEL_lesen

General information:

Oelwechsel intervall- Codierdaten lesen

This function is created to read out the country dependant factors for oil change intervall.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	32h	RCI_OEL_lesen
3	RecordCommonIdentifier Low Byte	M	00h	RCI_OEL_lesen

Positive Response on service

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_OEL_lesen
3	RecordCommonIdentifier Low Byte	M	00h	RCI_OEL_lesen
4	recordValue 1 = FAC_OIL_EXT_REQ_1	M	XXh	RV_FAC_OIL_EXT_REQ_1
5	recordValue 2 = FAC_OIL_EXT_REQ_2	M	XXh	RV_FAC_OIL_EXT_REQ_2

7.29.27 22_3210 – RCI_IGR_lesen

General information:

Read coding of IGR (Intelligente Generator-Regelung)
This function is created to read out the selected value intelligent alternator control variant code.

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	32h	RCI_IGR_lesen
3	RecordCommonIdentifier Low Byte	M	10h	RCI_IGR_lesen

Positive Response on service

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_IGR_lesen
3	RecordCommonIdentifier Low Byte	M	10h	RCI_IGR_lesen
4	recordValue = LV_ALTER_CTL_ENA	M	XXh	RV_ LV_ALTER_CTL_ENA

7.29.28 22_3211 – Xenonverbau-Codierdaten lesen

General information:

This function is created to read out the selected value of "xenon-filled headlight mounted" variant code.

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	32h	RCI_CDXEN
3	RecordCommonIdentifier Low Byte	M	11h	RCI_CDXEN

Positive Response on service

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_CDXEN
3	RecordCommonIdentifier Low Byte	M	11h	RCI_CDXEN
4	recordValue = B_cdxenonr	M	XXh	RV_B_CDXENON

7.29.29 22_3220 – RCI_SPA_lesen

General information:

SPA-Codierdaten lesen
This function is created to read out the "Schaltpunktanzeige"

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	Request Service ID	M	22h	RDBCI
2	RecordCommonIdentifier High Byte	M	32h	RCI_SPA_lesen
3	RecordCommonIdentifier Low Byte	M	20h	RCI_SPA_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_SPA_lesen
3	RecordCommonIdentifier Low Byte	M	20h	RCI_SPA_lesen
4	recordValue1 = B_spa_csoll	M	XXh	RV_SPA_CSOLL
5	recordValue1 = B_spa_cist	M	XXh	RV_SPA_CIST

7.29.30 22_3230 - RCI_BZE_lesen

General information:

BZE-Codierdaten lesen
This function is created to read out the "Batteriezustands Erkennung"

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	Request Service ID	M	22h	RDBCI
2	RecordCommonIdentifier High Byte	M	32h	RCI_BZE_lesen
3	RecordCommonIdentifier Low Byte	M	30h	RCI_BZE_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_BZE_lesen
3	RecordCommonIdentifier Low Byte	M	30h	RCI_BZE_lesen
4	recordValue1 = Qv_cdherst_1	M	XXh	RV_CD_HERST1
5	recordValue2 = Qv_cdherst_2	M	XXh	RV_CD_HERST2

7	recordValue4 = Qv_cdherst_4	M	XXh	RV_CD_HERST4
8	recordValue5 = Qv_cdherst_5	M	XXh	RV_CD_HERST5
9	recordValue6 = Qv_cdherst_6	M	XXh	RV_CD_HERST6
10	recordValue7 = Qv_cdherst_7	M	XXh	RV_CD_HERsT7
11	recordValue8 = Qv_cdherst_8	M	XXh	RV_CD_HESRT8

7.29.31 22_3240 - RCI_AGK_lesen

General information:

Read Coding Exhaust gas flap
This function is created to read out "Codierung fuer Abgasklappe auslesen"

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	Request Service ID	M	22h	RDBCI
2	RecordCommonIdentifier High Byte	M	32h	RCI_AGK_lesen
3	RecordCommonIdentifier Low Byte	M	40h	RCI_AGK_lesen

Positive Response on service

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	32h	RCI_AGK_lesen
3	RecordCommonIdentifier Low Byte	M	40h	RCI_AGK_lesen
4	recordValue1 = CONF_EF	M	XXh	RV_CODIERUNG_AGK

7.29.32 22_3250 - Read Coding of MSA

General information:

With this comand the coding value of MSA is read out.

Application conditions:

Initialisation: ---

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Formula Section:

Request

Data Byte	Parameter Name	Cvt	Hex Value	Mnemonic
1	**ReadDataByCommonIdentifier Request Service Id**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier	M	32h	RCI_CDMSA
3	RecordCommonIdentifier	M	50h	RCI_CDMSA

4	recordValue1 = Dfmonitor	M	XXh	Dfmonitor

7.29.36 22_4002 - RCI_SSZ1_lesen

General information:

Read Switch Position

This function is created to read the actual position of the car switches.
All switches are active “1” in the Bit position, as well as ground was switched.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	40h	RCI_SSZ1_lesen
3	RecordCommonIdentifier Low Byte	M	02h	RCI_SSZ1_lesen

Positive Response on service

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Response Service ID**	**M**	**62h**	**RDBCIPR**
2	RecordCommonIdentifier High Byte	M	40h	RCI_SSZ1_lesen
3	RecordCommonIdentifier Low Byte	M	02h	RCI_SSZ1_lesen
4	recordValue1 = Bitfield1	M	XXh	RV_SWITCH_POSITION

Note: For data, longer than one byte, the lowest byte is sent first

Byte #	*Name*	*Size*	*Conversion (hex/bin)*	*Conversion (physical)*	*Mnemonic*	*Resol.*
#4d	Bitfield 1	1	xxxxxxx1 b xxxxxx1x b xxxxx1xx b xxxx1xxx b xxx1xxxx b xx1xxxxx b x1xxxxxx b 1xxxxxxx b	LV_IGK LV_ES LV_CS LV_IM_BLS LV_IM_BTS not used not used LV_ACCOUT_RLY	RV_LV_IGK RV_LV_ES RV_LV_CS RV_LV_IM_BLS RV_LV_IM_BTS RV_LV_ACCOUT_RLY	

7.29.37 22_4003 - RCI_MLR_lesen

General information:

Read values of engine roughness
This function is created to read out the values from the function-test engine roughness. The calculation of the function is described in the chapter OBDII functions.

Request

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
1	**Request Service ID**	**M**	**22h**	**RDBCI**
2	RecordCommonIdentifier High Byte	M	40h	RCI_MLR

7.29.38 22_4006 - RCI_NWA_lesen

General information:

Read CAMSHAFT-Sensor Adaption

This function is created to read the actual adaption data form the camshaft sensor of the engine. All switches are active “1” in the Bit position, as well as ground was switched.

7.29.47 22_4019_000 - RDBCI_FSPFR

General information:

read Error Memory with freeze frame data extra long, extended

This function is created to read out the failure memory with all the errors including the freeze frame data. The index of the environment values allows a classification to the list of the environment values from BMW.

Record Common Identifier table usage and reading:

- record values usage as BYTE Values (Freeze Frame, Umweltbedingung, DDLI etc.) should support the full range 0x00 to 0xFF as VALID. A value that is not supported will be transmitted as 0xFF

- record values usage as WORD Values (DDLI etc.) should support the range 0x0000 to 0xFFFE as VALID. Invalid is shown with 0xFFFF.

This should enable the full range of internal Byte values to be used with no compromise, but still allow the diagnostic equipment to recognise if a value is available or not.

Formula section:

IF ERR_DTC[x] = 0000h **or**

ERR_DTC[x] = FFFFh

THEN send **negative respones**

ELSE send **positive response**

7.29.54 22_4021 - RCI_IBS_lesen

Formula section:

BMW part numbers ASCII byte 7-1 conversion from Hex to ASCII:

The value of Zbibs is limited to a valid range between 0d and 9 999 999d for converting and reporting the data as ASCII string.
Note: zbibs_rest and temp_byte are only help values for conversion, they are not accessable as online-values or RAM-cells.

```
IF      Zbibs < 9 999 999d
THEN    zbibs_rest = zbibs
ELSE    zbibs_rest = 9 999 999d
ENDIF

temp_byte = (zbibs_rest / 1 000 000d)
BMW part numbers ASCII byte 7 = temp_byte + 30h
zbibs_rest = Zbibs - (temp_byte * 1 000 000d)

temp_byte = (zbibs_rest / 100 000d)
BMW part numbers ASCII byte 6 = temp_byte + 30h
zbibs_rest = zbibs_rest - (temp_byte * 100 000d)

temp_byte = (zbibs_rest / 10 000d)
BMW part numbers ASCII byte 5 = temp_byte + 30h
zbibs_rest = zbibs_rest - (temp_byte * 10 000d)

temp_byte = (zbibs_rest / 1 000d)
BMW part numbers ASCII byte 4 = temp_byte + 30h
zbibs_rest = zbibs_rest - (temp_byte * 1 000d)

temp_byte = (zbibs_rest / 100d)
BMW part numbers ASCII byte 3 = temp_byte + 30h
zbibs_rest = zbibs_rest - (temp_byte * 100d)

temp_byte = (zbibs_rest / 10d)
BMW part numbers ASCII byte 2 = temp_byte + 30h
zbibs_rest = zbibs_rest - (temp_byte * 10d)

BMW part numbers ASCII byte 1 = zbibs_rest + 30h
```

7.29.57 22_4026 - RCI_RBMMODE9_lesen

General information:

Rate Based Monitoring Mode 9 auslesen

This function ist for reading the rate based monitoring data. It gives back the denmominators and numerators of the RBM relevant diagnoses.

Description:

API to select Rate-Based Monitoring data to be transmitted via Mode $09

based on spec 30B02601.00E

This is only for information! This chapter will not be updated when the spec 30B02601 changes!

The following paragraph descibes the data selection algorithm to be executed only once (for CPU load saving reason), upon external tool request via Mode $09, by calling an API.

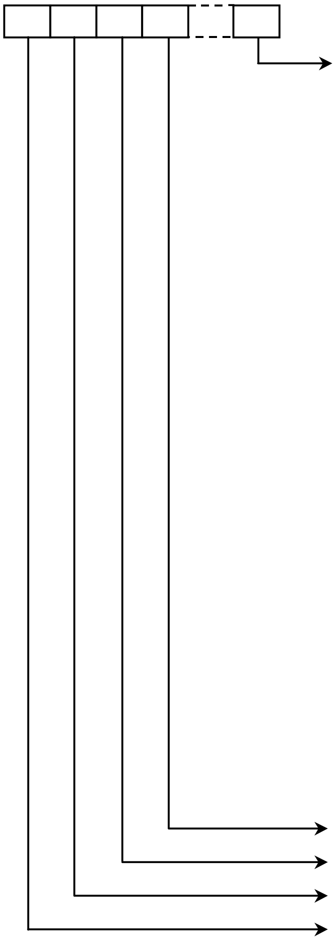
Syntax :	ACTION_ERRM_SelectRbmData (INOUT < ListRbmData >, OUT < ResultRbmData >)
Parameter (in) :	No parameter
Parameter (out) :	ResultRbmData
Parameter(inout) :	ListRbmData
Short description :	This API calculates and returns the Rate-Based Monitoring data to be transmitted to the Scan-Tool, when requested by the Mode 09$ (InfoType $08).

ResultRbmData : Indicates if the API has been executed or not.

Authorised values for ResultRbmDataSelection are :

- POSITIVE_RESPONSE : the call of the API is successful
- NEGATIVE_RESPONSE : the call of the API is unsuccessful

ListRbmData : Software structure filled-up with 16 counters of 2 bytes coming from Rate-Based Monitoring



EVAP Monitor Conditions Encountered Counts (denominator - LSB byte)

Hint: transmitte 0ffh for variables which are not exist in project

7.29.66 22_5F88 - ADRECOVERY_lesen

General information:

This command read out the informations about the Nox-trap from ECU. This is necessary before reprogramming or change of ECU.

Formula section:

```
If      service 22_5F_88 is received
then
        send positive response
endif
```

7.29.77 22_5FF6 - RCI_UEN_lesen

General information:

Exact description of the Function see file 14A06301.

Detection of an overreving event and non-volatile storage of:

An overreving event starts at exceeding the engine speed C_N_LIM_MIN and active engine speed limitation (LV_N_MAX = 1).

At each overreving event, the event frequency counter is incremented by 1. The highest engine speed reached N_MAX and the associated total running time in case of highest engine speed reached TRT_N_MAX is only overwritten if a higher engine speed was reached.

Application conditions:

Initialisation:	at reset the values from the NVMY
Activation:	Kl.15 on
Deactivation:	Kl.15 off Diagnostic timeout
Service location:	see list of “implemented diagnostic services”

7.30 SID 2Eh: writeDataByCommonIdentifier Service

General information:

All implemented SID 2Eh services are described below.

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
B_msahfkreset	O/V	0...1H	0...1	1	[-]
Flag indicating request "Reset MSA-Tabellenspeicher"					
B_msasw	O/V	0...1H	0...1	1	[-]
Bedingung MSA bis zum nächsten Zündungswechsel deaktivieren					
B_pmrestore	O/V	0...1H	0...1	1	[-]
Bedingung Daten zurückgeschrieben					
B_spa_csoll	O/V/S	0...1H	0...1	1	[-]
Codierung SPA aus Tester					
B_zrlvs_clr	O/V	0...1H	0...1	1	[-]
Zurücksetzen der internen Zähler des LVS					
CHK_STAMP	O/S	0...FFFFFFFFH	0...4294967295	1	[-]
Check stamp written by the customers production					
CONF_EF	O/V/S	0...FFH	0...255	1	[-]
Configuration of exhaust gas flap					
CTR_NS_AD_CYC_EXT_ADJ[NC_NOX_SENS_CONF]	O/V	0...FFFFH	0...65535	1	[-]
External Adjustment value for Counter of NOx signal gain adaptations					
CTR_NT_AGI_AD_CMPL_SUM_EXT_ADJ	O/V	0...FFFFH	0...65535	1	[-]
External adjustment value for counter of completed aging adaptation					
CTR_NT_AGI_SO2P_FQ_EXT_ADJ	O/V	0...FFFFH	0...65535	1	[-]
External adjustment value for counter of completed aging adaptation during FQ adaptation					
CTR_NS_SHIFT_CYC_EXT_ADJ[NC_NOX_SENS_CONF]	O/V	0...FFFFH	0...65535	1	[-]
External values of CTR_NS_SHIFT_CYC					
DIST_NS_NEW_EXT_ADJ	O/V	0...FFFFH	0...524280	8	[km]
External adjust value for mileage counter value of last exchange of NOx sensor					
DIST_NT_NS_AD_EXT_ADJ[NC_NOX_SENS_CONF]	O/V	0...FFFFH	0...524280	8	[km]
External Adjustment for Current distance from last NOx signal gain adaptation					
DIST_NT_NS_SHIFT_EXT_ADJ[NC_NOX_SENS_CONF]	O/V	0...FFFFH	0...524280	8	[km]
External adjustment value for DIST_NT_NS_SHIFT					
EGY_SP_IV_EXT_ADJ[NC_CYL_NR]	O/V/S	0...FFFFH	0...255	3.8911e-3	[mJ]
external adjusted injection valve EGY setpoint value (high flow)					
FAC_MFF_ADD_EXT_ADJ	O/V	0...FFH	-50...49.60937	0.390625	[%]
Factor for CO correction in idling					
FAC_NOX_NS_AD_EXT_ADJ[NC_NOX_SENS_CONF]	O/V	0...FFFFH	0...127.99804	1.9531e-3	[-]
External Adjustment for Adaptation of the NOx sensor characteristic shift					
FAC_NT_AGI_LIM_EXT_ADJ	O/V	0...FFFFH	0...0.99998	0.0153e-3	[-]
External adjustment value for limited NOx trap aging factor					
FAC_NT_AGI_MDL_EXT_ADJ	O/V	0...FFFFFFFFH	0...0.99999	0.2328e-9	[-]
External value for modeled aging of NT					
FAC_OIL_EXT_REQ_1	O/V/S	0...FFH	0...2.55	0.01	[-]
Country dependant factor for oil change intervall via tester					
FAC_OIL_EXT_REQ_2	O/V/S	0...FFH	0...2.55	0.01	[-]
Country dependant factor for oil change intervall via tester					
IDX_VAR_COD[2]	O/V/S	0...FFH	0...255	1	[-]
changing index of vehicle configuration code via tester					
IMOB_KWP_K_EWS4[16]	O	0...FFH	0...255	1	[-]
Received secret key					
IMOB_KWP_K_EWS4_1[16]	O	0...FFH	0...255	1	[-]
Received secret key, 1st backup					
IMOB_KWP_K_EWS4_2[16]	O	0...FFH	0...255	1	[-]
Received secret key, 2nd back up					
IMOB_KWP_K_EWS4_TMP0[16]	O	0...FFH	0...255	1	[-]
Received secret key, temporaery					
LV_ACT_N_SP_IS_BAS_EXT_ADJ	O	0...1H	0...1	1	[-]

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
logical variable for switching off the max-selection					
LV_ALTER_CTL_ENA	O/V/S	0...1H	0...1	1	[-]
Intelligent alternator control activated					
LV_CAT_CONF_DIS_EXT_REQ	O/V/S	0...1H	0...1	1	[-]
disable of learnig cat variants and setting variant to "no cat" via tester					
LV_FAC_MFF_ADD_EXT_ADJ_NVMY	O/V	0...1H	0...1	1	[-]
Logical value for storing CO correction in NVMY					
LV_FHW_RST	O/V	0...1H	0...1	1	[-]
boolean for reset of wrong used pedal unit					
LV_IGK_OFF_ACK_ENA	O/V/S	0...1H	0...1	1	[-]
Diagnosis acknowledge IGK off enabled via service tester job (1= enabled)					
LV_KWP_ENA	O/V	0...1H	0...1	1	[-]
logical variable for idle speed setpoint offset by tester enabled					
LV_LTG_GAS_ENA	O/V/S	0...1H	0...1	1	[-]
xenon-filled headlights mounted					
LV_NT_AFS_REQ_AGI_TMP_3_EXT_ADJ	O/V	0...1H	0...1	1	[-]
External adjustment value for logical value for the request of lambda =1 operation					
LV_POW_MNG_HIS_RST	O/V	0...1H	0...1	1	[-]
conditions for function request parking power					
LV_RST_MFF_ADD_EXT_ADJ_NVMY	O/V	0...1H	0...1	1	[-]
Flag to reset external MFF correction to 0					
LV_SO2P_REQ_2_EXT_ADJ	O/V	0...1H	0...1	1	[-]
External adjustment value for request of a desulfation (forces catalyst heating)					
LV_SO2P_REQ_FQ_EXT_ADJ	O/V	0...1H	0...1	1	[-]
External adjustment value for logical value for active FQ adaptation					
LV_STST_DEAC	O/V/S	0...1H	0...1	1	[-]
Logical value for switch off the MSA permanently					
LV_VAR_OBDC_CAN	O/V	0...1H	0...1	1	[-]
Variable to activate OBD communication on CAN (=1)					
LV_STST_VAR_COD	O/V/S	0...1H	0...1	1	[-]
logical value for MSA-coding (0 - without MSA. 1 - with MSA)					
LV_VVL_MIN_EXT_ADJ	O/V	0...1H	0...1	1	[-]
activation of external adjustment by tester					
LV_VVL_MIN_NVMY_EXT_ADJ	O/V	0...1H	0...1	1	[-]
activation of external adjustment by tester					
MFF_ABSV_IV_EXT_ADJ[NC_CYL_NR]	O/V/S	0...FFFFH	0...1389	0.0211948	[mg/stk]
External adjusted injection valve absolute MFF correction value (low flow)					
N_KWP_OFS	O/V	80...7FH	-256...254	2	[rpm]
idle speed setpoint offset at LV_ACIN = 0 and LV_DRI = 0

7.30.2 Standard application conditions

Initialisation at reset: 0, **except:** nonvolatile variables from NVRAM

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0 **or** Diagnostic timeout

Service location: see "list of implemented diagnostic services"

Standard Global negative Responses:

Data Byte	*Parameter Name*	*Cvt*	*Hex Value*	*Mnemonic*
#1d	**negativeResponse Service Id**	**M**	**#7Fh**	**NR**
#2d	WriteDataByCommonIdentifier Request Service Id	M	#2Eh	WDBCID
#3d	General response code	M	#XX	RC

Table: WriteDataByCommonIdentifier Negative Response Message

Remark:
The detailed message of the negative response code is described in chapter "Error codes".

7.30.3 2E_10_00 Write check stamp

General information:

With this comand the 3 bytes of the check stamp are written to the ECU (only lowest 3 byte of CHK_STAMP are used in software). Those are actually in the volatile memory. In the latch off phase (n = 0 rpm and Kl.15 off) this values are written down into the non volatile memory. If the battery voltage is removed from the ECU, bevor the power latch phase ends, the storage of the check stamp is cancelled and the value up to now was kept.
The writing of the check stamp was reserved for the customers production, that means that the check stamp can´t be writen by the ECU production factory.

Because for writing CHK_STAMP NVMY programing is necessary it is written to the EEPROM during the ECU power latch. During this time the value of CHK_STAMP is buffered in RAM.

7.30.4 2E_10_01 Reset BOS data

General information:

With this comand the required service data (BOS-bedarfsorientierte Servicedaten löschen) can be reseted.
The BMW module OZ/PM/.. makes a reset if the layervalue Id_bosrtt (via QOIL_DS_RST_KWP_1) is not equal 00h.

Additional Application conditions:

Recurrence: 100 ms

Formula section:

```
If(1)     service 2E_10_01 is received
then(1)
          QOIL_DS_RST_KWP_i = corresponding record value
elseif(1)

//this part has to be calculated with a recurrence of 100ms:
if        Id_bosrtak = QOIL_DS_RST_KWP_1
then      QOIL_DS_RST_KWP_1 = 0
endif

7.30.5 2E_30_00 MIL-OFF Codierung schreiben

General information:

With this command the MIL (malfunction indication lamp) can be switched off permanently. In case of a production ECU (active authentification/signature) the selection is only possible within the first 10 hours of ECU- runtime (TRT < 10 hours). The selection is stored in non volatile memory immediately during runnig time (because after coding the ECU is reset) and can not be changed after 10 hours. After 10 hours the ECU answers to the write- command with "subFunctionNotSupported."

Additional Application conditions:

Activation: LV_ES = 1 **and**
(TRT <= 10 hours - only if authentification/signature is active)

Deactivation: Diagnostic timeout **or**
(TRT > 10 hours - only if authentification/signature is active)
//send negative response code 12: subFunctionNotSupported

Formula section:

```
IF      C_VAR_STATE = 1
THEN    STATE_MIL_ON_DIS_EXT_REQ = 0
ELSE    IF    recordValue#1 > 2H

7.30.19 2E_5F_87 LaufruheVerbesserungssystem Zaehler Reset

General information:

This command generate a request to reset the counter of "Laufruheverbesserungssystem" in BMW-software.

Formula section:

```
If      service 2E_5F_87 is received
then
        set B_zrlvs_clr = 1 for 2 sec.
        send positive response
endif
```

7.30.20 2E_5F_88 ADRECOVERY vorgeben

General information:

This command write informations about the Nox-trap into ECU. This is necessary after reprogramming or change of ECU.

Formula section:

```
If  service 2E_5F_88 is received
Then
        store received values into corresponding variables
        call ACTION_NOXM_WriteSulfurExtAdj(void)
        call ACTION_NOXM_WriteAgingExtAdj(void)
```

```
            call ACTION_NOXM_WriteAgiMExtAdj

Table WriteDataByCommonIdentifier Positive Response Message

7.30.24 2E_5F_8E MSA_DEAK

General information:

With this command the deactivation of MSA can be switched on / off.
In the first 250 km the MSA can switched off permanently with service request 2E_5F_8E_08. After more then 250km the ECU answers on this request with "subFunctionNotSupported" and the deactivation of MSA with 2E_5F_8E_07 is only possible for the actual driving cylce.

Additional Application conditions:

Initialisation at reset or LV_IGK 1 > 0:

```
If      CTR_KM_CAN >249 km and LV_STST_DEAC = 1
Then    store LV_STST_DEAC = 0 in non volatile memory
Endif
B_msasw =  LV_STST_DEAC
```

Formula section:

```
if(1)     record value#1 = 0
then(1)
          LV_STST_DEAC      = 0
          B_msasw      = 0
          store LV_STST_DEAC = 0 in non volatile memory
          send positive respones
endif(1)
```

```
if(1)   record value#1 = 7
then(1)

Table WriteDataByCommonIdentifier Positive Response Message

7.30.26 2E_5F_90 IMAALLE programmieren

Description:

With this service all injection valve corrections are written indivudal for each cylinder. The values EGY_SP_IV_EXT_ADJ[NC_CYL_NR] and MFF_ABSV_IV_EXT_ADJ[NC_CYL_NR] must be stored in **reprogramming resistant** non volatile memory. At first run of new ECU or in case of NVRAM error the output data must initialized with zero.
STATE_IV_CHG is used at engine stop to engine run.

Additional Application conditions:

```
Initialisation:  at reset: from NVRAM and from reprogramming resistant NVRAM ,
                 at exit start:   if STATE_IV_CHG <>  0
                                  then   STATE_IV_CHG = 0
                                         write NVRAM "BMW coding"
                                  endif
Activation:      LV_ES = 1
Deactivation:    LV_ES = 0
```

Formula Section:

```
If received service 2E_5F_90
then
    EGY_SP_IV_EXT_ADJ[NC_CYL_NR] = corresponding received values

7.30.31 2E_5F_F0_07 Abgleichswert LL ansteuern

General information:

With the tester via KWP telegram an idle speed offset for five different conditions can be calibrated. The idle speed setpoint offsets stored into the non volatile memory are initialized with 0 as default value. In case of a tester is connected via KWP N_KWP_OFS_ACC_DRI, N_KWP_OFS_DRI, N_KWP_OFS_ACC, N_KWP_OFS and N_KWP_OFS_VB are sent and the bit “store” was sent the adjusted values are stored into non volatile memory.
In case of LV_KWP_ENA = 1 and a tester is connected via KWP the adjustment values N_KWP_OFS_ACC_DRI_KWP, N_KWP_OFS_DRI_KWP, N_KWP_OFS_KWP, N_KWP_OFS_ACC_KWP and N_KWP_OFS_VB_KWP from tester are used.

N_SP_OFS_KWP is permanently used in the idle speed module, so the calculation within the KWP-module have to do permanantly.

For the time, when the tester works on the car, the max. selection should be off for this Kl.15 cycle. Now the new setting of the offsets can be made.

Additional Application conditions:

Initialisation at reset:

N_KWP_OFS_ACC_DRI = N_KWP_OFS_ACC_DRI_NVMY

N_KWP_OFS_DRI = N_KWP_OFS_DRI_NVMY

N_KWP_OFS = N_KWP_OFS_NVMY

N_KWP_OFS_ACC = N_KWP_OFS_ACC_NVMY

N_KWP_OFS_VB = N_KWP_OFS_VB_NVMY

N_SP_OFS_KWP = 0

Activation: LV_KWP_ENA = 1

Deactivation: LV_KWP_ENA = 0

Recurrence: 10 ms

Formula section:

7.30.35 2E_5F_F1_07 CO- Abgleich ansteuern

Description:

With this service the MFF trim value for CO- Adjust can be adjusted. This is necessary for cars without catalyst.

The value from tester is written in the variable FAC_MFF_ADD_EXT_ADJ for 1 second. Then the variable FAC_MFF_ADD_EXT_ADJ is set to 0 for 1s. After the 2 seconds, the next value can be sent. During this 2 seconds no new value from tester is accepted to avoid too fast trimming (= negative response).

Additional Application conditions:

Initialisation: FAC_MFF_ADD_EXT_ADJ = 0 %
TIMER_1 = 0 s

Activation: LV_VAR_LSH_UP = 0 **and**
LV_IS = 1 **and**
CTR_ERR_DYN_NR = 0 **and**
TCO > C_TCO_MIN_MFF_ADD_EXT_ADJ

Deactivation: not activation or timeout

Formula section:

```
IF       Service 2E_5F_F1_07 is received  and
         TIMER_1 = 0 s
THEN     initialise TIMER_1 with 2 s                 and
         FAC_MFF_ADD_EXT_ADJ = value from tester     and
         send positive response

ELSEIF   TIMER_1 = 2 s or 1s
THEN     FAC_MFF_ADD_EXT_ADJ = 0
         TIMER_1 = TIMER_1 - 1s
         send negative response "conditions not correct" when Service 2E_5F_F1_07 is
         received  again
ENDIF
```

7.30.36 2E_5F_F1_08 CO- Abgleich programmieren

Description:

With this service the MFF trim value for CO- Adjust can be programmed into non volatile memory after power latch phase.

After receiving the service 2E_5F_F1_08, the flag LV_FAC_MFF_ADD_EXT_ADJ_NVMY is set to 1 for 2 seconds. The flag LV_FAC_MFF_ADD_EXT_ADJ_NVMY triggers the CO-Adjust function to save the trim value into non volatile memory after power latch phase.

Additional Application conditions:

Activation: LV_IS = 1 **and**
LV_VAR_LSH_UP = 0 **and**
CTR_ERR_DYN_NR = 0 **and**
TCO > C_TCO_MIN_MFF_ADD_EXT_ADJ

Deactivation: not activation or timeout

Formula section:

```
IF      service 2E_5F_F1_08 is received
THEN    LV_FAC_MFF_ADD_EXT_ADJ_NVMY = 1 for 2s
ENDIF
```

7.30.37 2E_5F_F2_04 Varianten loeschen

General information:

This service resets the bits of learned variants. Re- learning is possible depending on the learning conditions of every device (see chapter "variant coding"). If the byte on position x in the tester telegram is 01, the variant flag/variable which is dedicated to position x is set to 0 and so the variant is erased.
The variants LV_VAR_BN and LV_VAR_VEH are vehicle specific can not be reset via tester (safety reasons; see also chapter "variant coding").

Additional Application conditions:

Activation: LV_ES=1

Deactivation: LV_ES=0

Formular section:

7.30.41 2E_5F_F6_04 Ueberdrehzahlsicherung loeschen

General information:

Detection of an overreving event and non-volatile storage of:

- highest engine speed reached N_MAX
- associated total running time in case of highest engine speed reached TRT_N_MAX
- event frequency counter CTR_N_MAX

An overreving event starts at exceeding the engine speed C_N_LIM_MIN and active engine speed limitation (LV_N_MAX = 1).

At each overreving event, the event frequency counter is incremented by 1. The highest engine speed reached N_MAX and the associated total running time in case of highest engine speed reached TRT_N_MAX is only overwritten if a higher engine speed was reached.

For this service authenticity is necessary.

Additional Application conditions:

Activation: LV_ES = 1 **and**
authentification is necessary

Deactivation: LV_ES= 0

Formula section:

IF service 2E_5F_F6_04 is received

THEN N_MAX = 00h

Table StopRoutineByLocalIdentifier Negative Response Message

Remark:
The detailed message of the negative response code is described in chapter "Introduction".

7.31.3 32_2F stop Desulfatisierung Fahrbetrieb

General information:

With this command the "Desulfatisierung Fahrbetrieb" is switch off.

Application conditions:

Initialisation: ---

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)

Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Formular section:

```
If      service 32_2F       is received

Then    call ACTION_NOXM_StopCatHeatDesu()
        Send positive response
Endif
```

Global Negative Responses

7.31.5 32_F0 stop checksum calculation for Inca PC

General information:

With this service the tester stops the checksum calculation, which is started with the service 31_F0.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: Kl.15 off
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.31.6 32_F1 stop programming of calibration data for IncaPC

General information:

With this service the tester deletes the request for programming of calibration data after the power latch, which is started with the service 31_F1.

Once the programming of calibration data is started after the power latch it can not be interrupted.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)

Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Global Negative Responses

7.31.7 32_F6 stop default values PM for BN-SS

General information:

With this comand the values described in the chapter “Power Management” are set to default values.

The value LV_POW_MNG_MES_MOD is saved after a powerlatch phase into the non volatile memory.

Application conditions:

Initialisation: at reset with B_fapmmess from NVM

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)

Diagnostic timeout

Service location: see list of “implemented diagnostic services”

Formular section:

IF service 32_F6 is received

7.32.13 33_F0 Report results of checksum calculation for IncaPC

General information:

With this service the tester can ask for the results of the checksum calculation, which is started with the service 31_F0.

If the checksum is equal to the checksum, which is given by 31_F0, the ECU reports a positive response. Otherwise a negative response is sent.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.32.14 33_F1 Report results of “programming the calibration data in the power latch” of IncaPC

General information:

With this service the tester can ask for the results of the programming process of the calibration data in the power latch, which is started with the service 31_F1

Please consider that the calibration data are programmed at the end of the power latch phase. That means the ECU is not able to send the positive response for finishing the programming of the calibration data.

Application conditions:

Initialisation: at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off)
Diagnostic timeout

Service location: see list of “implemented diagnostic services”

7.33.2 Lambda- setpoint for external adjustment

FUNCTION DESCRIPTION:

General information:

This function is for shifting the lambda-setpoint in the lambda coordination to fulfill requests of external adjustment / EOL diagnosis.

i=1 for cylinder bank 1 and i = 2 for cylinder bank 2

Description:

The lambda-setpoint LAMB_SP_EXT_ADJ[i] is calculated as long as the activation bits:

- LV_ACT_VLS_EOL *//Lambda setpoint shifting for lambda sensor EOL test*
- LV_ACT_SA_EOL *//Lambda setpoint shifting for secondary air EOL test*

are active. The bit are set/reset by customer tool.

Application conditions:

Initialisation: LV_LAMB_SP_EXT_ADJ[i] = 0
LAMB_SP_EXT_ADJ[i] = 1
at LV_IGK =1 **or** ECU reset

Recurrence: 20ms

Activation: LV_IGK = 1

Formula section:

Lambda setpoint shifting for lambda sensor EOL test

If LV_ACT_VLS_EOL = 1
Then LV_LAMB_SP_EXT_ADJ[i]= 1 *//bank 1 and bank 2*
LAMB_SP_EXT_ADJ[i] = LAMB_SP_VLS_EOL[i]

Lambda setpoint shifting for secondary air EOL test

```
ElseIf    LV_ACT_SA_EOL = 1
Then      LV_LAMB_SP_EXT_ADJ_[i] = 1          //bank 1 and bank 2
          LAMB_SP_EXT_ADJ[i] =  LAMB_SP_SA_EOL

Lambda setpoint shifting passive
Else      LV_LAMB_SP_EXT_ADJ_[i] = 0          //bank 1 and bank 2
          LAMB_SP_EXT_ADJ[i] =  1
Endif
```

7.33.3 Services 21_20 / 31_20 / 32_20 / 33_20 for end of line test: SA-system test

FUNCTION DESCRIPTION:

General information:

The EOL test is performed in order to check the SA system in the factory or in the workshop. If EOL test is active (LV_ACT_EOL_SA = 1) then secondary air function (Pump and Valve) and the configurated diagnosis (depending of LC_SA_SWI_ACQ) is activated as long as EOL is requested or diagnosis is finished.

Description:

The EOL test contain the services:
- **21_20 - Read Status EOL- test**
- **31_20 - EOL Test start**
- **32_20 - EOL Test stop**
- **33_20 - Report EOL test results**

Application conditions:

Initialisation:	at LV_IGK 0->1 or reset STATE_EOL_KWP_SA = NOT_START LV_ACT_SA_EOL = 0
Recurrence:	same as SA function
Activation:	see following chapter
Service location:	ECU-SW

7.33.3.1 Secondary air system diagnosis through SAF-meter (SAFM)

Description:

This service is only performed if **LC_SA_SWI_ACQ = 1**

7.33.4 Services 21_22 / 31_22 / 32_22 / 33_22 for end of line test: CPS Check

7.33.4.1 31_22 – Start EOL-Test CPS-Check - StartRoutineByLocalIdentifier service

General information:

This funktion handles the functional check CPS also “end of line test CPS” called.

Application conditions:

Initialisation: LV_EOL_CPS =00h at reset
STATE_EOL_KWP_CPS= NOT_START at reset

Activation: LV_IGK=1 (Kl.15 on) **and**
LV_EOL_CPS = 1

Deactivation: LV_IGK=0 (Kl.15 off) **or**
Diagnostic timeout

Service location: see “list of implemented diagnostic services”

Formula section:

calculation of LV_EOL_CPS
IF LV_IGK=1 (Kl.15 on) **and**
LV_ST_END = 1 **and**

```
                LV_INH_DIAGCPS = 0                      and
                VS = 0                                  and

7.33.6 Services 21_27 / 31_27 / 32_27 / 33_27 for end of line test: VVL adaption

7.33.6.1 31_27 - start VVL Adaptation - StartRoutineByLocalIdentifier service

General information:

This function handles the tester adaption request. After receiving the Tester request the function sets the variables KWP_B_FA, KWP_B_FAVVTAL and VVT_KWP_EXT_AD_ERV_REQ. Then it waits till the adaption process starts which can be detected testing the STATE_AD_RUN_VVL variable. After finishing the adaption process the function returns the result of the adaption routine
The general function is described in the chapter “VVL Position Sensor Adaptation”.

Application conditions:

Initialisation at reset state / at restart:
STATE_EOL_KWP_VVL_AD = NOT_START

Recurrence: 10ms - see Activation

Activation: started from the KW2000 request handler when the corresponding diagnose message is received

Deactivation: response sent to the tester

Service location: see list of “implemented diagnostic services”

Formula section:

```
if (STATE_KWP_SRV_AD_REQ_VVL!=“TERMINATE”)
then
    Send negative response with ResponseCode=22h;
    //ConditionNotCorrectOrRequestSequenceError
else
    if(2) ((REYS_01==01h) || ( REYS_01==06h))
    then(2)
        Send positive response
        call function “Set KWP adaption request state variable “ with parameter (REYS_01)
    else(2)
        Send negative response with ResponseCode=22h;
        //ConditionNotCorrectOrRequestSequenceError
    endif(2)
endif
```

7.33.13.4 33_DA - report results of - DMTL EOL - RequestRoutineResultsByLocalIdentifier service

General information:

With this service the tester can ask for the results of DMTL end of line test which is started with the service 31_DA.

Remark: This service resets the EOL-state variable STATE_EOL_KWP_DMTL to NOT_START ("function not started yet") if EOL test has finished/cancelled before
(STATE_EOL_KWP_DMTL = 07h/08h/09h, "function finished or cancelled").
This is necessary because of the NVMY data storage of the DMTL-EOL test.

Application conditions:

Initialisation: 0 at reset

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off) **or**
Diagnostic timeout

Service location: see “list of implemented diagnostic services”

7.33.14 Services 21_DF / 31_DF / 32_DF / 33_DF for end of line test: Lambda sensors confused / wrong wired - linear sensors

7.33.14.1 31_DF EOL Test ON - Lambda sensors confused / wrong wired - StartRoutineByLocalIdentifier service

FUNCTION DESCRIPTION:

General information:

This EOL test is to detect confused or wrong wired linear lambda sensors in order to prevent bad emmissions.

i = 1 for cylinder bank1 and i = 2 for cylinder bank 2

Application conditions:

Initialisation: STATE_EOL_KWP_VLS = NOT_START at reset
LV_ACT_VLS_EOL_EXT_ADJ = 00h at reset

Activation: LV_IGK=1 (Kl.15 on) **and**
LV_IS = 1 **and**
TCO > C_TCO_MIN_VLS_EOL **and**
TEG_CAT_DOWN_MDL[i]
> C_TEG_CAT_DOWN_EOL **and** *//for both exhaust banks*
LV_LAMB_LS_UP_VLD[i] = 1 **and** *//for both exhaust banks*
LV_LS_DOWN_READY[i] = 1 **and** *//for both exhaust banks*
STATE_LSH_UP[i] = LSH_POW_CTL **and** *//for both exhaust banks*
STATE_LSH_DOWN[i] = LSH_POW_CTL **and** *//for both exhaust banks*
LV_DIAG_ACT_INH_LS_UP_DOWN[i] = 0 *//for both exhaust banks*

Deactivation: LV_IGK=0 (Kl.15 off) **or**
conditions from activation not fullfilled **or**
Diagnostic timeout

Service location: see “list of implemented diagnostic services”

Formula section:

activation of EOL test

```
IF      service 31_DF   is received                      and
        activation conditions for EOL test fullfilled (see above)
THEN    STATE_EOL_KWP_VLS      = ACT           // ACT
        LV_ACT_VLS_EOL_EXT_ADJ = 1             //request to start EOL test
ELSE    STATE_EOL_KWP_VLS remains unchanged
        LV_ACT_VLS_EOL_EXT_ADJ = 0
ENDIF
```

7.33.15 Services 21_D5 / 31_D5 / 32_D5 / 33_D5 for end of line test: ECRAS system test

FUNCTION DESCRIPTION:

General information:

This EOL test is to test the ECRAS System. The ECRAS diagnosis will be enabled.

Application conditions:

Initialisation: at reset or LV_IGK 0->1: STATE_EOL_KWP_ECRAS = NOT_START,
LV_ACT_ECRAS_EOL_EXT_ADJ = 00h

Recurrence: same as ECRAS diagnosis function (100ms)

Activation: LV_IGK=1 (Kl.15 on)

Deactivation: LV_IGK=0 (Kl.15 off) **or**
Diagnostic timeout

Service location: see “list of implemented diagnostic services”

Formula section:

Calculation of STATE_EOL_KWP_ECRAS:

The calculation of the state STATE_EOL_KWP_ECRAS is started with activation of LV_ACT_ECRAS_EOL_EXT_ADJ (0->1). Depending on several conditions the state and LV_ACT_ECRAS_EOL_EXT_ADJ will be set. The Determination of STATE_EOL_KWP_ECRAS is stopped after deactivation of the EOL by tester. In this case STATE_EOL_KWP_ECRAS = NOT_START (function not started). Once the calculation of the STATE_EOL_KWP_ECRAS is started, it has to be calculated with a recurrence of 100ms until deactivation.

If LV_ACT_ECRAS_EOL_EXT_ADJ = 1

Then **If** LV_ECRAS_UP_EXT_ADJ = 1 **or**

```
                LV_ECRAS_DOWN_EXT_ADJ = 1  or
                LV_CDN_VB_MIN_DIAG = 0
         Then   LV_ACT_ECRAS_EOL_EXT_ADJ = 0
                STATE_EOL_KWP_ECRAS = 01H  //conditions not correct
         Elself LV_ECRAS_EOL_INH = 1       and
                LV_ERR_ECRAS_EOL = 1
         Then   LV_ACT_ECRAS_EOL_EXT_ADJ = 0
                STATE_EOL_KWP_ECRAS = 9H   //function finished, error present
         Elseif LV_ECRAS_EOL_INH = 1
         Then   LV_ACT_ECRAS_EOL_EXT_ADJ = 0
                STATE_EOL_KWP_ECRAS = 8H   //function finished, without error
         Endif
Else     no change
Endif
```

7.33.15.1 31_D5 EOL Test ON - ECRAS system test - StartRoutineByLocalIdentifier service

Description:

If the activation service is received and the activation conditions are fulfilled the ECRAS system test is started (LV_ACT_ECRAS_EOL_EXT_ADJ 0-> 1)

Formula section:

activation of EOL test

```
IF       service 31_D5   is received         and
         LV_ECRAS_UP_EXT_ADJ = 0             and
         LV_ECRAS_DOWN_EXT_ADJ = 0           and
         LV_CDN_VB_MIN_DIAG = 1              and
         LV_ECRAS_EOL_INH = 0
THEN     STATE_EOL_KWP_ECRAS = ACT           // ACT

PV = PV_AV

8.2 Determination of accelerator pedal value

General information:

The accelerator pedal value is determined by means of a two-channeled system (PVS: pedal value sensor). Upon operating the accelerator pedal, both independently supplied sensor channels supply a synchronized Voltage signal, which shows a definite Voltage-ratio (2:1). Both Voltage-signals are adapted to the supply Voltage of the potis in order to minimize measurement inaccuracy.

Plausibility unit monitors both output signals of the pedal sensor system as well as the supply Voltages and determine from this the state of the PVS's system (see chapter PVS diagnosis).

From the Voltages of both PVS-channels the Kick-Down operation is determined.

Dependent on the System State, the driver's demand is determined from the pedal activation values. In the case of a disturbed PVS-signal (ERR_PVS ≠ 0), a selection of pedal values occurs from one of both PVS-channels and/or an output of zero.

Figure 1 shows a function overview of determination of the driver's demand.

Signal flow diagram:

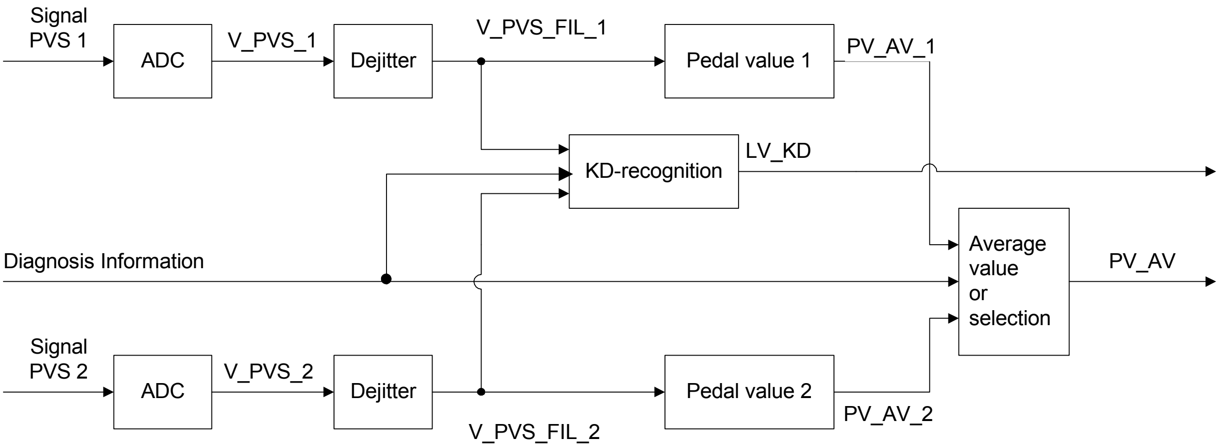

Fig. 1: Function overview of determination of the driver's demand

Comment:
Since we are dealing with a two-channel system, the letter 'X' is used for either channel 1 or 2, in order to simplify the description. The letter 'Y' indicates the other respective channel.

Application conditions:

Recurrence: 10 ms

8.2.1 Filtration of the PVS-values

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
V_PVS_FIL_1	V	0...3FFH	0...4.99511	4.8828e-3	[V]
Filtered voltage of Pedal Value Sensor 1					
V_PVS_FIL_2	V	0...3FFH	0...4.99511	4.8828e-3	[V]
Filtered voltage of Pedal Value Sensor 2					

Input data:

V_PVS_1	V_PVS_2		

FUNCTION DESCRIPTION:

In order to maintain a stabile driver’s demand, the PVS-Voltage values need to be filtered.

During the filtration, a hysteresis band is laid around the determined PVS-value (Width: 2 * C_V_PVS_HYS_FIL). The PVS-value is only changed when the current measurement value exceeds the limits of the hysteresis band. Thereby a jitter-free signal is produced, which actually hurries after the ‘true’ measurement value around the width of the hysteresis band. However, this signal reacts without hesitation to dynamic alterations of the driver’s demand.

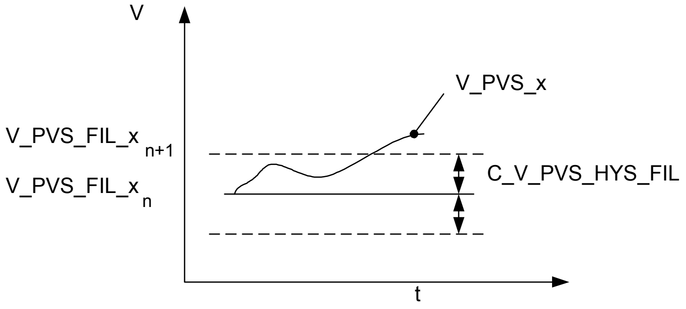

Fig. 2 Filtration of PVS Voltage

Formula section:

If $V\_PVS\_x_{(n)} > V\_PVS\_FIL\_x_{(n-1)} + C\_V\_PVS\_HYS\_FIL$ **or**
$V\_PVS\_x_{(n)} < V\_PVS\_FIL\_x_{(n-1)} - C\_V\_PVS\_HYS\_FIL$

Then $V\_PVS\_FIL\_X_{(n)} = V\_PVS\_x_{(n)}$

Else $V\_PVS\_FIL\_X_{(n)} = V\_PVS\_FIL\_x_{(n-1)}$

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_V_PVS_HYS_FIL	1	0...FFH	0...1.24511	4.8828e-3	[V]
Area of the dejitter-filters					

8.2.2 Standardisation of the PVS-voltage value

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
PV_AV_1	O/V	0...FFH	0...99.60937	0.390625	[%]
degree of activation of the accelerator pedal from PVS-channel 1					
PV_AV_2	O/V	0...FFH	0...99.60937	0.390625	[%]
degree of activation of the accelerator pedal from PVS-channel 2					
PV_CUS_1	O/V	0...FFFFH	0...99.99847	1.5259e-3	[%]
degree of activation of the accelerator pedal from PVS-channel 1 with higher resolution for customer purposes					
PV_CUS_2	O/V	0...FFFFH	0...99.99847	1.5259e-3	[%]
degree of activation of the accelerator pedal from PVS-channel 2 with higher resolution for customer purposes					

FUNCTION DESCRIPTION:

The pedal values are normalized by the determined producer values for the potentiometer slope C_PVS_SLOP and offset C_PVS_OFS in a range between 0% and 99,6%.

Formula section:

PV_CUS_x = PV_AV_x = (V_PVS_FIL_x - C_V_PVS_OFS_x) * C_PVS_SLOP_x

Calibration hint: in order to prevent the signal PVS 2 with it's worse resolution is selected for PV_AV_RAW (see following Value selection), the offset and slope for that sensor should be calibrated accordingly. PV_AV_2 always should be a little higher than PV_AV_1. The difference should correspond to the usual occurring signal jitter which depends from the used sensor

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_PVS_SLOP_1	1	0...FFH	0...79.6875	0.3125	[%/V]
Slope value of the pedal value 1					
C_PVS_SLOP_2	1	0...FFH	0...79.6875	0.3125	[%/V]
Slope value of the pedal value 2					
C_V_PVS_OFS_1	1	0...FFH	0...1.24511	4.8828e-3	[V]
Offset of the pedal value 1					
C_V_PVS_OFS_2	1	0...FFH	0...1.24511	4.8828e-3	[V]
Offset of the pedal value 2					

8.2.3 Value selection

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
PV_AV_RAW	O/V	0...FFH	0...99.60937	0.390625	[%]
Global degree of activation of the gas pedal					
PV_CUS_RAW	O/V	0...FFFFH	0...99.99847	1.5259e-3	[%]
Global degree of activation of the gas pedal with higher resolution for customer purpose					

Input data:

LV_DET_NOT_PLAUS_ACT	STATE_PVS_DIAG	N_32	LV_IGK
LV_ERR_PVS_BLS_NOT_PLAUS	LV_PVS_BLS_NOT_PLAUS_ACT		

FUNCTION DESCRIPTION:

For an error-free system, the pedal value PV_AV_RAW (PV_CUS_RAW) is determined from minimum of both pedal values PV_AV_x (PV_CUS_x). In case of an error the selection depends on the PVS Diagnostic status. The restriction of the accelerator pedal value takes place at the limp home management.
In case of a not plausible accelerator-brake plausibility the driver demand is limited to C_PVS_BLS_NOT_PLAUS to defuse a clamp driver pedal.

Application conditions:

Initialisation: 0

Recurrence: 10ms

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0, set PV_AV_RAW=0, PV_CUS_RAW=0

Formula section:

```
If(1)        STATE_PVS_DIAG = PVS_NO_ERROR
Then(1)      PV_AV_MIN  =  MIN  ( PV_AV_1; PV_AV_2 )
             PV_CUS_MIN  =  MIN  ( PV_CUS_1; PV_CUS_2 )
    If(2)           LV_PVS_BLS_NOT_PLAUS_ACT = 0       and
                    LV_ERR_PVS_BLS_NOT_PLAUS = 0
    Then(2)         PV_AV_RAW = PV_AV_MIN
                    PV_CUS_RAW = PV_CUS_MIN
    Else(2)If(3)    LV_DET_NOT_PLAUS_ACT =1
             Then(3) If(4)      PV_AV_RAW >  C_PV_AV_BLS_NOT_PLAUS
                 Then(4)        $PV\_AV\_RAW_n$  = MIN (PV_AV_MIN; $PV\_AV\_RAW_{n-1}$ -
                                        C_PV_AV_BLS_NOT_PLAUS_LGRD)
                                $PV\_CUS\_RAW_n$  = MIN (PV_CUS_MIN; $PV\_CUS\_RAW_{n-1}$
-
                                        C_PV_AV_BLS_NOT_PLAUS_LGRD)
                 Else(4)  If(5)     PV_AV_RAW $\geq$ PV_AV_MIN
```

```
                    Then(5)   $PV\_AV\_RAW = PV\_AV\_MIN$
                              $PV\_CUS\_RAW = PV\_CUS\_MIN$
                    Else(5)   $PV\_AV\_RAW_n = PV\_AV\_RAW_{n-1}$
                              $PV\_CUS\_RAW_n = PV\_CUS\_RAW_{n-1}$
        Else(3)If(6)  $|PV\_AV\_RAW_{n-1} - PV\_AV\_MIN| > C\_PV\_AV\_BLS\_NOT\_PLAUS\_HYS$
            Then(6) If(7)     $PV\_AV\_RAW_{n-1} < PV\_AV\_MIN$
                    Then(7)   $PV\_AV\_RAW_n = PV\_AV\_RAW_{n-1} + C\_PV\_AV\_BLS\_NOT\_PLAUS\_LGRD$
                              $PV\_CUS\_RAW_n = PV\_CUS\_RAW_{n-1} + C\_PV\_AV\_BLS\_NOT\_PLAUS\_LGRD$
                    Else(7)   $PV\_AV\_RAW_n = PV\_AV\_MIN$
                              $PV\_CUS\_RAW_n = PV\_CUS\_MIN$
            Else(6) $PV\_AV\_RAW_n = PV\_AV\_MIN$
                    $PV\_CUS\_RAW_n = PV\_CUS\_MIN$
Endif
```

In case of a present PVS error witch is not debounced yet, the pedal value is frozen in risen direction:

```
If      $STATE\_PVS\_DIAG = PVS\_LIH\_PRED$ and
        $PV\_AV\_1 \geq PV\_AV\_RAW$
Then    $PV\_AV\_RAW_n = PV\_AV\_RAW_{n-1}$
        $PV\_CUS\_RAW_n = PV\_CUS\_RAW_{n-1}$
Else    $PV\_AV\_RAW_n = PV\_AV\_1$
        $PV\_CUS\_RAW_n = PV\_CUS\_1$
Endif

If      $STATE\_PVS\_DIAG = PVS\_LIH\_MIN$ or $PVS\_LIH\_1$ or $PVS\_LIH\_2$
Then    PV_AV_RAW and PV_CUS_RAW are limited upwards to IP_PV_LIH_MAX and
        the positive gradient is restricted to
        $PV\_AV\_RAW_n \leq PV\_AV\_RAW_{n-1} + C\_PV\_GRD\_LIH\_MAX$
        $PV\_CUS\_RAW_n \leq PV\_CUS\_RAW_{n-1} + C\_PV\_GRD\_LIH\_MAX$
Endif

If      $STATE\_PVS\_DIAG = PVS\_LIH\_MIN$
Then    $PV\_AV\_RAW = Min(PV\_AV\_1, PV\_AV\_2)$
        $PV\_CUS\_RAW = Min(PV\_CUS\_1, PV\_CUS\_2)$
Endif
If      $STATE\_PVS\_DIAG = PVS\_LIH\_1$
Then    $PV\_AV\_RAW = PV\_AV\_1$
        $PV\_CUS\_RAW = PV\_CUS\_1$
Endif
If      $STATE\_PVS\_DIAG = PVS\_LIH\_2$
```

```
Then    PV_AV_RAW = PV_AV_2
        PV_CUS_RAW = PV_CUS_2
Endif

If      STATE_PVS_DIAG = PVS_DBL_ERROR  or
        STATE_PVS_DIAG = PVS_LIH_1_PRE  or
        STATE_PVS_DIAG = PVS_LIH_2_PRE  or
        STATE_PVS_DIAG = PVS_LIH_BLS
Then    PV_AV_RAW = 0
        PV_CUS_RAW = 0
Endif
```

Calibration data:

Input data:

GEAR_INFO	LV_AT		STATE_GEAR_REV_AT_AMT
VS_FIL	LV_IM_CS_PN		STATE_GEAR_REV_CAN
N_DIF	N	PV_AV_MAX_BRAKE_DET	
LV_RNG_L_REQ	LV_VAR_TCT	STATE_ETCU_CLU	

FUNCTION DESCRIPTION:

PV_AV and PV_CUS are the corrected driver interpretation and are used in the torque structure, CAN outputs and other functions.
The correction is a summation out of three parts, the basic, starting and gear shift correction.

Application conditions:

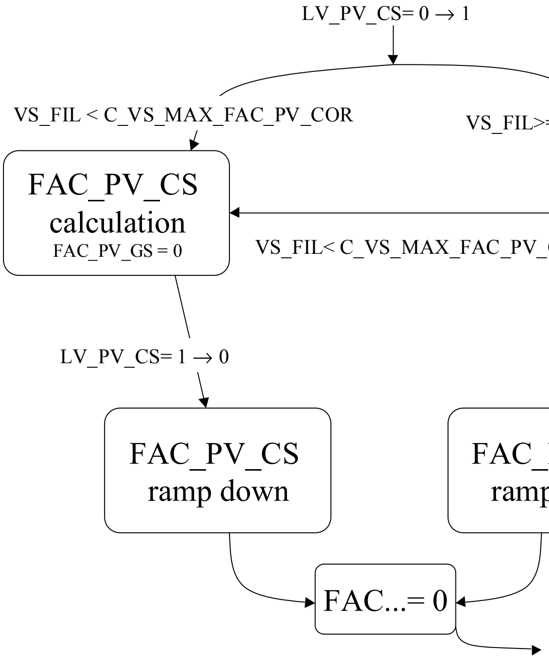
Initialisation: 0

Recurrence: 10ms

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0, set PV_AV=0, PV_CUS=0

Signal flow diagram:



Formula section:

```
If(1) LV_AT = 1
        Then(1)
            If(2) GEAR_INFO = 1 and VS_FIL < C_VS_MAX_FAC_PV_COR_AT
            Then(2)         LV_PV_CS = 1
            Else(2)         LV_PV_CS = 0
            Endif(2)
        Endif(1)
Elseif(1) LV_VAR_TCT = 1
        Then(3)
            If(4) STATE_ETCU_CLU = 03H (CLU_CLOSED)
                OR 04H (CLU_SLIP_CTRL) OR 05H (CLU_DYN_SLIP)
            Then(4)         LV_PV_CS = 0
            Else(4)         LV_PV_CS = 1
            Endif(4)
        Endif(3)
Endif(1)
```

```
If      LV_AT = 0   and   LV_VAR_TCT = 0
```

```
then    LV_PV_CS = LV_IM_CS_PN
Endif
```

Basic correction:

PV_AV = MIN ((PV_AV_RAW * (1 - FAC_PV_COR)); PV_AV_MAX_BRAKE_DET)

PV_CUS = MIN ((PV_CUS_RAW * (1 - FAC_PV_COR)); PV_AV_MAX_BRAKE_DET)

FAC_PV_COR = min(1 ; max(0 ; (FAC_PV_CS_COR + FAC_PV_GS_COR + FAC_PV_BAS_COR)))

FAC_PV_COR has to be limited in the range between zero and one, so that no amplification of the raw value exists!

Progression correction at drive off FAC_PV_CS_COR:

Calculation by getting active Function LV_PV_CS = 0 to 1:

```
If(1)      VS_FIL < C_VS_MAX_FAC_PV_COR
Then(1)    If(2)      LV_VAR_TCT = 1
           Then(2)    FAC_PV_CS_COR = IP_FAC_PV_CS_COR_TCT
           Else(2)    If(3)      LV_AT = 0
                      Then(3)    FAC_PV_CS_COR = IP_FAC_PV_CS_COR_MT
                      Else(3)    If(4)      LV_RNG_L_REQ = 1
                                 Then(4)    FAC_PV_CS_COR =
                                            IP_FAC_PV_CS_COR_AT_RNG_L
                                 Else(4)    FAC_PV_CS_COR =
                                            IP_FAC_PV_CS_COR_AT
                                            Endif(4)
                      Endif(3)
           Endif(2)
Else(1)    "see further definitions"
Endif(1)
```

Calculation by active Function LV_PV_CS = 1:

The calculation conditions remains from "Calculation by getting active Function:"
If there is a transition from VS_FIL < C_VS_MAX_FAC_PV_COR to VS_FIL ≥ C_VS_MAX_FAC_PV_COR during active clutch, then the calculation remains as well as VS_FIL < C_VS_MAX_FAC_PV_COR fullfilled condition . FAC_PV_CS_COR and FAC_PV_GS_COR doesn't exists at the same time.

Calculation triggered by leaving active Function LV_PV_CS = 1 to 0:

At transition LV_PV_CS 1 to 0 then FAC_PV_CS_COR is ramped down as followed:

- FAC_PV_CS_COR is basically calculated like the active function.

```
If(1)       $LV\_PV\_CS_{(n)} = 0$ and $LV\_PV\_CS_{(n-1)} = 1$
Then(1)     If(2)       $LV\_AT = 1$
            Then(2)     start decremented timer $T\_PV\_CS\_COR = C\_T\_FAC\_PV\_CS\_AT$
                        If(3)       $LV\_RNG\_L\_REQ = 1$
                        Then(3)     $FAC\_PV\_CS\_COR = IP\_FAC\_PV\_CS\_COR\_AT\_RNG\_L * T\_PV\_CS\_COR / C\_T\_FAC\_PV\_CS\_AT$
                        Else(3)     $FAC\_PV\_CS\_COR = IP\_FAC\_PV\_CS\_COR\_AT * T\_PV\_CS\_COR / C\_T\_FAC\_PV\_CS\_AT$
                        Endif(3)
            Else(2)     start decremented timer $T\_PV\_CS\_COR = C\_T\_FAC\_PV\_CS\_MT$
                        $FAC\_PV\_CS\_COR = IP\_FAC\_PV\_CS\_COR\_MT * \frac{T\_PV\_CS\_COR}{C\_T\_FAC\_PV\_CS\_MT}$
            Endif(2)
            Function is finished at $T\_PV\_CS\_COR = 0$.
Endif(1)
```

The progression correction is retriggered at detection of LV_PV_CS 0 to 1 during ramp.

Progression correction at starting FAC_PV_GS_COR *(only MT or TCT)*:

Calculation by transition Function LV_PV_CS = 0 to 1:

```
IF(1)       $VS\_FIL \geq C\_VS\_MAX\_FAC\_PV\_COR$
Then (1)    FAC_PV_GS_COR  calculation see bellow
Else (1)    FAC_PV_GS_COR is not calulated FAC_PV_CS_COR is calculated furthermore
endif
```

Calculation by active Function LV_PV_CS = 1:

```
IF(1)       $VS\_FIL \geq C\_VS\_MAX\_FAC\_PV\_COR$
Then(1) IF(2) $LV\_VAR\_TCT = 1$
    Then(2)     $FAC\_PV\_GS\_COR = IP\_FAC\_PV\_GS\_COR\_TCT * IP\_FAC\_VS\_PV\_GS\_COR\_TCT$
    Else (2)IF(3) $LV\_AT = 0$
```

```
                Then(3)    FAC_PV_GS_COR = IP_FAC_PV_GS_COR_MT *
                                           IP_FAC_VS_PV_GS_COR_MT
                Else(3)    FAC_PV_GS_COR = 0
Else(1)    FAC_PV_GS_COR = 0
Endif
```

Calculation leaving of the active function LV_PV_CS 1 to 0:

At transition LV_PV_CS 1 to 0 then FAC_PV_GS_COR is ramped down as followed:

- FAC_PV_GS_COR is basically calculated like the active function.

```
IF    $LV\_PV\_CS_{(n)} = 0$ and $LV\_PV\_CS_{(n-1)} = 1$
Then      start decremented timer T_PV_GS_COR = C_T_FAC_PV_GS
    FAC_PV_GS_COR = (IP_FAC_PV_GS_COR_x * IP_FAC_VS_PV_GS_COR_x) *
                                   T_PV_GS_COR / C_T_FAC_PV_GS
          Function is finished at T_PV_GS_COR = 0.
Endif
```

The progression correction is retriggered at detection of LV_PV_CS 0 to 1 during ramp.

Progression correction general FAC_PV_BAS_COR:

Dependig on the type of gearbox and state of reverse gear the general correction is calculated. This correction depends from N, VS_FIL and PV_AV_RAW.

```
IF        STATE_GEAR_REV_AT_AMT = 1 or STATE_GEAR_REV_CAN = 1
Then      FAC_PV_BAS_COR = IP_FAC_PV_BAS_COR_x * IP_FAC_VS_PV_BAS_COR_x
                           + IP_FAC_PV_BAS_COR_GEAR_REV_y
Else      FAC_PV_BAS_COR = IP_FAC_PV_BAS_COR_x * IP_FAC_VS_PV_BAS_COR_x
Endif

IF    LV_VAR_TCT = 1
then x = TCT
          y = TCT
else      if      LV_AT = 1
          then    y = AT
                  (in first recurrence x is initialised with AT)
                  Progression changed if mode of transmission is changed (AT_SPT...
                  sport mode, AT_MAN...manual mode), changes become only valid if
                  PV_AV is under or above a certain threshold to avoid jumps in PV_AV
                  signal.
                  if      [(STATE_ETCU_PROG_INFO = 2 and LV_VAR_BN = 1) or
                           (STATE_ETCU_PROG_INFO = 1 and LV_VAR_BN = 0) ]   and
```

```
                [PV_AV < C_THD_MIN_PV_AV or
                 PV_AV > C_THD_MAX_PV_AV]
            Then   x = AT_MAN
            Elseif [(STATE_ETCU_PROG_INFO = 1 and LV_VAR_BN = 1) or
                    (STATE_ETCU_PROG_INFO = 2 and LV_VAR_BN = 0) ]  and
                   [PV_AV < C_THD_MIN_PV_AV or
                    PV_AV > C_THD_MAX_PV_AV]

8.2.5 Kick-Down-Recognition

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_KD	V/O	0...1H	0...1	1	[-]
Flag for Kick-Down-Recognition (internally recognized from both PVS-voltages)					

Input data:

	STATE_PVS_DIAG		

FUNCTION DESCRIPTION:

The recognition of kick-down (LV_KD) occurs, if the filtered pedal values (V_PVS_FIL_1) of channel one is exceed the respective threshold values C_V_PVS_THD_KD_x.
Because of more jitters at Channel two only Channel one is used.

Application conditions:

Initialisation: 0

Recurrence: 10ms

Activation: LV_IGK = 1

Deactivation: LV_IGK = 0, set LV_KD=0

Formula section:

```
If(1)      STATE_PVS_DIAG = PVS_NO_ERROR   or
           STATE_PVS_DIAG = PVS_LIH_PRED
Then(1)
    If(2)  V_PVS_FIL_1 > C_V_PVS_THD_KD        and    LV_KD = 0
    Then(2)        LV_KD = 1
    Else(2)
       If (3) V_PVS_FIL_1 < C_V_PVS_THD_KD - C_V_PVS_THD_KD_HYS        and
              LV_KD = 1

       Then(3)     LV_KD = 0
       Else(3)     LV_KD = 1
Else(1)    LV_KD = 0
Endif
```

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_V_PVS_THD_KD	1	0...FFH	0...4.998	0.0195313	[V]
Pedal value to kick-down-recognition (Channel 1)					
C_V_PVS_THD_KD_HYS	1	0...FFH	0...4.998	0.0195313	[V]
Hysteresis of kick down recognition Channel 1					

8.2.6 Selection of maximum pedal value

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
PV_MAX	V/O	0...FFH	0...99.60937	0.390625	[%]
Maximum selection of Pedal value interpretation

Pedal value interpretation of Cruise control					
PV_CRU_1	V	0...FFH	0...99.60937	0.390625	[%]
Pedal value interpretation of Cruise control temporary					
PV_CRU_RAW	V	0...FFH	0...99.60937	0.390625	[%]
Pedal value interpretation of Cruise control rawsignal					

Input data:

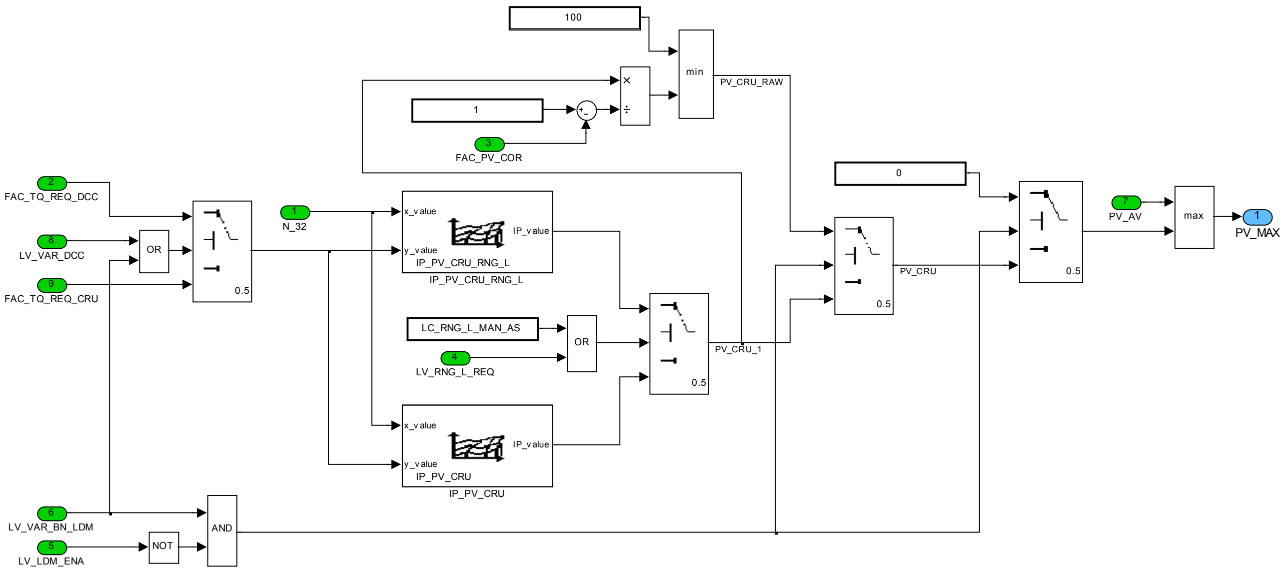
N_32	FAC_TQ_REQ_CRU	LV_LDM_ENA	LC_RNG_L_MAN_AS
LV_RNG_L_REQ	FAC_TQ_REQ_DCC	LV_VAR_DCC	LV_VAR_BN_LDM

FUNCTION DESCRIPTION:

For CAN messages during cruise control and other functions the maximum selection between Pedal value and interpretation of cruise control charge request is needed.

The maps IP_PV_CRU__RNG_L and IP_PV_CRU have to be inverse maps of IP_FAC_TQ_REQ_RNG_L and IP_FAC_TQ_REQ_DRIV.

Signal flow diagram:



Calibration data:

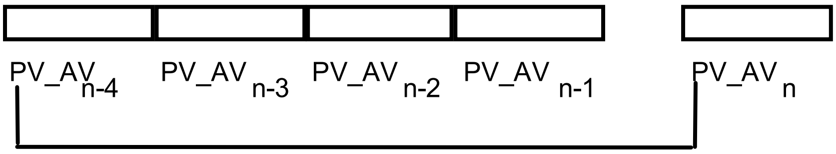
Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
IP_PV_CRU	8*8	0...FFH	0...99.60937	0.390625	[%]
LDPM_N__FAC_TQ_REQ_DRIV	8	0...FFH	0...8160	32	[rpm]
LDPM_FAC_TQ_CRU_DCC	8	0...FFFFH	0...1.99996	0.0305e-3	[-]
Scaling factor for requested torque at clutch from driver					
IP_PV_CRU_RNG_L	8*8	0...FFH	0...99.60937	0.390625	[%]
LDPM_N__FAC_TQ_REQ_DRIV	8	0...FFH	0...8160	32	[rpm]
LDPM_FAC_TQ_CRU_DCC	8	0...FFFFH	0...1.99996	0.0305e-3	[-]
Scaling factor for requested torque at clutch from driver in low range mode					

8.2.7 Calculation of PV_AV gradient:

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
PV_AV_GRD	V/O	0...FFH	-1250... 1240.23437	9.765625	[%/s]
Pedal value gradient					

The PV_AV gradient is calculated at intervals of 10 ms.
To this effect, the PV_AV values are written into the ring buffer. Thus, the last four PV_AV values are available in addition to the current PV_AV value.



The PV_AV gradient is based on a PV_AV change over 40 ms.

The PV_AV_GRD reflects the gradient of the actual driver's demand prior to the corrections.

$$PV\_AV\_GRD = (PV\_AV_{n} - PV\_AV_{n-4}) * 25$$

8.3 Pedal value sensor diagnosis (PVS_x)

FUNCTION DESCRIPTION:

General information:

The following diagnosis are performed:

- Diagnosis of sensor–supply voltage VCC_PVS_i
- PVS-synchronization control (RATIO-Check)
- Signal range check low and high (SRCL, SRCH)
- PVS double error
- Plausibility between brake / PVS

Input data:

VCC_PVS_1	V_PVS_1	LV_IGK	N
VCC_PVS_2	V_PVS_2	VS	PV_AV
LV_IM_BLS	LV_IM_BTS	BRAKE_PRS	LV_BRAKE_DET
LV_ERR_BLS_PLAUS	STATE_BRAKE_PRS		

8.3.1 Global PVS system error LV_ERR_PVS

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_PVS	O/V	0...1H	0...1	1	[-]
Global PVS system error					

Description:

The global error LV_ERR_PVS is set if at least one PVS error is set.

Application conditions:

Initialisation: 0 at LV_IGK 0->1 **or** reset

Recurrence: 10ms

Activation: LV_IGK = 1

Formula section:

If LV_ERR_V_REF_x = 1 *// 1 or 2*

or LV_ERR_PVS_x = 1

or LV_ERR_PVS_RATIO = 1

Then LV_ERR_PVS = 1

Else LV_ERR_PVS = 0

Endif

8.3.2 Diagnosis of sensor-supply voltage VCC_PVS_i

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_V_REF_1	O/V	0...1H	0...1	1	[-]
Present error PVS V_REF					
LV_ERR_V_REF_2	O/V	0...1H	0...1	1	[-]
Present error PVS V_REF					
LV_CDN_DIAG_V_REF_1	O/V	0...1H	0...1	1	[-]
Diagnosis condition PVS V_REF					
LV_CDN_DIAG_V_REF_2	O/V	0...1H	0...1	1	[-]
Diagnosis condition PVS V_REF					
ERR_SYM_V_REF_1	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	1	[-]
Detected symptom PVS V_REF					
ERR_SYM_V_REF_2	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	1	[-]
Detected symptom PVS V_REF					
LV_END_DIAG_V_REF_1	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS V_REF					
LV_END_DIAG_V_REF_2	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS V_REF					

General information:

The PVS sensor supply voltage 5V [Range 0...9.9902 V] is compared with the measured actual supply voltage every 10 ms (forming differences).

x = 1 and 2

Description:

If diagnosis condition is reached and error symptom is detected ERR_SYM_V_REF_i is set. After the debounce LV_ERR_V_REF_1 (at error channel 1), LV_ERR_V_REF_2 (at error channel 2) are set. The faulty channel is not evaluated during this driving cycle.

Remark:

During the debounce time (ERR_SYM_V_REF_x = SYM_3) the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").

Error-symptoms are defined to this diagnosis function as following :

```
 │  │  │  └─> -                                   (= SYM_0)
 │  │  └───> -                                    (= SYM_1)
 │  └─────> -                                     (= SYM_2)
 └───────> PVS - Voltage controller faulty        (= SYM_3)
```

Application conditions:

Initialisation: all 0 at LV_IGK 0->1 **or** reset

Recurrence: 10ms

Activation:

```
If      LV_IGK = 1                  and
        LV_ERR_V_REF_x = 0
Then    LV_CDN_DIAG_V_REF_x = 1
Else    LV_CDN_DIAG_V_REF_x = 0
Endif
```

Formula section:

Error detection PVS-Channel:

```
If(1)       | 5V – VCC_PVS_x | > C_VCC_DIF_PVS
Then(1)     ERR_SYM_V_REF_x = SYM_3
Set of LV_ERR_V_REF_1 (or 2) and LV_ERR_PVS:
    If(2)       ABC counter reaches max
                    // CTR_ABC_V_REF_x >=  C_ABC_MAX_V_REF_x
    Then(2)     LV_ERR_V_REF_x =  1       // set for this DC
    Endif(2)
Else(1)     ERR_SYM_V_REF_x = NO_SYM
Endif(2)
```

Calculation end of diagnosis

LV_END_DIAG_V_REF_x is calculated by error management

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_VCC_DIF_PVS	1	0...3FFH	0...9.9902	9.7656e-3	[V]
max. permissible variance of the supply voltage of 10V					
C_ABC_INC_V_REF_1	1	0...FFH	0...255	1	[-]
Anti-bounce increment value (x=1,2)					
C_ABC_INC_V_REF_2	1	0...FFH	0...255	1	[-]
Anti-bounce increment value (x=1,2)					
C_ABC_MAX_V_REF_1	1	1...FFH	1...255	1	[-]
Anti-bounce maximum value (x=1,2)					
C_ABC_MAX_V_REF_2	1	1...FFH	1...255	1	[-]
Anti-bounce maximum value (x=1,2)					

8.3.3 PVS-synchronization control (RATIO-Check)

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_PVS_RATIO	O/V	0...1H	0...1	1	[-]
Present error PVS_RATIO					
LV_CDN_DIAG_PVS_RATIO	O/V	0...1H	0...1	1	[-]
Diagnosis condition PVS_RATIO					
ERR_SYM_PVS_RATIO	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	1	[-]
Detected symptom PVS_RATIO					
LV_END_DIAG_PVS_RATIO	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS_RATIO					

Description:

In order to have an error free system the pedal value sensor voltages V_PVS_x may not deviate more than IP_PVS_RATIO_HYS (V_PVS_2 must be doubled!) from each other. The smaller PVS-voltage serves as a break point for the characteristic curve.

The RATIO-Check is then only carried out if both channels are error - free.

ERR_SYM_PVS_RATIO is set when the error conditions are present; after debounce the error bit LV_ERR_PVS_RATIO is set.

During the debounce time (ERR_SYM_PVS_RATIO = SYM_3) the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").

Error-symptoms are defined to this diagnosis function as following :

```
|_|_|_|_|
 | | | └─> -                            (= SYM_0)
 | | └───> -                            (= SYM_1)
 | └─────> -                            (= SYM_2)
 └───────> PVS voltages not plausible   (= SYM_3)
```

Application conditions:

Initialisation: all 0 at LV_IGK 0->1 **or** reset

Recurrence: 10ms

Activation:

```
If      LV_IGK = 1                  and
        LV_ERR_PVS = 0              and
Then    LV_CDN_DIAG_PVS_RATIO = 1
Else    LV_CDN_DIAG_PVS_RATIO = 0
Endif
```

Formula section:

Error detection:

```
V_PVS_MIN  =  Min(V_PVS_1, 2 * V_PVS_2)
If(1)       | V_PVS_1 - (2 * V_PVS_2) |  >  IP_PVS_RATIO_HYS__V_PVS_MIN
Then(1)     ERR_SYM_PVS_RATIO = SYM_3
Set of LV_ERR_PVS_RATIO and LV_ERR_PVS:
    If(2)           ABC counter reaches max
                        // CTR_ABC_PVS_RATIO  >=  C_ABC_MAX_PVS_RATIO
    Then(2)         LV_ERR_PVS_RATIO =       1        // set for this DC
    Endif(2)
Else(1)     ERR_SYM_PVS_RATIO = NO_SYM
Endif(1)
```

Calculation end of diagnosis

LV_END_DIAG_PVS_RATIO is calculated by error management

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit

LV_END_DIAG_PVS_1	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS					
LV_END_DIAG_PVS_2	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS					

General information:

Both diagnosis are only performed if the channel is not debounced as faulty (x = 1 and 2).

- The **SRCH** diagnosis is to detect a short to Vbatt error.
- The **SRCL** diagnosis is to detect a short to Ground /open load error.

Description:

SRCH diagnosis:

The sensor voltage must lie below the permissible voltage limits (C_V_PVS_MAX_DIAG_x) for an error-free system. ERR_SYM_PVS_x is set while the error symptom is present, the bits LV_ERR_PVS_X are set after debounce. The channel x is no longer evaluated during this driving cycle.

SRCL diagnosis:

The sensor voltage must lie upper the permissible voltage limits (C_V_PVS_MIN_DIAG_x) for an error-free system. ERR_SYM_PVS_x is set while the error symptom is present, the bits LV_ERR_PVS_X are set after debounce. The channel x is no longer evaluated during this driving cycle.

Remark:

During the debounce time (ERR_SYM_PVS_x = SYM_0 or SYM_1) and while error conditions are true the PV_AV value is limited upwards to the last valid PVS-value (see chapter 4 "Determination of accelerator pedal value").

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> Short circuit to Vbatt                (= SYM_0)
 │ │ └───> Short circuit to GND or open load     (= SYM_1)
 │ └─────> -                                     (= SYM_2)
 └───────> -                                     (= SYM_3)
```

Application conditions:

Initialisation: all 0 at LV_IGK 0->1 **or** reset

Recurrence: 10ms

Activation:

```
If      LV_IGK = 1              and
        LV_ERR_PVS_x = 0        and
        LV_ERR_V_REF_x = 0
Then    LV_CDN_DIAG_PVS_x = 1
Else    LV_CDN_DIAG_PVS_x = 0
Endif
```

Formula section:

Short circuit to Vbatt:

```
If(1)        V_PVS_x > C_V_PVS_MAX_DIAG_x          (X = 1,2)
Then(1)      ERR_SYM_PVS_x = SYM_0
Short circuit to GND or open load
Else(1)If(2)     V_PVS_x < C_V_PVS_MIN_DIAG_x
    Then(2)      ERR_SYM_PVS_x = SYM_1
    PVS voltage is in valid range
    Else(2)      ERR_SYM_PVS_x = NO_SYM
    Endif(2)
Endif(1)
```

Calculation end of diagnosis and present failure

LV_ERR_PVS_x and LV_END_DIAG_PVS_x are calculated by error management

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_V_PVS_MAX_DIAG_1	1	0...3FFH	0...4.99511	4.8828e-3	[V]

8.3.5 PVS – Double error

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_PVS_DOUBLE	O/V	0...1H	0...1	1	[-]
Present error PVS DOUBLE					
LV_CDN_DIAG_PVS_DOUBLE	O/V	0...1H	0...1	1	[-]
Diagnosis condition PVS DOUBLE					
ERR_SYM_PVS_DOUBLE	O/V	0H 1H 2H 4H 8H	NO_SYM SYM_0 SYM_1 SYM_2 SYM_3	1	[-]
Detected symptom PVS DOUBLE					
LV_END_DIAG_PVS_DOUBLE	O/V	0...1H	0...1	1	[-]
End of diagnosis PVS DOUBLE					

Description:

In order to illuminate the MIL if both PVS channels are detected as faulty there is a seperate error flag LV_ERR_PVS_DOUBLE (all other PVS errors shall be calibrated as non – MIL relevant).

If a channel is already detected as faulty (through sensor supply, SRCH, SRCL) and afterwards another sensor error appears, then the system goes into the PVS limp home for this driving cycle (see limited dynamic 2).

Error-symptoms are defined to this diagnosis function as following :

```
┌─┬─┬─┬─┐
└─┴─┴─┴─┘
 │ │ │ └─> -                          (= SYM_0)
 │ │ └───> -                          (= SYM_1)
 │ └─────> -                          (= SYM_2)
 └───────> PVS - Double error         (= SYM_3)
```

Application conditions:

Initialisation: all 0 at LV_IGK 0->1 **or** reset

Recurrence: 10ms

Activation:

```
If      LV_IGK = 1                    and
        LV_ERR_PVS_DOUBLE = 0
Then    LV_CDN_DIAG_PVS_DOUBLE = 1
        LV_END_DIAG_PVS_DOUBLE = 1
Else    LV_CDN_DIAG_PVS_DOUBLE = 0
Endif
```

Formula section:

If [LV_ERR_V_REF_1 = 1 **or**

```
        LV_ERR_PVS_1 = 1 ]        and
        [ LV_ERR_V_REF_2 = 1      or
        LV_ERR_PVS_2 = 1 ]
Then    ERR_SYM_PVS_DOUBLE = SYM_3
        LV_ERR_PVS_DOUBLE = 1          //set direct
Endif
```

8.3.6 Plausibility between PVS signal and brake detection

PV_AV_MAX_BRAKE_DET	O/V	0...FFH	0...99.60937	0.390625	[%]
PV_AV_MAX_BRAKE_DET					

General information:

This function is to detect a mechanical stucking PVS sensor or a break actuation while the gas pedal is already activated.
The diagnosis algorithm can be configured with C_PVS_BLS_BTS_PLAUS_CONF:

0 Function is disabled
1 Function is enabled but no error entry
2 Function is enabled with error entry

Description:

Error detection is based on a plausibility check brake/pedal value.

LV_PVS_BLS_NOT_PLAUS_ACT is using the same debounce calibration data like LV_ERR_PVS_BLS_NOT_PLAUS but without error entry.
If the configuration is switched within the active engine run after an active error was present then the error is not reseted until the error memory is cleared.

Error-symptoms are defined to this diagnosis function as following :

```
☐☐☐☐
 |  |  |  └─> -                                  (= SYM_0)
 |  |  └───> -                                   (= SYM_1)
 |  └─────> -                                    (= SYM_2)
 └───────> PVS to Brake not plausible            (= SYM_3)
```

Application conditions:

Initialisation: at LV_IGK 0->1 **or** reset **or** at clearing error memory:
PV_AV_MAX_BRAKE_DET = 100%, all other output 0

Recurrence: 10 ms

```
Activation:  If    C_PVS_BLS_BTS_PLAUS_CONF = 0   or
                   LV_IGK = 0
             Then       Function is disabled  and
                        PV_AV_MAX_BRAKE_DET = 100%  and
                        LV_CDN_DIAG_PVS_BLS_NOT_PLAUS = 0
             Else       function is active

Status of PVS-diagnosis					
LV_DET_ERR_PVS	V	0...1H	0...1	1	[-]
Logical value (set, if a PVS-error is present)					

General information:

Depending if there is a ratio or single or double PVS error, different limp homes are applied.

PVS_LIH_PRED: Is active during debounce – time is active. The pedal value is frozen in rising direction.

PVS_LIH_x_PRED: Is active if only one channel is detected as faulty and the remaining channel was not in idle detection range for a calibratable time. Pedal value is 0.

PV_LIH_x: Is active if only one channel is detected as faulty and the remaining channel was in idle detection range for a calibratable time. Limited dynamic 1 is applied (= Lower engine speed limitation and if brake or brake error is active then pedal value is 0).

PVS_LIH_MIN: Is active if ratio error is present. Pedal value is selected as a MIN-selection.

PVS_DBL_ERROR: Is active if both channels are detected as faulty or with a present ratio error and a high range error of the observed (=MIN) channel. Limited dynamic 2 is applied (= pedal value is 0, Idle speed with a higher idle speed setpoint. If brake or brake error is active then the normal idle speed setpoint is applied).

PVS_LIH_BLS: Is active if limited dynamic 1 or 2 is active and brake is detected or brake failure is present. Then pedal value is 0

Signal flow diagram:

PVS - Limp

8.4.1 PVS limp-home limited dynamic 1

Description:

The dynamic of the vehicle is limited in order secure controlled vehicle reactions and adequately longer reaction times for the driver when **one** of the both PVS-channels are detected as faulty.
When brake activity or an brake error is detected a lower engine speed limitation is active.
If the error memory is cleared the limp home LV_DYN_LIM_1_ACT is set to 0 as well.

Formula section:

```
If(1)     STATE_PVS_DIAG =     PVS_LIH_1         or
                               PVS_LIH_2         or
                               PVS_LIH_MIN       or
                               PVS_LIH_1_PRED    or
                               PVS_LIH_2_PRED    or
                               PVS_LIH_BLS
Then(1)   LV_DYN_LIM_1_ACT = 1
          If (2)      STATE_PVS_DIAG = PVS_LIH_BLS
          Then (2)    LV_MTC_LIH_ACT = 1          //Limp home engine speed limit
          Else (2)    LV_MTC_LIH_ACT = 0
          Endif (2)
Else(1)   LV_DYN_LIM_1_ACT = 0
Endif (1)
```

8.4.2 PVS limp-home limited dynamic 2

Description:

The dynamic of the vehicle is limited in order secure controlled vehicle reactions and adequately longer reaction times for the driver when **both** channels are detected as faulty.
If an error free pedal value sensor signal is no longer present “Limited dynamic 2” is set.
With the Limited dynamic 2 the vehicle is more handicaped than with Limited dynamic 1, the vehicle is driven by two idle speed setpoints.
If the error memory is cleared the limp home LV_DYN_LIM_2_ACT is set to 0 as well.

Formula section:

```
If(1)     STATE_PVS_DIAG = PVS_DOUBLE_ERROR
Then(1)   LV_DYN_LIM_2_ACT = 1
          LV_MTC_LIH_ACT = 1      (see “Engine speed limit coordination)
          If(2)       LV_BRAKE_DET = 1          or
                      LV_ERR_BLS_PLAUS = 1
          Then(2)     LV_N_SP_IS_LIH_ACT = 0              (PV_AV = 0)
          Else(2)     LV_N_SP_IS_LIH_ACT = 1
```

```
        Endif(2)
Else(1) LV_DYN_LIM_2_ACT = 1
Endif (1)
```

8.4.3 Determination of STATE_PVS_DIAG

Description:

The PVS Value selection (See also: ”Determination of accelerator pedal value, Value selection”) and the PVS-Limp home determination is based on the status value: STATE_PVS_DIAG.

Formula section:

Status of non-debounced PVS_error

```

FUNCTION DESCRIPTION:

General information:

In principle both brake light switch and brake test switch must be active at each braking. An edge mismatch between the brake light switch and brake test switch signal of +/- 20 µs can occur. A defective BTS is therefore detected by means of the following function.

Description:

The following errors can be detected:

- BLS implausible

```

Scaling factor for requested torque at clutch from driver in low range mode					

9.1.1 FUNCTION DESCRIPTION:

General information:

The scaling factor FAC_TQ_REQ_DRIV is the interpretation of the driver torque demand depending on engine speed and pedal value. Depending on gear mode LV_RNG_L (LV_RNG_L =1 if low range is engaged) two maps can be calibrated with different pedal value interpretation for normal and low range mode.

LV_FCUT_CDN_PUC_PL	V	0...1H	0...1	1	[-]
External authorization of sequential or 2-step-method at transition from PUC to PL					

Input data:

LV_IGK	N_DIF_COR	N_GRD	TQI_SP_SLOW
LV_PU	LV_PUC	LV_PL	LV_IS
LV_DT	LV_AT	GEAR	LV_ES
LV_ST	T_SEG_AV	STATE_ENG	

FUNCTION DESCRIPTION:

General information:

At transition from trailing throttle to trailing throttle fuel cut off, torque jumps generally occur at trailing throttle fuel cut off which are noticeable as jerks in the vehicle. To reduce the torque at this transition, the ignition timing is retarded and the combustion air is adjusted to small values.

These procedures however do not always achieve the required torque reduction, because ignition timing and combustion air can only be reduced that far, that jerk free engine operation is still possible.

To support the above mentioned torque reduction measurement, it is possible that the injection is switched on and/or switched off for individual cylinders within a defined number of engine cycles (on and/or deactivation) incase of PUC and reentry into Idle.

The engine speed gradient is monitored in order to cancel the selective reentry idle at rapid engine speed drops. If the engine speed gradient is below the threshold C_N_GRD_MIN_SEL_RIS or N_DIF_COR is greater than or equal to C_N_DIF_MAX_SEL_RIS then all cylinders are immediately activated (-> CASE 2). The same happens if during selective reentry there is a significant increase of torque request, e.g. TQI_SP_SLOW_DIF is higher than C_TQI_SP_SLOW_DIF_MAX (-> CASE 2 and 3).

10.1.1 Calculation of TQI_SP_SLOW dynamic

Description:

This value is needed for fast restart of fuel feed.

Application conditions:

Initialisation: TQI_SP_SLOW_DIF = 0

Recurrence: 20ms

Activation: at every engine state

Deactivation: -

Formula section:

TQI_SP_SLOW_DIF = TQI_SP_SLOW(n) - TQI_SP_SLOW(n-1)

10.1.2 NR_PAT_SEL_CYL calculation

Recurrence: Segment-synchronous

10.1.2.1 Calculation of T_OSC_DT:

```
if LV_AT = 0
then        T_OSC_DT = ID_T_OSC_DT(GEAR)
else        T_OSC_DT = 0
endif
```

Description (Example for 4-cylinder engines)

At a transition LV_PU → LV_PUC,. LV_PUC → LV_IS and LV_PUC → LV_PL , 32 cycles (8 x 720°CRK) in case of a 4-cylinder can be influenced. To realize this, a table ID_PAT_SEL_CYL contains the sequences of injection patterns (0...7), predefined in the table ID_PAT_IND. “ NR_SEL_CYL ” means the logical number in the shut off sequence (1...8).

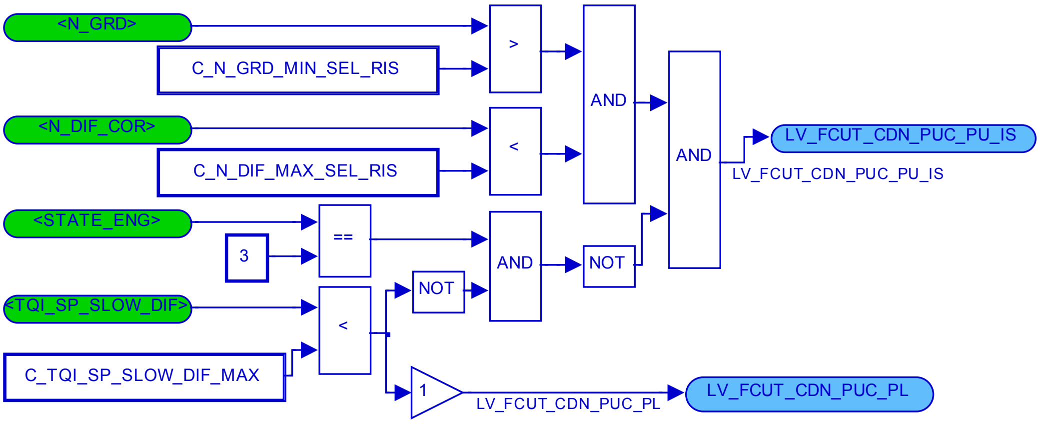
Application conditions:

Activation:

At active cylinder specific transitions LV_SEL_CYL =1

10.1.2.2 Calculation of exit conditions for running sequences (CASE 2 and CASE 3)

These bits are needed to terminate running sequences.



10.1.2.3 Transition from PU → PUC (CASE 1)

The entrance in the transition pattern for PUC follows, when all conditions for PUC are fulfilled.

```
if LC_ENA_FCUT_AJ = 0 or LV_AT = 1
        then if (LV_DT = 0 and LC_INH_DT_PU = 0)
                then    NR_SEL_CYL = 8
                        NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                else    NR_SEL_CYL starts from 1 and is incremented every 720 °KW
                        until its maximum value. In case of deactivation NR_SEL_CYL
                        is reset to 1.
        else
        if (LV_DT = 0 and LC_INH_DT_PU = 0)
        then    NR_SEL_CYL = 8
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                T_FCUT_AJ is initialized with T_OSC_DT / 2
        else    NR_SEL_CYL = C_NR_SEL_CYL_1
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                LV_SEL_CYL = 1
                if T_FCUT_AJ - T_SEG_AV = 0
                then    NR_SEL_CYL = 8
                        NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                        T_FCUT_AJ is initialized with T_OSC_DT / 2
                        LV_SEL_CYL = 0
                else    $NR\_SEL\_CYL_n = NR\_SEL\_CYL_{n-1}$
                T_FCUT_AJ is decremented
                end
        end
end
```

The transition is completed, when the last of the 32 transition cycles has run out. The pattern index applied as last one has to be the highest used for the cut-off strategy , that means all cylinders are cut off. NR_SEL_CYL is reset to 1.

If in the course of the transition pattern or while the time sequence an engine operating state change to PU, PL or IS happens, all cylinders are switched on immediatedly (pattern index : “0“), NR_SEL_CYL is reset to 1.

10.1.2.4 Transition from PUC → IS or PUC → PU (CASE 2)

The entrance in the transition pattern for RIS (reactivation idle speed) follows, when all conditions for IS resp. PU are fulfilled.

```
if LC_ENA_FCUT_AJ = 0 or LV_AT = 1
then    if (LV_DT = 0 and LC_INH_DT_PU = 0) or LV_FCUT_CDN_PUC_PU_IS = 0
        then    NR_SEL_CYL = 8
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
        else    NR_SEL_CYL starts from 1 and is incremented every 720 °KW
                until its maximum value.

else
        if (LV_DT = 0 and LC_INH_DT_PU = 0) or LV_FCUT_CDN_PUC_PU_IS = 0
        then    NR_SEL_CYL = 8
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                T_FCUT_AJ is initialized with T_OSC_DT / 2
        else    NR_SEL_CYL = C_NR_SEL_CYL_2
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                LV_SEL_CYL = 1
                if T_FCUT_AJ - T_SEG_AV = 0
                then    NR_SEL_CYL = 8
                        NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                        T_FCUT_AJ is initialized with T_OSC_DT / 2
                        LV_SEL_CYL = 0
                else    NR_SEL_CYL$_n$ = NR_SEL_CYL$_{n-1}$
                        T_FCUT_AJ is decremented
                end
        end
end
```

The transition pattern is completed, when the last cycle of the 32 transition cycles has run out. The pattern number applied as last one has to be „0“ , that means all cylinders are switched on. NR_SEL_CYL is reset to 1.

If in the course of the transition pattern or while time sequence a engine operating state change to PUC happens, the transition pattern or time sequence for RIS runs out to its end and after that the transition pattern for PUC starts, if required.

If the function is deactivated (see deactivation conditions), all cylinders are switched on immediatedly. In case of deactivation NR_SEL_CYL is reset to 1.

10.1.2.5 Transition from PUC → PL (CASE 3)

The entrance in the transition pattern for RPL (reactivation part load) follows, when all conditions for PL are fulfilled.

```
if LC_ENA_FCUT_AJ = 0 or LV_AT = 1
then    if (LV_DT = 0 and LC_INH_DT_PU = 0) or LV_FCUT_CDN_PUC_PL = 0
        then    NR_SEL_CYL = 8
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
        else    NR_SEL_CYL starts from 1 and is incremented every 720 °KW
                until its maximum value. In case of deactivation NR_SEL_CYL
                is reset to 1.

else
        if (LV_DT = 0 and LC_INH_DT_PU = 0) or LV_FCUT_CDN_PUC_PL = 0
        then    NR_SEL_CYL = 8
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                T_FCUT_AJ is initialized with T_OSC_DT / 2
        else    NR_SEL_CYL = C_NR_SEL_CYL_3
                NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                LV_SEL_CYL = 1
                if T_FCUT_AJ - T_SEG_AV = 0
                then    NR_SEL_CYL = 8
                        NR_PAT_SEL_CYL = ID_PAT_SEL_CYL(NR_SEL_CYL)
                        T_FCUT_AJ is initialized with T_OSC_DT / 2
                        LV_SEL_CYL = 0
                else    $NR\_SEL\_CYL_n = NR\_SEL\_CYL_{n-1}$
                        T_FCUT_AJ is decremented
                end
        end
end
```

The transition pattern is completed, when the last cycle of the 32 transition cycles has run out. The pattern number applied as last one has to be „0“ , that means all cylinders are switched on. NR_SEL_CYL is reset to 1.

If in the course of the transition pattern a engine operating state change to PUC happens, the transition pattern for reentry PL runs out to its end and after that the transition pattern for PUC starts, if required. If the function is deactivated, all cylinders are switched on immediatedly.

Deactivation:

- LV_ES = 1 **or**
- LV_ST = 1 **or**
- LV_IGK = 0 **or**
- Pattern completed

At passive cylinder specific transitions:

LV_SEL_CYL = 0 and NR_SEL_CYL = 1

T_FCUT_AJ is initialized with T_OSC_DT / 2

Transition tables

The transition pattern indexes are adjustable in the table ID_PAT_SEL_CYL. There are 8 fade out patterns which are applicable per transition table (definition of patterns see chapter 7, “Cylinder shut off with pattern“).

The following cases are distinguished in ID_PAT_SEL_CYL:

CASE 1: Trailing throttle fuel cut off (PUC)
CASE 2: Restart IS (RIS)
CASE 3: Restart PL (RPL)

Example for shut-off sequences with 8 levels and a shut off pattern for the 4 next injections (4-cylinder)

CASE_SEL_CYL↓ NR_SEL_CYL →

	1	***2***	***3***	***4***	***5***	***6***	***7***	***8***
1	1	1	2	2	3	3	4	4
2	5	5	5	6	6	7	7	0
3	5	6	6	7	0	0	0	0

According shut off sequences: (0 : Injection, 1: no injection)

Case 1 1 0 0 0 1 0 0 0 1 0 1 0 1 0 1 0 1 0 1 1 1 0 1 1 1 1 1 1 1 1 1 1

Case 2 0 1 1 1 0 1 1 1 0 1 1 1 0 1 0 1 0 1 0 1 0 0 0 1 0 0 0 1 0 0 0 0

Case 3 0 1 1 1 0 1 0 1 0 1 0 1 0 0 0 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Formula section:

NR_PAT_SEL_CYL = ID_PAT_SEL_CYL

Application assistances

Handling of reactivation functions (out of PUC):

Injection (Reactivation fuel feed) : To ensure, that all cylinders get at least once the same amount of TI_ADD_REAC, TI_ADD_REAC is not decremented as long as sequential transition PUC → IS resp. PUC → PL is ongoing.

Ignition: The according reactivation functions are not concerned by sequential transition functions.

Handling of engine states:

The detection of PU, PUC, PL and IS is not concerned by sequential transition functions.

11.1 ECM2 - Requirements to Infrastructure

Export actions:

ACTION_INFR_GetVPVSMON(OUT <V_pvs_1_mon>, OUT<V_pvs_2_mon>)
Readout both PVS channels
ACTION_INFR_GetVTPSMON(OUT <V_tps_1_mon>, OUT<V_tps_2_mon>)
Readout both TPS channels
ACTION_INFR_GetTSEGSWMON(OUT <T_seg_sw_mon>)
Readout segment time from Infrastructure timer
ACTION_INFR_ResetTSEGSWMON()
Reset segment time from Infrastructure timer

Description for actions:

ACTION_INFR_GetVPVSMON(V_pvs_1_mon, V_pvs_2_mon)					
Readout both PVS channels with a defined coherency.					
Name	Type	Hex. Limits	Phys. Limits	Resol.	Unit
V_pvs_1_mon	OUT	0 ... 3FFH	0 ... 4.9952	5/1024	V
Channel 1 of PVS for monitoring					
V_pvs_2_mon	OUT	0 ... 3FFH	0 ... 4.9952	5/1024	V
Channel 2 of PVS for monitoring					

ACTION_INFR_GetVTPSMON(V_tps_1_mon, V_tps_2_mon)					
Readout both TPS channels with a defined coherency.					
Name	Type	Hex. Limits	Phys. Limits	Resol.	Unit
V_tps_1_mon	OUT	0 ... 3FFH	0 ... 4.9952	5/1024	V
Channel 1 of TPS for monitoring					
V_tps_2_mon	OUT	0 ... 3FFH	0 ... 4.9952	5/1024	V
Channel 2 of TPS for monitoring					

ACTION_INFR_GetTSEGSWMON(T_seg_sw_mon)					
Readout segment time from Infrastructure timer					
Name	Type	Hex. Limits	Phys. Limits	Resol.	Unit
T_seg_sw_mon	OUT	0 ... FFFFFFFH	0 ... 268435455	1	µs
segment time determined by means of an infrastructure timer					

ACTION_INFR_ResetTSEGSWMON()
Reset segment time from Infrastructure timer

FUNCTION DESCRIPTION:

General information:

ACTION_INFR_GetVPVSMON reads out the two PVS channels of an analogue pedal value sensor with a defined coherency/coincidence and diversity level.
To define the scope of the *Process Monitoring* as wide as possible, the voltages shall be a direct output of the ADCs. As far as possible, the used program syntax must prevent the action from returning consistent wrong information for both channels. This means for wrong PVS**:** Signals are too high and V_pvs_1_mon would be double of V_pvs_2_mon.

ACTION_INFR_GetVTPSMON reads out the two TPS channels of an analogue throttle position sensor with a defined coherency/coincidence diversity level.
To define the scope of the *Process Monitoring* as wide as possible, the voltages shall be a direct output of the ADCs. As far as possible, the used program syntax must prevent the action from returning consistent wrong information for both channels. This means for wrong TPS: Signal V_tps_2_mon would be Vref - V_tps_1_mon.

ACTION_INFR_GetTSEGSWMON reads out the segment time. The segment time is generated by a timer solution in the infrastructure and shall be independent of the level-1-timer- solution in ENSD part (Engine position and speed determination – aggregate). Reason is that the segment time T_SEG_SW_MON is necessary to generate an engine speed signal that is independent from N_32 (generated from T_SEG). It is used in the module ‚Monitoring of engine speed‘ of the aggregate ECM2.

The timer is triggered by crankshaft segments and produces time stamps for the trigger events. The maximum delay between event and time stamp, i.e. the temporal difference of determination/calculation of T_SEG and T_SEG_SW_MON, must be less than 300 µs (split into an invariable part of 50 µs and a maximum variable part of 250µs). From the time stamps the signal T_SEG_SW_MON is determined; its resolution is 1 µs.
The precision of the signal, i.e. the maximum allowed difference in value of the segment time level 2 to level 1, has to be 5 % of the actual segment time T_SEG.

Furthermore, after first initialisation of the segment time T_SEG_SW_MON while power on of ECU, its value has to be re-initialized with the calculated/extrapolated value of T_SEG of level 1 once more for only one time. Both signals shall be equal at first calculation of T_SEG. After that, they shall always be separately determined.

The segment trigger used of I/O-level is called *SIG_SegTrig*.

ACTION_INFR_ResetTSEGSWMON reset the segment time to the maximum value.

Since for the event <Engine Stop> the engine speed N_32 is set to zero in the function level (and T_SEG is set to its maximum value, respectively), the segment time T_SEG_SW_MON has to be set to its maximum value for <Engine Stop> as well. This action therefore resets T_SEG_SW_MON.

However, this action must not be triggered by using the variable LV_ES=0, but must be initialized within the application layer when recognizing the transition <Engine Run to Engine Stop> by the engine operation states manager.

Requirements for ACTION_INFR_GetVPVSMON:

Data acquisition

Parameter	Absolute precision	Relative precision	Resolution	Coincidence with parameter	Comment
V_pvs_1_mon	Not relevant	1% of reference supply voltage for sensor	10bit	The time duration between the digitalization of both analog voltages must be less than 1.0 ms	The precisions and resolutions of V_pvs_2_mon must match the one of V_pvs_1_mon
V_pvs_2_mon	- see V_pvs_1_mon -				

Diagnosis: no electrical diagnosis done here

Coincidence requirements: -

Requirements for ACTION_INFR_GetVTPSMON:

Coincidence requirements: -

11.2 Reset independant ETC- Limp Home

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_N_LIM_REQ_RST_CHK	V/O	0...1H	0...1	1	[-]
Logical variable to set engine speed limitation after ECU reset					
LIH_ACT	V	0...FFFFH	0...65535	1	[-]
0H = kein E-GAS-Notlauf / AF50H = E-Gas-Notlauf aktiv (gespeichert im resetfesten Bereich)					

Input data:

LV_IGK	LV_TPS_MTC_N_LIM	LV_N_LIM_REQ_MON	
LV_MTC_LIH_ACT	LV_ERR_TQI_N_MAX_MON		

FUNCTION DESCRIPTION:

General information:

If ETC-Limp home is active, performance is limited for the driver. After a reset of the ECU this limitation of performance is lost from one second to another. To prevent this dangerous situation the word LIH_ACT is saved to reset independant memory every 100 ms. This special part of memory is not deleted in case of warm reset (LV_WARM_RST = 1). In case of cold reset (LV_WARM_RST = 0) even information in this reset resistant memory is lost.

While initializing the ECU the word LIH_ACT is been read out of the reset resistant memory. If it is set, LV_N_LIM_REQ_RST_CHK is set to 1 for the current driving cycle. At transition LV_IGK = 1 → 0 or if the failure memory is been deleted, LV_N_LIM_REQ_RST_CHK and LIH_ACT are reset to 0.

Application Conditions:

Recurrence: 100ms

Initialisation:

at reset (but not in case of warm-reset LV_WARM_RST = 1) **OR**
at transition LV_IGK = 1 → 0 **OR**
after clearing failure memory

LV_N_LIM_REQ_RST_CHK = 0
LIH_ACT = 0

The following initialization is only used after warm-reset (LV_WARM_RST = 1):

```
IF        after warm-reset   LIH_ACT = AF50 hex (44880 dec)
          (read after warm-reset from reset resistant memory)

THEN      LV_N_LIM_REQ_RST_CHK = 1
          (to be written only once while initializing ECU)

ELSE      LV_N_LIM_REQ_RST_CHK = 0
          (to be written only once while initializing ECU)

ENDIF.
```

Activation:

LV_IGK = 1

Deactivation:

LV_IGK = 0

Formula section:

```
IF        LV_TPS_MTC_N_LIM = 1          OR    // ETC-LIH request
          LV_MTC_LIH_ACT = 1            OR    // PVS-LIH request
          LV_N_LIM_REQ_MON = 1          OR    // MON-LIH request
          LV_ERR_TQI_N_MAX_MON = 1      OR
          LV_N_LIM_REQ_RST_CHK = 1

THEN      LIH_ACT = AF50 hex (44880 dec)
          (to be written to reset resistant memory every 100ms)

ELSE      LIH_ACT = 0 (to be written to reset resistant memory every 100ms)

ENDIF.
```

11.3 General

11.3.1 Basic Idea

The Monitoring Concept has to prevent an ETC system from dangerous behaviour like sudden acceleration against the driver's intent. At first faults, this must be without intervention of the driver. To avoid immobile cars at first faults, a limited limp home function is activated. This means the dynamic behaviour of the car is limited, and so in case of another (second) fault, the driver must possibly react (activation of brake pedal). The accepted fault reaction time is 500 ms. Minor deviations in the order of about 5% are possible due to run time fluctuations, aging effects and temperature influences. No or low engine power is seen as a safe state.

The Siemens ETC-Monitoring-Concept is based on the ETC-Safety-Concept of VDA Arbeitskreis E-Gas using the following main modification:

Additional, diverse AD-converter in monitoring unit (MU) for monitoring af A/D conversion. The used analog voltage must be non-constant, the frequency of the voltage changes must match to the synchronisation constraints given in the Processor Monitoring.

The monitoring concept consists of three levels, as shown in the following figure:

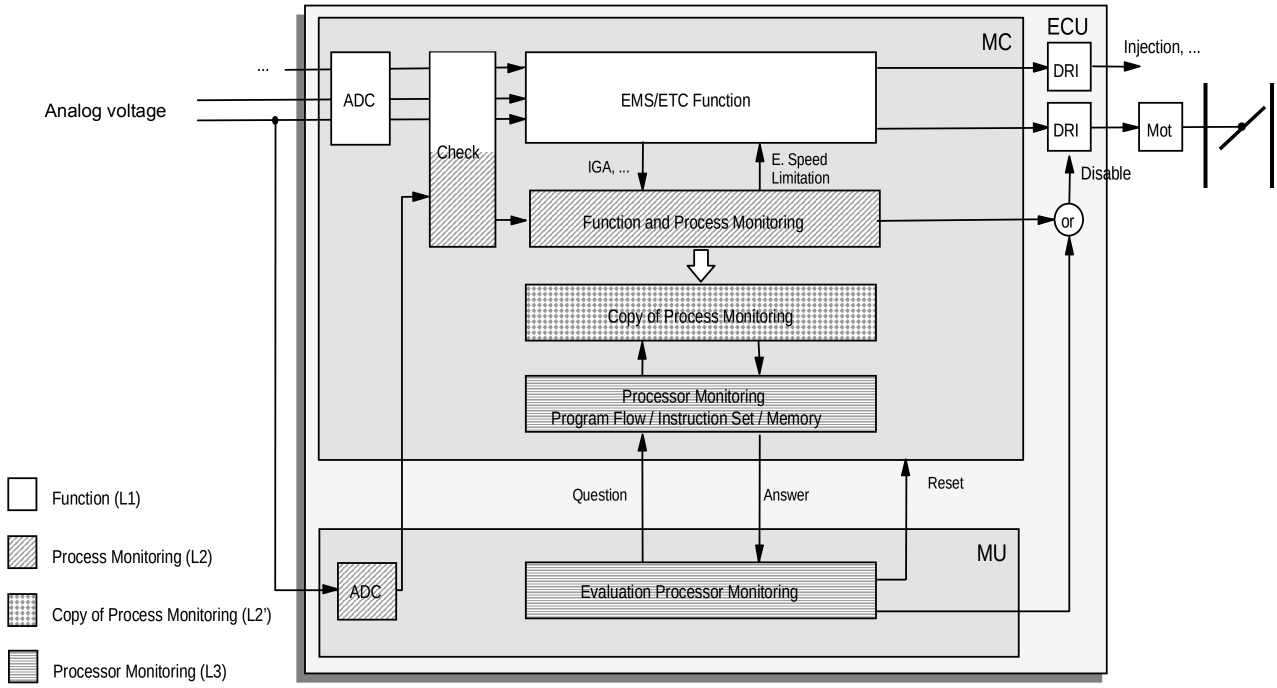

Figure 1: The three levels of the monitoring concept.

- The function level is located on the main processor (MC).
- The function/process monitoring level is also located on the main processor.
- The processor monitoring level is located on the main processor and on the monitoring processor (MU).

11.3.1.1 Function Level (VDA-name: Level 1)

The function level performs standard EMS functions including ETC functionality (description *not* to be found in this chapter):

- Determination of the drivers demand (via PVS) including standard diagnosis (signal range check, ...)
- Determination of throttle position (via TPS) including standard diagnosis (signal range check, ...)
- Receiving external torque requests (e.g. ASR, MSR, ...) including standard diagnosis (e.g. monitoring CAN by parity bit, ...). External modules must generate correct torque requests (safety requirement!) the ECU can only check, whether the transmission of this request was without faults.
- Internal calculation of torque requests (ISC, Cruise Control)
- Co-ordination and realisation of requested torque

\- output: throttle position, ignition angle, injection time and cylinder cut off

11.3.1.2 Process Monitoring Level (VDA-name: Level 2)

The process monitoring performs monitoring of sensors, actuators, torque effective functions, torque co-ordination, and torque realization as a check of the function level.

The description can be found in the modules:

- Process Monitoring
- Monitoring Sensor Signals (e.g. PVS, TCO, ...)
- Monitoring Internal Signals (e.g. MAF, N_32, ...)
- Monitoring CAN Signals
- Torque Monitoring
- Fault Reaction

11.3.1.3 Processor Monitoring Level (VDA-name: Level 3)

The processor monitoring monitors proper processor function: memory, operations of the processor, program flow, analog digital conversion

The description can be found in the modules:

- Processor Monitoring
- Communication between MC and MU
- Fault Reaction

There are additional port extensions located on the monitoring unit. Note that this functionality is not a core functionality of level 3:

- Input / Output (Description of port extension facility of the monitoring unit)

11.3.2 Hardware Safety Module

The main-processor (MC) and the monitoring processor (MU, incl. port extensions) are connected via an internal communication. MU has its own oscillator (ceramic resonator).

When resetting, MC gives a reset signal to MU so it will also reset. This enables synchronisation between them.

Via the internal communication informations are excanged. This informations belongs to: test calculations (level 2'), program flow of MC, monitoring of ADC, port extensions.

For the purpose of test calculations answers are compared to known results on MU. In case of faults, the power stages of the throttle and the injectors are disabled.

One analog voltage is connected with the first AD-channel of MU and the dedicated channel on MC. The MU value is transmitted to MC only to check the ADCs. Remaining AD-channels and digital outputs can be used as port extension (no monitoring function, but it has to be assured, that no damaging voltage is fed to the ports in case of any fault).

11.4 PROCESS MONITORING

Import actions:

ACTION_ECM3_ServicePfm(IN <>)

Note: This action is defined in chapter "Processor Monitoring", subsection "Program Flow Monitoring services for Process Monitoring". This action has to be executed as last instruction after all tasks have been executed. After the first block of tasks, the action has to be called with argument 1, after the second with 2, after the third with 3 and after the fourth with 4. At the very end of the scheduler finally the action has to be called with argument 0, 6, and 7.

ACTION_ECM2_LockPws()
ACTION_ECM2_UnlockPws()

Note: These two actions are defined in module "Fault Reaction of process monitoring".

Input data:

LV_RLY_MAIN_DLY_ERR	LV_DIAG_END_RLY_MAIN_DLY		

General information:

The task of process monitoring is to check whether ETC / torque functions (located in function level) work properly and to take a fault reaction, if not. This is described in the following modules:

- Limitation of Negative Temperature Gradient

Engine Losses depend on engine temperature (indicated by TOIL or TCO). Cold temperature means big losses. These losses are compensated by the torque structure. This means faults like a temperature step from hot to cold within permitted signal range lead to miscompensation of losses (undesired torque increase). To avoid this, the max. negative temperature gradient is limited to (small) values, given by physics.

- Monitoring Sensor Signals

Sensor Signals (PVS, TPS) are checked a second time in process monitoring. This is done by using bigger tolerances and longer debouncing times. Having detected a fault in process monitoring, but not in function level, means a faulty function level. Fault reaction is done as described below. A fault, detected in function level earlier than in process monitoring or at the same time, means normal working of function level, therefore standard reaction of function level is done.

- Monitoring CAN Signals

CAN signals are only checked against protocol (parity bit, message counter, ...). No plausibilisation of values is possible. CAN monitoring performed in process monitoring is a subset of CAN monitoring performed in function level.

- Monitoring Internal Signals

Internal signals (engine speed, torque demand of idle speed controller, torque demand of Cruise Control, cylinder-cut-off efficiency, ...) are partly moved from function level to process monitoring as value and its complement (engine speed); partly a plausibility check of the values is done (Cruise Control request) or the values are computed a second time (idle speed controller). Fault reaction is done as described below.

- Torque Monitoring

The desired maximum indicated engine torque is calculated from individual torque requests and compared to the actual indicated engine torque, calculated from MFF, engine speed, ignition angle- and other efficiencies. If the actual torque exceeds the desired torque by more than a certain threshold, a fault reaction is done as described below.

- Fault Reaction

Standard fault reaction of process monitoring is disabling of throttle actuator and engine speed limitation, commanded to function level. As function level is detected to be faulty, the commanded limitation is monitored and if it is not realized properly, a command is given to send wrong answers to the monitoring processor. This means, the monitoring processor will cut off throttle actuator and injector valves directly.

In case of faults detected when transmitting values and their complement (fault in memory or in instruction set), powerstages are disabled and a reset is performed.

Formula Section:

```
IF        LV_DIAG_END_RLY_MAIN_DLY == 1  AND   LV_RLY_MAIN_DLY_ERR == 0
THEN
      ACTION_ECM2_UnlockPws();
      /* Has to be executed exactly once!  */
      Tasks/ECM2-functions activated according to table 1 starting with task "1";
ELSE      ACTION_ECM2_LockPws();
ENDIF
```

11.4.1 Task scheduler

The process monitoring functionality is executed with an update rate of 40 ms. In order to achieve a balanced computational load of the controller, the functionality of the process monitoring is divided into 4 tasks (see following Table 1). For each task the first called module is the related part of Application Incidences of process monitoring.

Table 1: Distribution of the process monitoring functionality over four tasks. The task scheduler is executed every 10 ms. Within one task, the different functions are executed in the order according to the rows of the table.

Task 1 (k)	Task 2 (k+10 ms)	Task 3 (k+20 ms)	Task 4 (k+30 ms)
Application incidences of process monitoring(k)	Application incidences of process monitoring(k+10ms)	Application incidences of process monitoring(k+20ms)	Application incidences of process monitoring(k+30ms)
Monitoring of A/D-conversion	Monitoring of pedal value signals	Monitoring of engine speed limitation	Actual indicated engine torque
Monitoring of TCO		Monitoring of CAN signals	Desired indicated engine torque
Monitoring of engine speed	Monitoring of torque losses	Monitoring of cruise control conditions	Monitoring of actual indicated engine torque
Monitoring of idle speed controller	Monitoring of maximum torque at clutch	Monitoring of minimum torque at clutch	Fault reaction of process monitoring
Actual Fuel Mass Flow	Actual lambda deviation	Actual efficiencies	Combustion mode switch request
ACTION_ECM3_ ServicePfm(1)	Monitoring of Mass Fuel Flow		ACTION_ECM3_ ServicePfm(4)
ACTION_ECM3_ ServicePfm(0)	ACTION_ECM3_ ServicePfm(2)	ACTION_ECM3_ ServicePfm(3)	Error memory management of process monitoring
	ACTION_ECM3_ ServicePfm(0)	ACTION_ECM3_ ServicePfm(0)	ACTION_ECM3_ ServicePfm(0)

11.5 Debounce Mechanism

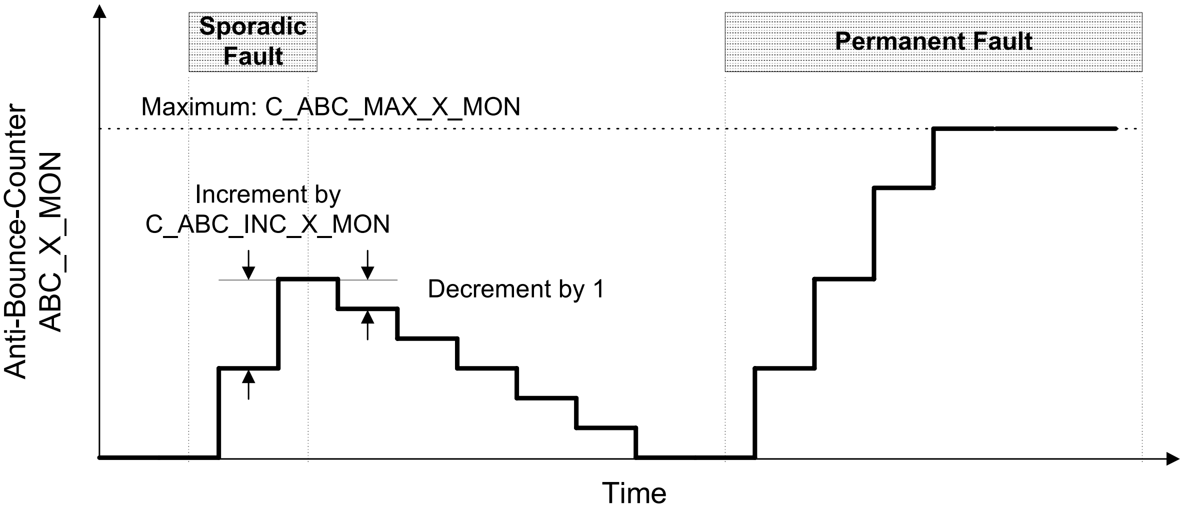
FUNCTION DESCRIPTION:

General information:

Many diagnosis algorithms need a debounce mechanism in order to avoid a faulty diagnosis caused by normal disturbances. Since the process monitoring is intended to represent redundancy to the functions of level 1, there is also a redundant debounce mechanism required. That means an algorithm with separate code, ROM- and RAM data. The debounce algorithm is used for the functions of level 2 and 2' (copy of process monitoring).

Description:

The anti-bounce-counter ABC_X_MON is increased by C_ABC_INC_X_MON, if the conditions for fault detection are fulfilled. Otherwise, the anti-bounce counter is decremented by 1. If the anti-bounce-counter ABC_X_MON exceeds its threshold C_ABC_MAX_X_MON the first time during this engine running, the relating error-flag is set and a fault can be stored in the customer error memory.



Application conditions:

The activation, deactivation and recurrency of this module depends on the data of the related diagnosis function.

Formula section:

```
IF   (Fault detection condition fulfilled)
THEN
     Increment ABC_X_MON by C_ABC_INC_X_MON
     (limited to C_ABC_MAX_X_MON)
ELSE
     Decrement ABC_X_MON by 1          (limited to 0)
```

11.6 Application Incidences and Configuration of Process Monitoring

Import actions:

ACTION_ECM3_Service0TaskPfm(IN <>)
ACTION_ECM3_Service1TaskPfm(IN <>)
ACTION_ECM3_Service2TaskPfm(IN <>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The input arguments have the values 1, 2, 3 and 4.

For further information concerning the order of action calls compared to the specified functions, please have a look on the following page.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service0TaskPfm() and ACTION_ECM3_Service1TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)
ACTION_ECM3_ChkCpl(IN <>, IN <>)
ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: All variables with Mode O and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

ACTION_INFR_GetVTPSMON(OUT <V_tps_1_mon>, OUT<V_tps_2_mon>)

Note: This action is defined in chapter "ECM2 – Requirements to infrastructure interface".

Order of action calls:

1 Application Incidences and Configuration or Process Monitoring

Initialization conditions

ACTION_ECM3_Service0TaskPfm(1)

ACTION_ECM3_McChkStack()

ACTION_ECM3_Service1TaskPfm(1)

Application incidences for the activation conditions of process monitoring

Application incidences for monitoring of torque demand from idle speed controller

1.16.1 Acquisition of sport-mode-switch for monitoring

11.6.1 Initialization conditions

FUNCTION DESCRIPTION:

General information:

The application condition for the initialization of e.g. the error bits, the anti-bounce-counters and other variables of the process monitoring is commonly defined here for all modules of the process monitoring. There is only a reference to the following definition of the application conditions in the different modules.

The error bits, anti-bounce-counters and other variables are initialized
- at reset
- at transition from LV_IGK = 0 to 1
- at clearing of the failure memory
- with physical "0" if not defined differently!

There is one exception from the rule above. If the reset counter at the monitoring unit increased up to 7 resets, the fault reaction of the monitoring unit will be continued until the power supply of the monitoring unit is switched off.

11.6.2 Application incidences for the activation conditions of process monitoring

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_N_LIM_ETC_MON	O/V	0...1H	0...1	1	[-]
Logical variable for activation of engine speed limitation monitoring					
LV_TQI_MON_ACT_MON	O/V	0...1H	0...1	1	[-]
Activation condition for fuel cut off monitoring fulfilled - generic interface					
V_TPS_1_MON	O/V	0...3FFH	0...4.99511	4.8828e-3	[V]
Adapted TPS signal channel 1					
V_TPS_2_MON	O/V	0...3FFH	0...4.99511	4.8828e-3	[V]
Adapted TPS signal channel 2					
LV_IGK_MON	O/V	0...1H	0...1	1	[-]
Logical variable for ignition key on					

Input data:

LV_N_LIM_REQ_MON	LV_N_LIM_ETC_LIH	LV_N_LIM_ETC_LIH_REV	PV_AV_MON
LV_MTC_CUR_OFF	LV_IGK	LV_N_LIM_REQ_RST_CHK	

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_V_TPS_1_LIH_MON	1	0...3FFH	0...4.99511	4.8828e-3	[V]
Threshold for detection of throttle position 1 outside limp home position					
C_V_TPS_2_LIH_MON	1	0...3FFH	0...4.99511	4.8828e-3	[V]
Threshold for detection of throttle position 2 outside limp home position					

FUNCTION DESCRIPTION:

General information:

The logical variable LV_N_LIM_ETC_MON indicates, that any etc-safety-function of level 1, 2 or 3 has requested engine speed limitation or ignition key is switched off. The monitoring of the engine speed limitation is also active, when

- any fault of the ETC-system (pedal value sensor, throttle position sensor, throttle actuator, power stage, idle speed actuator) is present and the driver demand is zero
- throttle is disabled and at least one throttle position signal is outside the specified limp home position
- after a warm reset in case any etc-safety-function of level 1, 2 or 3 had requested engine speed limitation before the warm reset

The torque monitoring can only be active, when the ignition key is on and the throttle is not disabled and no mechanical/electrical error of the idle speed actuator is detected. Otherwise the control of the torque is not possible and torque monitoring is forbidden. This is not a risk, because engine is switched off or in limp home mode then, and the monitoring of the engine speed limitation is active in most cases (at least when the driver releases the pedal).

The logical variable LV_IGK is copied to level 2 in the variable LV_IGK_MON, because it is used as a deactivation condition for the monitoring of PVS in level 2. In order to ensure the safety, the variable LV_IGK_MON is also used for the calculation of the global activation conditions LV_N_LIM_ETC_MON and LV_TQI_MON_ACT_MON.

Application conditions:

Activation: at every engine state

Update Rate: 40ms

Formula section:

```
LV_IGK_MON = LV_IGK

If  LV_IGK_MON                      =     0     Or
    LV_N_LIM_REQ_MON                =     1     Or    (request from level 2, 3)
    LV_N_LIM_ETC_LIH                =     1     Or    (requests from level 1)
    LV_N_LIM_ETC_LIH_REV            =     1     Or    (rev. SAS active, level 1)
    LV_N_LIM_REQ_RST_CHK            =     1     Or    (reset resisting LIH)

    (LV_MTC_CUR_OFF         =     1     And
    PV_AV_MON               =     0)            Or

    (LV_MTC_CUR_OFF         =     1     And
    (V_TPS_1_MON >  C_V_TPS_1_LIH_MON           Or
    V_TPS_2_MON <  C_V_TPS_2_LIH_MON))

Then
    LV_N_LIM_ETC_MON        =     1
Else
    LV_N_LIM_ETC_MON        =     0
Endif

If  LV_IGK_MON              =     1     And   (ignition key on)
    LV_MTC_CUR_OFF          =     0     And   (MTC NOT switched off)
    LV_N_LIM_ETC_LIH_REV    =     0
Then
    LV_TQI_MON_ACT_MON      =     1
Else
    LV_TQI_MON_ACT_MON      =     0
Endif
```

11.6.3.1 Application incidences for monitoring driver request passive

FUNCTION DESCRIPTION:

The aim of this chapter is the monitoring of the variable LV_CT which indicates whether a ‘driver request’ is present or not where the request can be not only from the driver but also from other sources like cruise control or vehicle speed limitation functionality.

As long as the impact between LV_CT = 0 and LV_CT = 1 can be tolerated in terms of torque thresholds, the value can be copied to L2 without plausibility check.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

Initialisation: for condition see ‘Application Incidences of Process Monitoring’

LV_CT_MON = 1

Update Rate: 40 ms

Formula section:

LV_CT_MON = LV_CT

11.6.3.2 Application incidences for monitoring of idle speed setpoint

General information:

The objective of this function is the monitoring of the idle speed setpoint (N_SP_IS) and the corrected idle speed setpoint. Both of these values have to be monitored because they are important inputs for the torque monitoring functionalities. This function consists of two sections.

The first section involves the monitoring of the basis idle-speed setpoint and external offsets (driving-off assistance, CVT etc.) that might be added depending on certain activation conditions. In the second part of this functionality, the Level 2 model value for the idle-speed setpoint and other torque monitoring relevant variables (engine speed deviation, engine speed ratio etc.) are calculated.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

Initialisation: (for condition see ‘Application Incidences of Process Monitoring’
OR LV_TQI_MON_ACT_MON = 0 → 1)
N_DIF_SP_IS_MON = 0 rpm
N_SP_IS_RATIO_MON = 0 rpm
N_SP_IS_MON = 0 rpm
N_DIF_MON = 0 rpm
N_DIF_MMV_MON = 0 rpm
N_SP_IS_BAS_MON = **min(**N_SP_IS, IP_N_SP_IS_BAS_MAX_MON**)**
FAC_RAMP_NEG_P_D_IS_MON = 0
LV_AT_MON = LV_AT
LV_VAR_TCT_MON = LV_VAR_TCT
N_SP_IS_EXT_ADJ_MON = **min**(N_SP_IS, C_N_SP_IS_MAX_EXT_ADJ_MON)
LV_ACT_N_SP_IS_EXT_ADJ_MON = 0
GR_MT_MON = 0 **at** [LV_ES = 1 **or** LV_ST = 1 **or** LV_CS = 1]
N_VS_RATIO_MON = 0
N_SP_IS_CS_MON = **min**(N_SP_IS, C_N_SP_IS_CS_MAX_MON)
N_SP_IS_EXT_REQ_MON $_{K}$ = **min(**N_SP_IS, IP_N_SP_IS_BAS_MAX_MON**)**
N_SP_IS_EXT_REQ_MON $_{K-1}$= **min(**N_SP_IS, IP_N_SP_IS_BAS_MAX_MON**)**
N_DIF_COR_MON = 0
LV_NT_SO2P_EXT_ADJ_ENA_MON= 0
CTR_N_SP_IS_EXT_REQ_DEC_ MON $_{K}$ = 0
CTR_N_SP_IS_EXT_REQ_DEC_ MON $_{K-1}$ = 0
LV_TCHA_DIAG_REQ_MON = 0
LV_ACT_N_SP_IS_POIL_EXT_MON = 0

Update rate: 40 ms

11.6.3.2.1 Plausibilisation of basis idle-speed setpoint and external-influences

General information:

The basis idle speed setpoint is limited by a coolant temperature dependent maximum value, IP_N_SP_IS_BAS_MAX_MON. Under certain circumstances (for e.g. driving off situation i.e. the driver is slightly on the gas pedal and releases the clutch abruptly --> can lead to engine stalling), to assist the driver in this situation, N_SP_IS_MON is raised to achieve a torque increasing demand from ISC. In case of an error, such external influences can lead to relatively large ‘unwanted’ acceleration which makes the monitoring of the relevant activation conditions imperative.

Formula section:

{N_SP_IS_LIM_MON represents the basis idle-speed setpoint plus any offsets (for e.g. catalyst heating or low battery voltage) that might be added in L1 based on certain activation conditions.}

N_SP_IS_LIM_MON = N_SP_IS

{Model value of maximum basis setpoint}
N_SP_IS_BAS_MAX_MON = IP_N_SP_IS_BAS_MAX_MON(TCO_MON)

{Idle speed setpoint plausibilisation through gradient limitation}
IF |N_SP_IS_LIM_MON$_{k}$ - N_SP_IS_BAS_MON$_{k-1}$**|** > C_N_SP_IS_BAS_DIF_MAX_MON
THEN N_SP_IS_BAS_MON$_{k}$ = **min(**N_SP_IS_BAS_MON$_{k-1}$, N_SP_IS_BAS_MAX_MON**)**
ELSE N_SP_IS_BAS_MON$_{k}$ = **min(**N_SP_IS_LIM_MON$_{k}$, N_SP_IS_BAS_MAX_MON**)**
ENDIF

FAC_RAMP_NEG_P_D_IS_MON = C_FAC_RAMP_P_D_MON

11.6.3.2.2 Calculation of idle-speed setpoint model value

The outputs of the function are:

- ratio between idle speed setpoint and actual engine speed - **N_SP_IS_RATIO_MON**
- deviation of actual engine speed from idle speed setpoint - **N_DIF_SP_IS_MON**
- deviation of actual engine speed from N_SP_IS - **N_DIF_MON**

11.6.3.3 Monitoring of Idle-speed controller activation conditions

Application conditions:

Activation:	LV_TQI_MON_ACT_MON = 1
Deactivation:	otherwise
Initialisation:	(for condition see 'Application Incidences of Process Monitoring' ***OR*** LV_TQI_MON_ACT_MON = 0 → 1) **STATE_REQ_ISC_MON = 'NOT_ACTIVE'** TQ_DIF_P_D_IS_MAX_2_MON = **max**(TQ_DIF_P_D_SLOW_IS$_k$, TQ_DIF_P_D_FAST_IS$_k$) TQ_DIF_P_D_IS_MON = 0 Nm TQ_DIF_P_D_IS_MAX_MON = **max**(TQ_DIF_P_D_SLOW_IS$_k$, TQ_DIF_P_D_FAST_IS$_k$) STATE_PAS_RAMP_ACT_P_D_IS_MON = 0 STATE_PAS_RAMP_ACT_I_IS_MON = 0 LV_PAS_RAMP_ACT_P_D_CHG_MON = 0 LV_PAS_RAMP_ACT_I_CHG_MON = 0
Update Rate:	40 ms

General information:

The ISC can be active either when the engine state idle is requested(LV_REQ_ISC =1) or when the DROF functionality is active or under certain conditions in trailing-throttle state (LV_PU=1) and part-load state (LV_PL=1) and. So all of these possible "ISC-active" phases have to be monitored. The activation conditions are based on the L1 ISC activation conditions as described in the module 'Application incidences for the idle speed controller'. In addition to the normal activation states, a 'NOT_ACTIVE' state is generated in order to be able to monitor the ISC if the activation information from the function level is faulty.

Formula section:

{The L1 ISC-Torque demand signal is copied to the process monitoring (L2) RAM}

Input data:

LV_ERR_BLS_PLAUS	LV_IM_BLS_MON	LV_IM_BTS_MON	LV_ERR_V_REF_1
LV_ERR_V_REF_2			

FUNCTION DESCRIPTION:

General information:

In order to be able to use the generic module for the monitoring of the pedal value signals in level 2, different information about the state of the brake are combined to one resulting information LV_BRAKE_MON. It is set, when at least one sensor (brake light switch or brake test switch) indicates an activated brake or a fault of a brake switch has been detected. The switch signals are read directly from port.

Application conditions:

Activation:	at every engine state
Deactivation:	otherwise
Initialisation:	for condition see ‘Application Incidences of Process Monitoring’
Update Rate:	40 ms

Formula section:

```
If      (LV_IM_BLS_MON = 1)       Or

FUNCTION DESCRIPTION:

General information:

In order to be able to use module for the monitoring of torque losses in level 2 the not engine related additional torque losses are calculated here.

The level 1 value of each additional torque loss will be compared with a modelled one. The larger value (minimum absolute Torque value) of the two is added to the sum TQ_LOSS_ADD_MON.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

Initialisation: for condition see 'Application Incidences of Process Monitoring'
TQ_LOSS_ADD_MON = 0
VS_MON = 0 km/h
TQ_LOSS_ADD_FIL_MON = 0
TQ_REQ_CLU_MON = 0
TQ_REQ_CLU_GRD_MON = 0
TQ_LOSS_FIL_MMV_MON =
max(TQ_LOSS_ADD_FIL , C_TQ_LOSS_FIL_MMV_INI_MIN_MON)

Recurrence: 40 ms

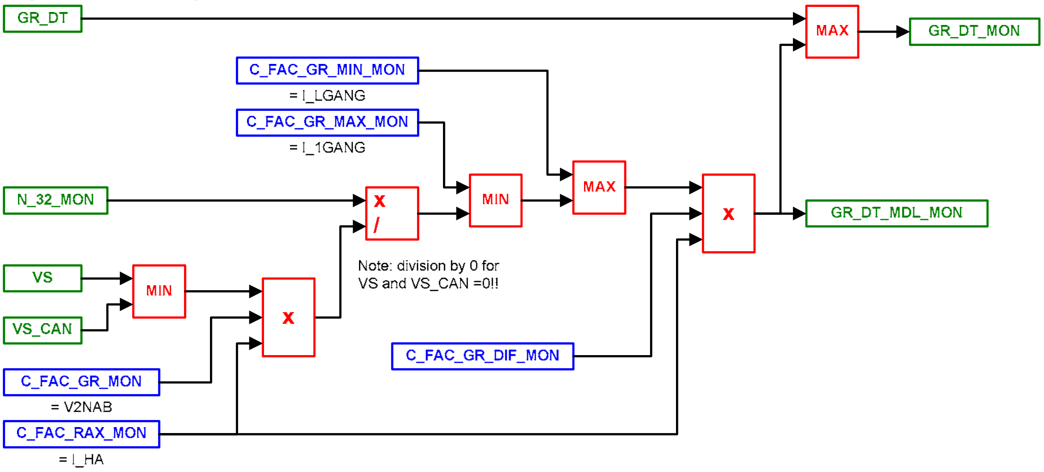
Min. value for gear ratio (longest gear step)					
C_FAC_GR_MAX_MON	1	0...FFH	0...31.875	0.125	[-]
Max. value for gear ratio (shortest gear step)					

FUNCTION DESCRIPTION:

General information:

For the monitoring of the torque request from IPM (intelligent powertrain management) it is necessary to determine the gear ratio factor GR_DT_MON.

Signal flow diagram:



Application conditions:

Activation:	LV_TQI_MON_ACT_MON = 1
Deactivation:	otherwise
Initialisation:	for condition see ‘Application Incidences of Process Monitoring’
	GR_DT_MON = 1
	GR_DT_MDL_MON = 1
Update Rate:	40 ms

Formula section:

Gear ratio of gear box:

GR_DT_MDL_MON_1 = (N_32_MON / 60) / *N_32 in [1/sec]*
((MIN (VS ; VS_CAN) / 3.6) * *VS in [m/sec]*
C_FAC_GR_MON * *1/wheelcircumference*
C_FAC_RAX_MON) *gear ratio rear axle*

Note: for VS and VS_CAN = 0 there is a devision by zero!

Limitation of gear ratio of gear box:

GR_DT_MDL_MON_2 = MAX (C_FAC_GR_MIN_MON ; *limit longest gear*
MIN (C_FAC_GR_MAX_MON; *limit shortest gear*
GR_DT_MDL_MON_1))

Modelled total gear ratio of powertrain

GR_DT_MDL_MON = GR_DT_MDL_MON_2 *
C_FAC_GR_DIF_MON *
C_FAC_RAX_MON

Powertrain gear ratio used for monitoring:

GR_DT_MON = MAX (GR_DT ; GR_DT_MDL_MON)

11.6.12 Application incidences for the monitoring of CAN signals

Max. limitation for converter torque adaptation					
C_TQ_REQ_CLU_GB_MAX_MON	1	0...FFH	0...510	2	[Nm]
Max. limitation for torque request from gearbox					

FUNCTION DESCRIPTION:

General information:

The objective of this function is the determination of the error-detection paths of the minimum torque at clutch. The error-detection is divided into PU state and non-PU state. This separation is done because the biggest influence on the value of the minimum torque that is available at the clutch is the self-stabilising factor FAC_N_SP_IS_RATIO_MON and this has a parabolic trajectory where the transition point from the positive values to TQ_LOSS_MON is around the idle-speed setpoint (N_SP_IS_MON). STATE_ERR_DET_TQ_MIN_MON is an input into the module 'Monitoring of minimum torque at clutch'.

Application conditions:

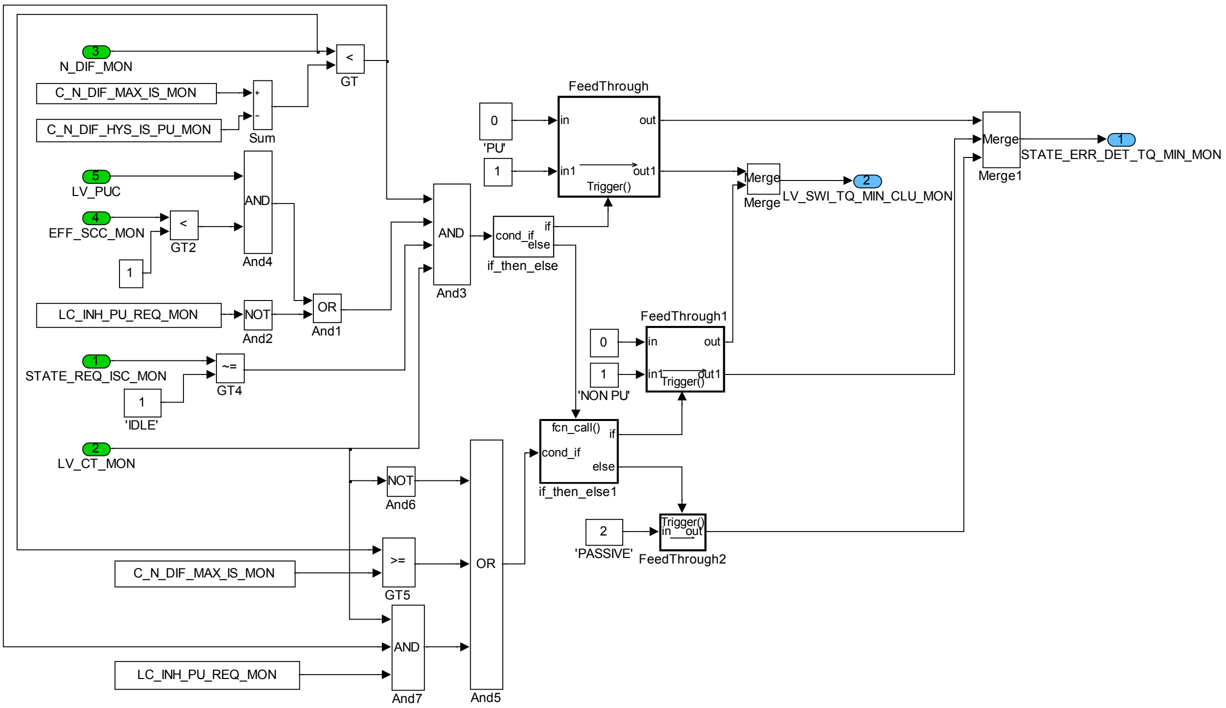
Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

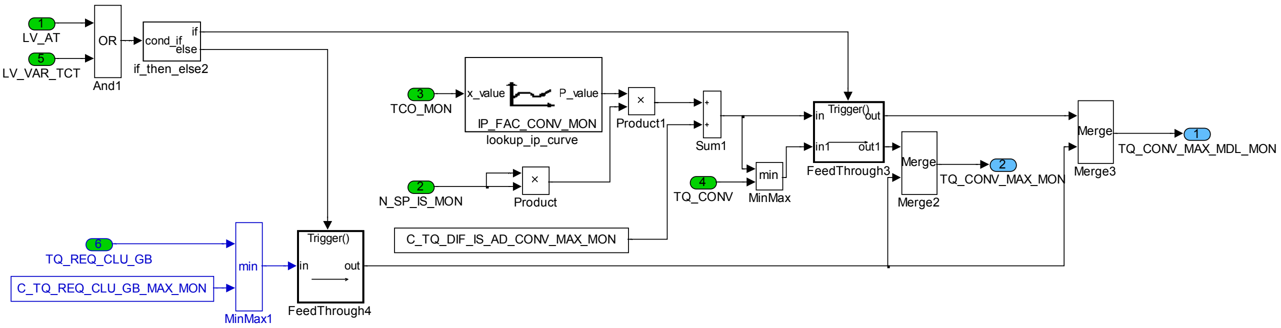
Initialisation: for condition see 'Application Incidences of Process Monitoring'
STATE_ERR_DET_TQ_MIN_MON = 'PASSIVE'
TQ_ADD_MIN_CLU_MON = 0 Nm
TQ_CONV_MAX_MON = 0 Nm
TQ_CONV_MAX_MDL_MON = 0 Nm
LV_SWI_TQ_MIN_CLU_MON = 0

Update Rate: 40 ms

Formula section:



{Calculation of Maximum Converter Torque
If a CVT system is used, then the torque demand/engine load resulting from the transmission has to be considered here. If this value is transmitted from the TCU via CAN, then it has to be checked first in the module 'Monitoring of CAN-signals' and only then used here. If a normal automatic transmission is used, then the torque losses resulting from the converter can be calculated as given below. The torque request of the manual gearbox is considered here. }



11.6.14 Application incidences for the actual efficiencies

Output data:

11.6.14.1 CONFIAPCPR

General information:

The calculation of IGA_REF_HOM_COR_EXT_MON and IGA_REF_HOMS_COR_EXT_MON is an additive combination of limited values of level 1. The limitation of each single value allows having a close tolerance range for monitoring. Furthermore, MFF_LAMB_REF_IGA_MON has to be provided for the "Actual Efficiencies" as scavaging corrected MFF-value.

Application conditions:

11.6.16.1 Acquisition of sport-mode-switch for monitoring

General information:

Calculation of the sport-mode request by taking the voltage of the sport-mode-switch and at BN 2000 variants on CAN message.
The request acts according to the rising edge of the voltage signal. This monitoring function connects to the level 1 function Chapter 9.

Application conditions:

Activation: LV_TQI_MON_ACT_MON ==1

Deactivation: otherwise

Initialisation: for condition see ‘Application Incidences of Process Monitoring’

In case of switch off the engine LV_ES = 0 to 1 or reset:

LV...MON = 0

Update Rate: 40 ms in general, exception voltage switch detection in 10 ms (this is realised by calling chapter 1.16.1 Acquisition of sport-mode-switch for monitoring" within each service task (see "Order of actions calls" at the beginning of this document)

Formula section:

Detection of tip switch position:

Application conditions:

Update rate: 10ms this in necessary to connect to level 1 because of monitoring 3 evaluation Cycles.

```
if (1)    LV_VAR_BN = 0
then (1)
    if (2)    LV_ERR_SOF_REQ = 0
    then (2)
        if (3)    (V_SOF_SWI_MON$_{n-1}$ > C_V_SOF_SWI_ON_TOL_MON) changes to
                  (C_V_SOF_SWI_ON_BOL_MON ≤  V_SOF_SWI_MON$_{n}$ ≤
                                                C_V_SOF_SWI_ON_TOL_MON)
                  (equal to 0 ->1)
                  and this result is valid for 3 evaluations
        then (3) LV_SOF_SWI_MON = ! LV_SOF_SWI_MON
```

```

then   LV_SOF_SWI_REQ_MON   = 1
else   LV_SOF_SWI_REQ_MON   = 0
endif
```

11.6.16.2 Low range detection (LV_RNG_L)

Description:

Depending on LC_RNG_L_MON, the sport-switch and the LV_RNG_L_AT_MON -request from EGS the bit LV_RNG_L_MON will be activated.

Meaning of C_STATE_ETCU_PROG_INFO_MON:

Bit	LV_RNG_L_AT_MON will be set at condition:
0	*AT / TCT in "S" / "DS" ("comfort transmission"; LV_VAR_ETCU_SPT=0)*
1	*AT / TCT in manual mode "M1 ... 6" ("comfort transmission"; LV_VAR_ETCU_SPT=0)*
2	*AT- / TCT-sport-switch in "S" / "DS" ("sport transmission"; LV_VAR_ETCU_SPT=1)*
3	*AT- / TCT-sport-switch in manual mode "M1 ... 6" ("sport transmission"; LV_VAR_ETCU_SPT=1)*
4	*Gearbox-sportswitch active and AT / TCT ("comfort transmission"; LV_VAR_ETCU_SPT=0)*
5	*Gearbox-sportswitch active and AT / TCT ("sport transmission"; LV_VAR_ETCU_SPT=1)*
6	*always with MT*
7	*not used*

Formula section:

If

AT / TCT "comfort" in "S-mode"

        LV_RNG_L_AT_MON = 1               // request from gearbox
Then    LV_RNG_L_MON = 1
```

```
Else      LV_RNG_L_MON= 0
Endif
```

11.6.16.3 Pedal value interpretation for monitoring

FUNCTION DESCRIPTION:

General information:

Depending on gear mode LV_RNG_L_MON (LV_RNG_L_MON =1) two maps can be calibrated with different pedal value interpretation for normal and low range mode. For this the switch condition LV_SWI_FAC_TQ_REQ_MON is triggered.
Because of the different recurrences of level 1 (10ms) and level 2 (40 ms) and the not regarded driver progression correction of level 1, the switch to the RNG_L_MON progression of monitoring follows by fulfilled conditions after switch of level 1 LV_RNG_L_REQ.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

Initialisation: for condition see ‘Application Incidences of Process Monitoring’

LV_SWI_FAC_TQ_REQ_MON= 0

Update Rate: 40 ms

Formula section:

```
IF      PV_AV_MON < C_PV_AV_SOF_MIN_MON                              or
        FAC_TQ_REQ_DRIV_MON > C_FAC_TQ_REQ_DRIV_SOF_MAX_MON or
        PV_AV_GRD > C_PV_AV_GRD_SOF_MAX_MON
        for at least C_T_PV_AV_GRD_SOF_MAX_MON
THEN    LV_CDN_RNG_L_REQ_MON = 1
ELSE    LV_CDN_RNG_L_REQ_MON = 0
ENDIF

IF      (LV_RNG_L_MON = 1 or  LC_RNG_L_MAN_AS_MON = 1)
        and

FUNCTION DESCRIPTION:

General information:

The torque demands from cruise control, electronic gear shift control and the electronic stability program are set to zero, if these functions are not available. Otherwise, the torque demands have to be copied to the corresponding variable of level 2 and these variables have to be checked for plausibility (e.g. CAN monitoring, CRU monitoring, control units [ESP, EGS] with internal plausibility check).

For torque request at trailing throttle (TQI_MIN_PU_MON) the map output TQI_MIN_PU_MAX_MON (monitoring threshold) will be taken into account. For consideration of the torque setpoint offset at engine start the corresponding torque value is added to TQI_MIN_PU_MAX_MON. After engine start this value is set to "0".

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1

Deactivation: otherwise

Initialisation: All 0 for condition see ‘Application Incidences of Process Monitoring’

Update Rate: 40 ms

11.7 Monitoring of analogue to digital conversion

Output data:

Name	Mode	Hex. limits	Phys. limits	Resol.	Unit
LV_ERR_CONV_MON	O/V	0...1H	0...1	1	-
Logical variable for ADC error					
ABC_CONV_MON	O/V	0...FFH	0...255	1	-
Anti-bounce counter for ADC error					

Input data:

VP_MC_AN_DIG_MON	VP_MU_AN_DIG_MON		

Calibration data:

Name	Dim	Hex. limits	Phys. limits	Resol.	Unit
C_ABC_INC_CONV_MON	1	0...FFH	0...255	1	-
Anti bounce counter increment (additive value in case of ADC error)					
C_ABC_MAX_CONV_MON	1	1...FFH	1...255	1	-
Value at which ADC error is recognised when reached					
C_STATE_AN_DIG_ERR_ACT_MON	1	0...FFH	0...255	1	-
Calibratable value used for provoking an error of the A/D conversion: if C_STATE_AN_DIG_ERR_ACT_MON has value F8H (=248) then the constant value 0, instead of ACQ_MU_0_MON is used as input for the comparison, resulting in an error.					
C_VP_ACQ_CONV_HYS_MON	1	0...7FFFH	0...4.999847	1.52588E-4	V
Maximal allowed difference between the voltages on main controller and monitoring unit					

Import actions:

ACTION_ECM3_Service3TaskPfm(IN <>)

ACTION_ECM3_Service4TaskPfm(IN <>)

ACTION_ECM3_Service5TaskPfm(IN <>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 1.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service3TaskPfm() and ACTION_ECM3_Service4TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)

ACTION_ECM3_ChkCpl(IN <>, IN <>)

ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: All variables with Mode O and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The analogue-digital-converter (ADC) diagnosis is performed by comparing two digital signals. The according analog signal is the same, it is converted once on the main controller (VP_MC_AN_DIG_MON) and also on the monitoring unit (VP_MU_ AN_DIG_MON).

On an error free system, both values are not allowed to differ more than the hysteresis C_VP_ACQ_CONV_HYS_MON.

This hysteresis also covers differences caused by the different sampling times.

There is the possibility to test whether the A/D monitoring works; this can be achieved by setting C_STATE_AN_DIG_ERR_ACT_MON to the value 248 (=F8H), resulting in the fact that the constant 0 (instead of VP_MU_AN_DIG_MON) is used as one of the inputs for the comparison, provoking a fault reaction of the ADC monitoring.

Threshold for the max. TCO_SUB temperature while TCO is lower than C_TCO_THD_MIN_MON					

11.8.1 FUNCTION PART: ECM2_DTSYSTCO

General information:

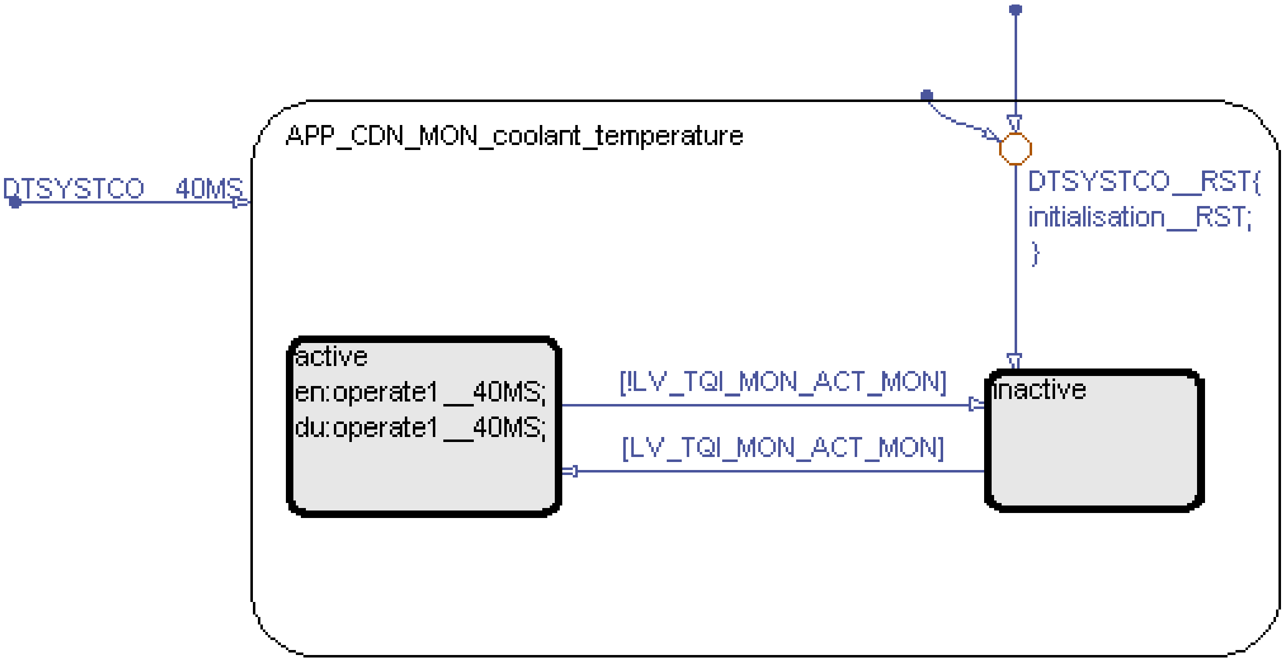
A sudden decrease in the coolant temperature TCO caused by a fault can lead to an undesired increase of the torque demand and thus to an undesired acceleration of the car because of the temperature dependent friction compensation. Therefore the negative temperature gradient of TCO shall be limited in the function level. In order to detect process faults, the gradient of the coolant temperature which is copied to the process monitoring level is also limited, i.e. to C_TCO_GRD_MAX_MON. Also the diagnosis for a too low TCO-sensor temperature is monitored. The resulting value TCO_MON is then used within the monitoring level. If a fault in TCO leads to an increased engine torque in the idle speed controller the module ‘Monitoring of idle speed controller’ detects this fault as an increased torque demand from the idle speed controller.

In case of an error free system the temperature TCO_MON used in the monitoring level should be the same as the temperature TCO used in the function level.

An additional timer is needed to compensate the different recurrencies of level 1 and level 2. The maximum counter threshold C_T_TCO_GRD_MAX_MON and the maximum negative temperature gradient C_TCO_GRD_MAX_MON need to be adapted in regard to the function recurrency and to C_TCO_GRD_MAX of level 1.

The resolution of T_TCO_GRD_MON and C_T_TCO_GRD_MAX_MON depend on the update rate of the module.

Application Condition



Note: DTSYSTCO__RST includes the function calls as defined in application incidences.

Function Description

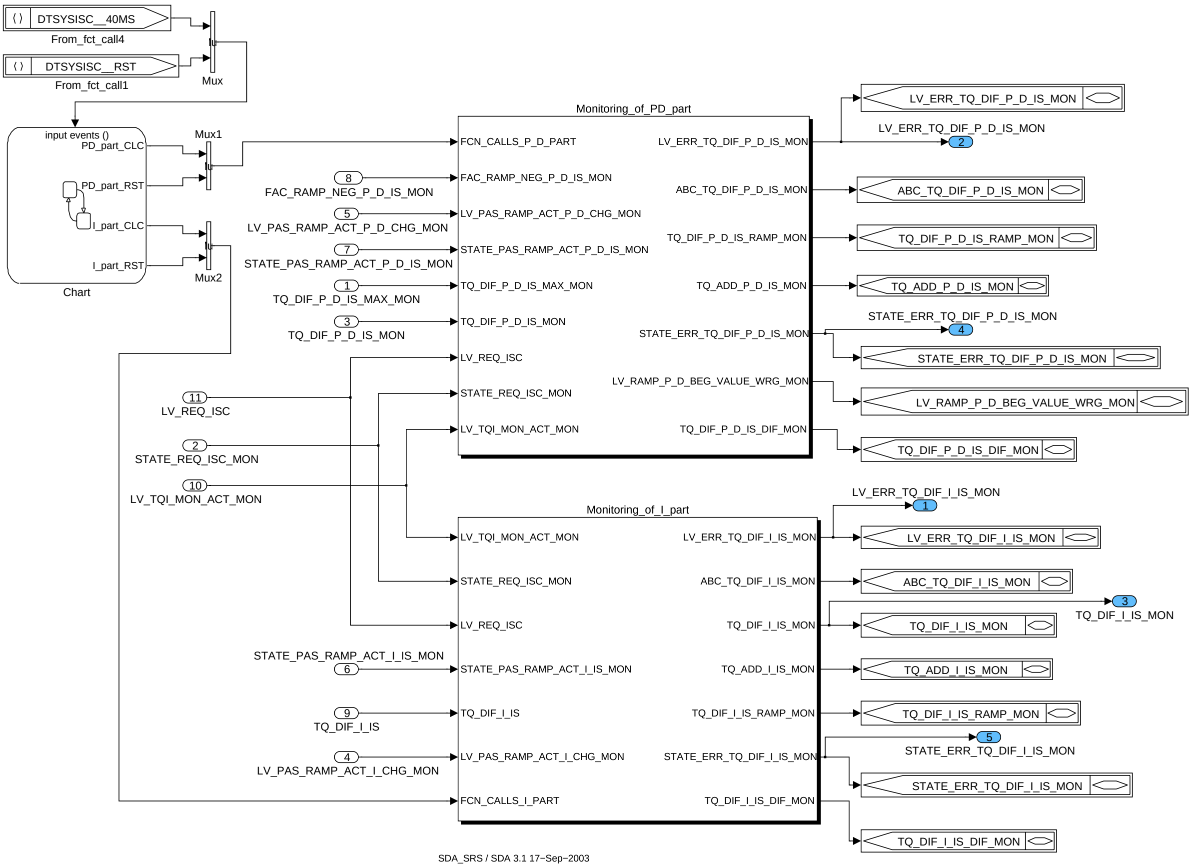

Figure 2 ECM2_DTSYSISC

11.9.1 Monitoring of PD controller

General information:

The objective of this function is the monitoring of the torque demand from the PD-part of the idle speed controller function. Depending on the speed deviation to the idle speed setpoint and the coolant temperature a maximum PD-part is generated (the worst case values for the PD-part in the function level, i.e. great PD-part values are allowed for the most negative speed gradients => for N < N_SP_IS_MON and for N > N_SP_IS_MON small PD-part values are allowed). To additionally monitor the activation of the idle-speed controller in L1, a model value STATE_REQ_ISC_MON) of the activation status is calculated in the module ‘Application incidences of process monitoring’. To effectively plausiblise the values of TQ_DIF_P_D_IS and TQ_DIF_I_IS from the function level, both the monitoring thresholds as well as the activation condition model value are used.

The functionality that is depicted in the following pages consists of two fault scenarios:

Error Path – ISC not active:

Case 1: If the ISC is in the ramp limit operation due to deactivation of ISC, this ramp function is monitored. If LV_PAS_RAMP_ACT_P_D_CHG_MON is 1(i.e. indicates a change of STATE_PAS_RAMP_ACT_P_D_IS(0) from 0 to 1 or a flank change between two L2 sample times), the ramp calculation is triggered. It is first checked if the L1 ramp start-value is below the maximum PD-part. If this is the case, a ramp decrement TQ_ADD_P_D_ IS_MON is calculated and the L1 start-value,TQ_DIF_P_D_IS_MON, plus a calibratable additive constant is copied to TQ_DIF_P_D_IS_RAMP_MON. During the ramp operation, the ramp model value is calculated by adding the ramp decrement to the model value ($TQ\_DIF\_P\_D\_IS\_RAMP\_MON_{k-1}$) from the previous recurrency. If however the ramp start-value is greater than the threshold, TQ_DIF_P_D_IS_MAX_MON, then LV_RAMP_P_D_BEG_VALUE_WRG_MON is set to one. The difference between monitored and modelled PD-part is set as a visible variable for application work.

In the error detection part of this functionality, either $TQ\_DIF\_P\_D\_IS\_MON_k >$ TQ_DIF_P_D_IS_RAMP_MON or LV_RAMP_P_D_BEG_VALUE_WRG_MON==1 will lead to the error flag STATE_ERR_TQ_DIF_P_D_IS_MON being set.

Function Description

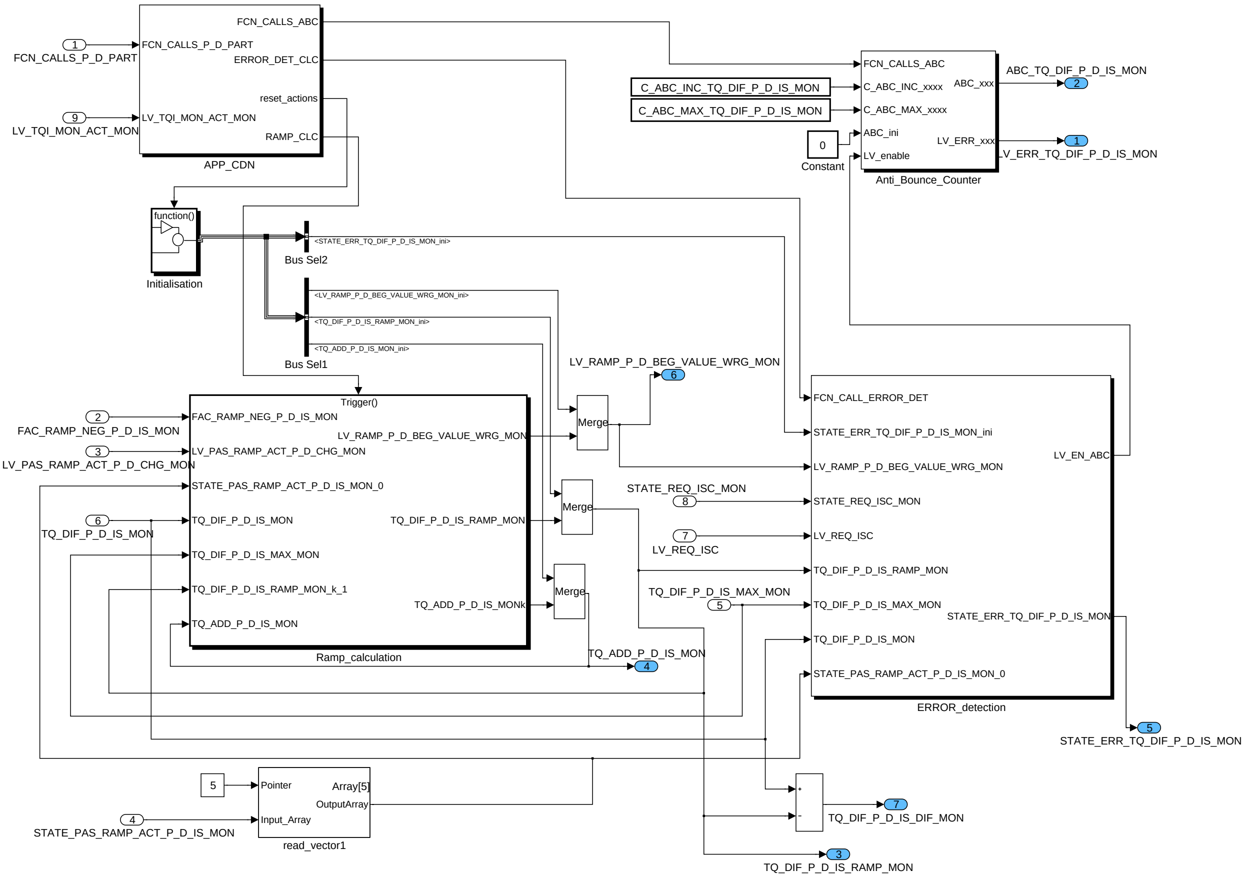

Figure 3 ECM2_DTSYSISC/ Monitoring_of_PD_part

Case 2: If the deactivation ramp is over, a torque demand from the PD-part of the controller greater than the passive value of zero indicates an error in the function level.

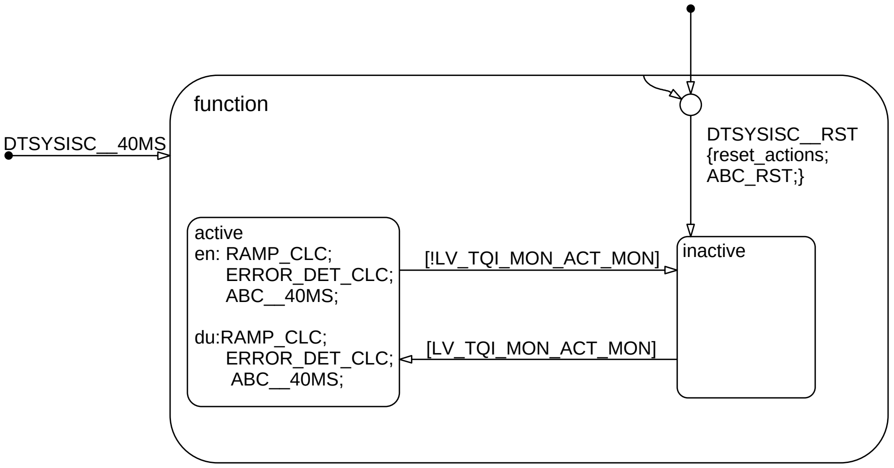
Error Path – ISC active:

Case 1: The ISC is when the engine is in idle state(LV_IS=1) or under certain conditions also in trailing-throttle(LV_PU=1) or part-load(LV_PL=1). So all of these possible "ISC-active" phases have to be monitored. A fault is set, if L1 declares the ISC be active and if L2 also detects the same based on plausiblised activation conditions (STATE_ REQ_ISC_MON = IDLE or TRAILING_THR or PART_LOAD) and if the monitored PD-part TQ_DIF_P_D_IS_MON exceeds the maximum PD-part TQ_DIF_P_D_IS_MAX_ MON.

Case 2: If in L1 the ISC is active(LV_REQ_ISC=1) but the activation conditions in L2 are not fulfilled i.e. STATE_ REQ_ISC_MON ≠ IDLE or TRAILING_THR or PART_LOAD, then if TQ_DIF_P_D_IS_MON is greater than a threshold value (C_TQ_P_D_ISC_NOT_ ACT_MAX_MON), the error-flag STATE_ERR_TQ_DIF_P_D_IS_MON is set .

If one of the errors above is detected, a fault is declared after debouncing by the idle speed controller montoring.

Application Conditions



Initialisation (DTSYSISC__RST)**:** for condition see ‘Application Incidences of Process Monitoring’.

Figure 4 ECM2_DTSYSISC/ Monitoring_of_PD_part/ APP_CDN/ Chart

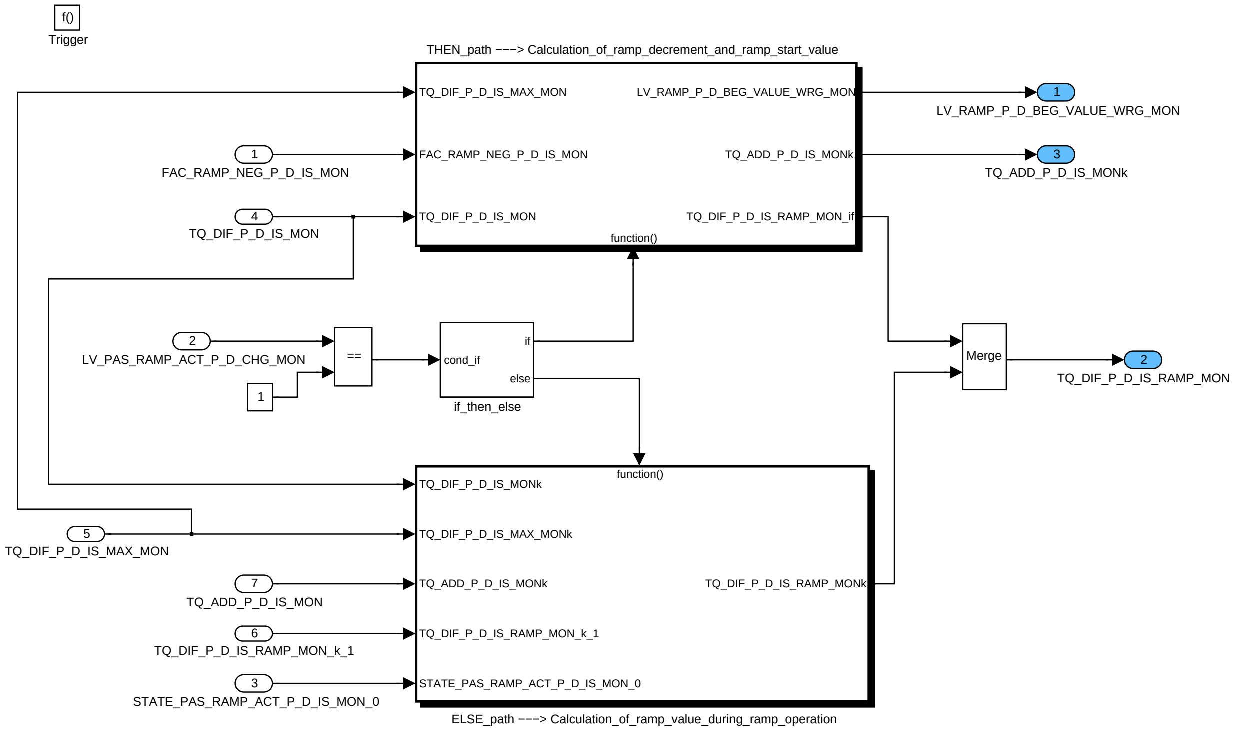

Figure 6 ECM2_DTSYSISC/ Monitoring_of_PD_part/ Ramp_calculation

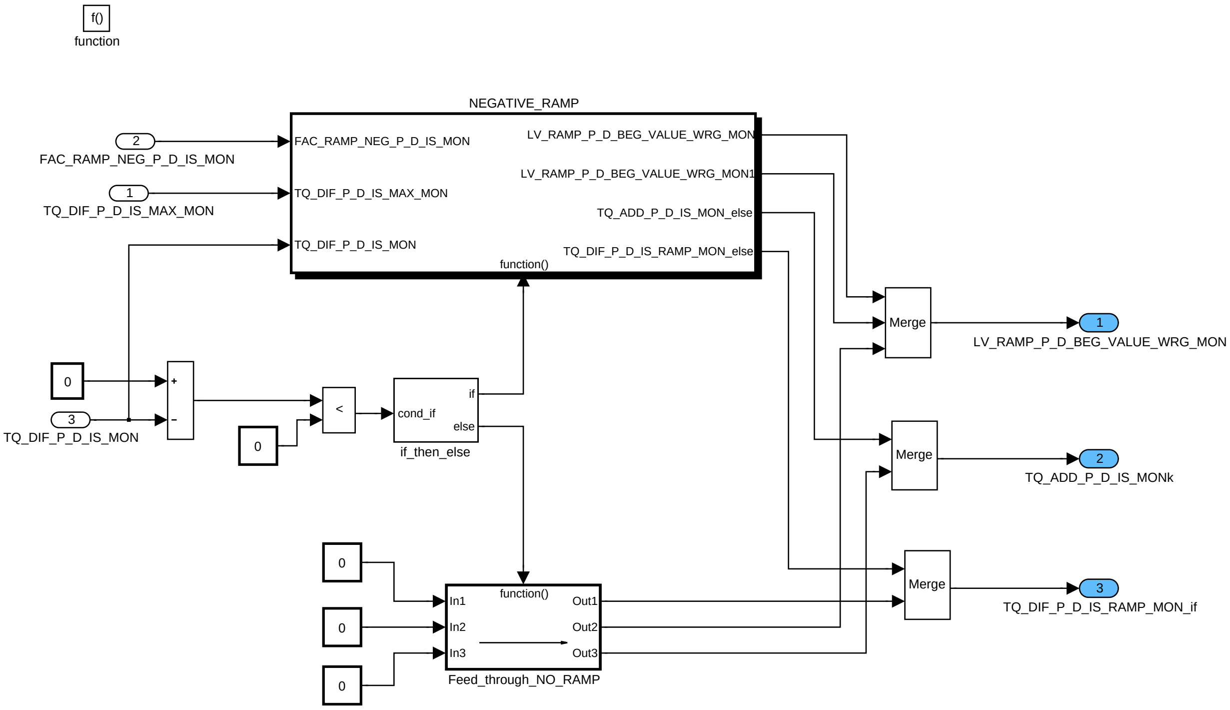

Figure 7 ECM2_DTSYSISC/ Monitoring_of_PD_part/ Ramp_calculation/ THEN_path

NOTE: The minimum PD-ramp increment/decrement is equal to the resolution of TQ_ADD_P_D_ IS_MON. If the theoretically calculated *absolute value* of TQ_ADD_P_D_IS_ MON **is *smaller* than the resolution and not equal to zero**, then is to be limited to the resolution. This would lead to a slower/faster descent of the deactivation ramp i.e. a shorter ramp time. If the theoretical value of TQ_ADD_P_D_IS_MON is equal to zero, this value is then maintained.

11.9.2 Monitoring of I controller

General information:

The objective of this function is the monitoring of the torque demand from the I-part of the idle speed controller function. Two different faults scenarios are considered:

Error Path – ISC not active:

Case 1: If the ISC is actually in the ramp limit operation due to deactivation of ISC, this ramp function is monitored. If LV_PAS_RAMP_ACT_I_CHG_MON is 1(i.e. indicates a change of STATE_PAS_RAMP_ACT_I_IS(0) from 0 to 1 or a flank change between two L2 sample times), a ramp decrement (TQ_ADD_I_IS_MON) is calculated and the actual I-part (TQ_DIF_I_IS_MON) plus a calibratable additive constant is copied to TQ_DIF_I_IS_RAMP_MON. Further on, TQ_DIF_I_IS_RAMP_MON is calculated by adding the calculated ramp decrement to the last delayed value. A fault is set, if TQ_DIF_I_IS_MON > TQ_DIF_I_IS_RAMP_MON or greater than the monitoring threshold C_TQ_DIF_I_IS_MAX_MON. If one of the errors is detected, a fault is declared after debouncing. The difference between monitored and modelled value is declared as a visible variable for application purposes.

Case 2: If in L2 idle speed controller is not active i.e. STATE_ REQ_ISC_MON = NOT_ ACTIVE but the I-part in the function level has not reached the passive value C_TQ_PAS_ I_IS_MON at the end the deactivation ramp, then an error is declared.

Error Path – ISC active:

Case 1: The ISC can be active either when the engine is in idle state (LV_IS=1) or under certain conditions in trailing-throttle state (LV_PU=1) and part-load state (LV_PL=1).So all of these possible “ISC-active” phases have to be monitored. A fault is set, if L1 declares the ISC be active and if L2 also detects the same based on plausiblised activation conditions (STATE_

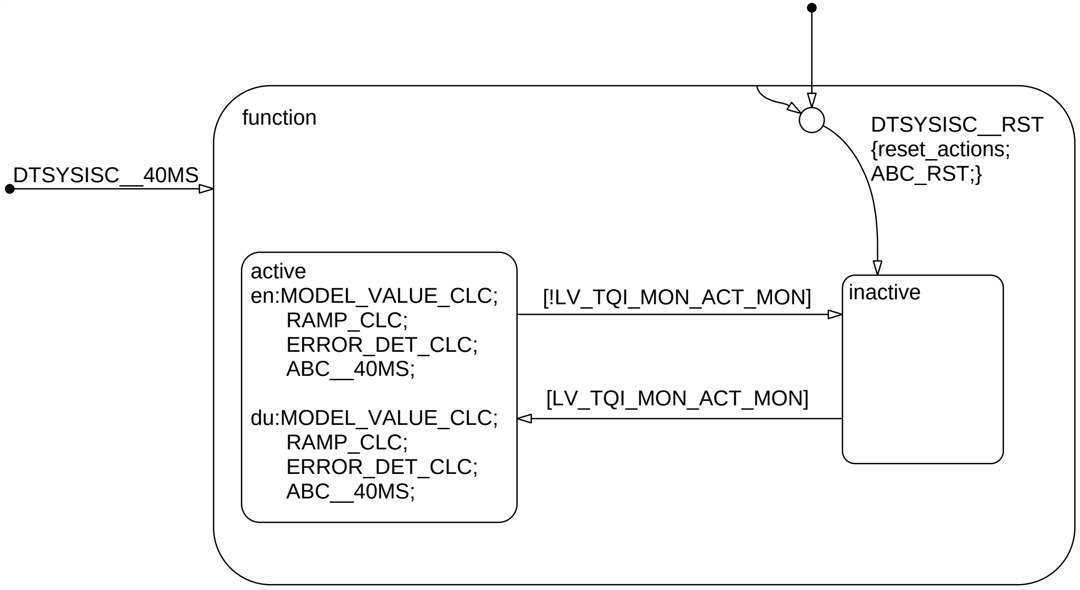
REQ_ISC_MON = IDLE or TRAILING_THR or PART_LOAD) and if torque demand fromL1, TQ_DIF_I_IS_MON, exceeds a threshold value C_TQ_DIF_I_IS_MAX _MON.

Case 2: If in L1 the ISC is active (LV_REQ_ISC=1) but the monitoring functionality detects this activation to be 'faulty' i.e. (STATE_ REQ_ISC_MON ≠ IDLE or TRAILING_THR or PART_LOAD), then an I-part torque demand from L1 greater than a threshold value (C_TQ_I_ISC_NOT _ACT_MAX_MON) will lead to an error detection.

If one of the errors above is detected, a fault is declared after debouncing by the idle speed controller montoring.

Note: The value of STATE_PAS_RAMP_ACT_I_IS (bit coded byte) and STATE_PAS_RAMP_ ACT_P_D_IS(bit coded byte) for the current recurrency (represented by STATE_PAS_RAMP_ACT_I_IS_0 and STATE_PAS_ RAMP_ACT_P_D_IS_0 respectively in the signal flow diagrams) are stored in the bit position 1.

Application Conditions



***Initialisation (DTSYSISC__RST)*:** for condition see 'Application Incidences of Process Monitoring'.

Figure 13 ECM2_DTSYSISC/ Monitoring_of_I_part/ APP_CDN/ Chart

Function Description

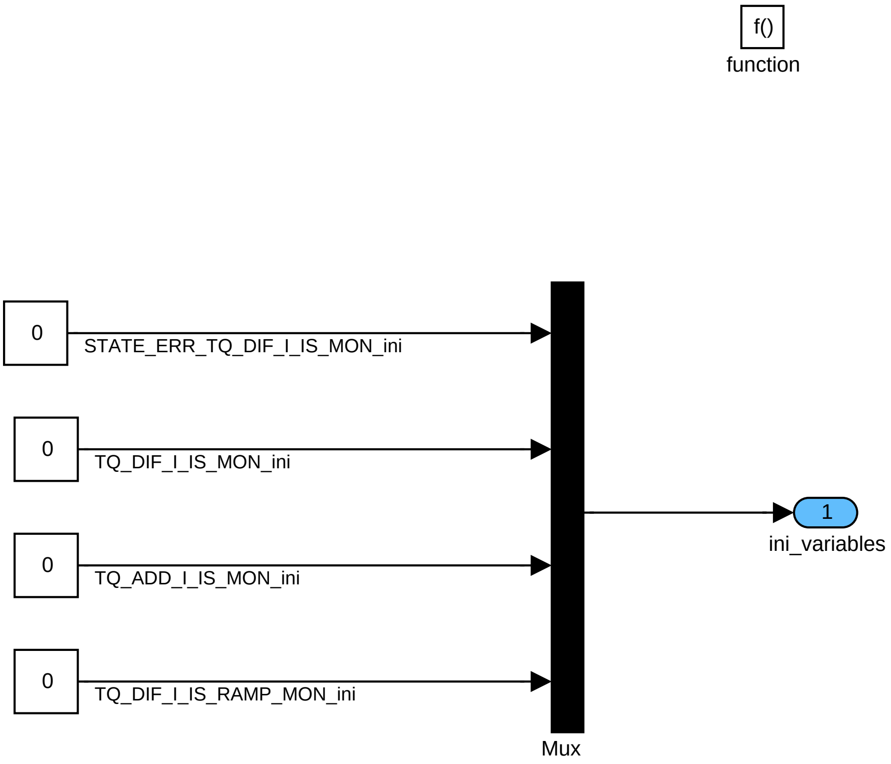

Figure 15 ECM2_DTSYSISC/ Monitoring_of_I_part/ Initialisation

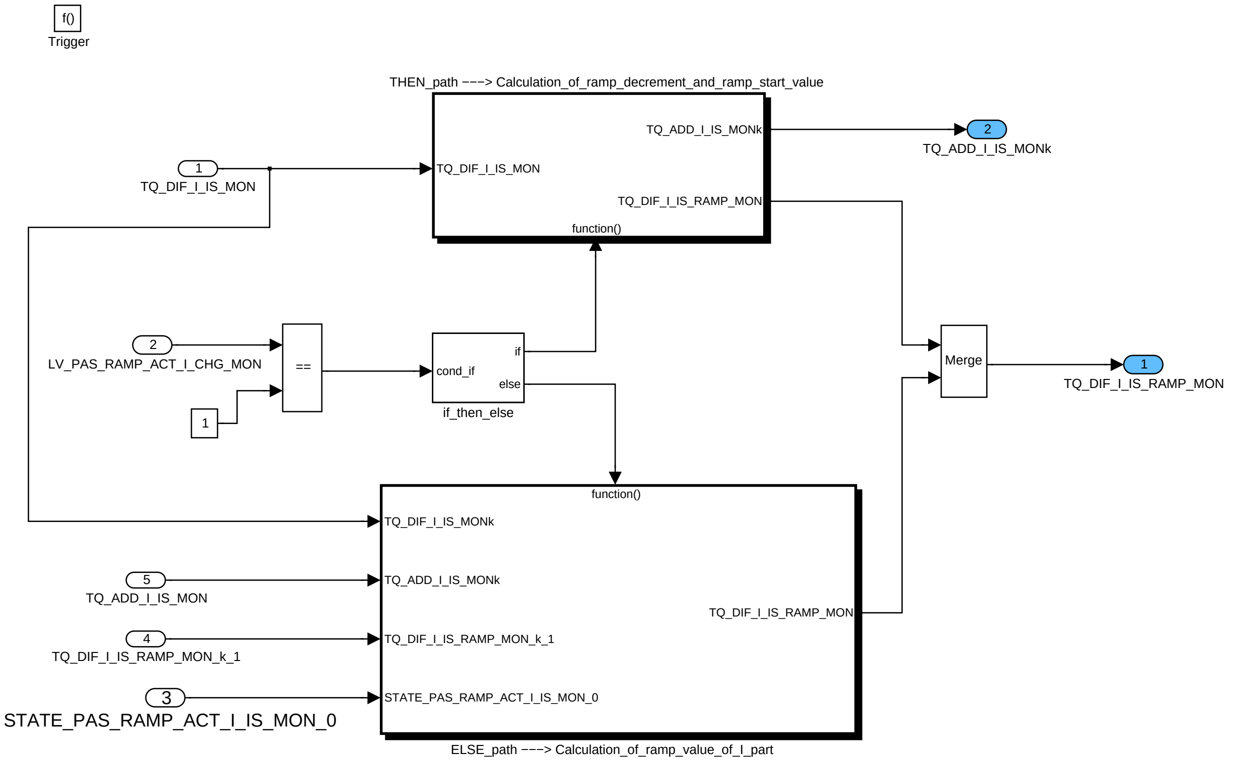

Figure 16 ECM2_DTSYSISC/ Monitoring_of_I_part/ Ramp_calculation

Note: The minimum I-ramp increment/decrement is equal to the resolution of TQ_ADD_I_IS_MON (0.03125Nm). If the theoretically calculated **absolute value** of TQ_ADD_I_IS_MON is ***smaller* than the resolution and not equal to zero**, then is to be limited to the resolution.This would lead to a faster ascent/descent of the deactivation ramp i.e. shorter ramp time. If the theoretical value of TQ_ADD_I_IS_MON is equal to zero, this value is then maintained.

For e.g: theoretical value = -0.04 Nm ---> Limited value = -0.03125 Nm
theoretical value = -0.01 Nm ---> Limited value = -0.03125 Nm
theoretical value = 0.04 Nm ---> Limited value = 0.0625 Nm
theoretical value = 0.01 Nm ---> Limited value = 0.03125 Nm

ACTION_ECM3_ReadChkCpl(**IN** <>, **IN** <>, **OUT** <>)
ACTION_ECM3_Service10TaskPfm(**IN** <>)
ACTION_ECM3_Service11TaskPfm(**IN** <>)

General Information

Import actions:

ACTION_ECM3_Service9TaskPfm(IN< >)

ACTION_ECM3_Service10TaskPfm(IN< >)

ACTION_ECM3_Service11TaskPfm(IN< >)

Note: This actions are defined in chapter "Processor Monitoring", subsection "Program Flow Monitoring services for Process Monitoring". The first action has to be executed as first instruction in this module, the second action has to be executed as last instruction of this module. The argument n has the value 2.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service9TaskPfm() and ACTION_ECM3_Service10TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT < >, OUT < >, IN < >)

ACTION_ECM3_ChkCpl(IN < >, IN < >)

ACTION_ECM3_ReadChkCplOUT < >, IN < >, IN < >)

Note: This actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode O and history variables in modules of the Process Monitoring have to be checked by the cyclical RAM test.

General information:
The objective of this function is the monitoring of the torque losses. It observes both level 1 values, TQ_LOSS and TQ_LOSS_REQ_CLU (filtered TQ_LOSS without pumping losses), that is exclusively used for the determination of TQ_MIN_CLU and TQ_MAX_CLU.
It has to be distinguished between engine immanent torque losses (e.g. TQFR) and not engine immanent torque losses (e.g. TQ_LOSS_ACC), that are determined in the module "Appl. Inc. and configuration of process monitoring".
A fault is detected after debouncing, if the monitored TQ_LOSS is smaller than the modelled one (TQ_LOSS_MDL_MON) or if the monitored TQ_LOSS_REQ_CLU is smaller than the modelled one (TQ_LOSS_REQ_CLU_MDL_MON).

11.11.1 FUNCTION PART: ECM2_DTSYSTQMIN

Import actions:

ACTION_ECM3_Service12TaskPfm(IN <>)

ACTION_ECM3_Service13TaskPfm(IN <>)

ACTION_ECM3_Service14TaskPfm(IN <>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The argument has the value 3.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service12TaskPfm() and ACTION_ECM3_Service13TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT<>, OUT<>, IN <>)

ACTION_ECM3_ChkCpl(IN<>, IN<>)

ACTION_ECM3_ReadChkCpl(OUT <>, IN<>, IN<>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

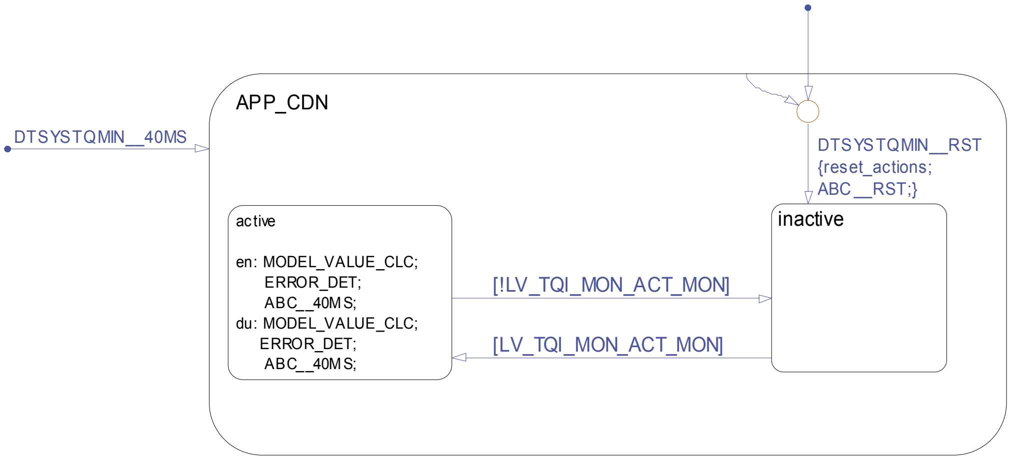
General information:

The objective of this function is the monitoring of the minimum torque at clutch. The model takes into account that a great part of the minimum torque at clutch could be the integral part of the ISC. Therefore the difference of monitored minimum torque at clutch and I-part of ISC is compared to a torque *threshold* which is dependent on:**1)** the engine self stabilising factor (function of ratio between engine speed and idle speed setpoint) **2)** TQ_LOSS_REQ_CLU_MON and **3)** TQ_CONV_MAX_MON. For engine speeds above idle speed setpoint this difference must be negative. For speeds below idle speed setpoint great values for minimum torque at clutch are allowed.

One exception of the above mentioned rule is at engine start. If the engine is in start phase, an constant additive term is taken into account for the threshold (see also "Chapter D – Minimum Torque at Clutch"). To monitor this start torque term, the actual engine speed is compared to an upper threshold for the engine start end-speed. In addition to the I-part of ISC, the two other factors influencing the minimum torque at clutch are hydraulic torque losses inside the converter of an automatic gearbox - TQ_CONV_MAX_MON (which depends on coolant temperature and idle speed setpoint) and the minimum requested indicated torque in the PU phase - TQI_MIN_REQ_PU_MON. However, if the engine is in PU or PUC mode TQ_MIN_ CLU_MDL is set to minimum possible torque that the driver can request i.e. TQ_LOSS_MON.

The plausiblisation of the L1 value, TQ_MIN_CLU, against a L2 model value is done based on current engine state. The variable STATE_ERR_DET_TQ_MIN_MON (calculated in the module ‘Application incidences of process monitoring’) is used to switch between the different error-detection paths. If the engine is in PU or PUC and the L1 minimum torque at clutch value is greater than TQ_LOSS_MON, then an error state is set. If however the engine is neither in PU or PUC, then the L1 value is compared to the L2 model value TQ_MIN_CLU_MDL_4_MON. If any of the error states are set, a fault is detected after debouncing.

Application Conditions



Initialisation(DTSYSTQMIN__RST): for condition see ‘Application Incidences of Process Monitoring’

Note: These actions are defined in chapter "Processor Monitroing", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The objective of this function is the monitoring of the maximum torque at clutch. The maximum torque at clutch is compared to a model threshold value (TQ_MAX_CLU_MAX_MON). The factors influencing this threshold are: IP_TQI_REF_MAX_MON (the worst case condition i.e. maximum possible fresh air entering in the cylinder is taken into account inside this map), TQ_LOSS_REQ_CLU_MON and driver request influence as a weighting factor in a crossfade calculation. A fault is detected after debouncing, if the maximum torque at clutch exceeds this threshold.

11.13.1 MSR monitoring

FUNCTION DESCRIPTION:

General information:

The torque demands received by the CAN-bus are monitored.

The input signals are read direct from CAN.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1
Deactivation: otherwise
Initialization: TQI_MSR_MON = 0
LV_ERR_MSR_INH_MON = 0
T_MSR_INH_MON = 0
ABC_MSR_INH_MON = 0
TQ_MSR_MON = -1024 Nm
Update Rate: 40 msec

Formula section:

LV_VAR_BN = 0:

```
IF   LV_ERR_MSR_INH_MON = 0
THEN
     TQI_MSR_MON = C_TQI_STND_MON  * TQI_MSR_CAN

```

Explanation of some MSR inhibit conditions listed above:

On an error free CAN 11H transmission: TQI_ASR_FAST_CAN is the same, but bitinverse value of TQI_MSR_CAN

The CAN-interface is directly checked for the CAN-Bus OFF fault

11.13.4.2 AMT plausibility monitoring

FUNCTION DESCRIPTION:

General information:

To supress incorrect Torque request of transmission unit a monitoring of messages is done.

Application conditions:

Initialization: 0

Recurrence: 40 ms

Activation: LV_TQI_MON_ACT_MON = 1 and LV_IGK_MON = 1

Signal flow diagram:

The structure is like the Level 1 function "AMT intervention plausibility"

Formula section:

```
If LV_VAR_BN = 0
Then        TQI_AMT_PLAUS_MON = TQI_AMT_MON
Else IF     LV_TQ_AMT_DEC_REQ = 1
      Then  TQI_AMT_PLAUS_MON =   TQI_AMT_FAST_DEC
else        TQI_AMT_PLAUS_MON =   TQI_AMT_FAST_INC
endif
```

Plausibility of shift phase:

```
If    LV_GS = 0
Then if  STATE_AMT = 0 and (TQI_AMT_PLAUS_MON <
                                            C_TQI_AMT_COND_DIAG_MON)
                Then   STATE_ERR_AMT_MON = 00H
                Else   STATE_ERR_AMT_MON = 01H
      End if
Else if     STATE_AMT = 0
       Then  if     LV_AMT_ES > 0
            Then  if     TQI_AMT_PLAUS_MON ≤ C_TQI_AMT_CAN_ES_MON and
                         VS_FIL < C_VS_FIL_AMT
                  Then   STATE_ERR_AMT_MON = 00H ; LV_AMT_ES_REQ =1

11.13.5 GS monitoring

11.13.5.1 GS torque monitoring

FUNCTION DESCRIPTION:

General information:

The torque demands received by the CAN-bus are monitored.

The input signals are read direct from CAN.

Application conditions:

Activation: LV_TQI_MON_ACT_MON = 1 **and** (LV_AT = 1 **or** LV_VAR_TCT = 1)

Deactivation: otherwise

Initialization:
TQI_GS_MON = 0
LV_ERR_GS_INH_MON = 0
T_GS_INH_MON = 0
ABC_GS_INH_MON = 0
TQ_GS_MON = -1024 Nm

Update Rate: 40 msec

Formula section:

11.14.1 FUNCTION PART: ECM2_DTSYSN

General information:

The comparison of the engine speed N_32 to an engine speed substitute N_32_SUB_MON, calculated in the monitoring level, performs the monitoring of the engine speed used in the monitoring level.

N_32_SUB_MON is calculated from a segment timing information that is generated by a software timer solution in the BSW (T_SEG_SW_MON). The software timer is triggered by crankshaft segments and produces time stamps for the trigger events. From these timing informations the signal T_SEG_SW_MON is determined (resolution: 1µs).

The engine speed signals N_32 and N_32_SUB_MON are compared to each other by means of a relative deviation. The ratio of the difference of N_32 and N_32_SUB_MON related to the minimum of the two values is not allowed to deviate more than the maximum difference C_N_32_DIF_REL_MAX_MON. Otherwise a process fault is assumed. Since for a small engine speed the relative error concept is leading to a rather small permitted absolute difference between N_32 and N_32_SUB_MON, the monitoring could be too tight here. Therefore, as soon as both engine speed signals are smaller than a limit C_N_32_MIN_MON, the relative error is calculated by relating the absolute difference to the constant C_N_32_LIM_MON.

On an error free system N_32 is copied to N_32_MON. If an engine speed error is detected, the maximum value of N_32 and N_32_SUB_MON is copied to N_32_MON to prevent from a sleeping fault in the module ‚Monitoring of engine speed limitation‘.

Note: This version of engine speed monitoring is for systems where a second hardware timer, which in other versions was delivering the signal SEG_T_MES, is not available on the ECU and where the missing timer is substituted by a software timer solution in the BSW.

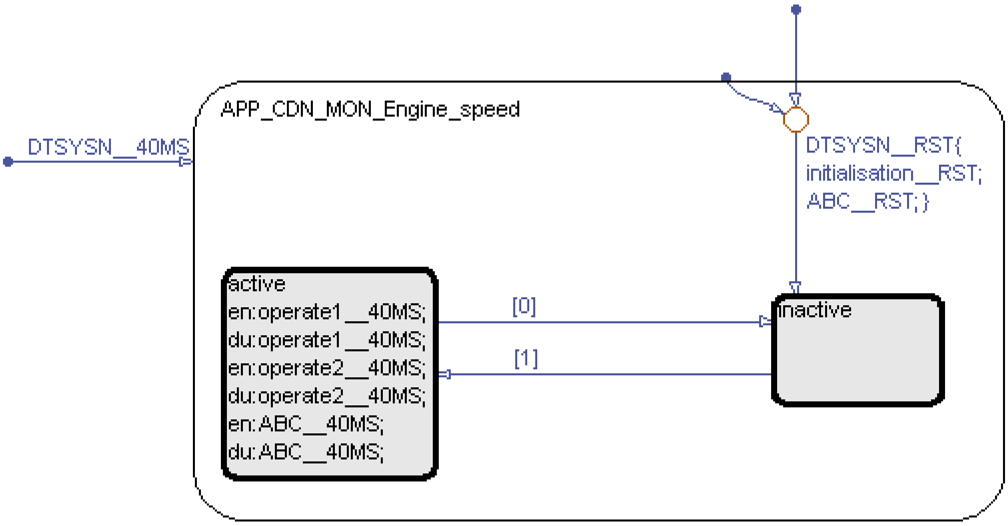
For configuration data:

NC_T_SEG_N_32_CLC is a constant for the calculation of N_32_SUB_MON from T_SEG_SW:

$$NC\_T\_SEG\_N\_32\_CLC = \frac{2*60*1000000}{NC\_CYL\_NR*\{resol.\ of\ \ N\_32\_SUB\_MON\}}$$

with NC_CYL_NR : number of cylinders

Application Condition



Note: DTSYSN__RST includes the function calls as defined in application incidences.

Import actions:

ACTION_ECM3_Service3TaskPfm(IN<>)

ACTION_ECM3_Service4TaskPfm(IN<>)

ACTION_ECM3_Service5TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 2.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service3TaskPfm() and ACTION_ECM3_Service4TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)

ACTION_ECM3_ChkCpl(IN <>, IN <>)

ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: All variables with Mode O and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

ACTION_INFR_GetVPVSMON(OUT<V_PVS_1_MON>, OUT<V_PVS_2_MON>)

Note: These actions is defined in IRS, it is responible for providing voltages from PVS channel 1 && 2

General information:

The pedal value diagnosis is made in the monitoring level in order to check the V_PVS input value of the torque monitoring function (level 2).

After the diagnosis, a resulting pedal value PV_AV_MON is used as input for the torque monitoring function.

A malfunction of level 1 will be assumed, if a ratio error of the two redundant pedal values is diagnosed after debouncing, yet no PVS failure was detected previously by the PVS diagnosis function of level 1.

The following errors were detected:

The difference between the values V_PVS_1_MON and V_PVS_2_MON is too large.

The diagnosis system of level 2 detects a PVS ratio fault and no fault is detected by the diagnosis of level 1.

Any PVS error-BIT of the PVS diagnosis in level 1 has been reset without permission.

To ensure that the PVS diagnosis of level 1 detects a fault earlier than the PVS ratio diagnosis of level 2, the fault detection time of the diagnosis function in level 2 has to be adjusted that it exceeds the fault detection time of level 1. Therefore, all level 1 PVS diagnosis thresholds, all constants of the debounce counters and the cycle time have to be taken into account.

Application Condition

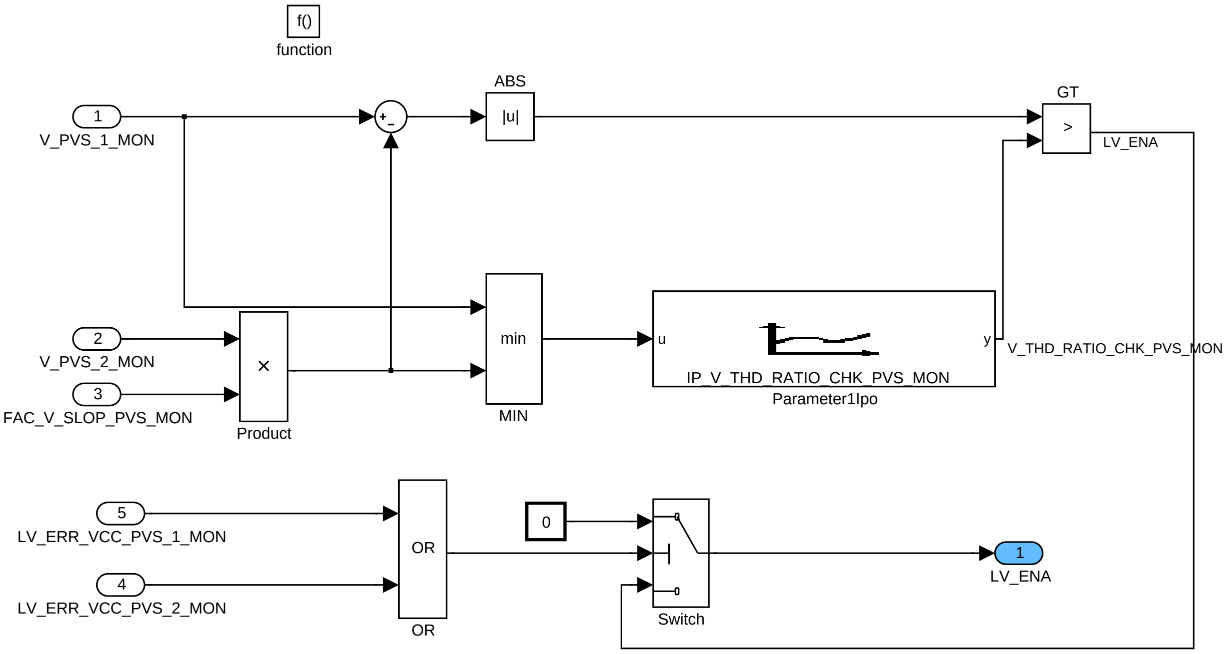

Figure 49 ECM2_DTSYSPVS/ operate/ RATIO_CHECK/ Ratio_check

ECM2_DTSYSPVS/OPERATE/RATIO_CHECK/ERROR_INFO_PROCESSING

The Bits LV_ERR_VCC_PVS_1_MON and LV_ERR_VCC_PVS_2_MON are reversible like the correspndent failure bits from level 1. That means, the output LV_ERR_PVS_RATIO_MON has to be reversible also depending of these two error bits.

All PVS error information of the function level is considered. This allows the different process levels to be based on the same error information:

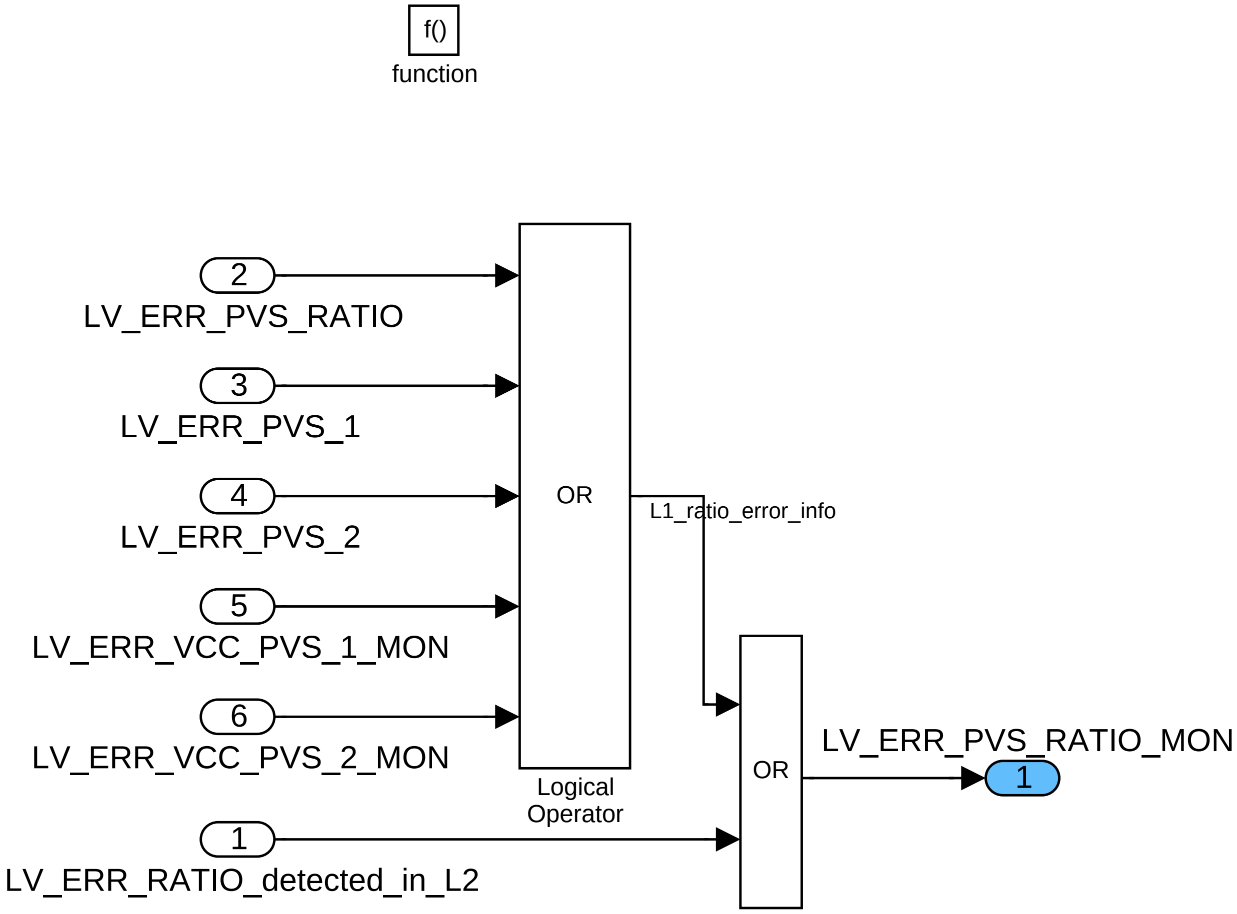

Figure 50 ECM2_DTSYSPVS/ operate/ RATIO_CHECK/ Error_info_processing

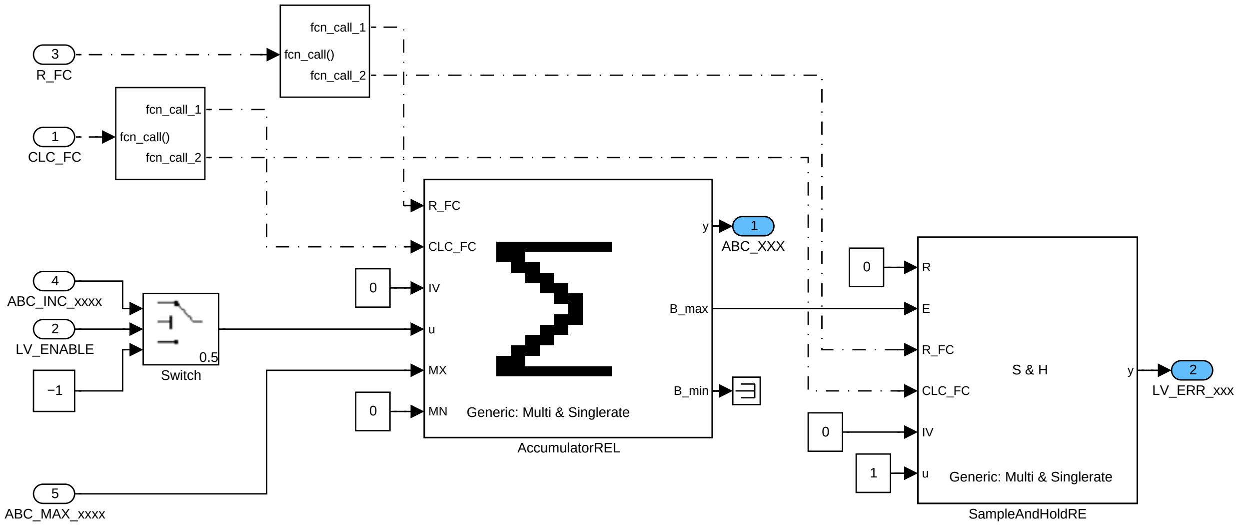

Figure 51 ECM2_DTSYSPVS/ operate/ RATIO_CHECK/ abc_multi_rate

ECM2_DTSYSPVS/OPERATE/DIAG_CHECK_BETWEEN_L1_L2

If any PVS ratio error is detected in level 2 and no PVS error is detected in level 1, a fault of the PVS diagnosis in level 1 will be assumed.

There is also a check, whether an error-BIT of the PVS diagnosis in level 1 was reset without permission. This is done by using the result of LV_ERR_PVS_RATIO_MON of the last recurrence.

LV_ERR_VCC_PVS_MON is assumed to be a PVS supply voltage error flag of a level 2 diagnosis in case of any PVS supply voltage error.

LV_ERR_VCC_PVS_1_MON and LV_ERR_VCC_PVS_2_MON are error flags that result from Level 1 diagnosis of PVS-1 and PVS-2 supply voltage and are assigned to the LV_ERR_VCC_PVS_1_MON and LV_ERR_VCC_PVS_1_MON respectively in the application incidences of process monitoring.

If an PVS?monitoring error is detected and the error bit LV_ERR_PVS_MON is set, then this bit muts not be reversible.

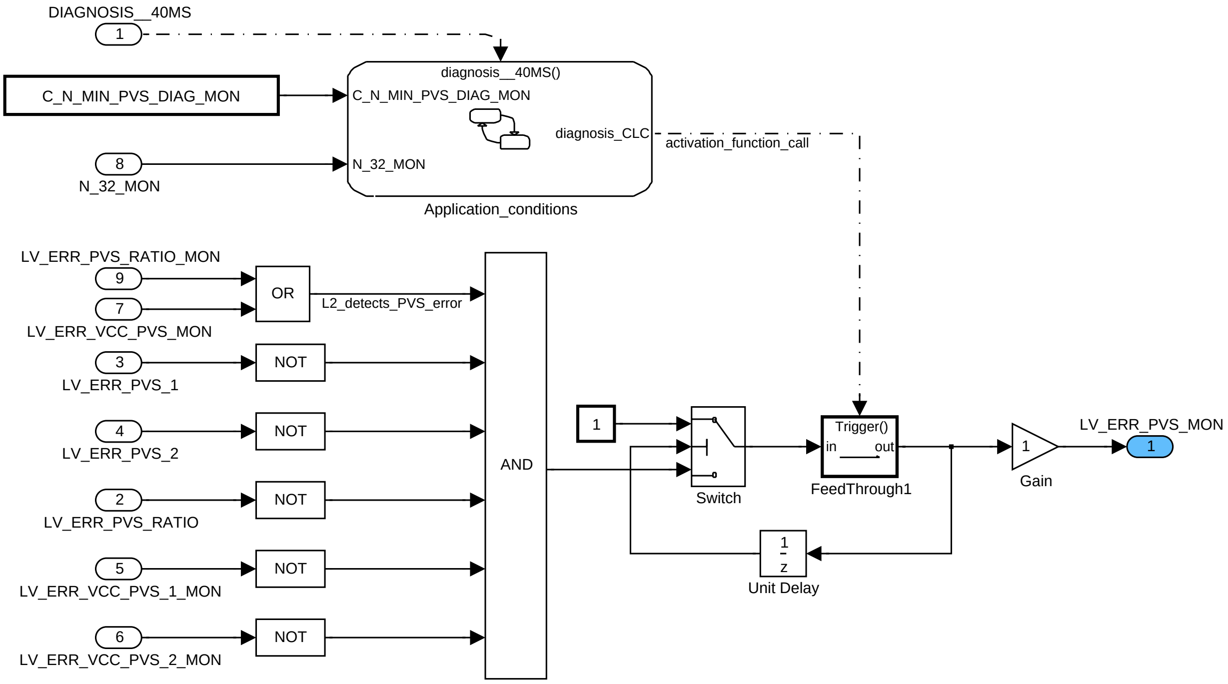

Figure 52 ECM2_DTSYSPVS/ operate/ Diag_check_between_L1_L2

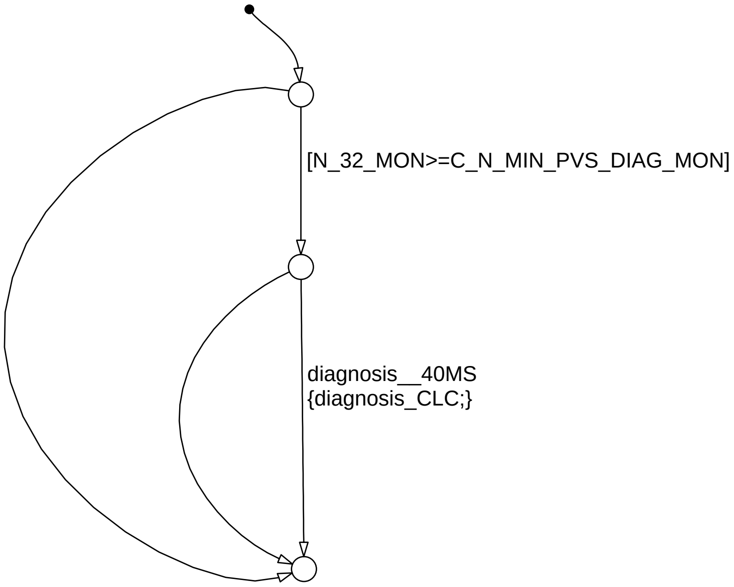

Figure 53 ECM2_DTSYSPVS/ operate/ Diag_check_between_L1_L2/ Application_conditions

ECM2_DTSYSPVS/OPERATE/PVS_CHANNEL_SELECT

Depending on the plausibility, the degree of pedal activation PV_AV_MON is defined by the signals PV_AV_1_MON and PV_AV_2_MON, as follows:

Error Level	Error bits set	Analysis, error handling
0	-	PV_AV_MON = MIN(PV_AV_1_MON,PV_AV_2_MON)
1	LV_ERR_PVS_RATIO_MON	PV_AV_MON = MIN(PV_AV_1_MON, PV_AV_2_MON) (minimum)
2	LV_ERR_PVS_1 **OR** LV_ERR_VCC_PVS_1_MON	PV_AV_MON = PV_AV_2_MON (selection)
3	LV_ERR_PVS_2 **OR** LV_ERR_VCC_PVS_2_MON	PV_AV_MON = PV_AV_1_MON (selection)

4	(LV_ERR_PVS_1 OR LV_ERR_VCC_PVS_1_MON) **AND** (LV_ERR_PVS_2 OR LV_ERR_VCC_PVS_2_MON)	PV_AV_MON = 0 driver demand not recoganizable

If any PVS error-BIT is set:

PV_AV_MON will be limited to C_PV_LIH_MAX_MON.

Use of the brake as a redundant driver demand:

IF (LV_BRAKE_MON = 1)

THEN

PV_AV_MON = 0 (same as Error level 4)

General Information

Import actions:

ACTION_ECM3_Service18TaskPfm(IN<>)
ACTION_ECM3_Service19TaskPfm(IN<>)
ACTION_ECM3_Service20TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 2.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service18TaskPfm() and ACTION_ECM3_Service19TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)
ACTION_ECM3_ChkCpl(IN <>, IN <>)
ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode O and history variables in modules of the Process Monitoring have to be checked by the cyclical RAM test.
General information:
The variable MFF_TQ_MON (represented via LAMB_DIF_MON) is needed for calculation of TQI_AV_MON. The modul checks the plausibility of MFF_TQ_MON (calculated in "Actual fuel mass flow"). Therefore LAMB_DIF_MON (actual Lambda reference Lambda) is checked against borders dependent on actual Lambda. The critical case will be, if LAMB_DIF_MON gets to small in nonAFS_mode (equivalent to acceleration). Additionally, LV_ERR_... coming from Level 1 are considered. If there is an implausible state during non AFSmode, OPM will be switched to AFS first.

An additional TPS ratio check is performed. This function checks if any TPS failure has been detected in level 1 when a TPS ratio error is recognized in level 2.

Hint!! Application Conditions - Initialisation: for condition see 'Application incidences of process monitoring'

ACTION_ECM3_Service17TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 2.

ACTION_ECM3_McChkStack()

Note: These actions are defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service15TaskPfm() and ACTION_ECM3_Service16TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)
ACTION_ECM3_ChkCpl(IN <>, IN <>)
ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The objective of this module is the determination of the deviation between the modelled Lambda and the sensor- signal during stratified combustion or the deviation between the modelled Lambda and the reference Lambda during homogeneous combustion.

Description:

Homogeneous combustion: The MFF_LAMB_MON signal has to be corrected by subtracting all enrichments (e.g. WUP, CAST, etc.) because after modelling the resulting Lambda by using MAF from Level1, a compare against the reference Lambda (normally 1) takes place. For this injection mode no Lambda sensor is necessary then.

Stratified combustion: The MFF_LAMB_MON signal has not to be corrected by enrichments, because the sensor signal is used here directly for the plausibility check. Due to physical transport delay of the exhaust gas the modelled Lambda signal has also to be delayed. This is done with a 'PADE- Filter'. Further the sensor behaviour itself has to be modelled by using a PT1- Filter. The resulting signal is compared with a mean value of both sensors or with the remaining, if one sensor is defect (in case of 2-bank engine).

Hint!! Application Conditions - Initialisation: for condition see 'Application incidences of process monitoring'

ECM2 DTSYSCRU: General information:

The cruise control function is able to request a lot of torque and to accelerate the car up to high speed. In order to avoid dangerous situations caused by a fault of the cruise control function. the main activation/deactivation conditions are monitored within the etc safety concept. Therefore the basic signals from the master control (Hauptschalter) and the brake are evaluated.
In a cruise control function including active deceleration also the conditions for deceleration enabling have to be monitored.

Application Condition

11.19 Torque Monitoring Overview

In the function level the various torque demands coming from the driver, the idle speed controller etc. are co-ordinated to a resulting quantfied charge setpoint. At the same time the actual indicated engine torque is calculated based on several measured and internal torque relevant variables.

The aim of the torque monitoring is to detect an increased actual indicated engine torque compared to the desired indicated engine torque. Therefore the co-ordination of the various torque demands and the calculation of the actual indicated engine torque done in the function level (level 1) is performed once again in the monitoring level (level 2), however with a simplified structure. Then the deviation between the actual (TQI_AV_MON) and the desired indicated engine torque (TQI_SP_MON) is checked for exceeding a threshold.

Signal flow diagram:

Import actions:

ACTION_ECM3_Service6TaskPfm(IN <>)

ACTION_ECM3_Service7TaskPfm(IN <>)

ACTION_ECM3_Service8TaskPfm(IN <>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The argument has the value 4.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service6TaskPfm() and ACTION_ECM3_Service7TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT<>,OUT<>,IN<>)
ACTION_ECM3_ChkCpl(IN<>, IN<>)
ACTION_ECM3_ReadChkCpl(OUT<>,IN<>, IN<>)

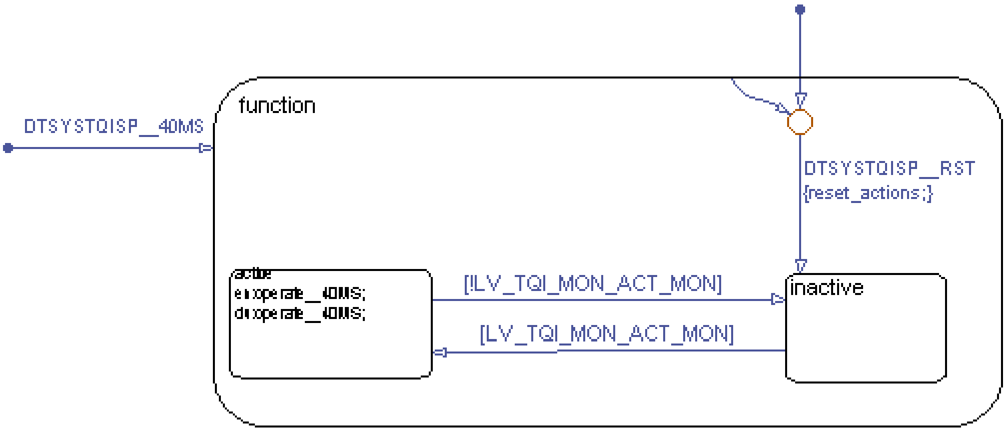
Note: This actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The objective of this module is to calculate the desired indicated engine torque which derives from the function level (level 1). All torque increasing demands are taken into account. The different parts are:

- calculation of scaling factor for requested torque at clutch from driver (FAC_TQ_REQ_MON) in different operation modes, depending on engine speed (N_32_MON) and adapted accelerator pedal activation degree (PV_AV_AD_MON)
- calculation of requested torque at clutch from driver
- switch from brake torque to indicated torque demands
- adding the torque request for drive off assistance
- filtering the raw torque demand in falling direction to take into account the system response time
- maximum choice between internal and external torque demands
- If the engine is in the trailing throttle state i.e. no driver demand but limitation on indicated engine torque to ensure a safe combustion at low load conditions, then the torque setpoint in L2 is limited by TQI_MIN_PU_MON.
- adding internal increasing torque demands (TQ_DIF_P_D_IS_MON)

Application Condition



Initialisation(DTSYSTQISP__RST): for condition see 'Application Incidences of Process Monitoring'.

11.21.1 ECM2_DTSYSMFFAC

This specification has to be coded according to the following method description: "M730204: Coding rules for process monitoring SW - ECM2.

Import actions:

ACTION_ECM3_Service15TaskPfm(IN<>)

ACTION_ECM3_Service16TaskPfm(IN<>)

ACTION_ECM3_Service17TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 1.

ACTION_ECM3_McChkStack()

Note: These actions are defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service15TaskPfm() and ACTION_ECM3_Service16TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)

ACTION_ECM3_ChkCpl(IN <>, IN <>)

ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The ETC safety concept uses the mass-fuel-flow signal as a basis for the generation of a actual indicated engine torque. Therefore not the complete injection is seen as torque relevant. The post- pulse especially becomes weighted with a factor, which depends on its phasing. The sum of first, second and the weighted post- pulse (MFF_TQ_MON) is input for the determination of the actual engine torque. The un-weighted sum of all pulses (MFF_LAMB_MON) becomes corrected by elimination of all enrichments (e.g. WUP, CAST, etc.) with the aim to create a Lambda signal, which is comparable against the reference Lambda (see also 'Actual lambda deviation').

Description:

The fuel mass flow is determined by a summation of all injection pulses for every cylinder with an arithmetic mean- value calculation afterwards. From I/O- Software the feedback-signal for the opening duration of the injectors (TI_X_MES) is supplied to the monitoring level as well as the the charge CHA_IV_X_MES. The energy which was put into the injector's piezo- stack is taken as representative for the needle lift. After correction of these signals to standard conditions, a characteristic curve for a dedicated energy level, delivers the correspondence between injection time and mass-fuel-flow.

Hint!! Application Conditions - Initialisation: for condition see 'Application incidences of process monitoring'

General Information

Import actions:

ACTION_ECM3_Service15TaskPfm(IN<>)

ACTION_ECM3_Service16TaskPfm(IN<>)

ACTION_ECM3_Service17TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 3.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service15TaskPfm() and ACTION_ECM3_Service16TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)

ACTION_ECM3_ChkCpl(IN <>, IN <>)

ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode O and history variables in modules of the Process Monitoring have to be checked by the cyclical RAM test.

11.24.1 DTSYSTQMON

Import actions:

ACTION_ECM3_Service9TaskPfm(IN<>)
ACTION_ECM3_Service10TaskPfm(IN<>)
ACTION_ECM3_Service11TaskPfm(IN<>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 4.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service9TaskPfm() and ACTION_ECM3_Service10TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)
ACTION_ECM3_ChkCpl(IN <>, IN <>)
ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: These actions are defined in chapter "Processor Monitoring", subsection "RAM test on MC for processor monitoring". All variables with Mode “O” and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

General information:

The objective of this module is the comparison of the desired indicated engine torque TQI_SP_MON (feed-forward path) and the actual indicated engine torque TQI_AV_MON (feedback path). In the fault free case, the actual indicated engine torque should not exceed the desired indicated engine torque. A fault is detected after debouncing, when the actual indicated engine torque exceeds the setpoint value by more than a threshold value TQI_DIF_MAX_MON depending on engine speed and the desired torque. If the operation mode is not equal to AFS a request for AFS will be debounced.

TQI_AV_MON depends on the dynamics of the intake manifold and on the dynamics of the lambda sensor which means that a possible fault cannot be detected before a certain time. Hence for a fast diagnosis TQI_AV_MON is not suitable but can be replaced by TQI_SP which is compared to TQI_SP_MON. In case that TQI_SP_MON differs from TQI_SP by more than a certain value, the error bit LV_ERR_TQI_AV_MON is set.

ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: All variables with Mode O and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

FUNCTION DESCRIPTION:

General information:

The objective of this module is to verify that the related level 1 function 'Engine speed limitation' works correctly. In case that the engine speed exceeds a certain speed level, the level 1 function activates ETC limp home mode (safety fuel cut-off) to protect the engine.

The level 2 function 'Monitoring of engine speed limitation' considers the status of the injection of all cylinders and the engine speed value and the ETC request flag (LV_N_LIM_ETC_MON). This flag is set to 1 if any function requests limp home activation.

In case that the engine speed exceeds the defined level 2 value C_N_MAX_MTC_LIH_THD_MON and limphome mode is requested (LV_N_LIM_ETC_MON = 1) and injection is active in at least one cylinder (PREV_STATE_IV ≠ 0; fuel cut-off is not active!), the related error bit LV_ERR_TQI_N_MAX_MON is set after having waited a certain debounce time defined by C_ABC_MAX_TQI_N_MAX_MON and C_ABC_INC_TQI_N_MAX_MON.
The injection status has to be checked to avoid that level 2 detects a failure in case that the engine speed exceeds the threshold although fuel cut-off has been put into action. This could happen if the vehicle is running down a hill and the engine speed increases because of the engine directly linked to the transmission.

11.27.1 ECM2_DTSYSCOPPRHPDI

Attention: All Level 2' calibration data are set to INVISIBLE and NOT TUNABLE epxect for C_STATE_RESP_MON2_RST_ACT_MON2. This is necessary in order to get a more robust calibration process in case of software or calibration data updates. C_STATE_RESP_MON2_RST_ACT_MON2 has to be visible and tunable in the calibration system in order to generate an L2' reset for test cases.

General information:

A copy of the main part of the process monitoring (level 2) is built (called level 2’) and used as a set of test calculations. The target is to verify the correct behaviour of the process monitoring at any time using predefined test data and comparing the resulting answer to the expected answer stored in a predefined table. Moreover there is a special calculation routine responsible for checking the correct data transfer between registers and stack in case of interrupts during the calculation.

This processor monitoring function includes the monitoring functions described in the table below. However, no real fault reaction like disabling of throttle etc. is released.

Since the answers of these test calculations will be compared to the predefined table ID_RESP_MON2 (see processor monitoring), it is important to generate a different answer for every index of starting values (NC_TEST_REC_IDX_MAX_MON2 different answers overall). The list of data points for the starting values must contain the indices 0...NC_TEST_REC_IDX_MAX_MON2-1 in ascending order. For details see also "Processor Monitoring" and "Processor Monitoring (Appl.Inc.)".

Table of software-code of level 2 modules that is included in level 2’:

Module:	**Specification:**
Desired indicated engine torque	`30E00K01.00I`
Actual efficiencies	`30E01401.00J`
Actual indicated engine torque	`30E00L01.00E`
Monitoring of actual indicated engine torque	`30E00M01.00E`
Monitoring of engine speed limitation	`30E00I01.00F`

Fault reaction of process monitoring	30E00G01.00J

The software-code of the level 2’ sub-modules is an exact copy of software-code of the level 2 modules listed in the table above, with exceptions described in the following sub chapters.

The following Application Condition takes into consideration that the level 2' module is triggered by Processor Monitoring (level 3).

Application Condition

11.27.1.1 OPERATE

General information:

Based on the number of the question asked by the monitoring unit a corresponding set of starting values for the test calculation is selected from the lists of starting values.

The values of LDPM_TEST_REC_IDX_MON2 are fixed. They depend on the maximum NC_TEST_REC_IDX_MAX_MON2 of the generated index TEST_REC_IDX_MON2. The hex and physical limits are defined with static values which depend on the possible number of questions in the HW.

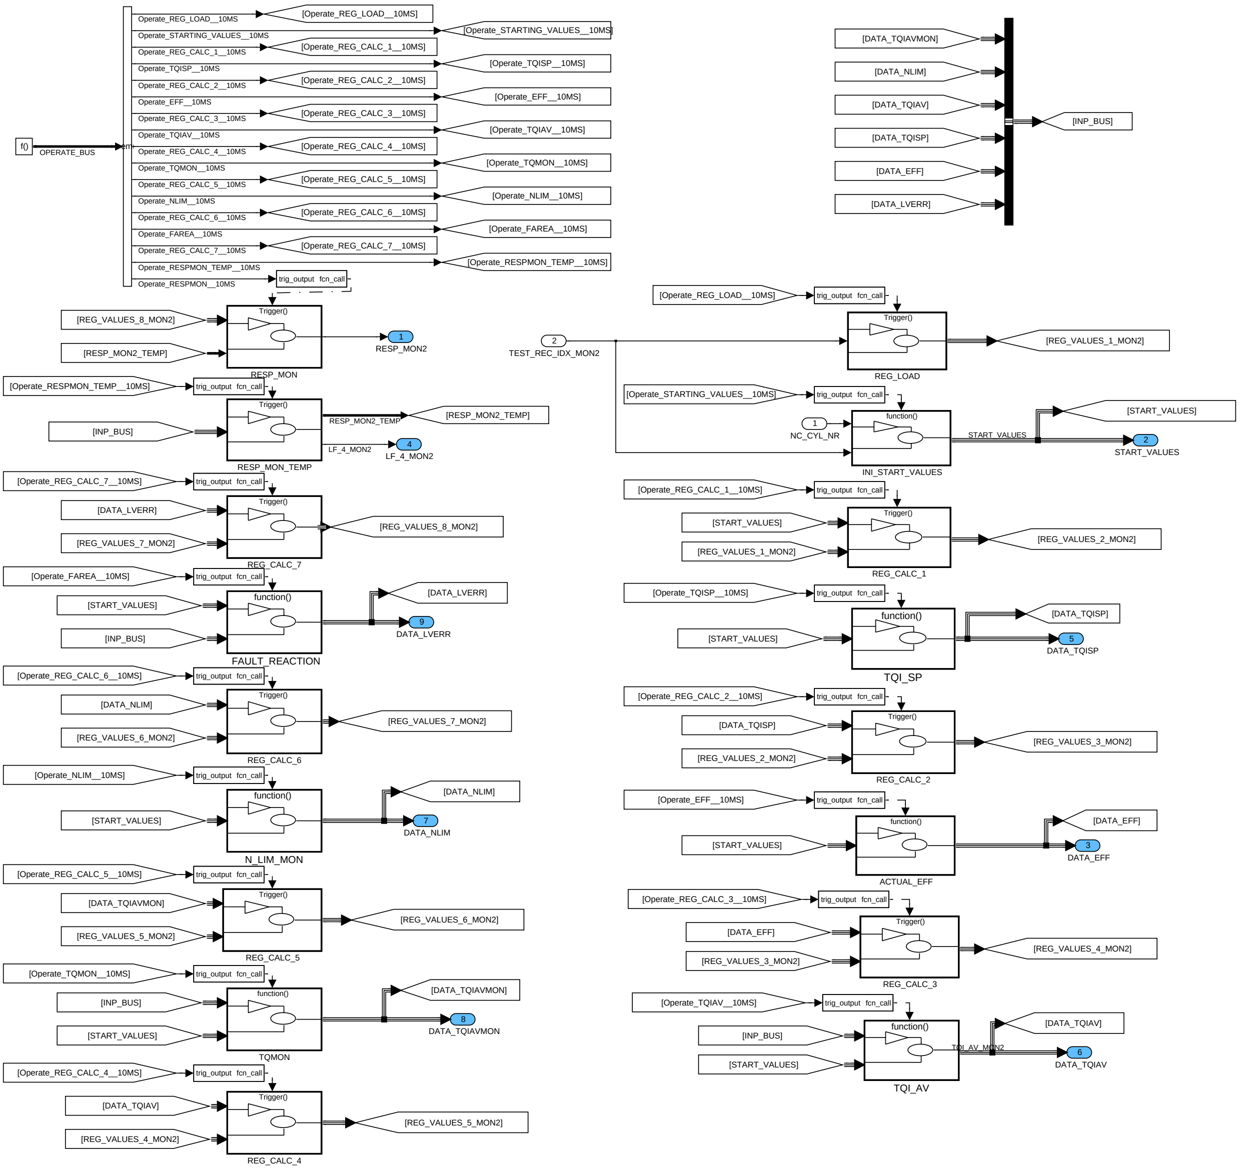

Figure 108 ECM2_DTSYSCOPPRHPDI/ OPERATE

Register LOAD for checking Interrupt routine

In order to simulate an interrupt at first all registers and some cells of the user stack (if available) will be loaded with some defined initial values (see figure below).

The data type for these values has to be signed 32 bit. It is not allowed to use arrays for the load values: after the first calculation every register or user stack value has to be stored separately.

After the calculation, the function call of the first module out of the L2 copied functions shall be carried out; thereby, the current register values will be copied onto the stack.

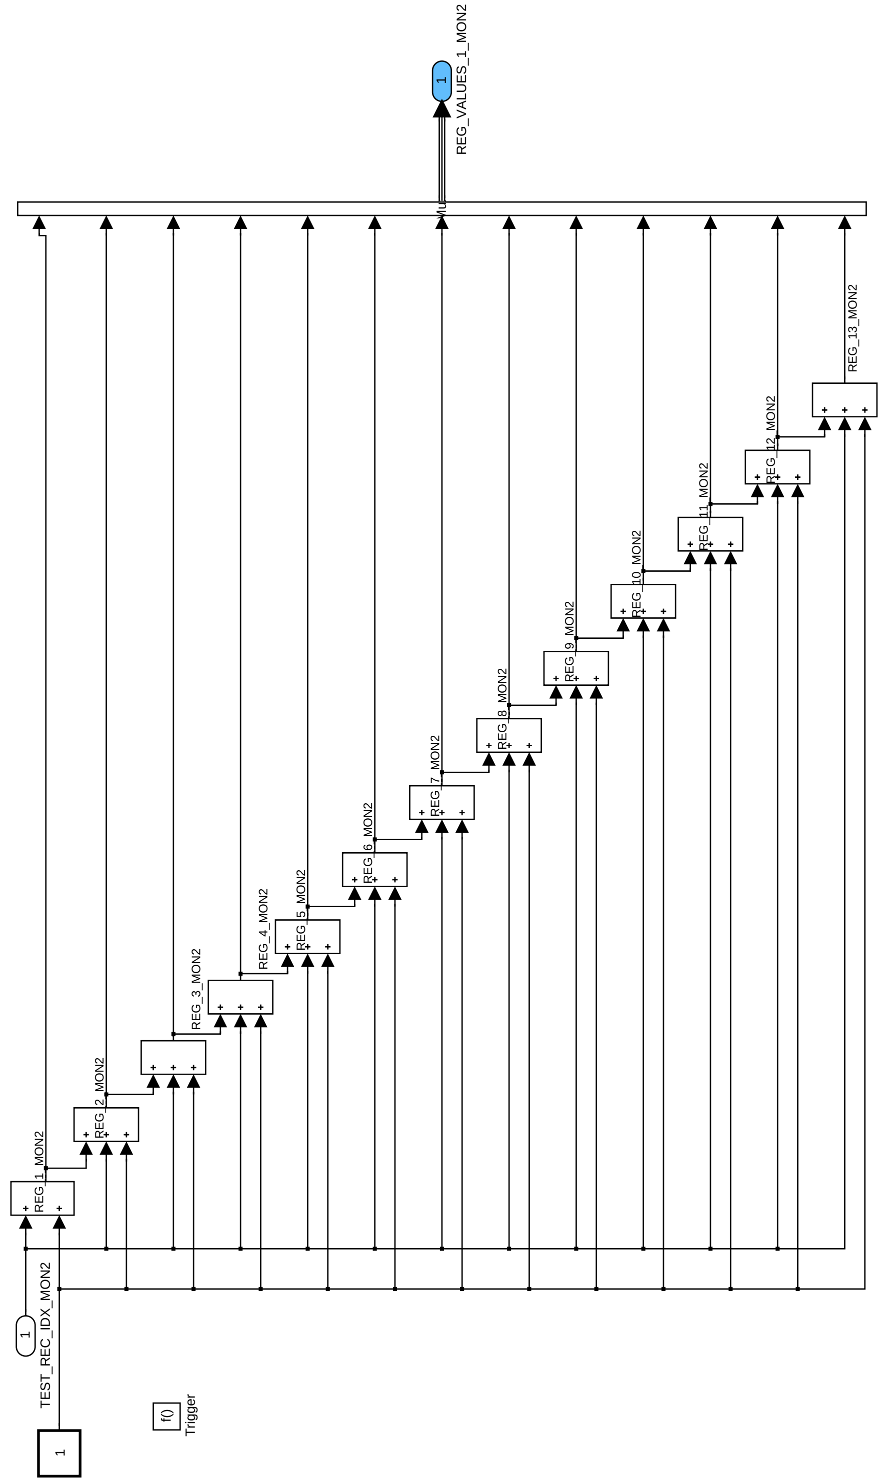

Figure 109 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_LOAD

ECM2_DTSYSCOPPRHPDI/OPERATE/INI_START_VALUES

Initialization of variables from the lists of starting values

In order to ensure an unambiguous final result for RESP_MON2 the values

TQI_AV_MON2, TQI_REQ_TOT_MON2, EFF_TOT_MON2 and FAC_TQ_REQ_MON2 have to be initialized with zero.

All logical variables are stored in tables of status bytes. In every recurrence, the information is copied from the table into the status bytes LF_1_MON2, LF_2_MON2, LF_3_MON2 and LF_4_MON2 respectively.

The position of the logical variables LV_xyz_MON2 within the status bytes are shown in the figures before:

HINT: The curve ID_RESP_MON2 is calibrated in this module. But the values depending on TEST_REC_IDX_MON2 are used in L3 (processor monitoring). Therefore, the output of this ID is terminated in this simulation.

<u>Register calculation 1 for checking Interrupt routine</u>

After reloading the register values REG_x_MON2 from the stack, N_32_MON2 from the sub-module INI_START_VALUE shall be added to every REG_x_MON2.

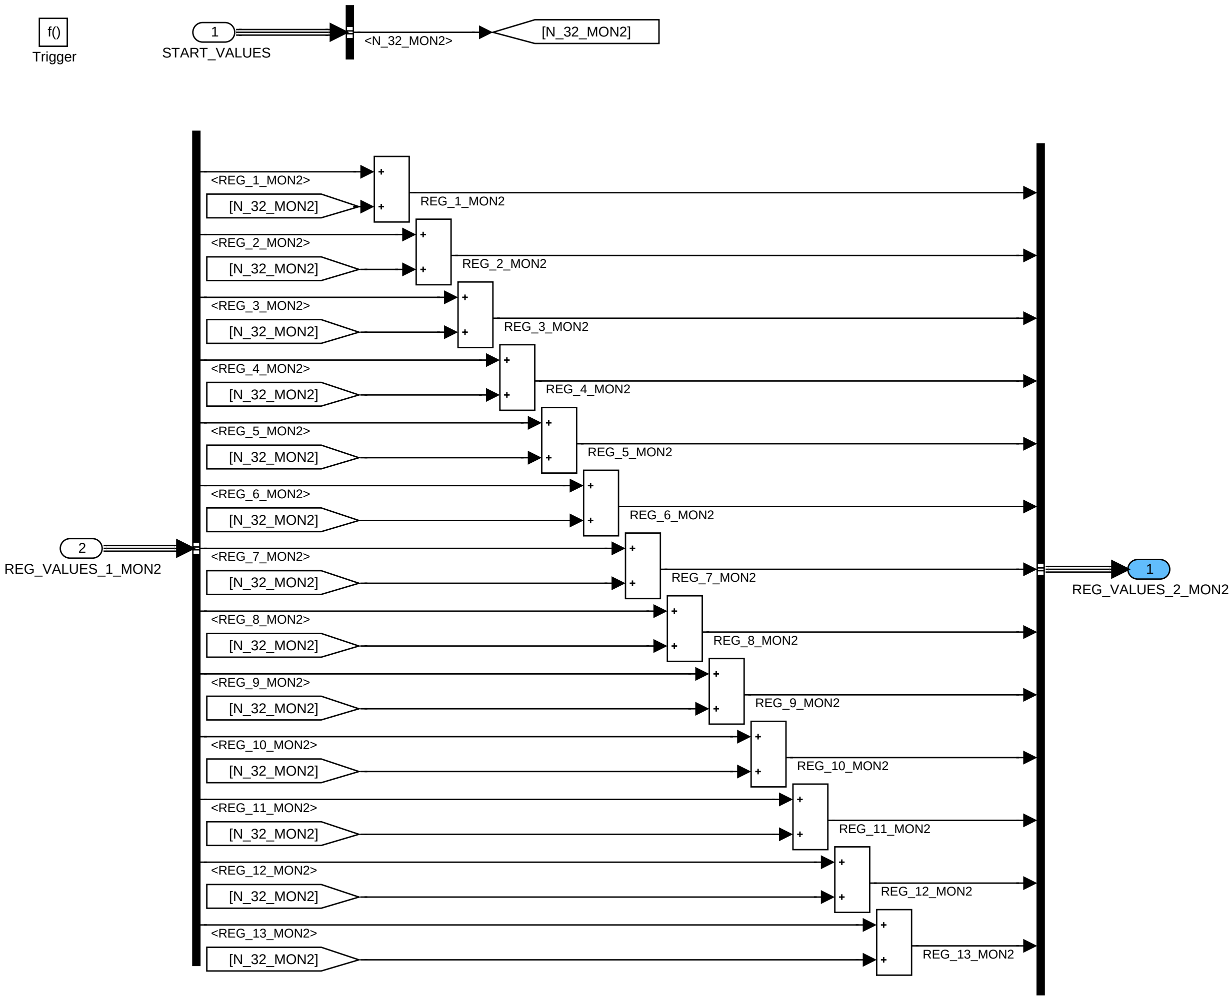

Figure 117 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_1

ECM2_DTSYSCOPPRHPDI/OPERATE/TQI_SP

General information:

The module has exactly the same functionality than the corresponding module ‘Desired indicated engine torque’ of level 2 (`30E00K01.00I`) except:

No RAM test of output data performed

No initialisation section included

TQI_SP_MON (output) renamed to TQI_SP_MON_MON2

All input data, output data and calibration data renamed to level 2’ naming Example: xyz_MON renamed to xyz_MON2

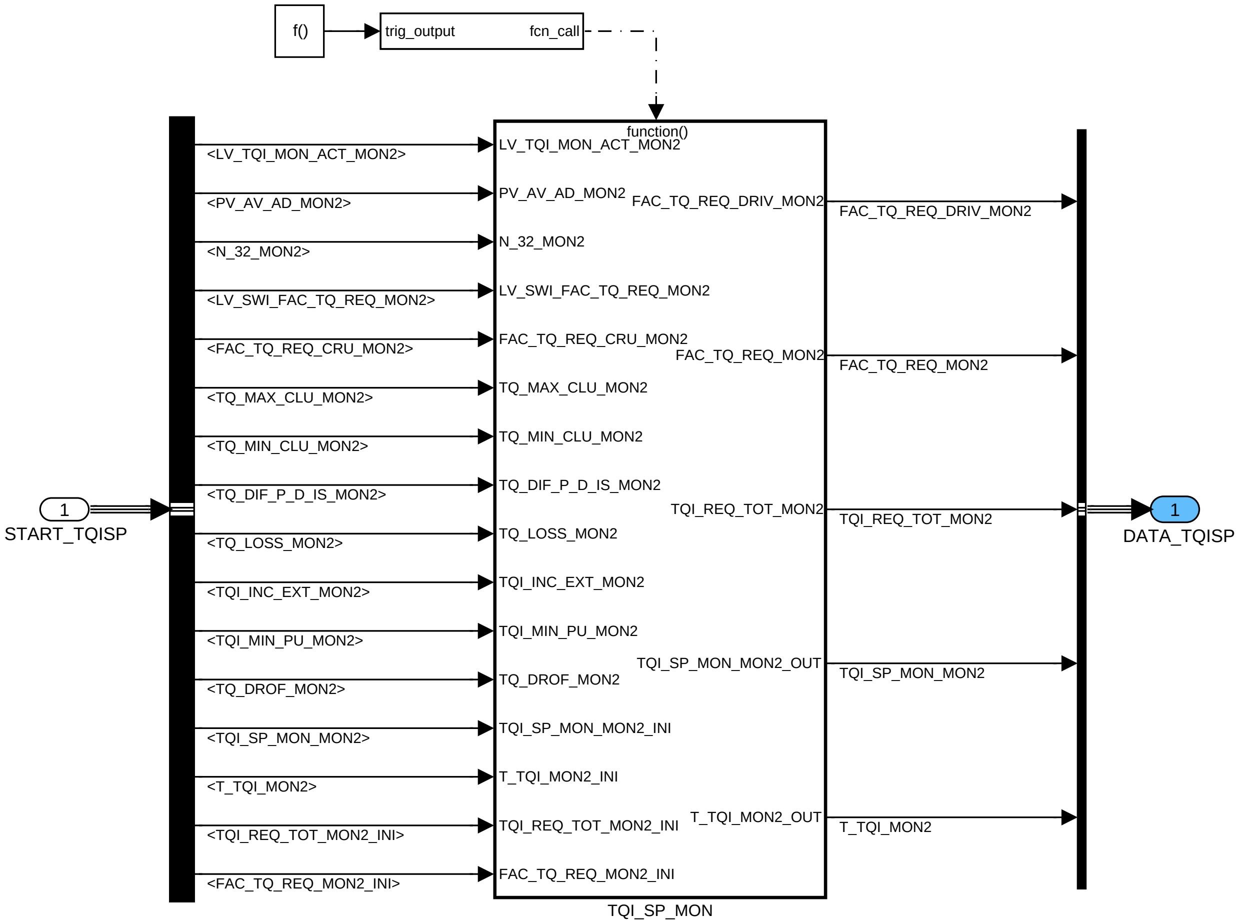

Figure 118 ECM2_DTSYSCOPPRHPDI/ OPERATE/ TQI_SP

<u>Register calculation 2 for checking Interrupt routine</u>

After reloading the register values REG_x_MON2 from the stack, TQI_SP_MON_MON2 from the sub-module TQI_SP shall be added to every REG_x_MON2.

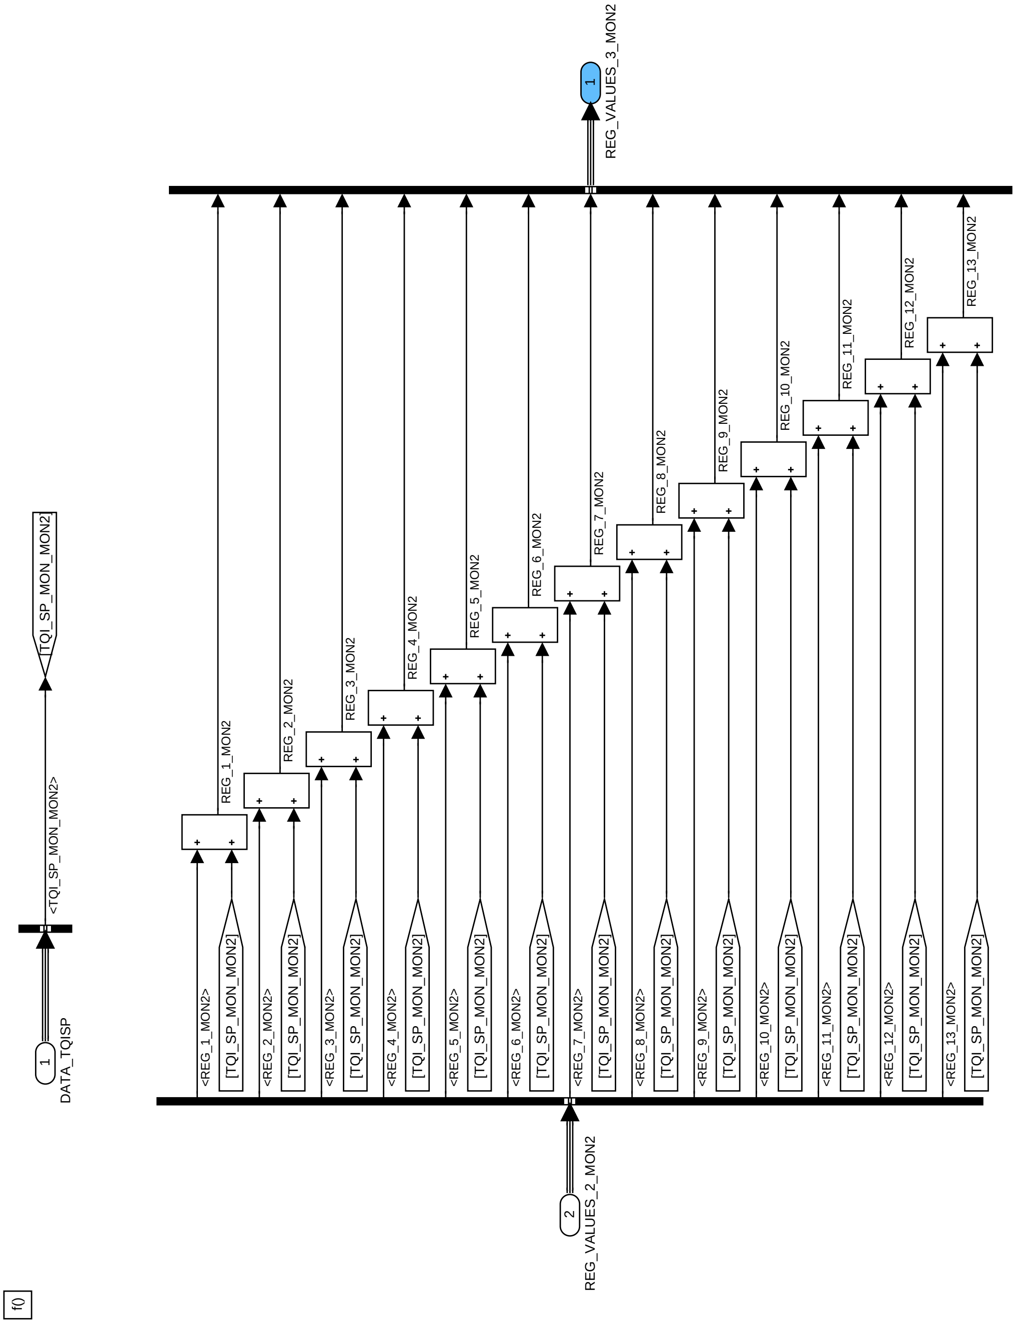

Figure 119 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_2

ECM2_DTSYSCOPPRHPDI/OPERATE/ACTUAL_EFF

General information:

The module has exactly the same functionality than the corresponding module ‘Actual efficiencies’ of level 2 (30E01401.00J) except:

No RAM test of output data performed

No initialisation section included

All input data, output data and calibration data renamed to level 2' naming Example: xyz_MON renamed to xyz_MON2

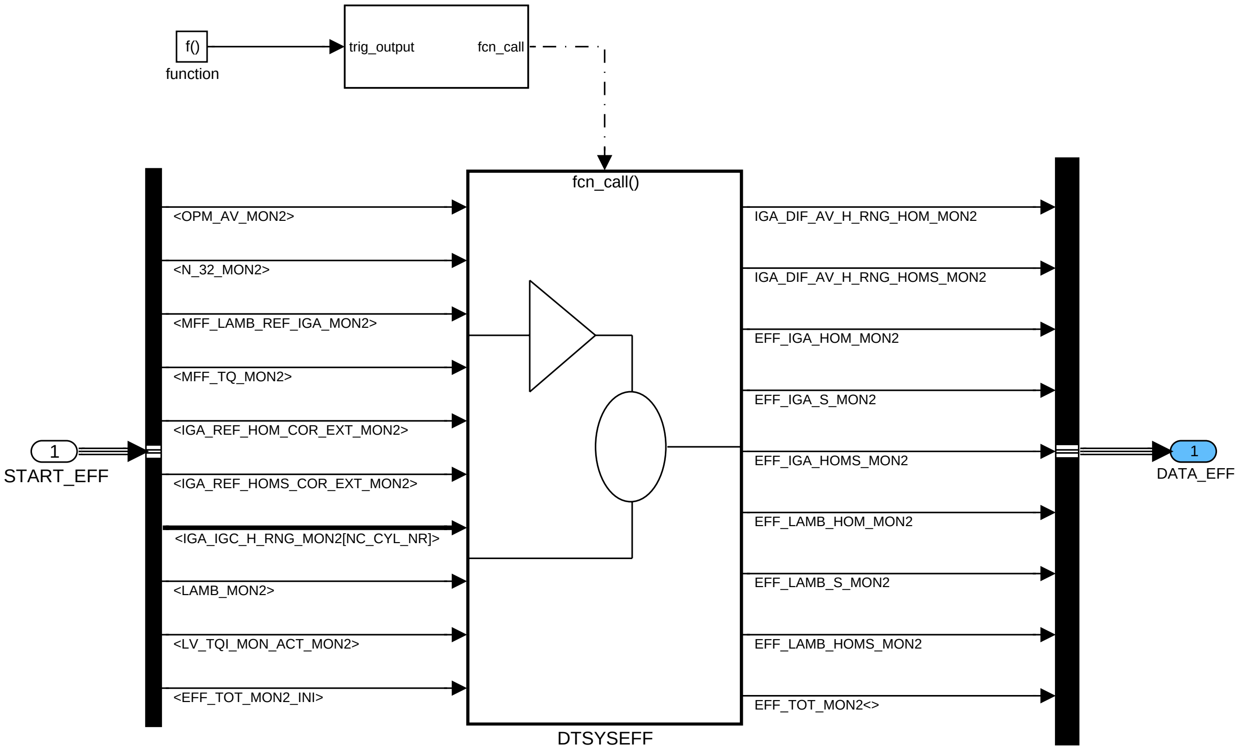

Figure 120 ECM2_DTSYSCOPPRHPDI/ OPERATE/ ACTUAL_EFF

Register calculation 3 for checking Interrupt routine

After reloading the register values REG_x_MON2 from the stack, EFF_TOT_MON2 from the sub-module ACTUAL_EFF shall be added to every REG_x_MON2.

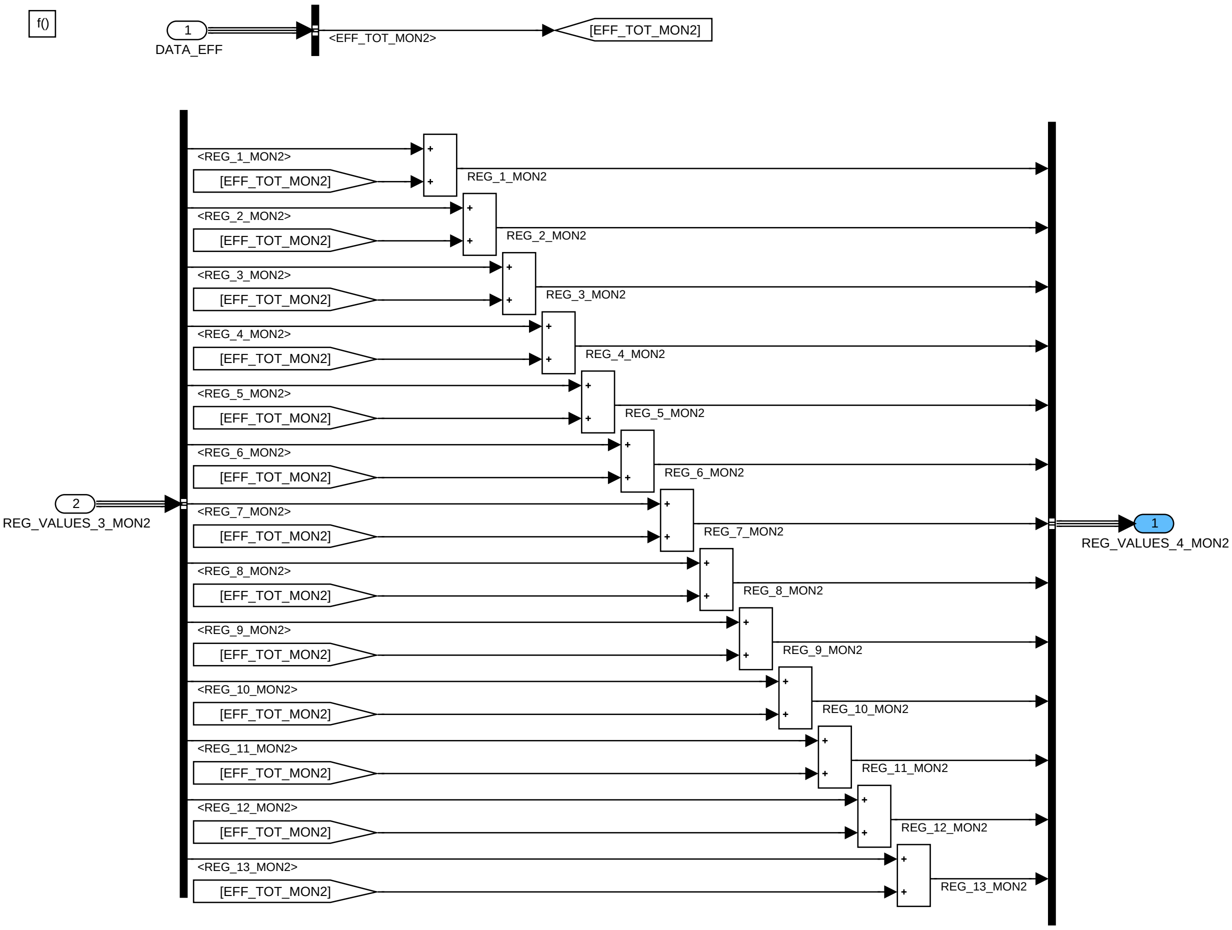

Figure 121 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_3

ECM2_DTSYSCOPPRHPDI/OPERATE/TQI_AV

General information:

The module has exactly the same functionality than the corresponding module ‘Actual indicated engine torque’ of level 2 (`30E00L01.00E`) except:

No RAM test of output data performed

No initialisation section included

All input data, output data and calibration data renamed to level 2’ naming Example: xyz_MON renamed to xyz_MON2

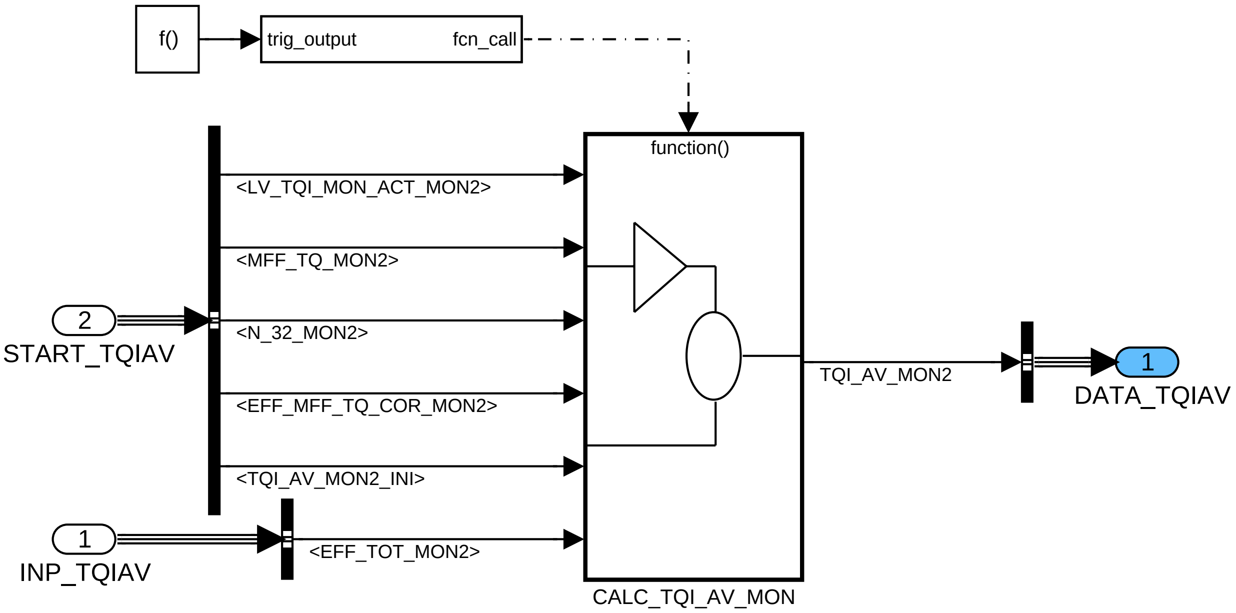

Figure 122 ECM2_DTSYSCOPPRHPDI/ OPERATE/ TQI_AV

Register calculation 4 for checking Interrupt routine

After reloading the register values REG_x_MON2 from the stack, TQI_AV_MON2 from the sub-module TQI_AV shall be added to every REG_x_MON2.

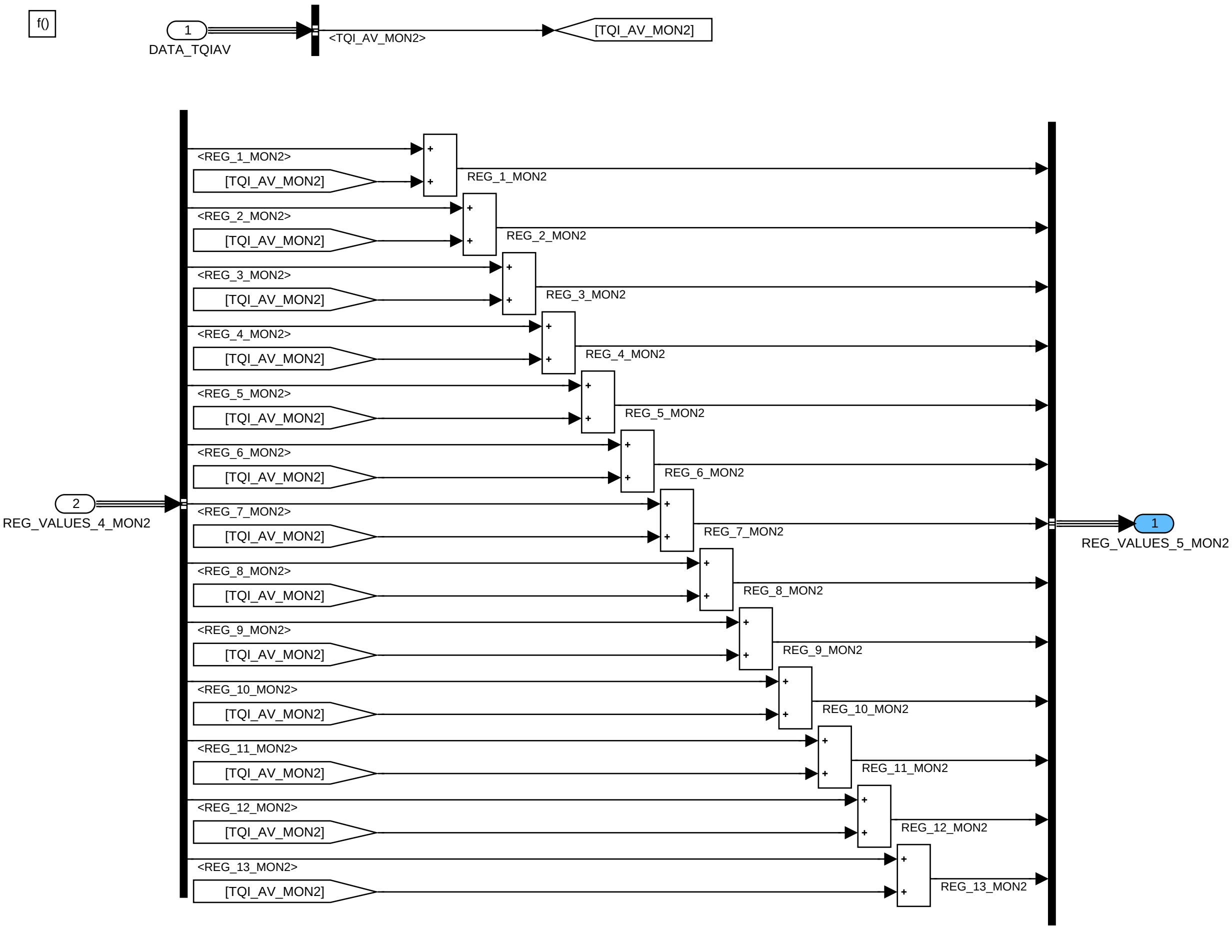

Figure 123 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_4

ECM2_DTSYSCOPPRHPDI/OPERATE/TQMON

General information:

The module has exactly the same functionality than the corresponding module ‘Monitoring of actual indicated engine torque’ of level 2 (`30E00M01.00E`) except:

No RAM test of output data performed

No initialisation section included

TQI_SP_MON (input) renamed to TQI_SP_MON_MON2

All input data, output data and calibration data renamed to level 2’ naming Example: xyz_MON renamed to xyz_MON2

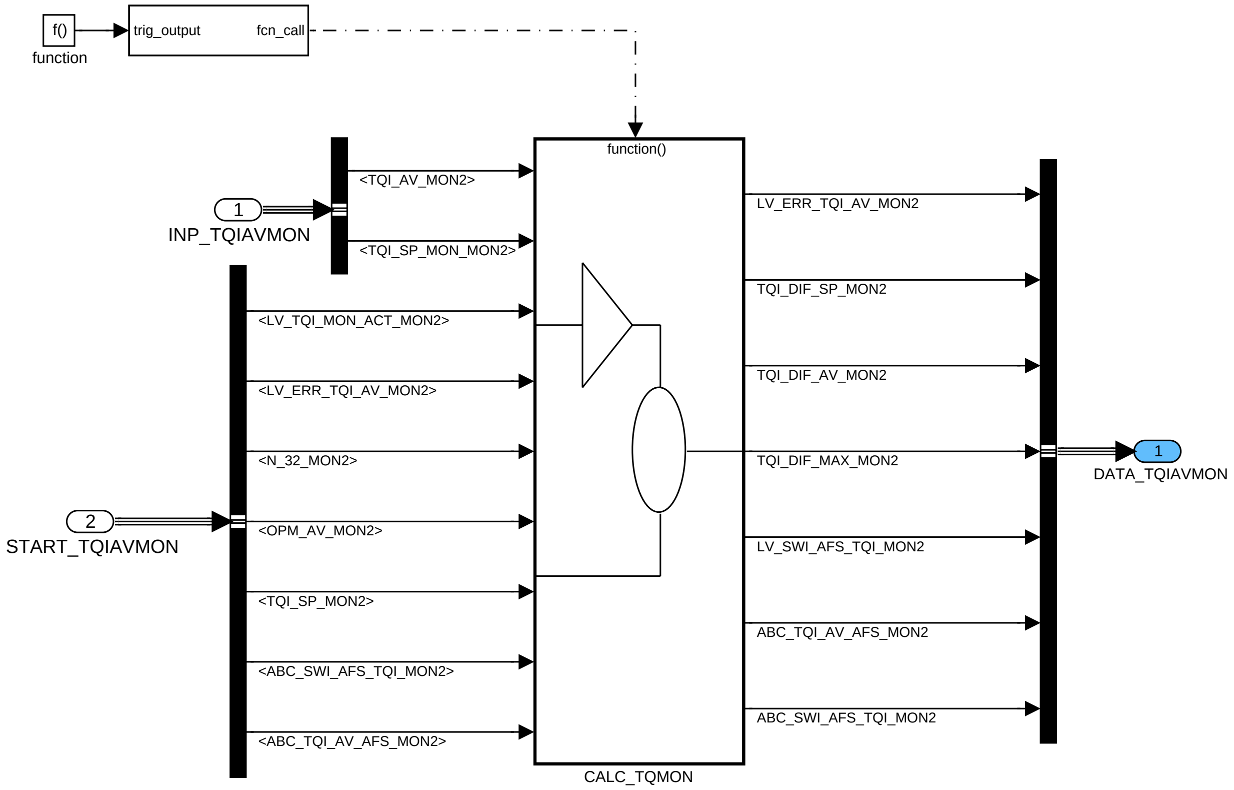

Figure 124 ECM2_DTSYSCOPPRHPDI/ OPERATE/ TQMON

Register calculation 5 for checking Interrupt routine

After reloading the register values REG_x_MON2 from the stack, ABC_TQI_AV_AFS_MON2 from the sub-module TQMON shall be added to every REG_x_MON2.

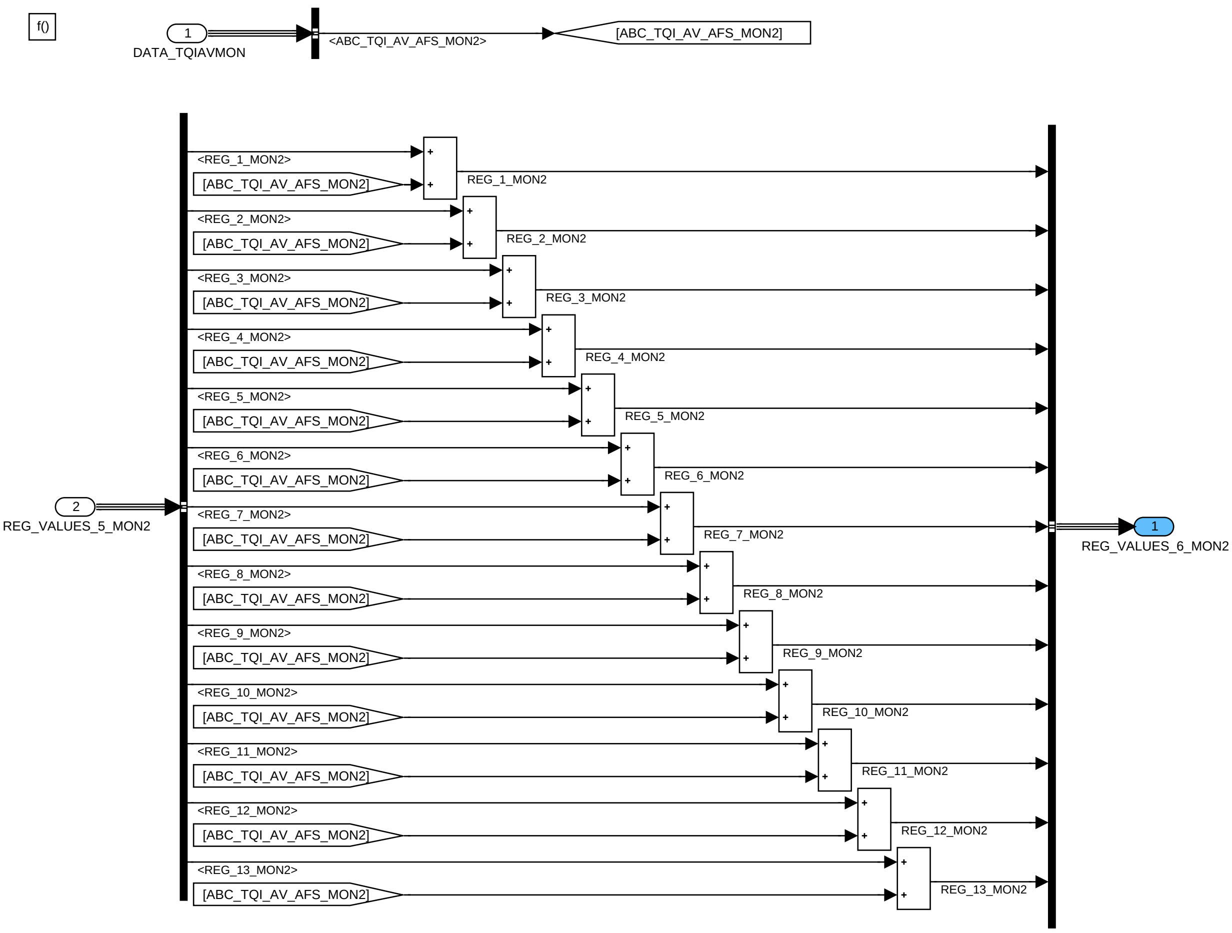

Figure 125 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_5

ECM2_DTSYSCOPPRHPDI/OPERATE/N_LIM_MON

General information:

The module has exactly the same functionality than the corresponding module ‘Monitoring of engine speed limitation’ of level 2 (`30E00I01.00F`) except:

No RAM test of output data performed

No initialisation section included

All input data, output data and calibration data renamed to level 2’ naming Example: xyz_MON renamed to xyz_MON2

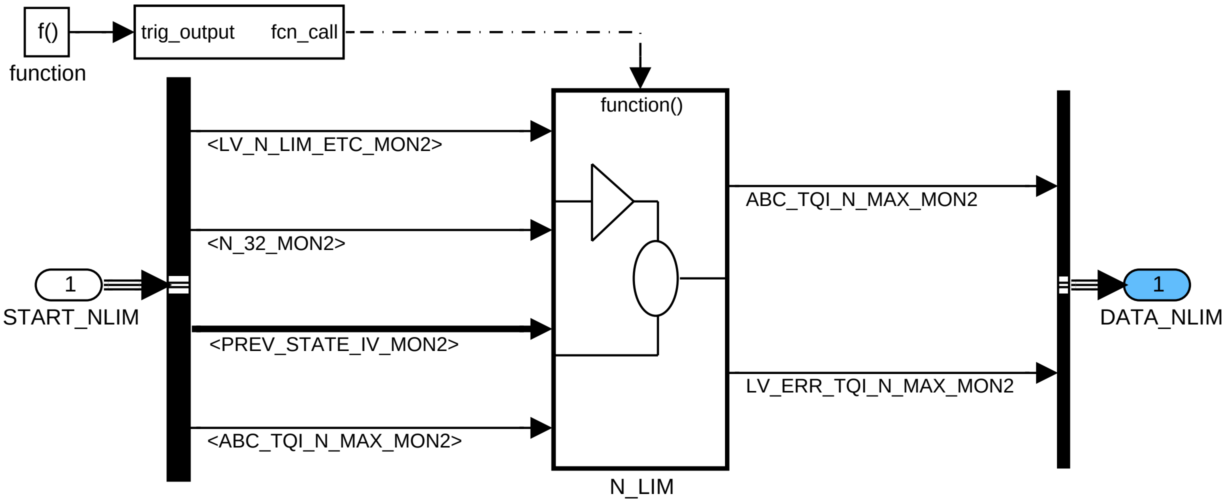

Figure 126 ECM2_DTSYSCOPPRHPDI/ OPERATE/ N_LIM_MON

Register calculation 6 for checking Interrupt routine

After reloading the register values REG_x_MON2 from the stack, ABC_TQI_N_MAX_MON2 from the sub-module N_LIM_MON shall be added to every REG_x_MON2.

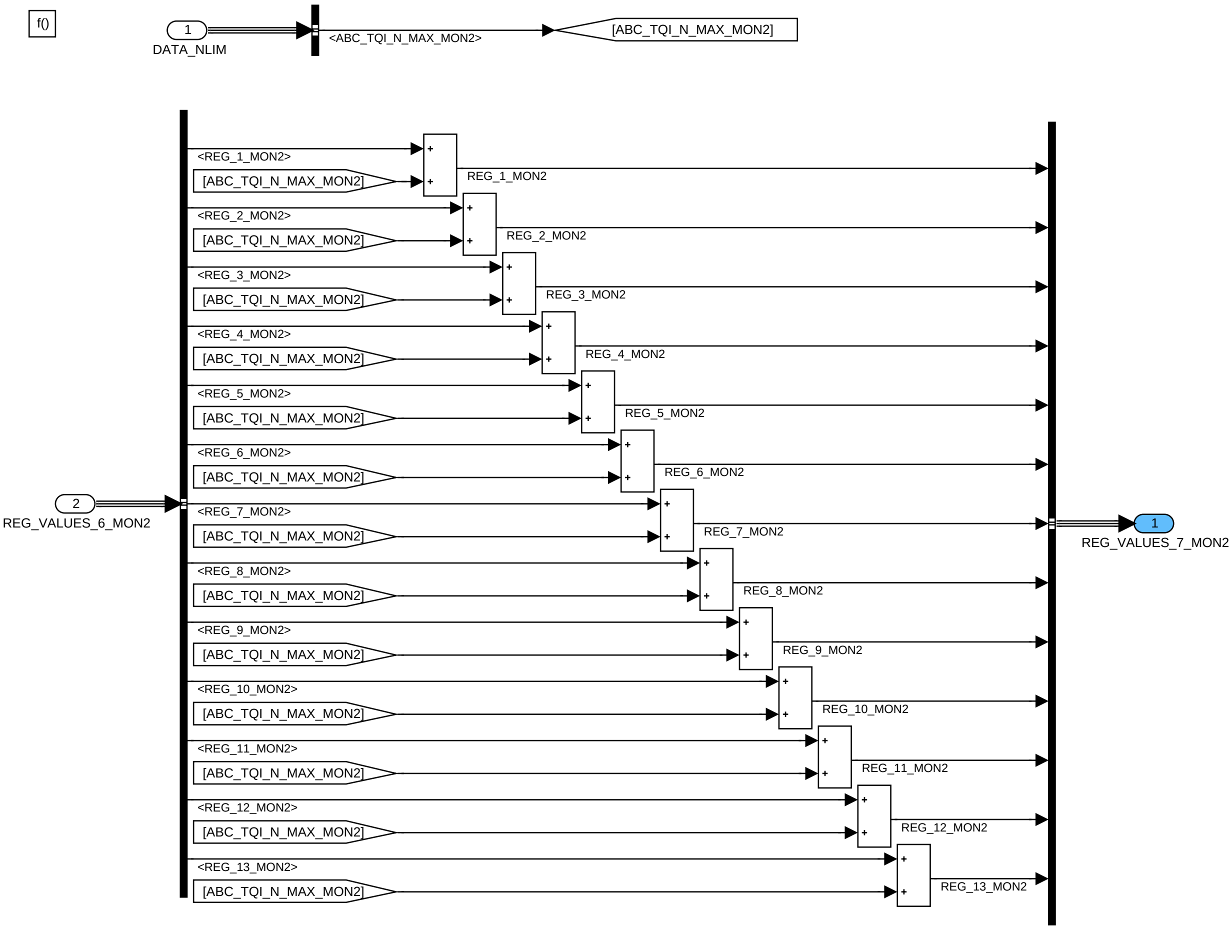

Figure 127 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_6

ECM2_DTSYSCOPPRHPDI/OPERATE/FAULT_REACTION

General information:

The module has exactly the same functionality than the corresponding module 'Fault reaction of process monitoring' of level 2 (`30E00G01.00J`) except:

No RAM test of output data performed

No initialisation section included

All input data, output data and calibration data renamed to level 2' naming Example: xyz_MON renamed to xyz_MON2

The ACTION_ECM3_RedSwitchOffPath() is replaced, instead of the original action call LV_DR_OFF_MU_MON2 is set to 1.

The byte LF_4_MON2 is updated with the output flags after execution.

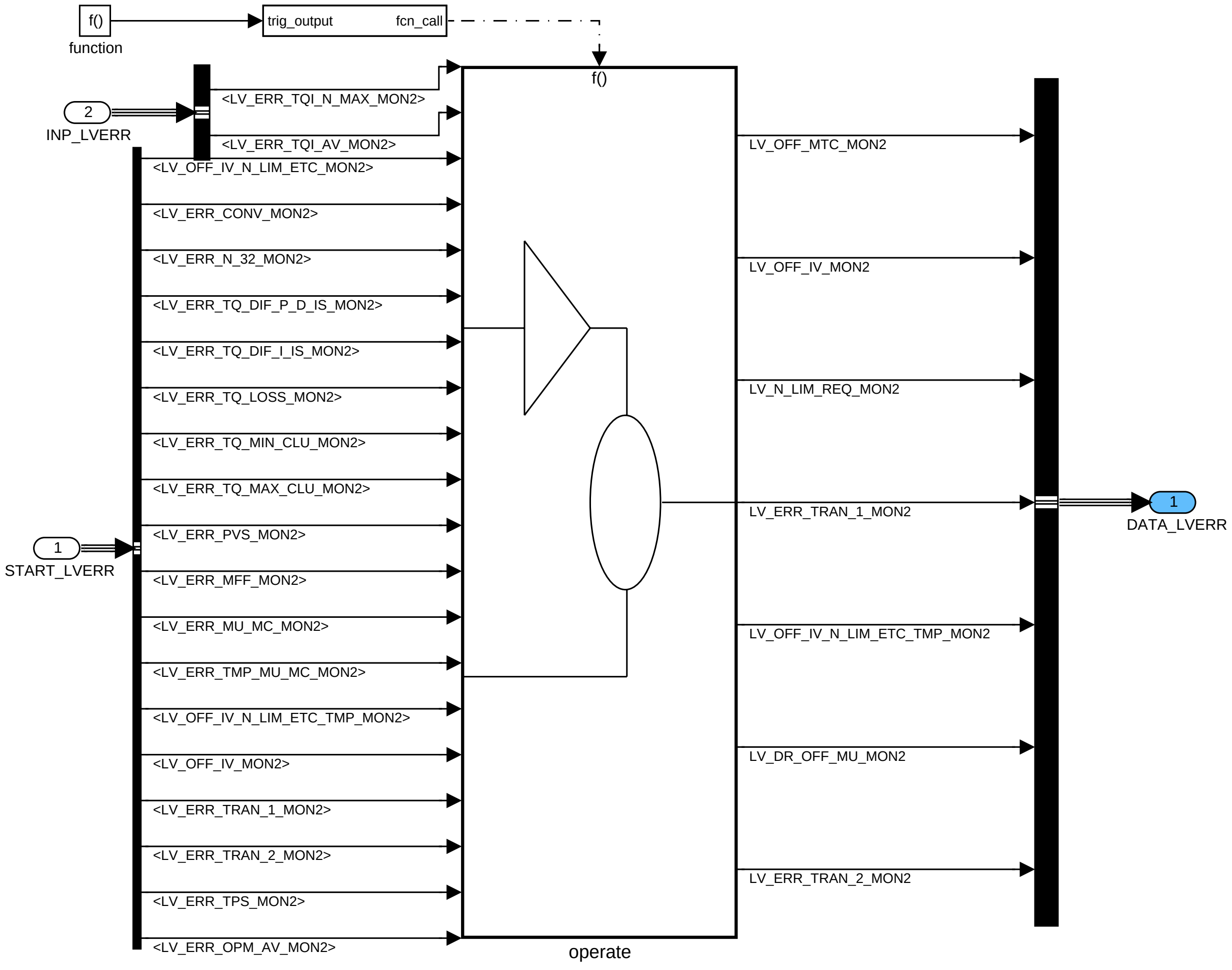

Figure 128 ECM2_DTSYSCOPPRHPDI/ OPERATE/ FAULT_REACTION

Register calculation 7 for checking Interrupt routine

After reloading the register values REG_x_MON2 from the stack, LV_OFF_IV_MON2 from the sub-module FAREA shall be added to every REG_x_MON2.

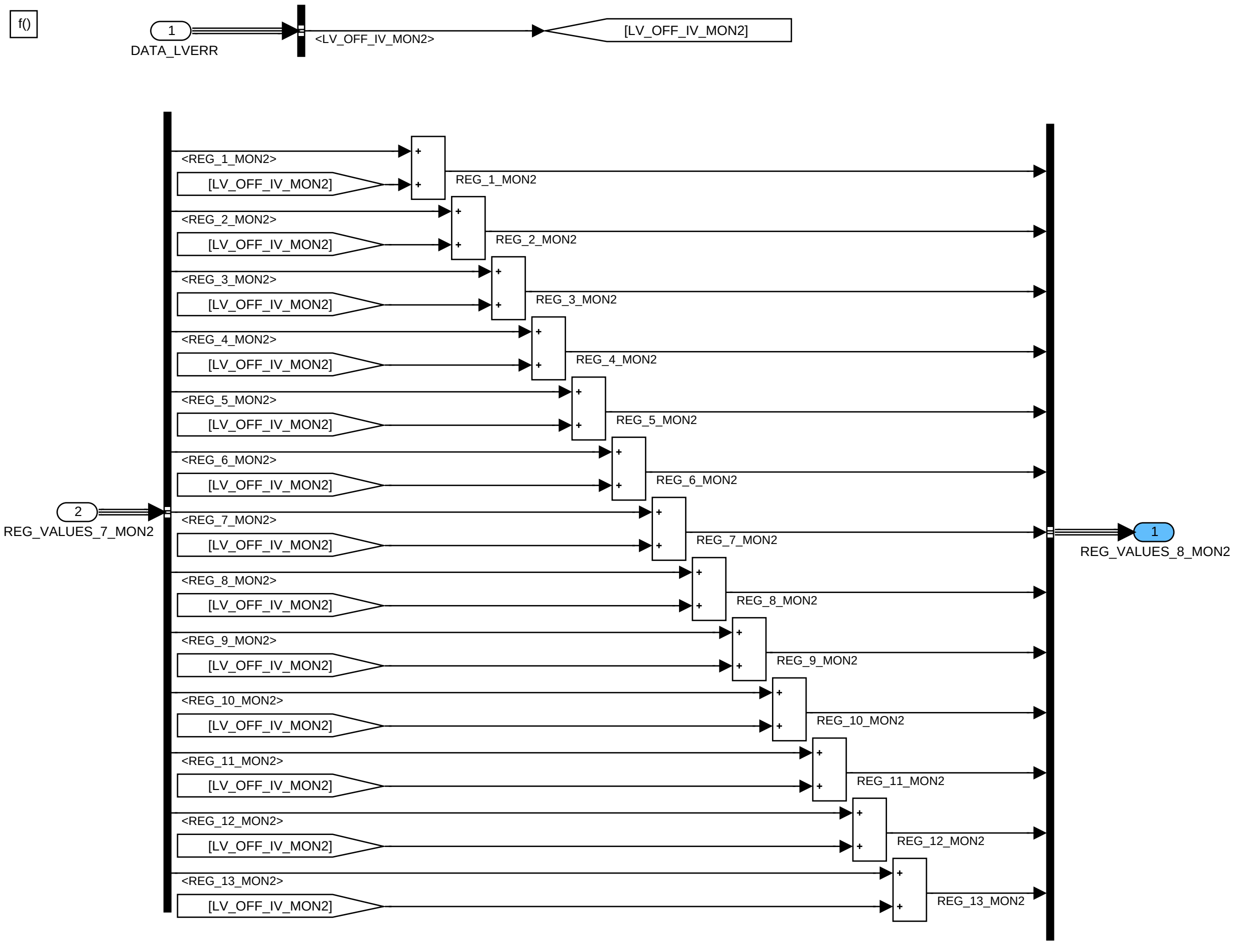

Figure 129 ECM2_DTSYSCOPPRHPDI/ OPERATE/ REG_CALC_7

ECM2_DTSYSCOPPRHPDI/OPERATE/RESP_MON_TEMP

General information:

The byte LF_4_MON2 is updated with the output flags after execution.

There is a possibility for faults, which leads to wrong interim results but to a correct final result of the test calculation. In order to ensure that such a kind of fault is detectable, the final result is composed of several intermediate ones coming out of different parts of the test calculation.

Formula section:

RESP_MON2_TEMP = (TQI_SP_MON_MON2
- TQI_AV_MON2
+ TQI_REQ_TOT_MON2
+ FAC_TQ_REQ_MON2
+ ABC_TQI_AV_AFS_MON2
+ 256 * ABC_TQI_N_MAX_MON2)

XOR (256 * LF_4_MON2)

All operations are performed with hexadecimal values only. The different units are not taken into account. The result of the operations and all intermediate results are 32 Bit word size.

ID_RESP_MON2 [TEST_REC_IDX_MON2] must fit to RESP_MON2 if the test calculation with index TEST_REC_IDX_MON2 has been executed correctly.

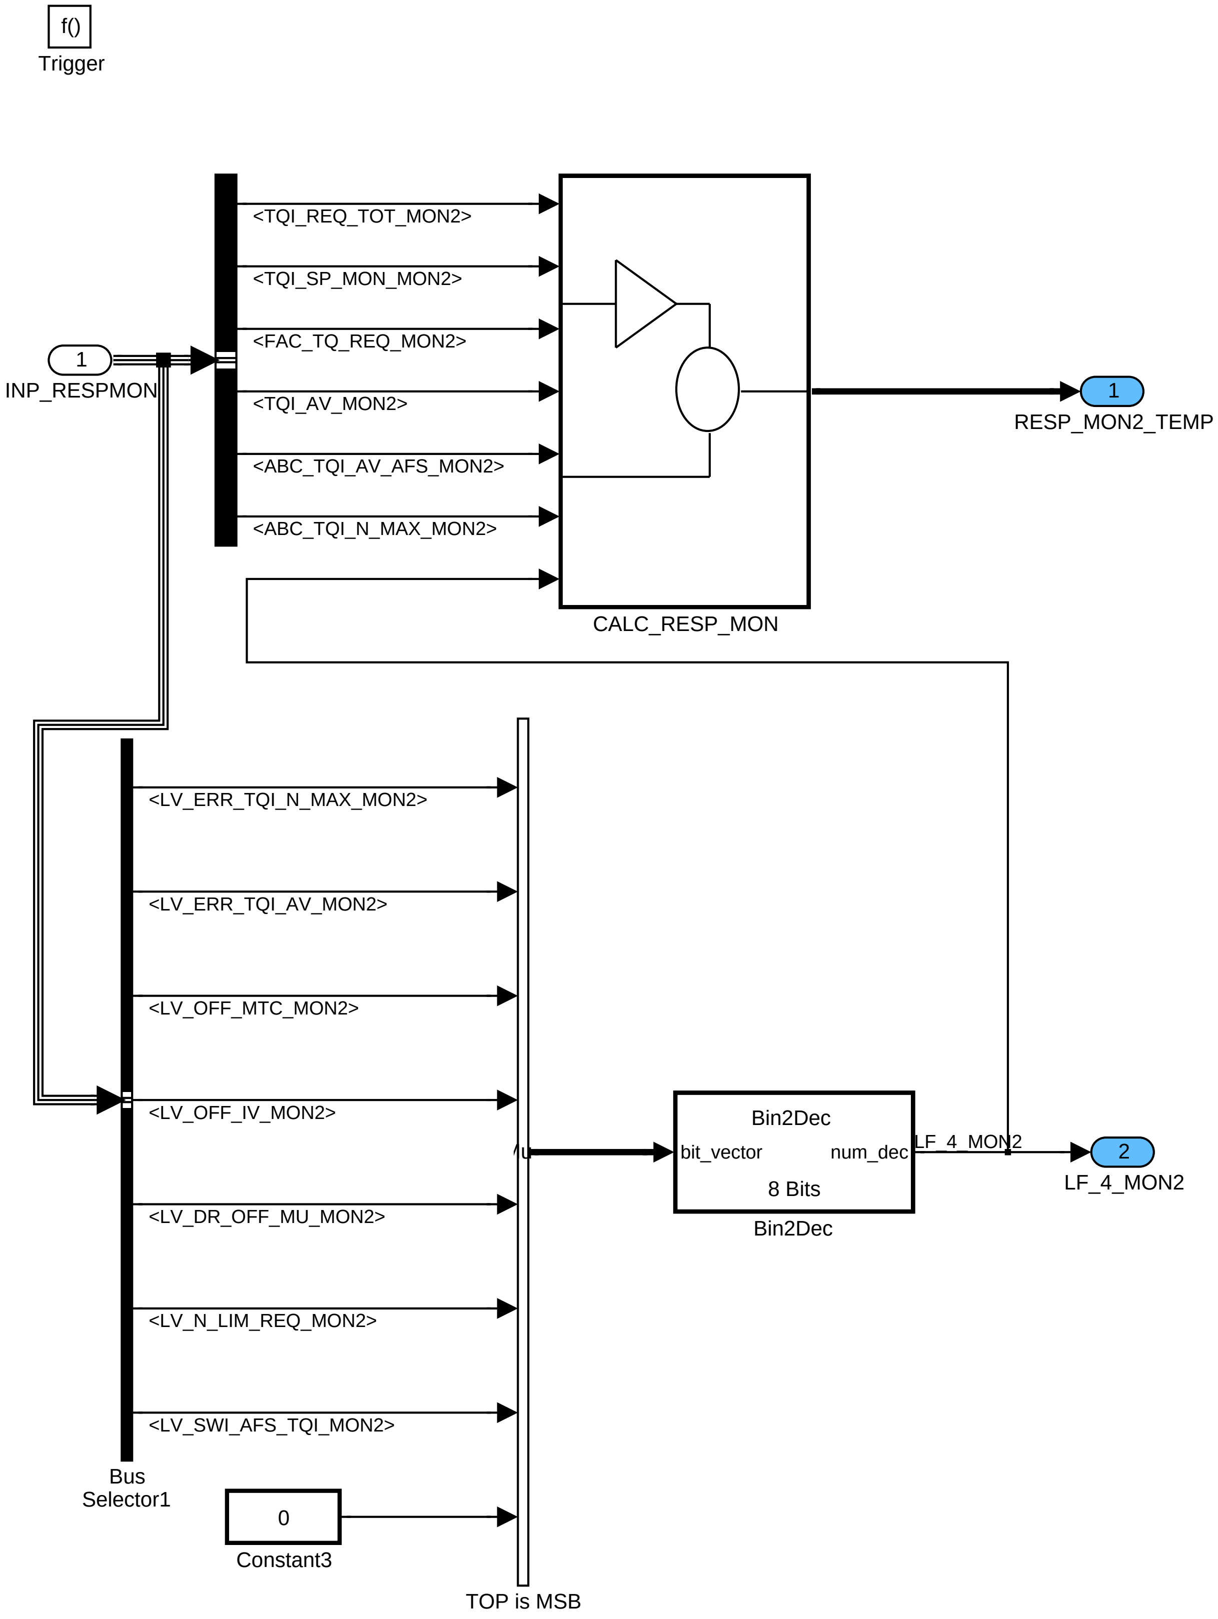

Figure 130 ECM2_DTSYSCOPPRHPDI/ OPERATE/ RESP_MON_TEMP

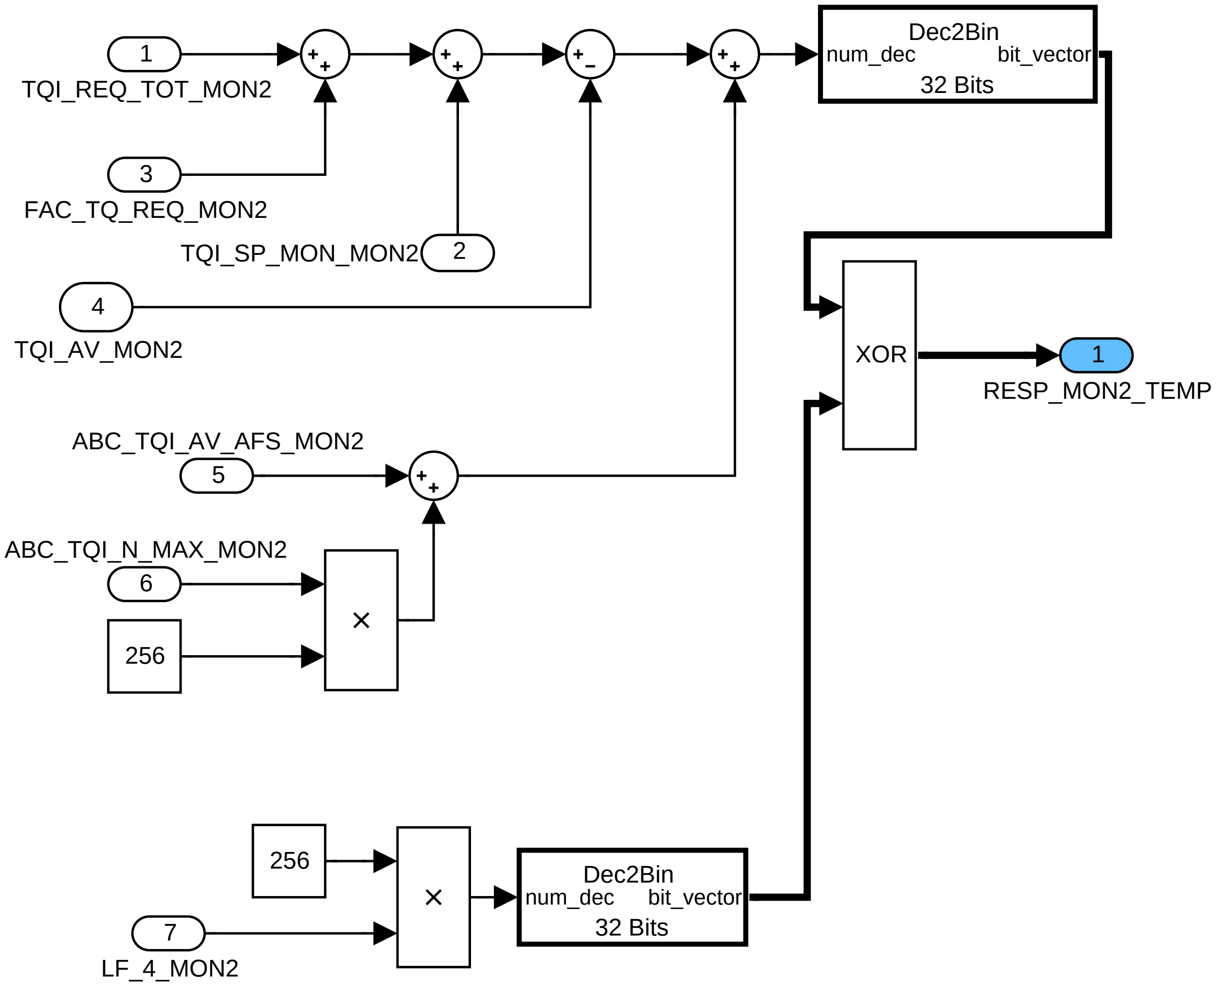

Figure 131 ECM2_DTSYSCOPPRHPDI/ OPERATE/ RESP_MON_TEMP/ CALC_RESP_MON

ECM2_DTSYSCOPPRHPDI/OPERATE/RESP_MON

For the final calculation of RESP_MON2, the 32 bit values used so far have to be encoded into a 16 bit value. Therefore, after adding the register values, the high and the low 16 bit values of the resulting sum shall be combined by an XOR. The same procedure shall be applied to the temporary result RESP_MON2_TEMP which shall the additionally also be XOR-ed with the final result of the register operations.

LV_ERR_MU_MC	LV_ERR_TMP_MU_MC	LV_ERR_TPS_MON	LV_ERR_OPM_AV_MON

Import actions:

ACTION_ECM3_Service12TaskPfm(IN <>)
ACTION_ECM3_Service13TaskPfm(IN <>)
ACTION_ECM3_Service14TaskPfm(IN <>)

Note: These actions are defined in chapter "Processor Monitoring". The first action shall be executed as first instruction in this module, the second after the stack check, and the third action as last instruction of this module. The arguments shall have value 4.

ACTION_ECM3_McChkStack()

Note: This action is defined in chapter "Processor Monitoring" and implements a stack check. It shall be executed between ACTION_ECM3_Service12TaskPfm() and ACTION_ECM3_Service13TaskPfm().

ACTION_ECM3_WriteChkCpl(INOUT <>, OUT <>, IN <>)
ACTION_ECM3_ChkCpl(IN <>, IN <>)
ACTION_ECM3_ReadChkCpl(OUT <>, IN <>, IN <>)

Note: All variables with Mode O and history variables in modules of the *Process Monitoring* have to be checked by the cyclical RAM test.

ACTION_ECM3_RedSwitchOffPath()

Note: This action is defined in chapter "Processor Monitoring", subsection "The redundant switch off path".

Export Actions:

ACTION_ECM2_LockPws()
Disable power stages by process monitoring (used when no ECM2 tasks executed)
ACTION_ECM2_UnlockPws()
Enable power stages by process monitoring for exactly one time (used when ECM2 tasks executed)
ACTION_ECM2_ResetErrorFlags()
Enable power stages unless fault reaction already active

Description for ACTION_ECM2_LockPws():

Description:

Syntax: ACTION_ECM2_LockPws()

Formula section:

LV_OFF_IV_MON = 1;

LV_OFF_MTC_MON = 1;

/* Disable injection and H-bridge */

Description for ACTION_ECM2_UnlockPws():

Description:

Syntax: ACTION_ECM2_UnlockPws()

Formula section:

LV_OFF_IV_MON = 0;

LV_OFF_MTC_MON = 0;

/* Enable injection and H-bridge for exactly one time */

Description for ACTION_ECM2_ResetErrorFlags():

Description:

Syntax: ACTION_ECM2_ ResetErrorFlags()

Formula section:

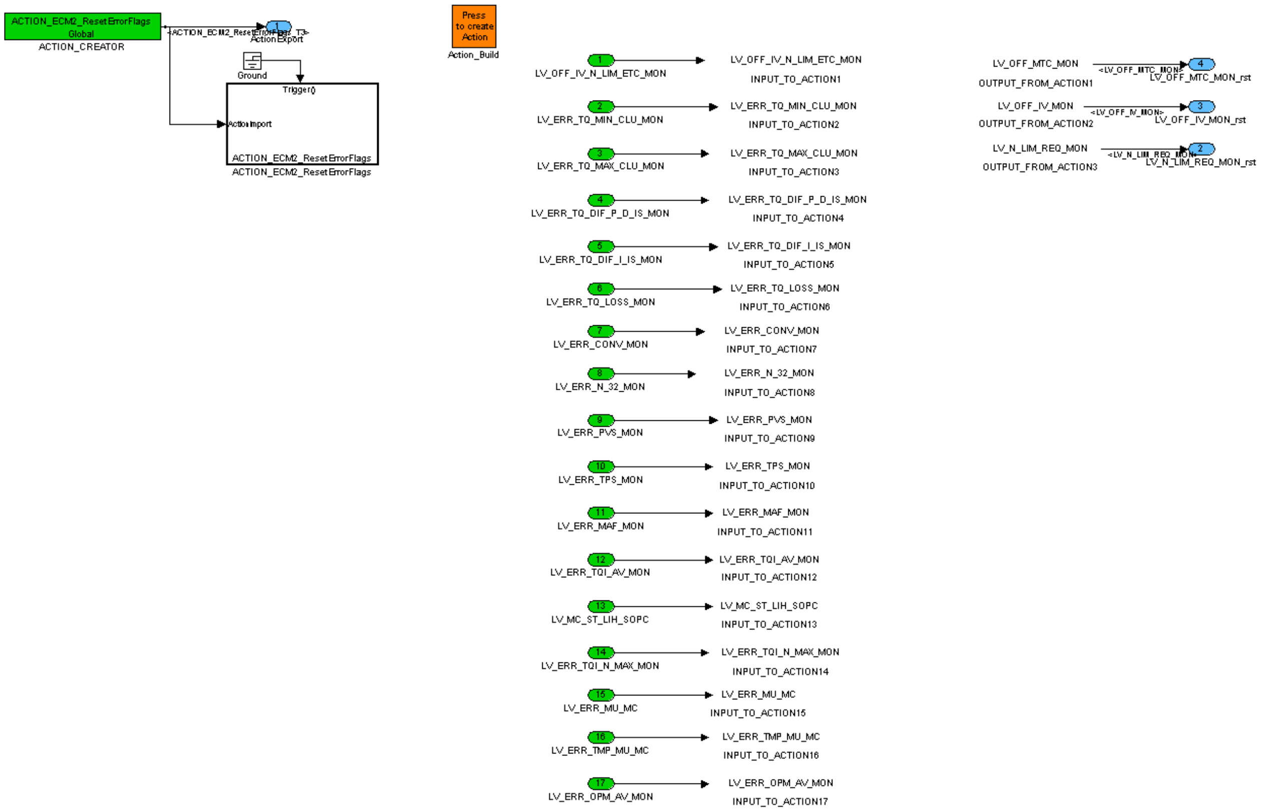

Figure 136 ECM2_DTSYSFAREA / ACTIONDEF_ECM2_ResetErrorFlags

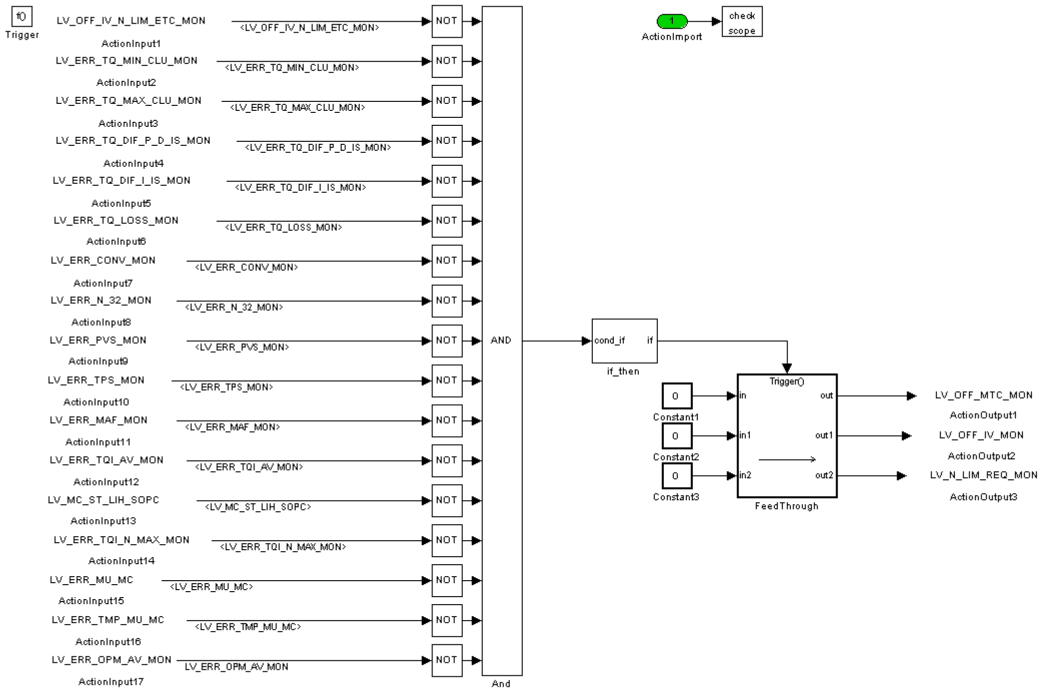

Figure 137 ECM2_DTSYSFAREA / ACTIONDEF_ECM2_ResetErrorFlags/ ACTION_ECM2_ResetErrorFlags

/* Reset of ECM2 error flags to enable power stages unless fault reaction already active */

General description:

The objective of this module is to react on faults detected by the process and processor monitoring of the etc-monitoring-concept. The following actions are introduced depending on the error level and the degree of degradation.

disable of throttle power stage (LV_OFF_MTC_MON)

disable of injection power stage (LV_OFF_IV_MON)

transmission of wrong answers from level 2’ to the monitoring processor in order to force the monitoring unit to reset the main controller and switch off the throttle and the injection power stages (ACTION_ECM3_RedSwitchOffPath())

The following table shows the fault reactions corresponding to the underlying faults. No fault reaction is reset until next ignition key on (transition from LV_IGK = 0 to 1). There are only two exceptions, 1.) for a temporary fault detected by the processor monitoring on the main controller (LV_ERR_TMP_MU_MC) and 2.) for injection cut off (LV_OFF_IV_MON) during engine speed limitation.

Faults	Fault reaction			
	Disable of MTC via main controller (LV_OFF_MTC_MON = 1)	Request engine speed limitation (LV_N_LIM_REQ_MON = 1)	Disable of IV via main controller (LV_OFF_IV_MON = 1)	Disable of MTC and IV via monitoring unit (ACTION_ECM3_RedSwitchOffPath())

LV_ERR_MU_MC	X	Z	X	Z
LV_ERR_TMP_MU_MC*	X	Z	X	Z

* reversible during present driving cycle, for actions after reset see formulas or model description

The map shows resulting states of output bits. The proceeding is top-down, e.g. the undermost set fault bit of a column defines the resulting state. Symbol “x” means the related bit is set, “z” the former result of present recurrence will not be changed and “0 “ resets the related bit, if the fault is not set.

LV_OFF_IV_MON must be calculated first by LV_OFF_IV_N_LIM_ETC_MON and than by non reversible fault reactions to be sure that a wrong write operation with LV_OFF_IV_MON = 0 is less prior than fault reactions with permanent fuel cut-off.

FUNCTION DESCRIPTION:

General information:

When a fault is detected by the level 2 of the ETC-Monitoring concept and the reaction is released in the module ‘fault reaction of process monitoring’, the fault is transferred to the error memory management.
